Rules and Regulations for the Classification of Naval Ships

January 2022

A guide to the Rules

and published requirements

Rules and Regulations for the Classification of Naval Ships

Introduction

The Rules are published as a complete set; individual Parts are, however, available on request. A comprehensive List of Contents is placed at the beginning of each Part.

Rules updating

The Rules are generally published annually and changed through a system of Notices between releases.

Rules programs

LR has developed a suite of Calculation Software that evaluates Requirements for Ship Rules, Offshore Rules, Special Service Craft Rules and Naval Ship Rules. For details of this software please contact LR.

Direct calculations

The Rules may require direct calculations to be submitted for specific parts of the ship structure or arrangements and these will be assessed in relation to LR's own direct calculation procedures. They may also be required for ships of unusual form, proportion or speed, where intended for the carriage of special cargoes or for special restricted service and as supporting documentation for arrangements or scantlings alternative to those required by the Rules.

January 2022

Lloyd's Register and variants of it are trading names of Lloyd's Register Group Limited, its subsidiaries and affiliates. For further details please see http://www.lr.org/entities

Lloyd's Register Group Limited, its subsidiaries and affiliates and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

Section 1

Background

- 1.1 Lloyd's Register Group Limited is a registered company under English law, with origins dating from 1760. It was established for the purpose of producing a faithful and accurate classification of merchant shipping. It now primarily produces classification Rules.
- 1.2 Classification services are delivered to clients by a number of other members subsidiaries and affiliates of Lloyd's Register Group Limited, including but not limited to: Lloyd's Register EMEA, Lloyd's Register Asia, Lloyd's Register North America, Inc., and Lloyd's Register Central and South America Limited. Lloyd's Register Group Limited, its subsidiaries and affiliates are hereinafter, individually and collectively, referred to as 'LR'.

■ Section 2

Governance

2.1 Lloyd's Register Group Limited is managed by a Board of Directors (hereinafter referred to as 'the Board').

The Board has:

appointed a Classification Committee and determined its powers and functions and authorised it to delegate certain of its powers to a Classification Executive and Devolved Classification Executives;

appointed Technical Committees and determined their powers, functions and duties.

2.2 LR has established National and Area Committees in the following:

Countries: Areas:

Australia (via Lloyd's Register Asia)

Benelux (via Lloyd's Register EMEA)

Canada (via Lloyd's Register North America, Inc.)

Central America (via Lloyd's Register Central and South America Ltd)

China (via Lloyd's Register Asia) Nordic Countries (via Lloyd's Register EMEA)

Egypt (via Lloyd's Register EMEA)

South Asia (via Lloyd's Register Asia)

Federal Republic of Germany (via Lloyd's Register EMEA)

Asian Shipowners (via Lloyd's Register Asia)

France (via Lloyd's Register EMEA) Greece (via Lloyd's Register EMEA)

Italy (via Lloyd's Register EMEA)

Volume 1, Part 1, Chapter 1

Section 3

LLOYD'S REGISTER

Japan (via Lloyd's Register Group Limited)

New Zealand (via Lloyd's Register Asia)

Poland (via Lloyd's Register (Polska) Sp zoo)

Spain (via Lloyd's Register EMEA)

United States of America (via Lloyd's Register North America, Inc.)

■ Section 3

Technical Committee

3.1 LR maintains a Technical Committee, at present comprised of a maximum of 80 members, and additionally an Offshore Technical Committee with specific responsibility for LR's Rules for Offshore Units, at present comprised of a maximum of 80 members. Membership of the Technical Committees includes:

Ex officio members:

- Chairman and Chief Executive Officer of Lloyd's Register Group Limited
- Chairman of the Classification Committee of Lloyd's Register Group Limited

Members Nominated by:

- Technical Committee or Offshore Technical Committee
- Professional bodies representing technical disciplines relevant to the industry
- National and International trade associations with competence relevant to technical issues related to LR's business
- 3.2 In addition to the foregoing:
- (a) Each National or Area Committee may appoint a representative to attend meetings of the Technical Committees.
- (b) A maximum of five further representatives from National Administrations may be co-opted to serve on the Technical Committees. Representatives from National Administrations may also be elected as members of the Technical Committees as Nominated Members.
- (c) Further persons may be co-opted to serve on the Technical Committees by the relevant Technical Committee.
- 3.3 All elections are subject to confirmation by the Board.
- 3.4 The function of the Technical Committees is to consider:
- (a) any technical issues connected with LR's business;
- (b) any proposed alterations in the existing Rules;
- (c) any new Rules for classification;

4

Where changes to the Rules are necessitated by mandatory implementation of International Conventions and Codes, or Common Rules, Unified Requirements and Interpretations adopted by the International Association of Classification Societies, these may be implemented by LR without consideration by the relevant Technical Committee, although any such changes may be provided to the Technical Committees for information.

Where changes to the Rules are required by LR to enable existing technical requirements within the Rules to be recognised as Class Notations or Descriptive Notes, these may be implemented by LR without consideration by the relevant Technical Committee, although any such changes will be provided to the relevant Technical Committee for information

- 3.5 The term of office of the Chairman and of all members of each Technical Committee is five years. Members may be reelected to serve an additional term of office with the approval of the Board. The term of office of the Chairman may be extended with the approval of the Board.
- 3.6 In the case of continuous non-attendance of a member, the relevant Technical Committee may withdraw membership.
- 3.7 Meetings of the Technical Committees are convened as often and at such times and places as is necessary, but there is to be at least one meeting in each year. Matters may also be considered by the Technical Committees by correspondence.

Volume 1, Part 1, Chapter 1

Section 4

- 3.8 Any proposal involving any alteration in, or addition to the General Regulations, of Rules for Classification is subject to approval of the Board. All other proposals for additions to or alterations to the Rules for Classification other than the General Regulations, will following consideration and approval by the relevant Technical Committee either at a meeting of that Technical Committee or by correspondence, be recommended to the Board for adoption.
- 3.9 The Technical Committees are empowered to:
- (a) appoint sub-Committees or panels; and
- (b) co-opt to the Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem.

■ Section 4

Naval Ship Technical Committee

4.1 LR's Naval Ship Technical Committee is at present composed of a maximum of 50 members and includes:

Ex officio members:

Chairman and Chief Executive Officer of Lloyd's Register Group Limited

Member nominated by:

- Naval Ship Technical Committee;
- The Royal Navy and the UK Ministry of Defence;
- UK Shipbuilders, Ship Repairers and Defence Industry;
- Overseas Navies, Governments and Governmental Agencies;
- Overseas Shipbuilders, Ship Repairers and Defence Industries;
- 4.2 All elections are subject to confirmation by the Board.
- 4.3 All members of the Naval Ship Technical Committee are to hold security clearance from their National Authority for the equivalent of NATO CONFIDENTIAL. All material is to be handled in accordance with NATO Regulations or, for non-NATO countries, an approved equivalent. No classified material shall be disclosed to any third party without the consent of the originator.
- 4.4 The term of office of the Naval Ship Technical Committee Chairman and of all members of the Naval Ship Technical Committee is five years. Members may be re-elected to serve an additional term of office with the approval of the Board. The term of the Chairman may be extended with the approval of the Board.
- 4.5 In the case of continuous non-attendance of a member, the Naval Ship Technical Committee may withdraw membership.
- The function of the Naval Ship Technical Committee is to consider technical issues connected with Naval Ship matters and to approve proposals for new Naval Ship Rules, or amendments to existing Naval Ship Rules. Where appropriate, Naval Ship Technical Committee may also recognise alternative LR Rule requirements that have been approved by the other Lloyd's Register Technical Committee as adjunct to the Naval Ship Rules.
- 4.7 Meetings of the Naval Ship Technical Committee are convened as necessary but there will be at least one meeting per year. Urgent matters may be considered by the Naval Ship Technical Committee by correspondence.
- 4.8 Any proposal involving any alteration in, or addition to, the General Regulations of Rules for Classification of Naval Ships is subject to approval of the Board. All other proposals for additions to or alterations to the Rules for Classification of Naval Ships, other than the General Regulations, will following consideration and approval by the Naval Ship Technical Committee, either at a meeting of the Naval Ship Technical Committee or by correspondence, be recommended to the Board for adoption.
- 4.9 The Naval Ship Technical Committee is empowered to:
- (a) appoint sub-Committees or panels; and
- (b) co-opt to the Naval Ship Technical Committee, or to its sub-Committees or panels, representatives of any organisation or industry or private individuals for the purpose of considering any particular problem.

Volume 1, Part 1, Chapter 1

Section 5

■ Section 5

Applicability of Classification Rules and Disclosure of Information

- 5.1 LR has the power to adopt, and publish as deemed necessary, Rules relating to classification and has (in relation thereto) provided the following:
- (a) Except in the case of a special directive by the Board, no new Regulation or alteration to any existing Regulation relating to classification or to class notations is to be applied to existing ships.
- Except in the case of a special directive by the Board, or where changes necessitated by mandatory implementation of International Conventions, Codes or Unified Requirements adopted by the International Association of Classification Societies are concerned, no new Rule or alteration in any existing Rule is to be applied compulsorily after the date on which the contract between the ship builder and shipowner for construction of the ship has been signed, nor within six months of its adoption. The date of 'contract for construction' of a ship is the date on which the contract to build the ship is signed between the prospective shipowner and the ship builder. This date and the construction number (i.e. hull numbers) of all the vessels included in the contract are to be declared by the party applying for the assignment of class to a newbuilding. The date of 'contract for construction' of a series of sister ships, including specified optional ships for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective shipowner and the ship builder. In this section a 'series of sister ships' is a series of ships built to the same approved plans for classification purposes, under a single contract for construction. The optional ships will be considered part of the same series of sister ships if the option is exercised not later than 1 year after the contract to build the series was signed. If a contract for construction is later amended to include additional ships or additional options, the date of 'contract for construction' for such ships is the date on which the amendment to the contract is signed between the prospective shipowner and the ship builder. The amendment to the contract is to be considered as a 'new contract'. If a contract for construction is amended to change the ship type, the date of 'contract for construction' of this modified vessel, or vessels, is the date on which the revised contract or new contract is signed between the Owner, or Owners, and the shipbuilder. Where it is desired to use existing approved ship or machinery plans for a new contract, written application is to be made to LR. Sister ships may have minor design alterations provided that such alterations do not affect matters related to classification, or if the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective owner and the ship builder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to LR for approval. Recognising the long time period that may occur between the initial design contract and the contract for construction for offshore units for fixed locations, the date determining effective classification requirements will be specially considered by LR in such cases.
- (c) All reports of survey are to be made by surveyors authorised by members of the LR Group to survey and report (hereinafter referred to as 'the Surveyors') according to the form prescribed, and submitted for the consideration of the Classification Committee.
- (d) Information contained in the reports of classification and statutory surveys will be made available to the relevant owner, National Administration, Port State Administration, P&I Club, hull underwriter and, if authorised in writing by that owner, to any other person or organisation.
- (e) Notwithstanding the general duty of confidentiality owed by LR to its client in accordance with the LR Rules, LR clients hereby accept that, LR will participate in the IACS Early Warning System which requires each IACS member to provide its fellow IACS members and Associates with relevant technical information on serious hull structural and engineering systems failures, as defined in the IACS Early Warning System (but not including any drawings relating to the ship which may be the specific property of another party), to enable such useful information to be shared and utilised to facilitate the proper working of the IACS Early Warning System. LR will provide its client with written details of such information upon sending the same to IACS Members and Associates.
- (f) Information relating to the status of classification and statutory surveys and suspensions/withdrawals of class together with any associated conditions of class will be made available as required by applicable legislation or court order.
- (g) A Classification Executive consisting of senior members of LR's Classification Department staff shall carry out whatever duties that may be within the function of the Classification Committee that the Classification Committee assigns to it.

Volume 1, Part 1, Chapter 1

Section 6

■ Section 6

Ethics

6.1 No LR Group employee is permitted under any circumstances, to accept, directly or indirectly, from any person, firm or company, with whom the work of the employee brings the employee into contact, any present, bonus, entertainment or honorarium of any sort whatsoever which is of more than nominal value or which might be construed to exceed customary courtesy extended in accordance with accepted ethical business standards.

■ Section 7

Non-Payment of Fees

7.1 LR has the power to withhold or, if already granted, to suspend or withdraw any ship from class (or to withhold any certificate or report in any other case), in the event of non-payment of any fee to any member of the LR Group.

Section 8

Limits of Liability

- 8.1 When providing services LR does not assess compliance with any standard other than the applicable LR Rules, international conventions and other standards agreed in writing.
- 8.2 In providing services, information or advice, LR does not warrant the accuracy of any information or advice supplied. Except as set out herein, LR will not be liable for any loss, damage or expense sustained by any person and caused by any act, omission, error, negligence or strict liability of LR or caused by any inaccuracy in any information or advice given in any way by or on behalf of LR even if held to amount to a breach of warranty. Nevertheless, if the Client uses LR services or relies on any information or advice given by or on behalf of LR and as a result suffers loss, damage or expense that is proved to have been caused by any negligent act, omission or error of LR or any negligent inaccuracy in information or advice given by or on behalf of LR then LR will pay compensation to the client for its proved loss up to but not exceeding the amount of the fee (if any) charged for that particular service, information or advice.
- 8.3 LR will print on all certificates and reports the following notice: Lloyd's Register Group Limited, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as 'Lloyd's Register'. Lloyd's Register assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.
- 8.4 Except in the circumstances of section *Vol 1, Pt 1, Ch 1, 8 Limits of Liability 8.2* above, LR will not be liable for any loss of profit, loss of contract, loss of use or any indirect or consequential loss, damage or expense sustained by any person caused by any act, omission or error or caused by any inaccuracy in any information or advice given in any way by or on behalf of LR even if held to amount to a breach of warranty.
- 8.5 Any dispute about LR services is subject to the exclusive jurisdiction of the English courts and will be governed by English law.

- 3 Character of Classification and Class notations
- 4 Surveys General
- 5 Type Approval/Type Testing/Quality Control System
- 6 Classification of machinery with [■]LMC or MCH notation
- 7 Classification of ship with *IWS notation
- 8 Classification of ship with operational role: Oil Supply Ship
- 9 Classification of naval ships using alternative LR's Rules

Introduction

Definition of Naval Class

Naval ship Classification may be regarded as the development and worldwide implementation of published Rules and Regulations, which, in conjunction with proper care and conduct on the part of the Owner, will provide for:

- (a) the structural strength and the watertight integrity of all essential parts of the hull and its appendages; this includes compliance with a suitable damage stability standard accepted by Lloyd's Register (hereinafter referred to as 'LR');
- (b) the safety and reliability of engineering systems essential for propulsion, steering and other Mobility and/or Ship Type-specific functions, see *Vol 2, Pt 1, Ch 1, 3 Engineering system designation*;
- (c) the operation and functioning of associated systems installed for operational requirements relating to the ship type, see Vol 2, Pt 1, Ch 1, 3 Engineering system designation; and
- (d) the effectiveness of other defined features and systems which have been built into the ship in order to establish and maintain basic conditions on board whereby appropriate stores, fuels, equipment and personnel can be safely carried whilst the ship is at sea, at anchor, or moored in harbour.

A naval ship is said to be in Class when the Rules and Regulations which pertain to it have been complied with, or compliance, equivalent to the Rules, has been ascertained.

LR maintains these provisions by way of periodical visits by its Surveyors to the ship as defined in the Regulations in order to ascertain that the vessel currently complies with those Rules and Regulations. Records of any defects found, or modifications carried out, between visits by LR Surveyors, which may affect Classification, are to be maintained. Any defects found are to be reported to LR with the minimum of delay. The records will form the basis of remedial action, where necessary, for maintenance of Class.

Military Distinctions

Military Distinction notations are awarded by LR as shown in Vol 1, Pt 4 Military Design and Special Features of these Rules. LR requires demonstration of the capability of the ship to withstand specified hostile military action without loss of capability. It is the responsibility of the navy or designer to specify and quantify the weapon performance and scenarios to be studied. A Military Distinction notation is awarded by LR on the basis that the assessment presented has been conducted in accordance with agreed procedures and the ship constructed in a manner that reflects the design requirements.

LR is to be informed of any incident of the ship sustaining damage. Such ships are to be made available for survey thereafter at the earliest possible opportunity.

Options

Volume 1, Part 1, Chapter 2

Section

The handling of safety matters such as ship's stability, life-saving appliances, pollution prevention arrangements and structural fire protection, fire detection and extinction arrangements is the prerogative of the Owner and his delegated Naval Administration. However, where these matters are delegated to LR they will be undertaken in accordance with agreed procedures and appropriate class notations will be assigned and entered into the vessel's Classification record.

Transfer of Information

To achieve naval class it is imperative to ensure that communication between LR, the Owner, Naval Administration, Prime Contractor, designer and Builder is effective. In designing, building and maintaining a ship to class, it is essential that liaison between the various parties involved is assured. In particular, formal written contracts are essential for commercial reasons between the contractors, but an additional responsibility rests with all participants to ensure that naval class leads to a transparency of information during construction and thereafter.

Section 1

Conditions for Classification

1.1 Framework of Classification

- 1.1.1 The Rules and Regulations for the Classification of Naval ships, hereinafter referred to as the Rules, are applicable to those types of ship which are defined in Vol 1, Pt 1, Ch 2, 2.1 Applicable ship types
- 1.1.2 The Rules do not, unless stated or implied in the Class notation, provide for special distributions or concentrations of loading associated with the operation of the ship. LR may require additional strengthening to be fitted in any ship which may be subjected to severe stresses due to particular features in the design or operation, or where it is desired to make provision for exceptional loading conditions. In such cases particulars and details of the required loadings are to be submitted for consideration.
- 1.1.3 Compliance with the Rules does not relieve the designer of their responsibilities for compliance with the Owner's and Naval Administration's requirements for the overall design features, in-service performance, certification requirements, and standards to which the ship is to be built.
- 1.1.4 New ships built in accordance with the Rules, or in accordance with requirements equivalent thereto, will be assigned a Class and will continue to be classed so long as they are found, upon examination at the prescribed surveys, to be maintained in accordance with the requirements of the Rules.
- 1.1.5 In addition to confirming compliance with the Rules, LR will, in conjunction with the Naval Administration, require to be satisfied that the ship is suitable for the geographical or other limits or conditions of the service requested.
- 1.1.6 Preparations required to permit a ship with a service area restriction specifying some service limitation to undertake duties that take the ship beyond the specified service restriction, either from port of building to its service area or from one service area to another, are to be in accordance with arrangements agreed by LR prior to the voyage.
- 1.1.7 Any damage, defect, breakdown or grounding, which affect the conditions for which a Class has been assigned, must be reported to LR. (Note that some ships have a grounding condition included for Class).
- 1.1.8 Where LR is acting on behalf of the Naval Administration, any relevant requirements of the Naval Administration are to be identified and advised to LR in writing.
- 1.1.9 It is a requirement of classification that stability and subdivision arrangements are to comply with and be maintained in compliance with a specified standard(s). The specified standard(s) and ongoing certification regime are to be notified to LR by the Naval Administration in writing. Where the Naval Administration, or its recognised organisation, approves the arrangements for compliance with the required stability and subdivision standards, a copy of the following documentation is to be submitted:
- approval documentation issued by the Naval Administration stating that arrangements have been examined against the required standard and are acceptable.
- accepted arrangements of openings, closing appliances, vents, etc. such that the limits of the watertight integrity may be
 defined at the design draught. From these limits the pressure heads for watertight structure and watertight/weathertight
 closing requirements for openings, etc. can be identified.

Alternatively, where requested, LR will approve the arrangements against the agreed standard(s).

Volume 1, Part 1, Chapter 2

Section 1

- 1.1.10 It is a requirement of classification that fire safety arrangements are to comply with and be maintained in compliance with a specified standard(s). The specified standard(s) and ongoing certification regime are to be notified to LR by the Naval Administration in writing. Alternatively, where requested, LR will approve the arrangements against the agreed standard(s).
- 1.1.11 It is a requirement that where a vessel operates aircraft, it is classed in accordance with the requirements of the **AIR** notation defined in *Vol 1, Pt 4, Ch 2, 10 Aircraft operations* for the landing, manoeuvring and parking areas.
- 1.1.12 It is a requirement, where the vessel has fitted lifting appliances considered by LR to be necessary for the vessel to fulfil its Ship Type role (eg. Aircraft lifts on aircraft carriers, stern ramp on a landing platform dock, or sea-boat davits), and where there are no alternative means of operation, that the lifting appliance(s) are to be designed, built and surveyed in accordance with LR's Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2 and the notation **LA** is to be assigned. See Vol 1, Pt 1, Ch 2, 3.5 Ship type notations 3.5.10.

Alternatively, where a vessel was classed by a recognised classification society other than LR, and is later transferred into class with LR and, where the vessel has fitted, on board, lifting appliances which are considered by LR to be necessary for it to fulfil its Ship Type role and the lifting appliance(s) have been designed, built and originally surveyed in accordance with the same society's requirements for lifting appliances the notation $\dot{\mathbf{L}}\dot{\mathbf{A}}$ will be assigned.

Elsewhere, classification of lifting appliances is optional and may be assigned at the request of the Owner on compliance with the appropriate requirements, see Vol 1, Pt 1, Ch 2, 3.9 Machinery and Engineering Systems notations and Vol 1, Pt 1, Ch 2, 3.10 Other notations.

- 1.1.13 It is the responsibility of the ship designer to ensure that the ship is suitable for any intended lifting appliance operation.
- 1.1.14 When a vessel has been assigned a special features class notation associated with lifting appliances, then the applicable lifting appliances are to be built in accordance with the requirements of LR's Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2, see Vol 1, Pt 1, Ch 2, 3.5 Ship type notations.
- 1.1.15 It is a requirement of classification that magazine safety arrangements are to comply with and be maintained in compliance with a specified standard(s). The specified standard(s) and ongoing certification regime are to be notified to LR by the Naval Administration in writing. LR will provide advice on this aspect at the request of the Owner/Naval Administration.
- 1.1.16 Where an onboard computer system having longitudinal strength capability, which is required by the Rules, is provided on a new ship, or newly installed on an existing ship, then the system is to be certified in respect of longitudinal strength in accordance with LR's document entitled *Approval of Longitudinal Strength and Stability Calculation Programs*, see also Vol 1, Pt 5, Ch 4, 5 Residual strength hull girder loads

1.2 Application

- 1.2.1 Except in the case of a special directive by LR no new Regulation or alteration to any existing Regulation relating to the character of Classification or to Class notations is to be applied to existing ships.
- 1.2.2 At the discretion of LR, ship types which are specifically covered by LRRules and Regulations for the Classification of Ships or other LR Rules and Regulations for Classification may be considered for classification in accordance with these Rules and Regulations. See Vol 1, Pt 1, Ch 2, 9.1 General 9.1.1.

1.3 Interpretation of the Rules

1.3.1 The interpretation of the Rules is the sole responsibility, and at the sole discretion, of LR.

1.4 Owner's responsibilities

- 1.4.1 The Owner is to give LR Surveyors every facility and necessary access to carry out their survey duties. The Owner should familiarise himself with the relevant LR Rules and, where appropriate, arrange that all sub-contractors, suppliers of components, materials or equipment do the same.
- 1.4.2 The survey procedures undertaken by LR when providing services are on the basis of periodical visits involving both monitoring and direct survey. LR's Surveyors may not be in continual attendance. As construction, outfitting and refitting are continuous processes, the Builder has the overall responsibility to his client to ensure and document that the requirements of the Rules, approved drawings and any agreed amendments made by the attending LR Surveyors, have been complied with.
- 1.4.3 Where the Owner/Naval Administration identifies standards, conducts audits or issues certificates, and the responsibility has not been delegated to LR, LR is to be advised of the identity of the Naval Administration and is to be furnished with all appropriate standards and to have full access to the Naval Administration at all times.

Volume 1, Part 1, Chapter 2

Section 2

1.5 Documentation

- 1.5.1 It is acknowledged that the Owner may wish to retain the originals of Certificates issued by LR, however, naval ships are required to carry the following documentation on board so that the attending surveyor is able to carry out his duties (certified copies of Certificates are acceptable):
- (a) Endorsable Certificate of Class.
- (b) C11(N) Record of watertight and weathertight closing arrangements.
- (c) Approved Stability information and damage control plan and the following as applicable.
- (d) Lifting Appliances Certificate.
- (e) Pollution record of equipment.
- (f) Tonnage Certificate.
- (g) Safety Equipment record of equipment.
- (h) Fire control plan.

1.6 Pre-Contract and Through-Life advice

1.6.1 LR will provide advice on the potential conditions of Classification for a naval ship, so that the Owner may specify design, construction and operation parameters that satisfy the requirements for Classification whilst being consistent with the intended application. A number of optional matters can be incorporated into the Conditions for Classification of the ship, see Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.11 and Vol 1, Pt 1, Ch 3, 2.4 Other notations. LR will also advise on Alterations and Additions and other matters which may affect the Conditions for Classification, and to liaise with the Owner on any other matter of concern for the purpose of assisting the Owner in establishing the parameters applicable to the ship's operational needs.

■ Section 2

Scope of the Rules

2.1 Applicable ship types

2.1.1 The Rules are applicable to naval ships designed and constructed for the purpose of carrying and operating naval systems. For the purposes of Classification, naval ships can be grouped into five categories as follows:

(a) NS1 ships

This category covers ships used for the deployment of aircraft or equipment and ships which may be used as centres of command. Designed for world wide operation and usually supported by ships from the NS2 category.

Typically it will cover ships above 140 m in length with a deep displacement of 10000 tonnes or more. It will include aircraft carriers, helicopter and amphibious support ships, and assault ships.

(b) NS2 ships

This category covers ships used to defend NS1 ships as part of a task force or act as independent units. They may have a variety of sole or multiple roles including air defence, anti submarine, sea defence, shore support and will be designed for world wide operation.

Typically it will cover ships of length of 70 m to 140 m with displacements of 1300 tonnes to 20000 tonnes. NS2 ships may be described as cruisers, frigates, destroyers, corvettes or similar.

(c) NS3 ships

This category covers ships that have a front line role but are not covered by the above descriptions. This category includes a variety of ships typically below 1500 tonnes displacement. They may operate independently or as part of a task force and are usually designed and constructed for specific roles such as mine sweeping, beach landings, coastal defence or fast patrol duties. A restricted service area may be specified.

(d) NS(SR) ships

This category covers auxiliary naval ships used for the support of civil and naval operations. They may have a variety of roles including the movement of military and other personnel, ammunition, vehicles, stores and fuels and the transfer of such to other naval ships. They do not have a defined military role but may have a limited self-defence capability. In general, the ships will comply with LR's *Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5*

Volume 1, Part 1, Chapter 2

Section 2

and any relevant requirements in Vol 1, Pt 1, Ch 2, 3.5 Ship type notations 3.5.6 for new vessels and any relevant requirements in Vol 1, Pt 1, Ch 3, 16 Classification of ships built under survey to LR Classification Rules and Regulations other than LR Naval Ship Rules and Regulations for existing vessels; and satisfy as far as practicable the requirements of the International Conventions applicable to the ship type. Any deviation from the applicable International Conventions requires agreement with the Owner or Naval Administration and where applicable the National Administration. A Design and Operating Scenario Statement declared by the Owner stating the role of the ship in terms of the carriage of equipment, personnel, stores and fuels, in accordance with Vol 1, Pt 1, Ch 2, 3.5 Ship type notations 3.5.7, is to be acceptable to LR. Where an NS(SR) notation is applicable, the requirements of the Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5, Pt 1, Ch 2 Classification Regulations are not applicable and the requirements of this Chapter are to be applied.

(e) NS(SSC) ships

This category is limited to ships typically below 1500 tonnes displacement or 110 m length. They do not have a defined military role but may have a limited self-defence capability and are usually designed and constructed for constabulary purposes such as coastal defence or patrol duties. In general, the ships will comply with LR's *Rules and Regulations for the Classification of Special Service Craft, July 2021, incorporating Notice No. 1, 2 & 3 and any relevant requirements in Vol 1, Pt 1, Ch 2, 3.5 Ship type notations 3.5.6 for new vessels or Vol 1, Pt 1, Ch 3, 16 Classification of ships built under survey to LR Classification Rules and Regulations other than LR Naval Ship Rules and Regulations for existing vessels; and satisfy as far as practicable the requirements of the International Conventions applicable to the ship type. Any deviation from the applicable International Conventions requires agreement with the Owner or Naval Administration and where applicable the National Administration. A Design and Operating Scenario Statement declared by the Owner stating the role of the ship in terms of the carriage of equipment, personnel, stores and fuels, in accordance with Vol 1, Pt 1, Ch 2, 3.5 Ship type notations 3.5.7, is to be acceptable to LR. Where an NS(SSC) notation is applicable, the requirements of the <i>Rules and Regulations for the Classification of Special Service Craft, July 2021, incorporating Notice No. 1, 2 & 3, Pt 1, Ch 2 Classification Regulations* are not applicable and the requirements of this Chapter are to be applied.

There are special requirements for hovercraft, mine-sweepers, landing ships, which are to be designed in accordance with the appropriate Sections of relevant LR's Rules and Regulations.

2.2 Definitions

- 2.2.1 For the purpose of the Rules and Class notations, the definitions given in *Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.2* to *Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.15* will apply.
- 2.2.2 **Clear water.** Water having sufficient depth to permit the normal development of wind generated waves.
- 2.2.3 **Designer.** The organisation which provides the design and constructional plans.
- 2.2.4 **Fetch.** The extent of clear water across which a wind has blown before reaching the ship.
- 2.2.5 **Laid-up notation.** A ship not under repair or not actively employed may be assigned the **laid-up** notation in order to maintain the ship in class subject to agreement by the Classification Committee. A general examination of the hull and machinery is to be carried out in lieu of the Annual Survey. An Underwater Examination (UWE) is to be carried out in lieu of the Special Survey. See;
- Vol 1, Pt 1, Ch 2, 4.10 Survey of ships out of commission and/or laid-up 4.10.1,
- Vol 1, Pt 1, Ch 3, 1.1 Frequency of surveys 1.1.4,
- Vol 1, Pt 1, Ch 3, 2.1 General 2.1.4,
- Vol 1, Pt 1, Ch 3, 5.1 General 5.1.4 and
- Vol 1, Pt 1, Ch 3, 7.1 Annual, Intermediate and Docking Survey 7.1.2.

The schedule of survey activities for a ship which is laid-up with personnel onboard and/or with some degree of ongoing system operation during the laid-up period will be specially considered.

- 2.2.6 **Maximum speed.** Maximum speed is the speed, in knots, achieved at the maximum continuous power for which the ship is certified in smooth water.
- 2.2.7 **Mono-hull ship.** A mono-hull ship is a ship whose single hull may be of displacement form or of a semi-planing or planing form subject to some support by hydrodynamic lift.
- 2.2.8 **Naval Administration.** An authority or authorities nominated by the Owner responsible for providing regulation associated with procurement and support of the ship. The Naval Administration may also be responsible for identifying appropriate standards, auditing and certification. The Naval Administration could be a Government department, Statutory Authority, LR or an

Volume 1, Part 1, Chapter 2

Section 2

independent organisation with appropriate standing. In the absence of a clearly defined Naval Administration, LR will refer to the Owner.

- 2.2.9 **Navy.** The operator of the ship. The Navy may also be the Owner.
- 2.2.10 **Owner.** Generally, this will be the government department responsible for naval procurement and support. In certain circumstances, the Navy may operate ships chartered from other Owners, in which case the Owner as defined in these regulations is to be agreed with LR on a case by case basis.
- 2.2.11 **Client.** LR's point of contact with the organisation contracting it to undertake work.
- 2.2.12 **Operational envelope**. The operational envelope will be provided by Lloyd's Register as an Annex to the Classification Certificate and defines limits of the vessel's service in terms of operational speeds, wave heights, displacements, service area and time required to seek refuge where this is required.
- 2.2.13 **Reasonable weather.** Reasonable weather is defined as wind strengths of force six or less on the Beaufort scale, associated with:
- (a) Sea states within the operational envelope which are sufficiently moderate to ensure that green water is taken on board at infrequent intervals only or not at all.
- (b) Motions such as do not impair the efficient operation of the ship.
- 2.2.14 **Sheltered water.** Water where the fetch is six nautical miles or less.
- 2.2.15 **Stability information.** Documents required for stability certification.
- 2.2.16 **Standard.** A set of appropriate requirements and/or criteria that are to be agreed by the Naval Administration prior to the plan appraisal stage.
- 2.2.17 **Concept of Operations**. The Concept of Operations (ConOps) is a statement of an Owner's intentions for the operation of the ship. The ConOps describes the ship's intended service in terms of purpose and function and is to include, but not be limited to, information on the following: crewing, operational speeds, wave heights, displacements, service area, temperatures, motions, aircraft and boat operations; arrangements under reasonably foreseeable, normal and abnormal conditions. The ConOps is to be provided by the Owner. LR may accept alternative documents where these provide the information which would be included within the ConOps, in such cases the relevant sections providing the information required to provide equivalence with the ConOps are to be identified.
- 2.2.18 **System Operational Concept.** A System Operational Concept is a description of the intended operation of each of the major ship systems, that is those comprised of sub-systems and equipment referenced within the Rules. The System Operational Concept is to demonstrate that the systems' architecture, configuration and criticality meet the requirements of the operational scenarios defined by the ConOps. The System Operational Concept statements are to be agreed between the designer and the Owner. LR may accept alternative documents where these provide the information which would be included within the System Operational Concept. In such cases the relevant sections providing the information required to provide equivalence with the System Operational Concept are to be identified.
- 2.2.19 **System Design Description.** The System Design Description is a document that describes the design of a system or equipment. The System Design Description details the system's capability and functionality under all normal and reasonably foreseeable abnormal operating and fault conditions. The System Design Description documents are to be agreed between the designer and the Owner. LR may accept alternative documents where these provide the information which would be included within the System Design Description. In such cases the relevant sections providing the information required to provide equivalence with the System Design Description are to be identified.
- 2.2.20 **Engineering and Safety Justification.** A statement or report which provides a reasoned and compelling argument supported by a suitable body of evidence, that either the system or sub-system under consideration will operate as intended for a defined application in a defined environment or in the case of a deviation from the Rules, evidence that the proposed alternative arrangements are equivalent. This is to include details of the safety implications and protective measures to be implemented to mitigate risks associated with the system or alternative arrangements. It may include references to design standards used, assumptions and technical evidence such as analysis or test reports. Where required this is to be derived from a Risk Based Analysis in accordance with *Vol 1*, *Pt 1*, *Ch 2 Classification Regulations*. It may include:
- (a) Possible failure modes of internal components and measures adopted to mitigate such failures that may have an effect on the internal machinery or the surrounding environment/structures/systems, taking due account of suitability of materials and the effects of stress raisers, etc.
- (b) Operating parameters and any required limitations.

Volume 1, Part 1, Chapter 2

Section 3

- (c) Details of life-limited critical components, including their declared lives and residual lives or balance of planned life remaining, in terms of operating time or operating cycles, or where life is derived from declared acceptance criteria, and the associated maintenance strategies.
- (d) Installation arrangements.
- (e) Details of potential failures that could lead to hazardous or major consequences and/or degradation in systems performance that could lead to failures and which are to be notified to the Operators.
- (f) Common failure modes and measures to minimise potential single points of failure such as system redundancy and environmental separation of equipment and services.
- (g) Identification of failure modes of the defined integrated system.

In addition, an Engineering and Safety justification is to be provided for each deviation from the Rule requirements, such deviations are normally raised by the designer or Builder and are to be agreed with the Owner and Naval Administration. In some cases a full justification and Risk Assessment may be required. See Requirements for Machinery and Engineering Systems of Unconventional Design, Vol 2, Pt 1, Ch 2 Requirements for Machinery and Engineering Systems of Unconventional Design and Risk Assessment (RA).

■ Section 3

Character of Classification and Class notations

3.1 General

- 3.1.1 This Section details the character symbols, Class notations which comprise the Class assigned to naval ships.
- 3.1.2 The character symbols identify whether the ship is built under LR Class and survey, the suitability for sea-going service, the provision of anchor handling equipment and the Rules used for the construction of the ship. The character symbols are described in *Vol* 1, *Pt* 1, *Ch* 2, 3.3 Character symbols.
- 3.1.3 The Class notations detail the particular features of the ship which are required to be especially considered in order to verify where additional care has been taken in particular aspects of the design of the ship. These Class notations are subject to an approval process in order to satisfy Classification requirements.
- 3.1.4 Optional notations detail particular features of the ship which may not form part of the hull approval process required for Classification. Typically they include details of military design features, machinery and safety/environmental aspects of the vessel.
- 3.1.5 The following are examples of character symbols, and Class notations as they would appear in the vessel's Classification record:
- ₩ 100A1 NS2 Frigate, SA1, AIR

3.2 Tailoring – Departures from the Rules and Rule additions

- 3.2.1 In general, there are different levels of deviation from the Rules:
- (a) Interpretations are applied where strict compliance with a Rule requirement cannot be achieved but where the proposed arrangement clearly satisfies the intent of the Rules. The decision to apply an interpretation is at LR's discretion and will be recorded in design appraisal documentation.
- (b) Exceptions or concessions are non-compliances with Rule requirements where LR is satisfied that the arrangements presented are an acceptable alternative to its Rules on the basis of an Engineering and Safety Justification Report. Exceptions are normally raised by the designer or Builder and are to be agreed with the Owner and Naval Administration.
- (c) Alternatives are deviations which represent a significant change to the Rule requirements. They may involve the use of an alternative standard to replace a Rule Chapter. In such cases, the (**NS**) character is to be appended to the notation, see Vol 1, Pt 1, Ch 2, 3.3 Character symbols 3.3.5. LR is to be satisfied that the arrangements are an acceptable technical alternative. Alternatives are normally raised by the designer or Builder and are to be agreed with the Owner and Naval Administration. A tailoring document or System Design Description is required to define the alternative proposal in advance of design appraisal.

Volume 1, Part 1, Chapter 2

Section 3

- 3.2.2 Tailoring is to be agreed between LR and the Naval Administration. Where a departure from the Rules is not agreed by LR, an exemption is required from the Naval Administration. at Board level.
- 3.2.3 Additions may involve the use of a standard in addition to the LR Rule requirements. In such cases, the (**NS**) character is to be appended to the notation, see *Vol 1*, *Pt 1*, *Ch 2*, 3.3 Character symbols 3.3.5. Additions are normally raised by the designer or Builder and are to be agreed with the Owner and Naval Administration. A tailoring document or System Design Description is required to define the addition in advance of design appraisal.
- 3.2.4 An Engineering and Safety justification is to be provided for each deviation from the Rule requirements, see *Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.20*.
- 3.2.5 At the design stage, departures from the Rules or additional requirements may be captured in a tailoring document developed by the designer. Tailoring is defined as the process by which specific requirements of a standard, specification or similar document are selected and used to meet the needs of a project. The tailoring document should cover subjects such as:
- (a) Additional standards;
- (b) Additional requirements of the Naval Administration or the Owner;
- (c) Additional designer requirements;
- (d) Interpretations;
- (e) Exceptions/non-compliances against Rules;
- (f) Exceptions/non-compliances against other defined standards or design policies;
- (g) Equipment and component procurement.

The tailoring document should clearly define the paragraphs of the Rules which are modified, what alternative requirements are to be used and reference to the Engineering and Safety Justification, where appropriate. The tailoring document is to be submitted with the plans at the time of appraisal and referenced in appraisal documentation.

3.2.6 At the build and through-life stages, significant non-compliances, alternative or additional requirements will be recorded by LR as exceptions, using appropriate documentation. They will be clearly defined and referenced in the Classification Certificates and any associated registers.

3.3 Character symbols

- 3.3.1 All ships, when Classed, will be assigned a character of Classification comprising one or more character symbols as applicable, e.g. **¥ 100A1**.
- 3.3.2 A full list of character symbols for which a ship may be eligible is as follows:
 - ♣ This distinguishing mark will be assigned, at the time of Classing, to new ships constructed under Special Survey, in compliance with the Rules, and to the satisfaction of LR.
 - 100 This character figure will be assigned to all ships considered suitable for sea-going service
 - **A** This character letter will be assigned to all ships which have been built or accepted into Class in accordance with LR's Rules and Regulations, and which are maintained in good and efficient condition.
 - 1 This character figure will be assigned to:
 - (a) Ships having on board, in good and efficient condition, anchoring and/or mooring equipment in accordance with the Rules.
 - (b) Ships Classed for a specific service, having on board, in good and efficient condition, anchoring and/or mooring equipment approved by the Classification Committee as suitable and sufficient for the particular service.
 - **E** This character letter will be assigned to ships on which LR has agreed that anchoring and mooring equipment need not be fitted in view of their particular service.
- 3.3.3 For Classification purposes either the character figure 1 or the character letter E is to be assigned.
- 3.3.4 In cases where the anchoring and/or mooring equipment is found to be seriously deficient in quality or quantity, the Class of the ship will be liable to be withheld.
- 3.3.5 Alternative or additional standards relating to the application of a character symbol or Class notation may be specified. Where these alternative or additional standards have been agreed by LR and the Naval Administration, a formal process for approval, construction, testing and verification throughout life has been established, this feature will be recognised by the addition of **(NS)** to a character symbol or Class notation. See also Vol 1, Pt 1, Ch 2, 3.4 Class notations. The alternative or additional requirements are to be clearly defined and referenced in the Classification Certificates and any required registers such as the

Volume 1, Part 1, Chapter 2

Section 3

register of lifting appliances. The following are examples of character symbols and Class notations that may recognise alternative or additional standards:

A(NS) Ship built or accepted into Naval Class in accordance with LR's Rules and Regulations for assignment of the A character

and additional specified requirements, see Vol 1, Pt 1, Ch 2, 3.2 Tailoring - Departures from the Rules and Rule additions

3.2.5 and Vol 1, Pt 1, Ch 2, 3.3 Character symbols 3.3.5.

Example 2 LMC(NS) Propelling and other machinery for Mobility and/or Ship Type systems (see Vol 2, Pt 1, Ch 1, 3 Engineering system

designation), constructed, installed and tested under Special Survey in accordance with LR's Rules and Regulations for assignment of ♣ **LMC** Class notation and additional specified requirements, see *Vol 1, Pt 1, Ch 2, 3.2 Tailoring* −

Departures from the Rules and Rule additions 3.2.5 and Vol 1, Pt 1, Ch 2, 3.3 Character symbols 3.3.5.

LA(NS) Lifting appliances designed and built in accordance with an agreed standard equivalent to LR's Code for Lifting Appliances

in a Marine Environment (LAME) requirements of the Navy.

FIRE(NS) Fire protection functional requirements are in accordance with LR's requirements for assignment of FIRE Class notation

and additional specified fire safety requirements, see Vol 1, Pt 1, Ch 2, 3.2 Tailoring - Departures from the Rules and Rule

additions 3.2.5 and Vol 1, Pt 1, Ch 2, 3.3 Character symbols 3.3.5.

3.3.6 Proposals to apply the additional symbol **(NS)** to a character symbol or Class notation are to be made to LR with details of the standard, see *Vol 1, Pt 1, Ch 2, 3.2 Tailoring – Departures from the Rules and Rule additions 3.2.5* and *Vol 1, Pt 1, Ch 2, 3.3 Character symbols 3.3.5*, together with proposed processes for approval, construction, testing and verification throughout life.

3.4 Class notations

- 3.4.1 When considered necessary by LR, or when requested by an Owner and agreed by LR, a Class notation will be appended to the character of Classification assigned to the ship. The Class notation may consist of any of the following:
- (a) a ship type notation, see Vol 1, Pt 1, Ch 2, 3.5 Ship type notations;
- (b) a service area notation, see Vol 1, Pt 1, Ch 2, 3.6 Service area notations;
- (c) a hull girder strength notation, see Vol 1, Pt 1, Ch 2, 3.7 Hull strength notations;
- (d) military distinction notations, see Vol 1, Pt 1, Ch 2, 3.8 Military Distinction notations;
- (e) machinery and engineering systems notations, see Vol 1, Pt 1, Ch 2, 3.9 Machinery and Engineering Systems notations;
- (f) other notations, see Vol 1, Pt 1, Ch 2, 3.10 Other notations.

3.5 Ship type notations

- 3.5.1 The ship type notation will be recorded in the appropriate Classification record indicating the primary purpose for which the ship has been designed and constructed.
- 3.5.2 A list of ship type notations for which a ship may be eligible is:

NS1 This notation will be assigned to NS1 category naval ships, as defined in *Vol 1, Pt 1, Ch 2, 2.1 Applicable ship types 2.1.1.(a)*

NS2 This notation will be assigned to NS2 category naval ships, as defined in *Vol 1, Pt 1, Ch 2, 2.1 Applicable ship types 2.1.1.(b)*

NS3 This notation will be assigned to NS3 category naval ships, as defined in *Vol 1, Pt 1, Ch 2, 2.1 Applicable ship types 2.1.1.(c)*

NS(SR) This notation will be assigned to NS(SR) category naval ships, as defined in *Vol 1, Pt 1, Ch 2, 2.1 Applicable* ship types 2.1.1.(d)

NS(SSC) This notation will be assigned to NS(SSC) category naval ships, as defined in *Vol 1, Pt 1, Ch 2, 2.1 Applicable ship types 2.1.1.(e)*.

3.5.3 The ship type notation will be followed by a description which indicates the operational role for which the ship is designed and the hull form type, if of unusual form. The following are examples of the description of the ship's role:

Destroyer

Cruiser

Helicopter Carrier

Aircraft Carrier

Frigate

Volume 1, Part 1, Chapter 2

Section 3

Corvette

Amphibious Assault Ship

Amphibious Transport Dock

Landing Craft

Landing Ship Dock

Minehunter

Minelayer

Mine-sweeper

Patrol ship

Fast Attack Craft

Fast Strike Craft

Fast Patrol Craft

Offshore Patrol Vessel.

3.5.4 The **NS(SR)** ship type notation will be followed by a description which indicates the operational role for which the ship is designed and operated. The following are examples of the description of an NS(SR) ship's role:

Replenishment Ship

Oil Supply Ship

Landing Ship Dock

Survey Ship

Stores Replenishment Ship

Transport Dock

Ro-Ro Ship

Troop Carrier

Vehicle Carrier

Landing Craft.

3.5.5 The **NS(SSC)** ship type notation will be followed by a description that indicates the operational role for which the ship is designed and operated. The following are examples of the descriptions of an **NS(SSC)** ship's role:

(Offshore or Inshore) Patrol Boat

(Offshore or Inshore) Patrol Vessel

Landing Craft

Air Cushioned Vehicle.

3.5.6 NS(SR) and NS(SSC) vessels

For vessels that are using either the NS(SR) or NS(SSC) ship type notations, the following requirements are to be complied with:

- (a) When naval ship classification using either the **NS(SR)** or **NS(SSC)** notation is requested, application should be made in writing.
- (b) Where vessels are to be built to these notations, the requirements set out in *Vol 1, Pt 1, Ch 2, 3.5 Ship type notations 3.5.7* are also to be complied with.
- (c) Plans showing the features of the ship not covered, or fully covered by the Rules and Regulations for the Classification of Special Service Craft, July 2021, incorporating Notice No. 1, 2 & 3 or Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5, as appropriate, are to be submitted. Where an appraisal is undertaken, strength and, where appropriate, stiffness aspects are to be addressed. Examples of features of the ship not covered, or fully covered by the Rules and Regulations for the Classification of Special Service Craft, July 2021, incorporating Notice No. 1, 2 & 3 or Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5 include:
 - (i) Masts (see Vol 1, Pt 6, Ch 3, 16 Masts).
 - (ii) Weapon system seats (see Vol 1, Pt 4, Ch 2, 9 Military installation and operational loads).
 - (iii) RAS seats and landing areas (see Vol 1, Pt 4, Ch 1, 5 Military design requirements and Vol 1, Pt 4, Ch 2, 9 Military installation and operational loads).
 - (iv) Aircraft landing guides (see Vol 1, Pt 4, Ch 2, 10 Aircraft operations).
 - (v) Towing points (see Vol 1, Pt 3, Ch 5, 7 Towing arrangements).
 - (vi) Military loads (see Vol 1, Pt 4, Ch 2 Military Load Specification).

Volume 1, Part 1, Chapter 2

Section 3

- (vii) Beaching (see Vol 1, Pt 4, Ch 2, 8 Strengthening requirements for beach landing operations).
- (viii) Material grades (see Vol 1, Pt 6, Ch 6 Material and Welding Requirements).
- (ix) Watertight integrity (see Vol 1, Pt 3, Ch 4 Closing Arrangements and Outfit).
- (x) Strength of watertight structure (see Vol 1, Pt 6, Ch 3 Scantling Determination).
- (xi) Lifts, ramps and shell doors (see Vol 1, Pt 4, Ch 3 Special Features).
- (d) Plans of systems within the scope of classification, as categorised in accordance with Vol 2, Pt 1, Ch 1, 3.1 Categories and not covered by the Rules and Regulations for the Classification of Special Service Craft, July 2021, incorporating Notice No. 1, 2 & 3 or Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5, as appropriate, are to be submitted to LR for approval in accordance with the requirements of the respective requirements of these Rules. The following are examples of such systems:
 - (i) Aircraft/helicopter and vehicle fuel storage and distribution systems (see Vol 2, Pt 7, Ch 4 Aircraft/Helicopter/Vehicle Fuel Piping and Arrangements).
 - (ii) Chilled water systems (see Vol 2, Pt 7, Ch 5 Ship Type Piping Systems).
 - (iii) High pressure sea-water systems (see Vol 2, Pt 7, Ch 5 Ship Type Piping Systems).
 - (iv) High and low pressure compressed air systems (see Vol 2, Pt 7, Ch 5 Ship Type Piping Systems).
 - (v) Hydraulic power actuating systems (see Vol 2, Pt 7, Ch 5 Ship Type Piping Systems).
 - (vi) Made and fresh water systems (see Vol 2, Pt 11, Ch 1 Made and Fresh Water Systems).
 - (vii) Heating, ventilation and cooling arrangements (see Vol 2, Pt 11, Ch 2 Heating, Ventilation and Cooling Arrangements).
 - (viii) Replenishment at sea arrangements where a **RAS** notation is requested (see Vol 3, Pt 1, Ch 5 Replenishment at Sea (RAS) Systems).
- (e) Confirmation regarding the items below is to be supplied.
 - (i) Fire Safety arrangements are to be in accordance with a specified fire safety standard and certified accordingly. For vessels being built to the **NS(SSC)** notation, the requirements of the Rules for Special Service Craft, Pt 17, Fire Protection, Detection and Extinction, are appropriate.
 - (ii) Stability is to be in accordance with a recognised stability standard which addresses both intact and damage stability criteria. Details of stability approval, including estimated position of waterline after damage, are to be provided to LR prior to any approvals of structural arrangements.
 - (iii) Munitions safety is to be in accordance with the navies' own technical requirements for the safe stowage and handling of the types and quantities of munitions carried.
- (f) Details of any aspects which may affect multiple systems are to be provided to LR including, but not limited to:
 - (i) Shock.
 - (ii) Operation at angles of trim or list greater than those assumed in the Rules for Special Service Craft.
 - (iii) Elevated or reduced ambient conditions either due to operational areas or close down arrangements.
 - (iv) Operational requirements for electromagnetic compatibility.
 - (v) Quality of electrical power supplies.

3.5.7 **Design and Operating Scenario Statement:**

This is required for **NS(SR)** or **NS(SSC)** ships and is to detail the civil and naval support functions of the ship. The statement is to include but is not limited to the following:

- (a) Types and volumes of stores, equipment, fuels and ordnance to be carried on board.
- (b) The number of crew and embarked personnel to be carried on board.
- (c) International Conventions that will be applied to the ship; and any National Administration requirements that will be applied together with details of any exemptions that are being considered.
- (d) National Administration and their involvement in approval and operation in service.
- (e) Naval Ship Class notations that will be applied to the ship.
- (f) The Rules used for design and construction of the hull structure and machinery systems.
- (g) Proposed survey periodicity.
- (h) Installed combat systems.
- (i) Installed handling equipment for stores and equipment.
- (j) Design survivability of the ship.
- (k) Operational modes of the ship.

Volume 1, Part 1, Chapter 2

Section 3

The statement is to be submitted at the time of submitting the Request for LR Services form and LR will advise acceptance of the contents of the statement before proceeding with detailed analysis of other plans and information required for classification purposes.

3.5.8 **NS3** vessels:

- (a) For vessels being built to the **NS3** notation, the following shall apply where the vessel is also being designed and built to comply with appropriate statutory regulations for the intended service of the vessel.
- (b) LR is to be contracted to issue Statements of Compliance with the nominated statutory regulation. Appropriate statutory regulations may include, but are not limited to:
 - (i) SOLAS International Convention for the Safety of Life at Sea.
 - (ii) Code of Safety for Special Purpose Ships (SPS Code).
 - (iii) LR's Grey Boat Code A Code of Practice for the Safety Assurance of Small Boats in Government Service.
 - (iv) UK MCA Workboat Code.
- (c) Vessels are to be certified for Intact and Damaged Stability, and Carriage of Munitions by a recognised Organisation. Other statutory requirements such as compliance with the International Convention for the Prevention of Pollution from Ships should also be issued by a recognised Organisation.
- (d) Details of required certification are to be submitted to LR at the time of contracting. Form 2506 is to be used for this information.
- (e) Where a vessel is so contracted, the following aspects of the Rules and Regulations for the Classification of Naval Ships, January 2022 will be exempted for the requirements of Classification:

All requirements for a Naval Administration to agree the contents of:

- (i) Concept of Operations Document(s).
- (ii) Design Statements.
- (iii) Other aspects as wherever referred to in the Rules are not applicable.
- (f) The requirements of Vol 1, Pt 5, Ch 4, 6.1 General 6.1.4 are to be complied with.
- (g) The limits of the Operating Envelope to which the hull structure has been approved are to be displayed prominently in the wheelhouse.
- (h) Where a vessel is to be classed using this approach, any exemptions are to be agreed by the Naval Administration and justified by using the approach set out in Vol 2, Pt 1, Ch 2 Requirements for Machinery and Engineering Systems of Unconventional Design.
- 3.5.9 **AIR**. This is a mandatory notation for all vessels operating aircraft, see *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.11*.
- 3.5.10 **LA**. This is a mandatory notation for all vessels that have lifting appliances fitted on board which are considered by LR to be essential for the vessel to fulfil its primary operational role, see *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.12*. This notation will be assigned in association with a Register of Lifting Appliances listing the appliances covered, see *Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.6*.
- 3.5.11 Lifting appliances designed and built in accordance with the lifting appliance requirements of a recognised classification society other than Lloyd's Register and later transferred into class with LR. In such cases, a new Register of Ship's Lifting Appliances & Cargo Handling Gear (LA.1) will be issued in accordance with LR's Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2. See also Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.12.

3.6 Service area notations

- 3.6.1 All ships classed under the Rules will be assigned a service area notation **SA** followed by a number or letter, e.g. **SA1.**
- 3.6.2 Service area notations listed below are available. The definitive extents of the service areas are shown in *Figure 2.2.2* Sea areas in Pt 5,Ch 2 and *Table 2.2.3 Environmental wave data for individual sea area* in Pt 5,Ch 2:

SA1 Service Area 1 covers ships having unrestricted world wide operation. SA1 includes operation in all other service areas

SA2 Service Area 2 is primarily intended to cover ships designed to operate in tropical and temperate regions. This service area excludes operating in sea areas for which a **SA1** notation is required.

SA3 Service Area 3 is primarily intended to cover ships designed to operate in tropical regions. This service area excludes operating in sea areas for which a **SA1** or **SA2** notation is required.

Volume 1, Part 1, Chapter 2

Section 3

SA4 Service Area 4 covers ships designed to operate in Sheltered water, as defined in *Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.14* This service area excludes operating in sea areas for which a **SA1**, **SA2** or **SA3** notation is required.

SAR Service Area Restricted covers ships that are designed to operate in a predetermined and contiguous area of operation.

3.6.3 More details of the service areas and extents are given in Vol 1, Pt 5, Ch 2 Environmental Conditions.

3.7 Hull strength notations

3.7.1 The following notations are available for naval ships with regard to global hull girder strength aspects:

ESA1 Extreme Strength Assessment. This notation will be assigned if it has been demonstrated that the extreme hull girder strength meets the requirements of a specified performance level with calculations performed using a simple elastic type analysis.

ESA2 Extreme Strength Assessment. This notation will be assigned if it has been demonstrated that the extreme hull girder strength meets the requirements of a specified performance level with calculations performed using an elastoplastic type analysis.

RSA1 Residual Strength Assessment. This notation will be assigned if it has been demonstrated that the residual hull girder strength after the ship has sustained structural damage meets the requirements of a specified performance level with calculations performed using a simple elastic type analysis.

RSA2 Residual Strength Assessment. This notation will be assigned if it has been demonstrated that the residual hull girder strength after the ship has sustained structural damage meets the requirements of a specified performance level with calculations performed using an elasto-plastic type analysis.

RSA3 Residual Strength Assessment. This notation will be assigned if it has been demonstrated that the residual hull girder strength after the ship has sustained structural damage meets the requirements of a specified performance level with calculations performed using a 3D non-linear finite element analysis.

TLA Total Load Assessment. This notation will be assigned if the scantlings have been verified using a total load approach.

SDA Structural Design Assessment. This notation will be assigned when direct calculations in accordance with agreed procedures have been applied.

FDA Fatigue Design Assessment. This notation will be assigned when an appraisal has been made of the fatigue performance of the structure in accordance with agreed procedures.

3.8 Military Distinction notations

- 3.8.1 Military Distinction notations may be assigned if a particular feature relating to military loads has been incorporated in the design. The requirements for all the Military Distinction notations are given in *Vol 1, Pt 4 Military Design and Special Features*.
 - ➡ MD This Military Distinction notation will be assigned when military aspects of the ship have been constructed under LR's Special Survey and in accordance with LR's Rules and Regulations.
 - **MD** This Military Distinction notation will be assigned when military aspects of the ship have been constructed under LR's Special Survey in accordance with plans approved by the Naval Administration in accordance with Rules and Regulations equivalent to those of LR.

MD This Military Distinction notation will be assigned when military aspects of the ship have been assessed by the Naval Administration in accordance with the Rules and Regulations equivalent to those of LR.

In particular, the following confidential notations are available, and will be known only to the Owner and LR.

EB1 External air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to withstand an external blast compatible with a specified performance level using the Rule loads and structural design methodology.

EB2 External air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to withstand an external blast compatible with a specified performance level using the Rule loads and an elasto-plastic structural design methodology.

EB3 External air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to withstand an external blast compatible with a specified performance level using the Rule loads and a finite element structural design methodology.

Volume 1, Part 1, Chapter 2

Section 3

21

EB4 External air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to withstand an external blast compatible with a specified performance level using a full 3D non-linear code for the loads and/or structural design.

IB1 Internal air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to prevent the spread of an internal blast compatible with a specified performance level in accordance with rules requirements.

IB2 Internal air blast notation. This confidential notation indicates that the ship is capable of meeting the structural requirements to prevent the spread of an internal blast compatible with a specified performance level in accordance with rules requirements, supplemented by additional testing or analysis work.

FP1 Fragmentation protection notation. This confidential notation indicates that the ship is capable of meeting the local structural requirements to withstand a defined fragmentation threat compatible with a specified performance level using the rule structural requirements.

FP2 Fragmentation protection notation. This confidential notation indicates that the ship is capable of meeting the local structural requirements to withstand a defined fragmentation threat compatible with a specified performance level using fragmentation penetration algorithms.

SP Small arms protection. This confidential notation indicates that the ship is capable of meeting the local strengthening requirements to withstand an attack from a defined small arms threat compatible with a specified performance level.

SH Shock enhancement notation. This confidential notation indicates that the ship is capable of meeting, as a minimum, the local structural requirements to withstand an underwater shock compatible with a specified performance level. The strength calculations are performed using a simplified approach. The minimum local assessment may be enhanced by undertaking a more complex assessment. The performance level may be enhanced by undertaking assessment of detailed design, seat design/shock mounts, hull valve design/integration and global strength assessment.

WH1 Whipping assessment notation. This confidential notation is known only to the Owner and indicates that the ship is capable of meeting the global structural requirements to withstand an underwater shock compatible with a specified performance level using a simple elastic type analysis.

WH2 Whipping assessment notation. This confidential notation is known only to the Owner and indicates that the ship is capable of meeting the global structural requirements to withstand an underwater shock compatible with a specified performance level using an elasto-plastic type analysis.

WH3 Whipping assessment notation. This confidential notation is known only to the Owner and indicates that the ship is capable of meeting the global structural requirements to withstand an underwater shock compatible with a specified performance level using a 3D non-linear finite element analysis.

3.9 **Machinery and Engineering Systems notations**

- 3.9.1 The following class notations are associated with the machinery construction and arrangement, and may be assigned:
 - ELMC This notation will be assigned when the propelling and other machinery for Mobility and/ or Ship Type systems, see Vol 2, Pt 1, Ch 1, 3 Engineering system designation, has been constructed, installed and tested under Special Survey and in accordance with LR's Rules and Regulations.
 - **EXECUTE** This notation will be assigned when the propelling and other machinery for Mobility and/or Ship Type systems, see Vol 2, Pt 1, Ch 1, 3 Engineering system designation, has been constructed under the survey of a recognised authority in accordance with the Rules and Regulations equivalent to those of LR. In addition the whole of the machinery will be required to have been installed and tested under Special Survey in accordance with LR's Rules and Regulations.
 - [🗷] LMC This notation will be assigned when the propelling arrangements, steering systems, pressure vessels and the electrical equipment for Mobility and/or Ship Type systems, see Vol 2, Pt 1, Ch 1, 3 Engineering system designation, have been constructed, installed and tested under LR's Special Survey and are in accordance with LR's Rules for Naval Ships. Other items of machinery for propulsion and electrical power generation including propulsion gearing arrangements and other auxiliary machinery for Mobility and/or Ship Type systems that are in compliance with LR Rules

24

Volume 1, Part 1, Chapter 2

Section 3

and supplied with the manufacturer's certificate will be acceptable under this notation. The system arrangements of propelling and auxiliary machinery are required to be appraised by LR, and found to be acceptable to LR. This notation is assigned subject to the conditions in *Vol 1*, *Pt 1*, *Ch 2*, *6.3 Survey and inspection 6.3.3* being complied with.

LMC This notation (without ♠) will be assigned when the propelling and other machinery for Mobility and/or Ship Type systems, see *Vol 2*, *Pt 1*, *Ch 1*, *3 Engineering system designation*, has neither been constructed nor installed under Special Survey, but the existing machinery, its installation and arrangement has been tested and found acceptable. This notation is assigned to existing ships in service which are accepted or transferred into LR class.

MCH This notation will be assigned when the propelling and other machinery for Mobility and/or Ship Type systems, see *Vol 2, Pt 1, Ch 1, 3 Engineering system designation*, has been installed and tested under LR's survey requirements and found to be acceptable to LR. Items of machinery and equipment for propelling and auxiliary machinery for Mobility and/or Ship Type systems supplied with the manufacturer's certificate will be acceptable under this class notation. The system arrangements of propelling and essential auxiliary machinery are required to be appraised by LR, and found to be acceptable to LR. This notation is assigned subject to the conditions in *Vol 1, Pt 1, Ch 2, 6.3 Survey and inspection 6.3.4* being complied with.

SCM Screwshaft Condition Monitoring. The notation will be assigned where an Owner adopts the requirements for monitoring of the screwshaft. The notation will indicate that physical and operational condition of that equipment. See *Vol 2, Pt 3, Ch 2, 5.2 Screwshaft Condition Monitoring (SCM)*.

TCM Turbine Condition Monitoring. This notation will be assigned when the main propulsion steam turbines are provided with approved vibration monitoring equipment and the requirements of *Vol 1, Pt 1, Ch 3, 8.2 Turbine condition monitoring (TCM)* are complied with.

PMR This notation will be assigned where the main propulsion systems are arranged such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.

PMR* This notation will be assigned where the main propulsion systems are arranged such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and where the machinery is installed in separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.

SMR This notation will be assigned where the steering systems for manoeuvring are arranged so that steering capability will continue to be available in the event of a single failure in the steering gear equipment or loss of power supply or control system for any steering system. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.

SMR* This notation will be assigned where the steering systems for manoeuvring are arranged so that steering capability will continue to be available in the event of a single failure in the steering gear equipment or loss of power supply or control system for any steering system and where the steering systems are installed in separate compartments such that, in the event of the loss of one compartment, steering capability will continue to be available. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.

PSMR This notation will be assigned where the main propulsion and steering systems are configured such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.

PSMR* This notation will be assigned where the main propulsion and steering systems are configured such that, in the event of a single failure in equipment, the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability. The propulsion and steering arrangements are to be installed in separate compartments such that in the event of the loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.

L This character will be added to the PMR, SMR, PSMR and * notations to indicate a limited capability.

ELS This notation will be assigned where both the quality and integrity of onboard electrical power supplies for designated loads meet the requirements of a relevant and acceptable Naval Standard, such as NATO Standardization Agreement (STANAG) 1008. It also denotes that the installation has been arranged, installed and tested in accordance with LR Rules.

Volume 1, Part 1, Chapter 2

Section 3

LLOYD'S REGISTER

AG1 This notation will be assigned where the design of gearing for propulsion and/or auxiliary purposes has used enhanced analysis methods to provide detailed knowledge of the reliability of the gear elements and where noise excitation is required to be minimised for anticipated service conditions.

AG2 This notation will be assigned where the design of gearing for propulsion and/or auxiliary purposes has in addition to the requirements for AG1, used three dimensional finite element analysis for determining the flexibility of the geometry of the mating gears.

AP1 This notation will be assigned to fast ships and craft where the propellers require an enhanced assessment of the manufacturing tolerances to control cavitation and noise characteristics.

AP2 This notation will be assigned where ships have propellers that are required to have reduced noise characteristics and have had an enhanced assessment of the manufacturing tolerances.

MPMS This notation will be assigned where the machinery installation has an approved planned maintenance scheme that incorporates preventive maintenance procedures and the requirements of *Vol 1*, *Pt 1*, *Ch 3*, *14 Machinery planned maintenance and condition monitoring, MPMS, MCM and RCM* are complied with.

MCM This notation will be assigned where an approved planned maintenance scheme for machinery incorporates condition monitoring techniques that are acceptable to LR and the requirements of *Vol 1*, *Pt 1*, *Ch 3*, *14 Machinery planned maintenance and condition monitoring, MPMS, MCM and RCM* are complied with.

RCM This notation will be assigned where an approved planned maintenance scheme for machinery incorporates a reliability centred maintenance analysis that is acceptable to LR and the requirements of *Vol 1*, *Pt 1*, *Ch 3*, *14 Machinery planned maintenance and condition monitoring, MPMS, MCM and RCM* are complied with.

RAS(ABV) This notation will be assigned where a vessel has replenishment at sea systems that enable operations astern, abeam and VERTREP. It also denotes that the installation and arrangements are in accordance with LR Rules.

RAS(AB) This notation will be assigned where a vessel has replenishment at sea systems that enable operations abeam and astern only. It also denotes that the installation and arrangements are in accordance with LR Rules.

RAS(AV) This notation will be assigned where a vessel has replenishment at sea systems that enable operations astern and VERTREP. It also denotes that the installation and arrangements are in accordance with LR Rules.

RAS(BV) This notation will be assigned where a vessel has replenishment at sea systems that enable operations abeam and VERTREP. It also denotes that the installation and arrangements are in accordance with LR Rules.

RAS(A) This notation will be assigned where a vessel has replenishment at sea systems that enable operations astern only. It also denotes that the installation and arrangements are in accordance with LR Rules.

RAS(V) This notation will be assigned where a vessel has replenishment at sea systems that enable operations VERTREP only. It also denotes that the installation and arrangements are in accordance with LR Rules.

RAS(B) This notation will be assigned where a vessel has replenishment at sea systems that enable operations abeam only. It also denotes that the arrangements are in accordance with LR Rules.

(NT) This notation will be assigned in addition to a RAS() notation where a vessel complies with NATO replenishment at sea requirements.

PRM This notation may be assigned when the provision refrigeration machinery and systems have been arranged, installed and tested in accordance with LR's Rules.

3.9.2 The following class notations are associated with the machinery control and automation, and may be assigned as considered appropriate by the Classification Committee:

UMS This notation may be assigned when the arrangements are such that the unit can be operated with the machinery spaces unattended. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

CCS This notation may be assigned when the arrangements are such that the machinery may be operated with continuous supervision from a centralised control station. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

ICC This notation may be assigned when the arrangements are such that the control and supervision of the ship operational functions are computer based. It denotes that the control engineering equipment has been arranged, installed and tested in accordance with LR's Rules, or is equivalent thereto.

HP - Hybrid Power Assigned to ships with an electrical power system utilising a combination of two or more different types of power source or utilising stored electrical energy to satisfy the ship's main power demand. The system and its component parts are in accordance with the existing applicable requirements of the Rules and the requirements of *Vol 3*, *Pt 1*, *Ch 6 Hybrid Electrical Power Systems*.

HP(+) - Hybrid Power (+) Assigned to ships meeting the requirements for **Hybrid Power** and the additional optional requirements for **Hybrid Power (+)** specified within *Vol 3, Pt 1, Ch 6 Hybrid Electrical Power Systems*. The additional

26

Volume 1, Part 1, Chapter 2

Section 3

27

optional requirements aim to provide for enhanced performance of the electrical power system achieved through the consideration of system simulation, system integration and the dependability of the electrical power system during normal or reasonably foreseeable abnormal operation.

3.9.3 The following class notation is associated with vessels capable of being operated unmanned, and may be assigned as considered appropriate:

Unmanned Assigned when a vessel is designed and constructed such that it may be operated unmanned, i.e. without crew, passengers or other persons on board.

- 3.9.4 Machinery and Engineering Systems class notations will not be assigned to ships where the hulls are not classed or intended to be classed with LR.
- 3.9.5 Other class notations may be assigned where the machinery and engineering systems are in accordance with the requirements of the additional features included in *Vol 3 Additional Class Notations* of the Rules.

3.10 Other notations

- 3.10.1 **LAP.** This optional notation will be assigned to naval ships in respect of the lifting appliances fitted which are classed in accordance with LR's *Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2* or equivalent standard, but where it is not mandated by the LA notation, see *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.12.* This notation will be assigned in association with a Register of Lifting Appliances listing the appliances covered, see *Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.3.*
- 3.10.2 **LAC.** This notation will be assigned to naval ships where the prescribed periodical surveys for certified lifting appliances are undertaken by Lloyd's Register at the request of the Owner. This notation will be assigned in association with a Register of Lifting Appliances listing the appliances covered, see *Vol 1*, *Pt 1*, *Ch 2*, *3.10 Other notations 3.10.3*.
- 3.10.3 A Register of Lifting Appliances is to be maintained for all classed and certified lifting appliances, including, where fitted:
- (a) Bow, side and stern doors serving as ramps and/or serving to provide watertight integrity of the ship.
- (b) Vehicle ramps.
- (c) Movable decks.
- (d) Personnel Lifts
- (e) Stores lifts.
- (f) Mechanized cargo handling systems.
- (g) Cranes.
- (h) Davits.
- (i) Overboard recovery davits.
- (j) Replenishment at sea equipment.
- (k) Engineers lifting arrangements.
- (I) Eye plates and securing devices exceeding 2,5 tonnes.
- (m) Miscellaneous lifting arrangements.
- (n) Towed body attachments.

Lifting Appliances for handling explosives stores or munitions can be brought within the scope of the **LAP** (or **LA**) notation but the Code for Lifting Appliances in a Marine Environment, July 2021, incorporating Notice No. 1 & 2 will need to be augmented with Naval Administration requirements.

Maintenance of the Register of Lifting Appliances is the responsibility of the Owner and should include all classed and certified lifting appliances. The \mathbf{LA} , $\dot{\mathbf{LA}}$, \mathbf{LAP} and/or \mathbf{LAC} notations will be retained so long as the appliances are found upon examination by LR at the prescribed surveys to be maintained in accordance with the standard.

- 3.10.4 **LE**. This notation will be assigned where the lifting eyes, with a permissible loading of 2,5 tonnes or less, installed for the purpose of shipping and unshipping equipment and machinery, and which do not form part of a lifting appliance, are of an approved design, tested during construction and inspected through life in compliance with the requirements of *Vol 1*, *Pt 3*, *Ch 4*, *11 Lifting eyes*.
- 3.10.5 **LI Loading Instrument.** This notation will be assigned where an approved loading instrument has been installed either as a Class or Owner's requirement.
- 3.10.6 **CM Construction Monitoring** complements the **SDA** and **FDA** notations and will be assigned when the controls in construction tolerances have been applied and verified.

Volume 1, Part 1, Chapter 2

Section 3

3.10.7 **SEA(VDR), SEA(VDR-n) Ship Event Analysis**. At the Owner's request, and in order to enhance safety and awareness on board during ship operation, provisions can be made for a hull surveillance system that monitors the hull girder stresses and motions of the ship and warns the ship's personnel that these levels or the frequency and magnitude of slamming motions are approaching a level where corrective action is advisable. The extension -n signifies the number of fitted strain gauges if connected to the system. The following option extensions will be added to the notation:

L The display and recording of the relevant strength information.

M The display and recording of the ship's motion.

N The facility to display and record navigational information.

VDR An interface with the ship's voyage data recorder system to enable the recording of hull stress, ship motion and hull pressure information.

- 3.10.8 **SERS Ship Emergency Response Service.** This service, offered by LR, provides a rapid computer assisted analysis of a damaged ship's stability and damaged longitudinal strength in the event of a casualty to the ship. Where an Owner adopts this service, the notation **SERS**, 'Ship is registered with LR's Ship Emergency Response Service' is available.
- 3.10.9 **EER Escape, Emergency Access, Evacuation and Rescue.** This notation will be assigned to naval ships which demonstrate compliance with all the requirements for **FIRE**, **ESC** and **LSAE** notations. It also denotes that the systems and their arrangements have been integrated in such a manner so as to support safe and effective task performance.
- 3.10.10 **FIRE Fire Protection**. This notation will be assigned to naval ships which are shown to have levels of fire protection that incorporate the functional requirements and objectives of the applicable IMO International Conventions or *ANEP-77 NATO Naval Ship Code* (NSC) and that have been accepted by LR in accordance with LR's Rules.
- 3.10.11 **ESC Escape and Emergency Access**. This notation will be assigned to naval ships which demonstrate levels of personnel safety in the event of a 'prepare to evacuate' situation and emergency access arrangements that incorporate the functional requirements and objectives of the applicable IMO International Conventions or *ANEP-77 NATO Naval Ship Code* (NSC) and that have been accepted by LR in accordance with LR's Rules. Where the requirements of the NSC are to be applied for an **ESC**** notation, the **LSAE**** notation must also be applied.
- 3.10.12 **LSAE Life-saving and Evacuation Arrangements**. This notation will be assigned to naval ships which demonstrate the provision of life-saving and rescue equipment on board that incorporates the functional requirements and objectives of the applicable IMO International Conventions *ANEP-77 NATO Naval Ship Code* (NSC) and that have been accepted by LR in accordance with LR's Rules. Where the requirements of the NSC are to be applied for an **LSAE**** notation, the **ESC**** notation must also be applied.
- 3.10.13 **SNC Safety of Navigation and Communication**. This notation will be assigned to naval ships which demonstrate levels of safety of navigation and communication arrangements on board that incorporate the functional requirements and objective of the applicable IMO International Conventions and that have been accepted by LR in accordance with LR's Rules.
- 3.10.14 **POL Pollution Prevention.** This notation will be assigned to naval ships which demonstrate that the pollution prevention arrangements on board that incorporate the functional requirements and objectives of the applicable IMO International Conventions and that have been accepted by LR in accordance with LR's Rules. The notation provides Naval Administrations with a voluntary independent assessment of their ships' compliance with IMO's environmental conventions.
- 3.10.15 **Ice Class notation.** An appropriate class notation for navigation in ice may be assigned when the hull structural and machinery installation are such that the ship may be operated in defined ice conditions, see below. The notation denotes that the hull structural arrangements and machinery installation have been designed, constructed, installed and tested in accordance with LR Rules or its equivalent thereto. The Class notations available are described below:
- (a) **Ice Class 1AS.** This strengthening is for ships intended to navigate in first year ice conditions equivalent to unbroken level ice with a thickness of 1.0 m.
- (b) **Ice Class 1A.** This strengthening is for ships intended to navigate in first year ice conditions equivalent to unbroken level ice with a thickness of 0.8 m.
- (c) **Ice Class 1B.** This strengthening is for ships intended to navigate in first year ice conditions equivalent to unbroken level ice with a thickness of 0,6 m.
- (d) **Ice Class 1C.** This strengthening is for ships intended to navigate in first year ice conditions equivalent to unbroken level ice with a thickness of 0,4 m.

If operation in first year is defined by the operational requirement as an emergency feature then special consideration will be given to the use of fully plastic design criteria for the shell plating. In such cases the ice class notation will be annotated with *.

Volume 1, Part 1, Chapter 2

Section 3

- 3.10.16 **LMA** or **LNMA.** These notations will be assigned where the ship's manoeuvring capability has been assessed in accordance with the respective performance criteria for each notation. It denotes that the manoeuvring performance has been verified through trials in accordance with LR's Rules.
- 3.10.17 **CEPAC.** This notation will be assigned where the noise and vibration levels in crew and embarked personnel spaces have been assessed and meet acceptance criteria for comfort. It denotes that the noise and vibration levels have been measured and reported in accordance with LR's Rules. Numerals 1 or 2 following the **CEPAC** notation indicate the acceptance criteria to which the noise and vibration levels have been assessed.
- 3.10.18 **ENV**. This notation will be assigned where the environmental protection arrangements demonstrate compliance with one or more characters as described in the Rules. Available characters include:

A Anti-fouling coatings;

ABN Airborne Noise;

GW Grey water and sewage;

IHM Inventory of Hazardous Materials;

MRV Monitoring, reporting and verification of carbon dioxide;

NOx-2, NOx-3 Emissions of nitrogen oxides;

OW Oily water management;

P Oil tanks in protected locations;

RS Refrigeration systems;

SOx Emissions of sulphur oxides;

UWN Underwater noise.

- 3.10.19 **SD Special Duties Notation.** A special duties notation will be recorded in the vessel's Classification record indicating that the ship has been designed, modified or arranged for special duties other than those implied by the type notation. Ships with special duties notations are not thereby prevented from performing any other duties for which they may be suitable.
- 3.10.20 **PCWBT** This notation will be assigned to naval ships, at the Owner's request, when protective coating systems have been applied during construction to all sea-water ballast tanks having boundaries formed by the hull envelope in accordance with the *ShipRight Protective Coatings in Water BallastTanks* procedure, and that the coating remains efficient and is maintained in good condition.
- 3.10.21 **ACS ().** This notation will be assigned to naval ships, at the Owner's request, when protective coating systems have been applied during construction in accordance with the *ShipRight Anti-Corrosion Notations procedure* and that the coating remains efficient and is maintained in good condition. The **ACS ()** notation, with the extension of one or more of the following associated supplementary characters shown in brackets, detailing the specified protected area or areas, may be assigned as follows:

B Water Ballast Tanks

V Void Spaces

- 3.10.22 *IWS. This notation (In-water Survey) may be assigned to a ship where the applicable LR requirements are complied with, see Vol 1, Pt 1, Ch 2, 7 Classification of ship with *IWS notation and Vol 1, Pt 1, Ch 3, 4.3 In-water Surveys.
- 3.10.23 Where it can be demonstrated that the vessel meets all of the buoyancy, stability and controllability performance requirements of the latest edition of Chapter III of the ANEP-77 NATO Naval Ship Code (NSC), a ship will be eligible to be assigned the **STAB** notation.
- 3.10.24 **SMS** (Safety Management System). This notation will be assigned to a Naval Vessel where the safety management and operational procedures have been implemented, assessed and accepted by LR. The safety management and operational procedures are to incorporate objectives and requirements of the *International Safety Management Code* (ISM Code). This notation provides support in demonstrating that a Naval Vessel has a functioning Safety Management System in place, as required by the *ANEP-77 NATO Naval Ship Code* (NSC) and equivalent standards.

Volume 1, Part 1, Chapter 2

Section 4

- 3.10.25 **DWA** This notation (Deep Water Anchoring) may be assigned to a ship with a Rule length $L_{\rm R}$ not less than 135 m, subject to the Rules in *Vol 1, Pt 3, Ch 5, 10 Anchoring equipment in deep and unsheltered water*, which has increased equipment for anchoring in deep water with a depth up to 120 m.
- 3.10.26 **HCD1()**. This ShipRight notation will be assigned when the development and operation of specified ship system(s) has been carried out in accordance with the process for 'Level 1 Reactive' detailed in the *ShipRight Procedure for Human-centred Design*. The names of the systems which meet the requirements will be listed as a suffix to the character, e.g. **HCD1**(mooring area, ECDIS).
- 3.10.27 **BOATS, Boat Operations at Sea**. This optional notation will be assigned to naval vessels where the onboard arrangements for the launch, recovery and carriage of small boats, and the interfacing of the vessel with waterborne craft alongside or persons in the water, are demonstrated to be in accordance with the Functional Objectives and Performance Requirements of ANEP-77 NATO *Naval Ship Code (NSC)* and accepted by LR in accordance with requirements specified in *Vol 3, Pt 1, Ch 7 Boat and Waterborne Operations*.

■ Section 4

Surveys - General

4.1 New construction

- 4.1.1 When it is intended to build a ship for Classification with LR, constructional plans and all particulars relevant to the hull, equipment and machinery, as detailed in the Rules, are to be submitted for the approval of LR before the work is commenced. Critical Areas (see *Vol 1, Pt 1, Ch 3, 1.5 Definitions 1.5.4*) will be identified at this stage. Any additional plans submitted will not be subject to appraisal or approval without separate agreement. Proposals for any subsequent modifications or additions to the scantlings, arrangements or equipment shown on the approved plans are also to be submitted in writing and on plans for approval.
- 4.1.2 Where the proposed construction of any part of the hull or machinery is of novel design, or involves the use of unusual material, or where experience has not sufficiently justified the principle or mode of application involved, special tests or examinations before and during service may be required. In such cases a suitable notation may be entered in the vessel's Classification record.
- 4.1.3 The materials used in the construction of hulls and machinery intended for Classification are to be of good quality and free from defects and are to comply with the requirements of the Rules. Material is to be manufactured at a works approved by LR. Alternatively, tests to the satisfaction of LR will be required to demonstrate the suitability of the material.
- 4.1.4 Copies of the latest approved plans, essential certificates and records, required loading and other instruction manuals are to be readily available for use when required by the attending Surveyors and are thereafter required to be kept on board.
- 4.1.5 Where requested, LR will check the intact and damage stability calculations and approve the Stability information in accordance with the agreed standard(s).
- 4.1.6 **Fire Protection FIRE.** The arrangements for fire protection, detection and extinction are to be examined to ensure that the following fire protection objectives have been satisfied:
- (a) **Fire Prevention Objective**. The ship is to be designed and equipped so as to reduce the risk of the occurrence of fire or explosion, taking due account of its civil and military operational role.
- (b) **Fire Detection Objective**. The ship is to be designed and equipped, as far as is practicable, to detect any potentially hazardous fire or explosion.
- (c) **Fire Extinguishing Objective**. The ship is to be equipped, so far as is practicable, so that all detected fires can be safely and effectively extinguished.
- (d) **Containment Objective**. The ship is to be arranged, so far as is practicable, to limit the spread of fire, smoke and toxic byproducts to the space of origin.
- (e) Personnel Hazard Objective. All reasonable measures are to be taken to prevent hazards to personnel as a result of fire.
- (f) **System Interaction Objective**. The possibility of fire protection measures or systems causing fire related, or non-fire related hazards is to be kept to a level that is as low as is reasonably practicable.
- (g) **Command and Control Objective**. Suitable means are to be provided to ensure any active fire control measures can be safely and effectively orchestrated.

Volume 1, Part 1, Chapter 2

Section 4

(h) **Structural Integrity Objective**. Sufficient structural integrity is to be maintained following a fire so as to prevent the whole or partial collapse of the ship's structures due to strength deterioration by heat.

4.1.7 **Pollution Prevention – POL (Optional)**

The arrangements for prevention of pollution of the sea and air from the ship are to be examined to ensure that the following MARPOL - International Convention for the Prevention of Pollution from Ships Regulations have been complied with:

- (a) MARPOL Annex I of MARPOL 73/78Regulations for the Prevention of Pollution by Oil (Prevention of Pollution by Oil)
- (b) MARPOL Annex V of MARPOL 73/78Regulations for the Prevention of Pollution by Garbage from Ships (Prevention of Pollution by Garbage)
- (c) MARPOL Annex IV of MARPOL 73/78Regulations for the Prevention of Pollution by Sewage from Ships (Prevention of Pollution by Sewage)
- (d) MARPOL Annex VI Regulations for the Prevention of Air Pollution from Ships (Prevention of Air Pollution)

4.1.8 Life-Saving and Evacuation – LSAE

The arrangements for life-saving and evacuation are to be examined to ensure that the following life-saving and evacuation objectives have been satisfied:

- (a) **Evacuation Objective.** Arrangements are to be provided to enable personnel to evacuate the ship safely and in a time acceptable to the Naval Administration.
- (b) **Personnel Protection Objective**. Evacuated personnel are to be kept protected until such time as they can be rescued from the survival craft.
- (c) **Rescue Objective**. The ship is to be suitably equipped to rescue personnel from the water.
- (d) **Command and Control Objective**. The ship is to be equipped and manned so that command of all evacuation and life-saving situations can be maintained.

4.1.9 Escape and Emergency Access – ESC

The arrangements for escape and emergency access are to be examined to ensure the following escape of personnel and emergency access objectives have been satisfied:

- (a) **Escape of Personnel Objective**. The ship is to be arranged so that all spaces have means of safe and effective escape for personnel to a designated place of safety, during reasonably forseeable emergency situations.
- (b) **Emergency Access Objective**. The ship is to be arranged so that personnel can access all areas with necessary equipment, for damage control and fire-fighting purposes and exercises.

4.1.10 Safety of Navigation and Communications – SNC

The arrangements for the safety of navigation and communications are to be examined to ensure the following safety of navigation and communication objectives have been satisfied:

- (a) **Communication Objective**. The ship is to be capable of communication to avert unnecessary danger to itself and other ships in the vicinity during normal and emergency conditions.
- (b) **Safety of Navigation Objective**. The ship is to be arranged with the necessary equipment to facilitate safe and effective navigation.
- (c) **Equipment Arrangements Objective.** All navigation and communications equipment is to be arranged to allow safe and effective task performance.
- 4.1.11 **Escape, Emergency Access, Evacuation and Rescue ERR** The arrangements for the integration of the requirements for compliance with the **FIRE**, **ESC** and **LSAE** notations are to be examined to ensure that the arrangements support safe and effective task performance.

4.2 Survey

- 4.2.1 The Surveyor is to be satisfied that the capability, organisation and facilities of the Builder are such that acceptable standards can be obtained for the construction of the ship and machinery.
- 4.2.2 In addition to Vol 1, Pt 1, Ch 2, 4.1 New construction 4.1.3, the hull construction of ships is to be controlled by a documented quality control system covering the Builder's management, organisation and relevant construction processes and inspection procedures.
- 4.2.3 New ships intended for Classification are to be built under Naval Class Special Survey. The Surveyors are to be satisfied that the materials, workmanship and arrangements are in accordance with the Rules. Any items found not to be in accordance

Volume 1, Part 1, Chapter 2

Section 4

with the Rules or the approved plans, or any material, workmanship or arrangements found so to be, are to be rectified or concession sought from LR.

- 4.2.4 For compliance with *Vol 1, Pt 1, Ch 2, 4.2 Survey 4.2.3*, LR will consider methods of survey and inspection for hull construction which formally include procedures involving the shipyard management, organisation and quality systems.
- 4.2.5 The Surveyor will prepare a report C11(N) record of hull and superstructure watertight, weathertight arrangements and closing appliances.
- 4.2.6 The date of completion of the Special Survey during construction of ships built under LR's supervision will normally be taken as the date of build to be entered in the *Register Book*. If the period between launching and commissioning is, for any reason, unduly prolonged, the dates of launching and completion or commissioning may be separately indicated in the *Register Book*.
- 4.2.7 When a ship, upon completion, is not immediately commissioned but is laid-up for a period, LR, upon application by the Owner, prior to the ship proceeding to sea, will direct an examination to be made by the Surveyors which may include a survey in dry dock. If, as the result of such survey, the hull and machinery are reported in all respects in accordance with applicable Rule requirements, the subsequent Special Survey and Complete Survey of the machinery will date from the time of such examination.

4.3 Existing ships

- 4.3.1 **Classification of ships not built under LR survey.** The requirements of LR for the Classification of ships which have not been built under LR's Survey are indicated in *Vol 1, Pt 1, Ch 3, 15 Classification of ships not built under LR survey.* Special consideration will be given to ships that have been designed, constructed and maintained to specified standards, and to ships transferring Class to LR from another recognised Classification Society who have appropriate Naval Ship Rules.
- 4.3.2 Classification of ships built under survey to Classification Rules and Regulations other than LR Naval Ship Rules and Regulations. The requirements of LR for the Classification of ships and craft which have not been built under LR's Survey to the LR Rules and Regulations for the Classification of Naval Ships are indicated in Vol 1, Pt 1, Ch 3, 16 Classification of ships built under survey to LR Classification Rules and Regulations other than LR Naval Ship Rules and Regulations
- 4.3.3 **Reclassification.** When reclassification or Class reinstatement is requested for a ship for which the Class previously assigned by LR has been withdrawn or suspended, LR will direct that a survey, appropriate to the age of the ship and the circumstances of the case, be carried out by Surveyors. If, at such survey, the ship is found or placed in a good and efficient condition in accordance with the Rules and Regulations, LR will be prepared to consider reinstatement of the original Class or the assignment of such other Class as may be deemed appropriate. The date of any reclassification will be recorded in the vessel's Classification record. When the original classification was not to the Rules for Naval Ships, then it will be necessary to demonstrate compliance with the additional requirements of these Rules.
- 4.3.4 LR reserves the right to decline an application for Classification or reclassification where the prior history or condition of the ship indicates this to be appropriate.

4.4 Damages, repairs and alterations

- 4.4.1 All repairs to hull, equipment and machinery which may be required in order that a ship may retain Class, see *Vol 1*, *Pt 1*, *Ch 2*, *1.1 Framework of Classification 1.1.7*, are to be carried out to the satisfaction of the Surveyors. When repairs are effected at a port, terminal or location where the services of a Surveyor to LR are not available, the repairs are to be surveyed by one of the Surveyors at the earliest opportunity thereafter.
- 4.4.2 Any damage in association with wastage over the allowable limit (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the ship's structural, watertight or weathertight integrity, is to be promptly and thoroughly repaired. Areas to be considered include, (where fitted):
- side shell frames, their end attachments or adjacent shell plating;
- deck structure and deck plating;
- bottom structure and bottom plating;
- side structure and side plating;
- inner bottom structure and inner bottom plating;
- inner side structure and inner side plating;
- watertight or oiltight bulkheads;
- hatch covers or hatch coamings.

Volume 1, Part 1, Chapter 2

Section 4

For locations where adequate repair facilities are not available, consideration may be given to allow the ship to proceed directly to a repair facility. This may require discharging stores/equipment and/or temporary repairs for the intended voyage.

- 4.4.3 Where repairs are to be carried out by a riding crew during a voyage, then these must be planned in advance. A complete repair procedure, including the extent of the proposed repair and the need for a Surveyor's attendance during the voyage, is to be submitted reasonably in advance to the Surveyor for agreement. Failure to notify LR in advance of the repairs may result in the Class of the ship being specially considered by the Classification Committee. Where emergency repairs are effected immediately due to an extreme emergency circumstance, the repairs should be documented in the ship's log and submitted thereafter to LR for use in determining further survey requirements.
- 4.4.4 When at any survey the Surveyor considers repairs to be immediately necessary, either as a result of damage, or wear and tear, they are to communicate their recommendations at once to the Owner, or his representative. When such recommendations are not complied with, immediate notification is to be given to the vessel's Naval Classification Liaison Office by the Surveyor.
- 4.4.5 When at any survey it is found that any damage, defect, or breakdown (see Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.7) is of such a nature that it does not require immediate permanent repair, but is sufficiently serious to require rectification by a prescribed date in order to maintain Class, a suitable Condition of Class is to be imposed by the Surveyors and recommended for consideration. This condition may be designated as an operational defect, under the Owner's control, but LR needs to be kept advised as to proposed actions. The technical impact of any deficiency on the operational needs of the ship must be considered by the Surveyor in liaison with the Owner before a decision is made with regard to corrective action.
- 4.4.6 If a ship which is Classed with LR is to leave harbour limits or protected waters under tow, the Owner is to advise LR of the circumstances prior to her departure.
- 4.4.7 If a ship which is Classed with LR is taken in tow whilst at sea, the Owner is to advise LR of the circumstances at the first practicable opportunity.
- 4.4.8 Plans and particulars of any proposed alterations (Mods. or A's and A's) to the approved scantlings and arrangements of the hull, machinery and engineering systems are to be submitted by the Owners or their representatives for approval by LR and such alterations are to be carried out to the satisfaction of LR's Surveyors.

4.5 Existing ships – Periodical Surveys

- 4.5.1 **Annual Surveys** are to be held on all ships within three months, before or after each anniversary of the completion, commissioning or Special Survey. The date of the last Annual Survey will be recorded in the vessel's Classification record. This survey may include optional requirements.
- 4.5.2 **Intermediate Surveys** are to be held on all ships instead of the third or fourth Annual Survey after completion, commissioning or Special Survey. The date of the last Intermediate Survey will be recorded in the vessel's Classification record.
- 4.5.3 The Owner should notify LR whenever a ship can be examined in dry dock or on a slipway. An inspection of the underwater hull and its appendages is to be carried out not less than twice every six years. The maximum period between inspections of the hull and its appendages in dock or in-water is not to exceed three and a half years. Consideration may be given at the discretion of LR to any special circumstances justifying an extension of the maximum periods between inspections. A **Docking Survey** is to be carried out concurrently with the Special Survey. The required Docking Survey is considered to coincide with the Special Survey when held within the six months prior to the due date of the Special Survey. See Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.5. Where the Special Survey of the hull is carried out on a Continuous Survey basis, as given in Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.10, the survey in dry dock may be held at any time within the six-year cycle.
- 4.5.4 The date of the last Docking Survey will be recorded in the vessel's Classification record.
- 4.5.5 Classification details and Survey requirements for **In-water Surveys** are given in *Vol 1, Pt 1, Ch 2, 7 Classification of ship with *IWS notation* and *Vol 1, Pt 1, Ch 3, 4.3 In-water Surveys* respectively. An In-water survey can be carried out in lieu of a Docking Survey for inspection of the underwater hull and appendages between the Docking Surveys that are to be carried out concurrently with the Special Survey. The date of the last In-water Survey will be recorded in the vessel's Classification record, preceded with the notation ***IWS**.
- 4.5.6 All ships classed with LR are also to be subjected to **Special Surveys**. These Surveys become due at six-yearly intervals, the first one six years from the date of build or date of Special Survey for Classification as recorded in the vessel's Classification record, and thereafter six years from the date recorded in the vessel's Classification record, for the previous Special Survey. Consideration can be given, at the discretion of LR, to any exceptional circumstances justifying an extension of hull Classification beyond the sixth year. If an extension is agreed the next period of hull Classification will start from the due date of the

Volume 1, Part 1, Chapter 2

Section 4

Special Survey before the extension was granted. In this context 'exceptional circumstances' means unavailability of dry-docking facilities; repair facilities; essential materials; equipment or spare parts; delays incurred by action taken to avoid severe weather conditions; or urgent operational requirements.

- 4.5.7 Special Surveys may be commenced at the fifth Annual Survey or anniversary, as appropriate, after completion, commissioning, or previous Special Survey, and be progressed during the succeeding year with a view to completion by the due date of the Special Survey.
- 4.5.8 Special Surveys which are commenced prior to their due date are not to extend over a period greater than twelve months, except with the prior approval of LR.
- 4.5.9 Ships which have satisfactorily passed a Special Survey will have a record entered in the vessel's Classification record indicating the date. Where the Special Survey is completed more than three months before the due date, the new record of Special Survey will be the final date of survey. In all other cases the date recorded will be the sixth anniversary.
- 4.5.10 At the request of an Owner, it may be agreed that the Special Survey of the hull can be carried out on a Continuous Survey basis, all compartments of the hull being opened for survey and testing, in rotation, with an interval of six years between consecutive examinations of each part. In general, approximately one sixth of the Special Survey is to be completed each year and all the requirements of the particular hull Special Survey must be completed at the end of the six-year cycle. Ships which have satisfactorily completed the cycle will have a record entered in the vessel's Classification record indicating the date of completion which will not be later than six years from the last assigned date of Complete Survey of the hull.
- 4.5.11 If any examination during Continuous Survey reveals defects, further parts are to opened up and examined as considered necessary by the Surveyor, and the defects are to be made good to his satisfaction.
- 4.5.12 Alternative arrangements for survey periodicity will be considered by LR upon request. Requests from the Owner, at build or during service, need to be supported by adequate evidence of satisfactory performance before survey periodicity can be changed. These requests could be based upon Reliability Centred Maintenance or other forms of condition monitoring.
- 4.5.13 Machinery is to be submitted to the surveys detailed in Vol 1, Pt 1, Ch 3 Periodical Survey Regulations
- 4.5.14 Complete Surveys of machinery become due at six-yearly intervals, the first one six years from the date of build or date of first classification as recorded in the vessel's Classification record, and thereafter six years from the date recorded in the vessel's Classification record for the previous Complete Survey. Consideration can be given at the discretion of LR to any exceptional circumstances justifying an extension of machinery class to a maximum of three months beyond the sixth year. If an extension is agreed to, the next period of machinery class will start from the due date of Complete Survey of machinery before extension was granted. Surveys which are commenced prior to their due date are not to extend over a period greater than 12 months, except with the prior approval of LR. On satisfactory completion of a survey, an appropriate record will be made in the vessel's Classification record. Where the complete survey is completed more than three months before the due date, the new date recorded will be the final date of survey. In all other cases the date recorded will be the sixth anniversary. See also Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.20.
- 4.5.15 Upon application by an Owner, LR may agree to the extension of the survey requirements for main propulsion machinery, which, by the nature of the ship's normal service, does not attain the number of running hours recommended by the machinery manufacturer for major overhauls within the survey periods given in Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.14.
- 4.5.16 When, at the request of an Owner, it has been agreed by LR that the Complete Survey of the machinery may be carried out on a Continuous Survey basis, the various items of machinery are to be opened for survey in rotation, so far as is practicable, to ensure that the interval between consecutive examinations of each item will not exceed six years. In general, approximately one sixth of the machinery is to be examined each year. A record indicating the date of satisfactory completion of the Continuous Survey cycle will be made in the vessel's Classification record. See also Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.20.
- 4.5.17 Upon application by an Owner, LR may agree to an arrangement whereby, subject to certain conditions, some items of machinery may be examined by the qualified naval engineering personnel responsible to the Marine Engineer Officer of the ship, followed by a limited confirmatory survey and annual audit of maintenance and repairs records. Particulars of this arrangement may be obtained from the vessel's Naval Classification Liaison Office. Where an approved planned maintenance scheme is in operation the confirmatory surveys of machinery may be held at annual intervals, at which time the records will be checked and the operation of the scheme verified. Particulars of this arrangement may also be obtained from the vessel's Naval Classification Liaison Office.
- 4.5.18 Where condition monitoring techniques are applied, LR, upon application by the Owner, will be prepared to amend applicable Periodical Survey requirements where details of the equipment are submitted and found satisfactory. Where machinery

Volume 1, Part 1, Chapter 2

Section 4

installations are accepted for this method of survey, it will be a requirement that an Annual Survey be held, at which time monitored records will be analysed and the machinery examined under working conditions. An acceptable lubricating oil trend analysis programme may be required as part of the condition monitoring procedures.

- 4.5.19 Where machinery installations include a 'lifed item' (an item of machinery, component or equipment necessary for the safety and reliability of propulsion, steering or other essential auxiliary engineering system) which is subject to an overhaul and/or ultimate life limitation, i.e. a period (expressed in operating hours or cycles and/or calendar time) at which the item is to be overhauled or scrapped, the life limitations are to be observed and take precedence over the periodicity of *Vol 1*, *Pt 1*, *Ch 2*, 4.5 Existing ships Periodical Surveys 4.5.14 and *Vol 1*, *Pt 1*, *Ch 2*, 4.5 Existing ships Periodical Surveys 4.5.16where the life limitation is less than the survey periodicity. Examples may include rolling bearing elements, gas turbines, turbochargers, flexible couplings and gear box elements. The manufacturer's maintenance and service instructions are to be strictly observed. Where machinery installations include a 'lifed item' details will be noted in the classification records as a Memorandum (Machinery) record.
- 4.5.20 Where propulsion and auxiliary machinery is maintained using an approved 'upkeep by exchange' system, the Marine Engineer Officer is to maintain records of all exchanges carried out. At the first convenient opportunity after exchange, a running test on load is to be witnessed by a LR Surveyor (this may typically be the time of annual survey). Where prime movers are maintained by an 'upkeep of exchange' system, details will be noted in the classification records as a Memorandum (Machinery) record.
- 4.5.21 Boiler surveys, examination of steam pipes and Screwshaft Surveys are to be carried out as stated in *Vol 1, Pt 1, Ch 3, 11 Boilers* and *Vol 1, Pt 1, Ch 3, 12 Steam pipes* of these Regulations. On satisfactory completion, appropriate records will be made in the vessel's Classification record.

4.6 Surveys for novel/complex systems, machinery and equipment

- 4.6.1 Where novel/complex systems, machinery and equipment have been accepted by LR and for which existing survey requirements are not considered to be suitable and sufficient, appropriate survey requirements are to be derived as part of the design approval process. In deriving these requirements LR will consider, but not be limited to, the following:
- (a) Plan appraisal submissions;
- (b) Risk Assessment documentation where required by the Rules;
- (c) Equipment manufacturer recommendations;
- (d) Relevant recognised National or International Standards.

4.7 Certificates

- 4.7.1 When survey reports have been received from the Surveyors and classification has been agreed by the Classification Executive, a Certificate of Classification may be issued by an authorised Surveyor. After approval by the Classification Committee, a Certificate of First Entry of Classification, signed by LR's Chairman, or the Chairman of the Sub-Committee of Naval Classification Committee, may be issued to the Builders or Owners.
- 4.7.2 A Certificate of Class valid indefinitely subject to endorsement for Annual and Intermediate Surveys, as appropriate, will also be issued to the Owners and a certified copy placed on board. A new certificate will be issued when no further endorsement spaces remain.
- 4.7.3 LR's Surveyors will issue provisional (interim) certificates, after survey, to enable a ship Classed with LR to proceed on voyage provided that it is in a satisfactory condition. Such certificates will embody the Surveyors' recommendations for continuance of Class, and are subject to confirmation by LR.

4.8 Notice of surveys

- 4.8.1 It is the responsibility of the Owners to ensure that all surveys necessary for the maintenance of Class are carried out at the proper time.
- 4.8.2 Timely notice to an Owner about forthcoming surveys is available by means of access to LR's Class Direct. The omission of such notice, however, does not absolve the Owner from their responsibility to comply with LR's survey requirements.
- 4.8.3 The Owner will give timely notice of the availability of ships for survey. Should a ship not be available at the due time, the agreement for postponement of the survey should be sought from LR.

Volume 1, Part 1, Chapter 2

Section 4

4.9 Withdrawal/Suspension of Class

- 4.9.1 When the Class of a ship, for which the Regulations as regards surveys on the hull, equipment and machinery have been complied with, is withdrawn by LR in consequence of a request from the Owner, the notation 'Class withdrawn at Owner's request' (with date) will be assigned.
- 4.9.2 When the Regulations as regards surveys on the hull equipment and machinery have not been complied with and the ship is thereby not entitled to retain Class, the Class will be suspended or withdrawn after consultation with the Owner and a corresponding notation will be assigned. In order to maintain class, LR will require documentary evidence regarding the material state of the ship, its systems and equipment in terms of reports, photographs, measures or videos where the operational requirements exceed 12 months.
- 4.9.3 LR will consider requirements from the Owner to continue Class where operational requirements curtail surveys being held.
- 4.9.4 When in accordance with Vol 1, Pt 1, Ch 2, 4.4 Damages, repairs and alterations 4.4.4 and Vol 1, Pt 1, Ch 2, 4.4 Damages, repairs and alterations 4.4.5 a Condition of Class is imposed, this will be assigned a due date for completion and the ship's Class will be subject to a suspension procedure if the condition of Class is not dealt with, or postponed by agreement, by the due date.
- 4.9.5 When it is found, from the reported condition of the hull or equipment or machinery of a ship, that an Owner has failed to comply with paragraphs *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.7, Vol 1, Pt 1, Ch 2, 4.4 Damages, repairs and alterations 4.4.1* or *Vol 1, Pt 1, Ch 2, 4.4 Damages, repairs and alterations 4.4.7*, the Class will be liable to be suspended or withdrawn, at the discretion of LR, and a corresponding notation assigned.
- 4.9.6 When any ship proceeds to sea with a design draught greater than that approved, the Class will be liable to be withdrawn or suspended for the voyage.
- 4.9.7 In all instances of Class withdrawal or suspension, the assigned notation, with date of application, will appear in the vessel's Classification record. In cases where Class has been suspended by LR and it becomes apparent that the Owners are no longer interested in retaining LR's Class, the notation will be amended to withdrawn status. After Class withdrawn status has been established in the vessel's Classification record for one year, it will be automatically amended to 'Classed LR until' (with date).
- 4.9.8 For reclassification and reinstatement of Class, see Vol 1, Pt 1, Ch 3, 4.3 In-water Surveys 4.3.2 and Vol 1, Pt 1, Ch 3, 4.3 In-water Surveys 4.3.2 and Vol 1, Pt 1, Ch 3, 4.3 In-water Surveys 4.3.3.

4.10 Survey of ships out of commission and/or laid-up

- 4.10.1 For ships assigned the notation 'laid-up', in order to maintain the ship in class, a general examination of the hull and machinery is to be carried out in lieu of the Annual Survey and an Underwater Examination (UWE) is to be carried out in lieu of the Special Survey, see;
- Vol 1, Pt 1, Ch 3, 2.1 General 2.1.4,
- Vol 1, Pt 1, Ch 3, 5.1 General 5.1.4 and
- Vol 1, Pt 1, Ch 3, 7.1 Annual, Intermediate and Docking Survey 7.1.2.

4.10.2 In cases where the ship has been laid up or has been out of service for a considerable period because of a major repair or modification, the next due Special Survey shall be carried out and the period of class will start from the survey completion date. Where the ship has been laid up for a shorter period and with consideration of the extent of system operation during the laid-up period, a reduced periodical scope will be specially considered at the request of the Owners and at the discretion of LR.

4.11 Appeal from Surveyor's recommendation

4.11.1 If the recommendations of the Surveyors are considered in any case to be unnecessary or unreasonable, appeal may be made to LR, who may direct a Special Examination to be held.

4.12 Ownership details

4.12.1 The Owner will ensure a member of the LR Group - Marine and Offshore division is promptly informed in writing of any change to their contact details and, in the event of a vessel/asset transfer or sale, is to supply details of the new Owner in writing. The new Owner is to promptly inform a member of the LR Group - Marine and Offshore division in writing of their contact details. If the new Owner fails to do so and if LR cannot verify the ownership record, then the class of that vessel/asset will be specially considered by the Classification Committee.

Volume 1, Part 1, Chapter 2

Section 5

Section 5

Type Approval/Type Testing/Quality Control System

5.1 LR Type Approval

- 5.1.1 LR Type Approval is an impartial certification system that provides independent third-party Type Approval Certificates attesting to a product's conformity with specific standards or specifications. It is based on design review and type testing or where testing is not appropriate, a design analysis.
- 5.1.2 The LR Type Approval System is a process whereby a product is assessed in accordance with a specification, standard or code to check that it meets the stated requirements and through selective testing demonstrates compliance with specific performance requirements. The testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under approval. Thereafter, the producer is required to use Quality Assurance procedures and processes to ensure that each item delivered is in conformity with that which has been Type Approved.
- 5.1.3 The selective testing required by *Vol 1, Pt 1, Ch 2, 5.1 LR Type Approval 5.1.2* is to include environmental testing applicable to the product's installation on board a ship classed or intended to be classed with LR.
- 5.1.4 LR Type Approval does not remove the requirements for inspection and survey procedures required by the Rules for equipment to be installed in ships classed or intended to be classed with LR. Also, LR Type Approval does not remove the requirement for plan appraisal of a system that incorporates Type Approved equipment where required by the Rules.
- 5.1.5 LR Type Approval is subject to the understanding that the producer's recommendations and instructions for the product and any relevant requirements of the Rules for the Classification of Naval Ships are fulfilled.
- 5.1.6 The producer supplying equipment or components under Quality Control procedures and processes is to have a recognised quality management system certified by an IACS member or a Notified Body. The Quality Control procedures and processes are to address the production of the product consistent with Vol 1, Pt 1, Ch 2, 5.3 Quality Control System.
- 5.1.7 Where equipment or components have been Type Approved in accordance with specifications and procedures other than LR's, details of the product, certification and testing are to be submitted for consideration where appropriate.

5.2 Type testing

- 5.2.1 Type testing is an impartial process that provides independent third-party verification that an item of machinery or equipment has satisfactorily undergone a functional type test.
- 5.2.2 Type testing is carried out against defined performance and test standards for a defined period of time with test conditions varying between minimum and maximum declared design conditions.
- 5.2.3 Type testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under assessment.
- 5.2.4 After type testing, mechanical equipment is to be opened out and inspected for damage or excessive wear.
- 5.2.5 On application from the manufacturer, type tests may be waived for equipment and machinery that has been proven to be reliable in marine service and where compliance with the current applicable standards can be demonstrated. Equipment and machinery that has been previously type tested with satisfactory testing evidence and certification need not have the type tests repeated where previous testing is in compliance with the current testing standards for the equipment.
- 5.2.6 The acceptance of type testing certification is subject to the understanding that the manufacturer's recommendations and instructions for the product and any relevant requirements of the applicable Rules are fulfilled.

5.3 Quality Control System

- 5.3.1 A quality control system for the purposes of LR acceptance of materials and machinery refers to a scheme that covers the operational techniques and activities that are used to demonstrate that the quality requirements of a product is in accordance with declared standards.
- 5.3.2 The quality control system for a particular product extends to all parties involved in the supply chain from manufacture and testing through to delivery of the product.
- 5.3.3 LR acceptance of machinery and equipment manufactured under a quality control scheme is dependent on the scheme being maintained through a traceable process involving planned audits and spot inspections at the discretion of LR Surveyors. The

Volume 1, Part 1, Chapter 2

Section 6

purpose of the audits and spot inspections is to ensure that the procedures for manufacture and quality control are being maintained in a satisfactory manner.

5.3.4 The use of a quality control system does not remove the requirements for inspection processes that may be required by the Rules applicable to the equipment being supplied with a manufacturer's certificate. Also the use of the quality control system does not remove the requirement for plan appraisal of equipment or systems where required by the Rules.

Section 6

Classification of machinery with [♣]LMC or MCH notation

6.1 General

6.1.1 After delivery of machinery and equipment with the manufacturer's certificate to the shipyard, Survey at the Shipyard and Periodical Surveys are to be in accordance with the requirements for ships built or accepted into class with the **ELMC** notation.

6.2 Appraisal and records

6.2.1 To facilitate survey and compilation of classification records, the same plans and information that are required for a ship being accepted into class with the **LMC** notation, are required to be submitted for the alternative notation **ELMC** or **MCH** for appraisal and information. Plans are not required where machinery and equipment have previously been approved by LR. In these cases it is only necessary to submit details of the machinery and equipment together with details of the previous approval.

6.3 Survey and inspection

- 6.3.1 The manufacturer's certificate for acceptance of machinery and equipment for assignment of the [🗷] **LMC** or **MCH** notation is to be in the English language and include the following information:
- (a) Design and manufacturing standard(s) used.
- (b) Materials used for construction of key components and their sources.
- (c) Details of the quality control system applied during design, manufacture and testing, and of any software maintenance.
- (d) Details of any type approval or type testing.
- (e) Details of installation and testing recommendations for the machinery or equipment.

The manufacturer is to have a recognised quality management system that is acceptable to LR.

- 6.3.2 The installation and testing of machinery and equipment at the build or fitting-out yard that has been supplied with a manufacturer's certificate is to be in accordance with the requirements applicable to a ship having the **LMC** notation.
- 6.3.3 Acceptance of manufacturer's certificates for items of machinery for propulsion (including propulsion gearing with single input/output arrangements) and for electrical power generation and for other auxiliary machinery for essential services where the $[\ \ \ \ \ \ \]$ **LMC** notation is to be assigned, is subject to the following conditions:
- (a) The vessel is an NS3 ship, an NS(SR) ship, or an NS(SSC) ship of less than 500 gross tonnage or is a ship of 500 gross tonnage or greater and is not required to comply with international conventions applicable to a ship with unrestricted service.
- (b) Propulsion power is provided by engines or gas turbines which have been type approved in accordance with LR requirements for marine application.
- (c) Electrical power is provided by generators driven by engines or gas turbines which have been type approved in accordance with LR requirements for marine application.
- (d) The design and manufacture standards for all machinery and associated systems are the applicable LR Rules.
- (e) The machinery and equipment are manufactured under a quality control system which is in accordance with a recognised National or International Standard for such systems that is acceptable to LR.
- (f) Propellers, propulsion shafting and multiple input/output gearboxes are not included within the scope of propulsion arrangements for acceptance of a manufacturer's certificate.
- 6.3.4 Acceptance of the manufacturer's certificate for propelling and essential auxiliary machinery, where the **MCH** notation is to be assigned, is subject to the following conditions:

Volume 1, Part 1, Chapter 2

Section 7

- (a) The ship is an NS3 ship, an NS(SR) ship, or an NS(SSC) ship of less than 500 gross tonnage or is a ship of 500 gross tonnage or greater and is not required to comply with International Conventions applicable to a ship with unrestricted service.
- (b) Propulsion power is provided by engines or gas turbines which have been type approved in accordance with LR requirements for marine application.
- (c) Electrical power is provided by generators driven by engines or gas turbines which have been type approved in accordance with LR requirements for marine application.
- (d) The power of any engine or gas turbine is less than 2,250 kW and the cylinder bore of any diesel engine is not greater than 300 mm.
- (e) The design standards for machinery and associated systems are the applicable LR Rules or other marine standards acceptable to LR.
- (f) The machinery and equipment is manufactured under a recognised quality control system that is acceptable to LR.

■ Section 7

Classification of ship with *IWS notation

7.1 General

- 7.1.1 Where the *IWS class notation for In-water Survey is requested, application should be made to the vessel's Naval Classification Liaison in writing with evidence of the Owner's agreement.
- 7.1.2 Where the *IWS notation is to be assigned, protection of the underwater portion of the hull is to be provided by means of a suitable high resistance paint applied in accordance with the manufacturer's requirements. Details of the high resistance paint are to be submitted for information in accordance with Ch 15 Corrosion Prevention of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.

7.2 Appraisal and records

- 7.2.1 To facilitate survey and compilation of classification records, the following plans and particulars are to be submitted to LR for appraisal and information.
- (a) Details of how the rudder pintle and bush clearances are to be measured and how the security of the pintles in their sockets is to be verified with the ship afloat.
- (b) Details showing how stern bush clearances are to be measured with the ship afloat.
- (c) Details of high resistance paint, for information only.
- 7.2.2 Where the ***IWS** notation is assigned, approved plans and particulars covering the items detailed in *Vol 1, Pt 1, Ch 2, 7.2 Appraisal and records 7.2.1* are to be placed on board.

■ Section 8

Classification of ship with operational role: Oil Supply Ship

8.1 General

8.1.1 Where the **Oil Supply Ship** description is to be assigned, the requirements in the *Rules and Regulations for the Classification of Ships* relating to oil tankers are to be complied with.

Volume 1, Part 1, Chapter 2

Section 9

Section 9

Classification of naval ships using alternative LR's Rules

9.1 General

9.1.1 Where it is proposed to class a naval ship with materials of construction and operating parameters not addressed within the scope of the Naval Ship Rules, then the appropriate elements of other LR Classification Rules may be used as agreed in the Tailoring Document, see Vol 1, Pt 1, Ch 2, 3.2 Tailoring – Departures from the Rules and Rule additions 3.2.1.

- 15 Classification of ships not built under LR survey
- 16 Classification of ships built under survey to LR Classification Rules and Regulations other than LR Naval Ship Rules and Regulations

Section 1

General

1.1 Frequency of surveys

- 1.1.1 The requirements of this Chapter are applicable to the Periodical Surveys set out in *Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys* Except as amended at the discretion of the Committee, the periods between such surveys are as follows:
- (a) Annual Surveys as required by Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.1.
- (b) Intermediate Surveys as required by Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.2.
- (c) Docking Surveys as required by Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.3.
- (d) In-water Surveys, see Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.5.
- (e) Special Surveys, see Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.6. For alternative arrangements, see also Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.10, Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.12 and Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.2
- (f) Complete Surveys of machinery of six-yearly intervals, see Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.14
- 1.1.2 When it has been agreed that the complete survey of the hull and machinery may be carried out on the Continuous Survey basis, all compartments of the hull and all items of machinery are to be opened for survey in rotation to ensure that the interval between consecutive examinations of each part will not exceed six years, see *Vol 1*, *Pt 1*, *Ch 2*, *4.5 Existing ships Periodical Surveys 4.5.11*.
- 1.1.3 For the frequency of surveys of machinery, boilers, steam pipes, screwshafts, tube shafts and propellers, see Sections *Vol 1, Pt 1, Ch 3, 7 Machinery survey General requirements*.

Volume 1, Part 1, Chapter 3

Section 1

- 1.1.4 For ships assigned the notation 'laid-up', in order to maintain the ship in class, a general examination of the hull and machinery is to be carried out in lieu of the Annual Survey and an Underwater Examination (UWE) is to be carried out in lieu of the Special Survey, see;
- Vol 1, Pt 1, Ch 3, 2.1 General 2.1.4,
- Vol 1, Pt 1, Ch 3, 5.1 General 5.1.4 and
- Vol 1, Pt 1, Ch 3, 7.1 Annual, Intermediate and Docking Survey 7.1.2.

1.2 Surveys for damage or alterations

- 1.2.1 At any time when a ship is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult of access are to be specially examined, e.g. if any part of the main or auxiliary machinery, including boilers or fittings, is removed for any reason, the hull structure in way is to be carefully examined, or when cement in the bottom, permanent ballast or sheathing on decks is removed, the structure in way is to be examined before replacement.
- 1.2.2 This examination should normally be carried out by a Surveyor, and the Owners should give as much notice as possible to LR so that arrangements can be made for attendance. In the absence of a Surveyor, due to the unforeseen nature of the removal, the Owner is to carry out a suitable examination and report the findings to LR as soon as practicable.

1.3 Unscheduled surveys

- 1.3.1 In the event that LR has cause to believe that its Rules and Regulations are not being complied with, LR reserves the right to perform unscheduled surveys.
- 1.3.2 In the event of significant damage or defect affecting any ship, LR reserves the right to perform unscheduled surveys of the hull of other similar ships classed by LR and deemed to be vulnerable.
- 1.3.3 A requirement to perform an unscheduled survey will be subject to the agreement of the Owner and operational needs.

1.4 Documentation

- 1.4.1 The Owner may wish to retain the originals of certificates issued by LR; however, Naval ships are required to carry the following documentation on board so that the attending Surveyor is able to carry out his duties (certified copies of certificates are acceptable):
- (a) Endorsable Certificate of Class.
- (b) C11(N) Record of watertight and weathertight closing arrangements.
- (c) Approved Stability information and damage control plan, and the following as applicable.
- (d) Lifting Appliances Certificate.
- (e) Pollution record of equipment.
- (f) Tonnage Certificate.
- (g) Safety Equipment Certificate and associated report.
- (h) Fire control plan.

1.5 Definitions

- 1.5.1 **Spaces** are all separate compartments within the hull and superstructure including plated masts. Integral tanks are considered to be separate spaces.
- 1.5.2 **Enclosed space** is any place of an enclosed nature where there is a risk of death or serious injury from hazardous substances or dangerous conditions. Examples include, but are not limited to: boilers, pressure vessels, cargo spaces (cargo holds, or cargo tanks), cargo space stairways, ballast tanks, double bottoms, double hull spaces, fuel oil tanks, lube oil tanks, sewage-tanks, pump-rooms, compressor rooms, cofferdams, void spaces, duct keels, inter-barrier spaces, engine crankcases, excavations and pits.
- 1.5.3 **Representative Spaces** are those which may be expected to reflect the condition of other spaces of similar type and service and with similar corrosion prevention systems. When selecting representative spaces account should be taken of the service and repair history on board and identifiable critical areas.
- 1.5.4 **Critical Areas** are locations which are known to be vulnerable to corrosion, buckling and/or fatigue cracking. These will be identified at the plan approval stage.

Volume 1, Part 1, Chapter 3

Section

- 1.5.5 **Suspect Areas** are locations within the hull structure vulnerable to increased likelihood of structural deterioration and may include:
- (a) For steel hulls, areas of corrosion and/or fatigue cracking.
- (b) For aluminium alloy hulls, areas of fatigue cracking and areas in the vicinity of bimetallic connections.
- (c) For composite hulls, areas subject to impact damage.
- (d) For high speed ships, areas of the bottom structure forward prone to slamming damage.
- 1.5.6 For ships designed to the *Rules and Regulations for the Classification of Ships*, **Substantial Corrosion** is defined as wastage of individual plates and stiffeners in excess of 75 per cent of allowable margins, but within acceptable limits.
- 1.5.7 For ships designed on a net scantling basis (using for example the *Rules and Regulations for the Classification of Naval Ships*)) **Substantial Corrosion** is defined as the wastage of individual plates and stiffeners in excess of the net scantlings, less an allowance for rolling, but within corrosion limits that are applicable for the structure concerned.
- 1.5.8 **Excessive Corrosion** is wastage in excess of acceptable limits that are applicable for the structure concerned.
- 1.5.9 **Protective Coatings** for steel ships should usually be hard coatings. Other coating systems (e.g. soft coating) may be considered acceptable as alternatives provided they are applied and properly maintained in compliance with the manufacturer's specification.
- 1.5.10 Coating conditions for steel ships are defined as follows:
 - GOOD condition with only minor spot rusting affecting not more than 20 per cent of areas under consideration.
 - **FAIR** condition with local breakdown at edges of stiffeners and weld connections and/or light rusting affecting 20 per cent or more of areas under consideration.
 - **POOR** condition with general breakdown of coating affecting 20 per cent or more of areas under consideration or hard scale affecting 10 per cent or more of the area under consideration.
- 1.5.11 A **Deep Tank** is a tank that extends upwards from the ship's bottom or inner bottom to or higher than the lowest deck.
- 1.5.12 A **Ballast Tank** is a tank which is solely used for salt-water ballast. A space which is used for purposes other than salt-water ballast but may also be used for salt-water ballast will be treated as a salt-water ballast tank when substantial corrosion has been found.

1.6 Preparation for survey and means of access

- 1.6.1 In order to enable the attending Surveyor(s) to carry out surveys, provisions for safe access and for survey are to be agreed between the Owner and LR.
- 1.6.2 Means are to be provided to enable the Surveyor to examine the structure in a safe and practical way. Where the provisions of safety and required access are determined by the Surveyor not to be adequate, then the survey of the space(s) involved is not to proceed.
- 1.6.3 Spaces are to be made safe for access and survey and are to be sufficiently cleaned, illuminated and ventilated.
- 1.6.4 In preparation for survey, thickness measurements and to allow for a thorough examination, cleaning is to include removal from surfaces of all loose accumulated corrosion scale. Spaces are to be sufficiently clean and free from water, scale, dirt, oil residues, etc. to reveal corrosion, deformation, fractures, damages or other structural deterioration, as well as the condition of the protective coating. However, those areas of structure whose renewal has already been decided by the Owner need only be cleaned and descaled to the extent necessary to determine the limits of renewed areas.
- 1.6.5 Where soft or semi-hard coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft or semi-hard coating is to be removed.
- 1.6.6 Prior to entering an enclosed space, it is to be verified by a competent person using a calibrated multi gas meter that the atmosphere in that space is free from hazardous gas and contains sufficient oxygen.
- 1.6.7 Emergency equipment and personnel are to be available in case of an emergency or rescue operation.
- 1.6.8 Information on procedures, equipment operating instructions and safety checklists is to be available.
- 1.6.9 During the survey, ventilation is to be ensured and periodic testing is to be carried out as necessary to verify that the atmosphere remains safe for access.

Volume 1, Part 1, Chapter 3

Section 1

- 1.6.10 For surveys, including close-up survey where applicable, in cargo spaces and ballast tanks, one or more of the following means of access, is to be provided:
- (a) Permanent staging and passages through structures.
- (b) Temporary staging and passages through structures.
- (c) Lifts and movable platforms.
- (d) Boats or rafts.
- (e) Other equivalent means.
- 1.6.11 Survey at sea or anchorage may be undertaken when the Surveyor is fully satisfied with the necessary assistance from the personnel on board and provided the following conditions and limitations are met:
- (a) Surveys of tanks by means of boats or rafts is at the sole discretion of the attending Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response in reasonable sea conditions. Appropriate life jackets are to be available for all participants. The boats or rafts are to have satisfactory residual buoyancy and stability even if one chamber is ruptured. A safety checklist is also to be provided. A multi-gas meter, breathing apparatus, lifeline and whistles are to be at hand during the survey. For oil supply ships an explosimeter is also to be provided.
- (b) A communication system is to be arranged between the survey party in the tank and the responsible officer on deck. This system must include the personnel in charge of ballast pump handling if boats or rafts are to be used.
- (c) Surveys of tanks by means of boats or rafts will only be permitted for the under deck areas of tanks when the coating of the under deck structure is in GOOD condition and there is no evidence of wastage. The only exception to this, at the discretion of the Surveyor, is where the depth of under deck web plating is 1,5 m or less. Alternatively, rafting may be used if a permanent means of access is provided in each bay to allow safe entry and exit. This means of access is to be direct from deck via a vertical ladder and a small platform fitted approximately 2 m below deck. Where these conditions are not met, then the under deck area will require to be staged for survey.

1.7 Repairs

- 1.7.1 Any damage in association with wastage over the allowable limit (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the ship's structural, watertight or weathertight integrity, is to be promptly and thoroughly repaired. Areas to be considered include, (where fitted):
- (a) Side shell frames, their end attachments or adjacent shell plating;
- (b) deck structure and deck plating;
- (c) bottom structure and bottom plating;
- (d) side structure and side plating;
- (e) inner bottom structure and inner bottom plating;
- (f) inner side structure and inner side plating;
- (g) watertight or oiltight bulkheads;
- (h) hatch covers or hatch coamings.

For locations where adequate repair facilities are not available, consideration may be given to allow the ship to proceed directly to a repair facility. This may require discharging the cargo and/or temporary repairs for the intended voyage.

1.7.2 Additionally, when a survey results in the identification of substantial corrosion or structural defects, either of which, in the opinion of the Surveyor, will impair the ship's fitness for continued service, remedial measures are to be implemented before the ship continues in service.

1.8 Thickness measurement at surveys

- 1.8.1 This Section is applicable to the thickness measurement of the hull structure where required by Vol 1, Pt 1, Ch 3, 2 Annual Surveys Hull, machinery and optional requirements, Vol 1, Pt 1, Ch 3, 3 Intermediate Surveys Hull and machinery requirements, Vol 1, Pt 1, Ch 3, 5 Special Survey Hull requirements, and Vol 1, Pt 1, Ch 3, 6 Special Survey Thickness measurement requirements for steel ships.
- 1.8.2 Further to the requirements of *Vol 1, Pt 1, Ch 3, 1.6 Preparation for survey and means of access 1.6.11* a survey planning meeting is to be held between the attending Surveyor(s), the Owner's representative and the thickness measurement firm's representative, so as to ensure the safe and efficient execution of the surveys and thickness measurements to be carried out on board.

Volume 1, Part 1, Chapter 3

Section 2

- 1.8.3 Thickness measurements are normally to be taken by means of ultrasonic test equipment and are to be carried out by a company approved in accordance with LR's *Approval for Thickness Measurement of Hull Structures*.
- 1.8.4 The Surveyor may require measuring the thickness of the material in any portion of the structure where signs of wastage are evident or wastage is normally found. Any parts of the structure which are found defective or excessively reduced in scantlings are to be made good by materials of the approved scantlings and quality. Attention is to be given to the structure in way of discontinuities.
- 1.8.5 Thickness measurements are to be witnessed by the Surveyor. This requires the Surveyor to be on board, while the measurements are carried out, to the extent necessary to control the process. This also applies to thickness measurements carried out while the ship is at sea.
- 1.8.6 The Surveyor may extend the scope of thickness measurement if deemed necessary.
- 1.8.7 Where it is required as part of the survey to carry out thickness measurements for the structural areas subject to Close-up Survey, then these measurements are to be carried out simultaneously with the Close-up Survey.
- 1.8.8 Thickness measurements are to be taken at the forward and aft areas of shell plates. A number of readings should be taken in a local area, and averaged to provide the recorded reading. The extent of local substantial corrosion of plates is to be established by intensive measurement in the affected areas. Where measured plates are to be renewed, the thicknesses of adjacent plates in the same strake are to be reported.
- 1.8.9 A report is to be prepared by the approved company carrying out the thickness measurements. The report is to give the location of measurement, the thickness measured as well as the corresponding original thickness. The report is to give the date when measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator.
- 1.8.10 The thickness measurement report is to be verified and signed by the Surveyor and countersigned by an authorising Surveyor.
- 1.8.11 In all cases the extent of the thickness measurements is to be sufficient to represent the actual average condition.

Section 2

Annual Surveys - Hull, machinery and optional requirements

2.1 General

- 2.1.1 Annual Surveys are to be held concurrently with any relevant maintenance period and in consultation with the Owner with regard to operational needs.
- 2.1.2 At Annual Surveys, the Surveyor is to examine the hull, so far as necessary and practicable, in order to be satisfied as to its general condition.
- 2.1.3 Particular attention is to be paid to critical areas.
- 2.1.4 For ships assigned the notation 'laid-up', in lieu of the normal Annual Survey requirements a general examination of the hull and machinery is to be carried out.

2.2 Hull

- 2.2.1 The Surveyor is to be satisfied regarding:
- (a) The efficient condition of doors, hatchways and lifts on upper and superstructure decks, weather deck plating and air pipes, exposed casings, deck-houses, superstructure bulkheads, side, bow and stern doors, windows, side scuttles and deadlights, guard rails, life-lines, ladders, pressure relief plates and other openings, together with all closing appliances and flame screens. In addition, the Surveyor is to externally examine all air pipe heads installed on exposed decks.
- (b) The efficient operating condition of mechanically operated hatch covers including stowage, fit, securing, locking, sealing and operational testing of hydraulic power components.
- (c) The efficient condition of scuppers and sanitary discharges (so far as is practicable); valves on discharge lines (so far as is practicable) and their controls; guard rails and bulwarks.

Volume 1, Part 1, Chapter 3

Section 2

- 2.2.2 Any hatch covers and coamings together with any doors, lifts or ramps which form part of the watertight integrity of the hull are to be examined to ensure that no alterations have been made to the approved arrangements.
- (a) Mechanically operated lifts, hatch covers or doors are to be tested for tightness to confirm the satisfactory condition of securing and sealing arrangements; drainage channels; operating mechanisms. Associated drainage channels and operating mechanisms, such as tracks and wheels, are also to be examined to confirm they are in satisfactory condition.
- (b) Hatch covers of the portable type are to be examined to confirm that the covers and closing appliances are in a satisfactory condition.

This examination will include hatches and doors in superstructures.

- 2.2.3 The anchoring and mooring equipment is to be examined so far as is practicable.
- 2.2.4 The watertight doors/closures in watertight bulkheads and any indicators or alarms are to be examined and operationally tested locally and, where applicable remotely. Other watertight bulkhead penetrations are to be examined so far as is practicable.
- 2.2.5 The Surveyor is to be satisfied regarding the draught marks on the ship's side.
- 2.2.6 The Surveyor is to be satisfied that no alterations have been made to the ship which affect stability and strength.
- 2.2.7 The Surveyor is to be satisfied that any alterations to approved scantlings and arrangements to the structure of magazine spaces have been approved by LR, see Vol 1, Pt 1, Ch 2, 4.4 Damages, repairs and alterations 4.4.8.
- 2.2.8 The surveyor is to check the C11(N) on board the vessel and verify with the actual arrangement on board.
- 2.2.9 For steel ships, the requirements of Vol 1, Pt 1, Ch 3, 3.2 Hull 3.2.2 and Vol 1, Pt 1, Ch 3, 5.4 Examination and testing Additional items for steel ships 5.4.2 regarding the survey of water ballast spaces, compensated fuel tanks, integral sanitary tanks and bilges are also to be complied with as applicable.
- 2.2.10 The Surveyor is to carry out an examination and thickness measurement of structure identified at the previous Special Survey or Intermediate Survey as having substantial corrosion.
- 2.2.1.1 The first Annual Survey should include a review of the year's service, taking into account feedback from the Owner. Special attention needs to be given to areas of the structure where defects have become apparent. It is important that this information is fed back to the Design Authority and building yards for follow-on ships.

2.3 Machinery

- 2.3.1 The Surveyor is to generally examine the machinery and boiler spaces with particular attention being given to the propulsion system, auxiliary machinery and to the existence of any fire and explosion hazards. Emergency escape routes are to be checked to ensure that they are adequately identified and free of obstruction.
- 2.3.2 The means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the alternative steering position, if fitted, are to be tested.
- 2.3.3 The Surveyor is to examine and test in operation all main and auxiliary steering arrangements including their associated equipment and control systems.
- 2.3.4 The bilge pumping and dewatering systems and bilge wells, including operation of extended spindles and level alarms, where fitted, are to be examined so far as is practicable. Satisfactory operation of the bilge pumps and dewatering eductors is to be proven, including access to all bilge areas.
- 2.3.5 Piping systems containing fuel oil, lubricating oil or other flammable liquids are to be generally examined and operated as far as practicable, with particular attention being paid to tightness, fire precaution arrangements, flexible hoses and sounding devices.
- 2.3.6 The Surveyor is to be satisfied regarding the condition of non-metallic joints in piping systems which penetrate the hull, where both the penetration and the non-metallic joint are below the deepest waterline.
- 2.3.7 The Surveyor is to be satisfied regarding the following items associated with machinery installations.
- (a) Locking arrangements for locked valves and inspection covers.
- (b) Integrity of guards for rotating machinery.
- (c) Lighting arrangements, particularly at control and instrumentation panels.
- (d) Operation of automatic start-up of pumps and systems for essential systems where they are required by the Rules.

(e) Condition of machinery securing and mounting arrangements.

Volume 1, Part 1, Chapter 3

Section 2

- (f) The condition of bulkhead glands.
- 2.3.8 The boilers, other pressure vessels and their accessories and associated fittings including safety devices, foundations, controls, relieving gear, high pressure and waste steam piping, insulation and gauges, are to be generally examined. Surveyors should confirm that Periodical Surveys of pressure vessels have been carried out as required by the Rules and that the safety devices have been tested.
- 2.3.9 Records of boiler treatment and analyses are to be retained on board and audited annually by the LR Surveyor. The water treatment and results of analyses are to be in accordance with the manufacturer's recommendations.
- 2.3.10 The main propulsion, essential auxiliary and emergency generators including safety arrangements, controls and foundations are to be generally examined. Surveyors are to confirm the Periodical Surveys of engines have been carried out as required by the Rules and that safety devices have been tested.
- 2.3.11 The electrical equipment and cabling forming the main and emergency electrical installations are to be generally examined under operating conditions as far as is practicable. Particular checks are to be made on the integrity of electrical enclosure and cleanliness of switchboards and bus bars. The satisfactory operation of the main and emergency sources of power and electrical services essential for safety in an emergency is to be verified; where the sources of power are automatically controlled they should be tested in the automatic mode. Bonding straps for the control of static electricity and earthing arrangements are to be examined where fitted.
- 2.3.12 The electrical installation including gas detection systems, in areas deemed dangerous, such as magazine spaces and spaces where low flash point oils are stored and handled and compartments adjacent to such spaces, is to be examined in order to verify that it is of the correct type, is in good condition and has been properly maintained.
- 2.3.13 Gas detection systems fitted to spaces potentially containing flammable, poisonous, toxic/corrosive, asphyxiant or irritant gases, are to be examined and tested, including their associated alarms and emergency shutdowns. It is to be confirmed that suitable indication of the nature of the potential hazards is provided at the entrance(s) to the spaces and, where applicable, on equipment. Portable gas detection equipment is to be examined and tested including sampling points. For both fixed systems and portable equipment, means of calibration are to be examined and calibration records are to be reviewed. Where arrangements other than a fixed gas detection system are in place for such spaces, these are to be examined.
- 2.3.14 Where lithium battery system installations are used as a power source for Mobility, Ship Type, Ancillary or emergency systems, testing is to be conducted in accordance with the trials requirements in *Table 12.1.3 Test/Trials requirements on lithium battery systems*. The following aspects of the battery space are to be inspected, as applicable to the installation:
- (a) structural fire protection;
- (b) fixed fire detection;
- (c) HVAC, ventilation, cooling, smoke extraction, fire damper systems;
- (d) fixed and portable extinguishing; and
- (e) escape and EEBD (emergency escape breathing device).
- 2.3.15 For Mobility, ship type and emergency machinery control engineering systems, a general examination of the equipment and arrangements is to be carried out. Records of modifications are to be made available for review by the attending Surveyor. Satisfactory operation of the safety devices and control systems is to be verified. For ships having **UMS** or **CCS** notation, a general examination of the control engineering equipment required for these notations is also to be carried out.
- 2.3.16 For Mobility, ship type and emergency machinery control engineering systems implemented using programmable electronic systems and software, the impact of changes upon system functionality and the context of use, when carried out are to be assessed by the System Design Authority as defined in *Vol 2, Pt 1, Ch 3, 21.2 Definitions 21.2.3*. The party undertaking through-life management of the software is to document the configuration management activities undertaken in the registries required by *Vol 2, Pt 9, Ch 8, 5.4 Programmable electronic systems Additional requirements for the production of software 5.4.2*. The registries are to be made available to the Surveyor for audit purposes.
- 2.3.17 Where remote access features or facilities for enabling temporary connections with external devices are included for the programmable electronic system(s), the Owner is to periodically review the provisions made within the associated hardware and software to ensure that new vulnerabilities and dependencies impacting safety have not occurred or have been adequately addressed to mitigate the risk related to their possible exploitation. The Surveyor is to confirm that this periodic review has been carried out by review of records, including review of test records, as applicable, and the registry of programmable electronic systems, logical (virtual) servers, desktops and network communication devices.
- 2.3.18 For ships fitted with an electronically controlled engine for main propulsion, essential auxiliary or emergency power purposes, the following is to be carried out to the satisfaction of the Surveyor:

Volume 1, Part 1, Chapter 3

Section 2

- (a) Verification of evidence of satisfactory operation of the engine and, where possible, this is to include a running test under load.
- (b) Verification of satisfactory operation of the safety devices and control, alarm and monitoring systems.
- (c) Verification that any changes to the software or control, alarm, monitoring and safety systems that affect the operation of the engine have been assessed by LR and are under configuration management control.
- 2.3.19 Dead ship starting arrangements for bringing machinery into operation without external aid are to be tested to the Surveyor's satisfaction.
- 2.3.20 The Surveyor is to be satisfied that any alterations to approved equipment, piping, cabling and electrical systems in magazine spaces have been approved by LR, see Vol 1, Pt 1, Ch 2, 4.4 Damages, repairs and alterations 4.4.8.
- 2.3.21 For ships fitted with machinery shock arrangements in accordance with *Vol 2, Pt 1, Ch 3, 4.11 Machinery shock arrangements*, the following is to be carried out to the satisfaction of the Surveyor:
- (a) A general examination of shock mounts including their condition, date of manufacture and deflection under static load. Particular attention is to be given to mounts which have been installed since the previous survey and to those on which the mounted machinery has been replaced.
- (b) Verification that clearances for shock mount deflection and flexible connections around shock capable equipment have been maintained.

2.4 Other notations

- 2.4.1 Where the following optional Class Notations have been assigned, the requirements below are to be included with the Annual Survey.
- 2.4.2 **Fire Protection (FIRE).** The arrangements for fire protection, fire detection and extinction are to be examined and are to include the following items:
- (a) Verification, so far as is reasonably practicable, that no significant changes have been made to the arrangements for structural fire protection.
- (b) Verification of the operation of manual and/or automatic doors where fitted.
- (c) Verification that fire control plans are properly posted.
- (d) Examination, so far as is possible, and testing as feasible, of the fire and/or smoke detection and alarm system(s).
- (e) Examination of the water fire-fighting system, and confirmation that each pump connected to the water fire-fighting system, including any emergency fire pump can be operated separately so that the required jets of water can be produced simultaneously from different hydrants.
- (f) Verification that fire-hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations.
- (g) Examination of fixed fire-fighting systems, controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing, including date of last systems tests, including operational alarm tests.
- (h) Verification that all portable and semi-portable fire-extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random checks for evidence of discharged containers.
- (i) Verification, so far as is reasonably practicable, that the remote control for stopping fans in accommodation spaces and the means of cutting off power to the galley are in good working order.
- (j) Examination of the closing arrangements of ventilators, hatches and doorways where applicable.
- (k) Verification that the fireman's outfits are complete and in good condition.
- 2.4.3 **Escape and Emergency Access (ESC).** The arrangements for escape of personnel and emergency access are to be examined and are to include the following:
- (a) Verification, so far as is reasonably practical, that no significant changes have been made to the arrangements for escape and emergency access.
- (b) Verification that all normal and emergency escape and emergency access routes are free of obstruction.
- 2.4.4 **Life Saving and Evacuation Arrangements (LSAE).** The arrangements for life saving and evacuation are to be examined and are to include the following:
- (a) Verification, so far as is reasonably practicable, that no significant changes have been made to the arrangements for life saving and evacuation.

Volume 1, Part 1, Chapter 3

Section 2

- (b) Verification of Life-jackets, Life-buoys, Immersion Suits, Thermal Protection Aids, etc. and their attachments for effectiveness and condition.
- (c) That rescue boats and survival craft have been serviced by an approved servicing company, and ascertain that they are identified and certificated with a valid date.
- (d) That the rescue boat and launching/recovery arrangements are in full working order.
- (e) The the survival craft launch arrangements, are in a good working order.
- 2.4.5 **Safety of Navigation and Communication (SNC).** The arrangements for navigation and communication equipment are to be examined and are to include the following:
- (a) Verification, so far as is reasonably practicable that no significant changes have been made to the navigation and communication equipment.
- (b) That the ship is in possession of up-to-date Nautical Publications, Emergency Instructions, International Code of Signals, Operating Instructions for Life-saving Appliances and their maintenance.
- (c) Shipboard navigational equipment.
- (d) Signalling equipment (lights and sounds).
- (e) Navigation lights.
- (f) Rockets and signals (pyrotechnics).
- (g) Black shapes.
- 2.4.6 **Pollution Prevention (POL)** The arrangements for pollution prevention are to be examined and are to include the following:
- (a) **Oil.** Verification of piping system arrangements between tanks, bilge and ballast systems, which are used to transfer oil/oily water and ballast water to ensure that no changes have been made to the systems since they were installed. Checking oil filters, oily water separators and sludge/oily water residue containment.
- (b) **Sewage.** Verification of the sewage treatment arrangements, containment and the piping systems.
- (c) **Garbage.** Verification of the garbage disposal arrangements and the installation of the equipment to ensure that no unauthorised changes have been made.
- (d) **Air.** Verification that the engine exhaust emissions are still within the NO_x Technical Code. Verification of the incinerator installation. Re-testing the fuel oils to ensure that the sulphur content is still below 4,5 per cent.
- 2.4.7 **Lloyd's Manoeuvring Assessment (LMA or LNMA).** The arrangements for the provision of manoeuvring information are to be examined and are to include confirmation that the following documents are on board and that any changes that can affect the manoeuvring performance of the vessel have been identified and manoeuvring information updated:
- (a) Bridge poster/card;
- (b) Manoeuvring Booklet/Operator Guidance;
- (c) Manoeuvring Information Card.
- 2.4.8 **Crew and Embarked Personnel Accommodation Comfort (CEPAC1 or CEPAC2).** The arrangements for managing observations/complaints for excessive noise and vibration are to be reviewed annually and any areas of concern identified for further monitoring. At each Renewal Survey measurements of noise and vibration are to be repeated at a minimum of 10 per cent of the original measurement locations and continued compliance confirmed. See Vol 3, Pt 2, Ch 7, 7 Survey requirements.
- 2.4.9 **Boat Operations at Sea (BOATS).** The onboard arrangements for the launch, recovery and carriage of small boats, and for interfacing of the vessel with waterborne craft alongside or persons in the water are to be examined and are to include the following:
- (a) Verification that no changes have been made to the provision of boats or permanently embarked watercraft designated for use onboard.
- (b) Survey of the boat stations, embarkation stations, recovery stations and associated shipboard arrangements to confirm satisfactory working condition of the fittings, control arrangements, communications, lighting and equipment.
- (c) Confirmation that the survey and test status of the launch and recovery appliances is up to date and verification that loose gear, lifting and securing equipment is appropriately certified and in effective condition.
- (d) Verification of the protective and safety equipment for effectiveness and condition and a review of the log of inspections, maintenance and testing.
- (e) Verification of the validity of certification for boats or watercraft permanently fitted onboard.

Volume 1, Part 1, Chapter 3

Section 3

- 2.4.10 The first Annual Survey shall include confirmation by the Owner that operational trials for the launch and recovery of boats and watercraft in the defined operational conditions have now been completed and that any findings have been fed back into the Operator Guidance and to the Design Authority and building yards for future vessels.
- 2.4.11 The first Annual Survey shall include confirmation by the Owner that the required Operator Guidance has been found suitable for the defined operational use.

Section 3

Intermediate Surveys - Hull and machinery requirements

3.1 General

3.1.1 Intermediate Surveys are to be held concurrently with any relevant maintenance period wherever practicable, see Vol 1, Pt 1, Ch 3, 2.1 General 2.1.1

3.2 Hull

- 3.2.1 The requirements of *Vol 1, Pt 1, Ch 3, 2 Annual Surveys Hull, machinery and optional requirements* are to be complied with so far as applicable.
- 3.2.2 For steel ships a general examination of salt water ballast tanks, compensated fuel tanks, integral sanitary tanks and bilges is to be carried out as required below. If such inspections reveal no visible structural defects then the examination may be limited to a verification that the protective coating remains in GOOD condition as defined in *Vol 1, Pt 1, Ch 3, 1.5 Definitions 1.5.9*. When considered necessary by the Surveyor thickness measurement of the structure is to be carried out. Where the protective coating is found to be other than in GOOD condition, and it has not been repaired, maintenance of Class will be subject to the spaces in question being internally examined and gauged as necessary at Annual Surveys.
- (a) For all ships over six years of age and up to 12 years of age, representative salt-water ballast tanks, compensated fuel tanks, integral sanitary tanks and bilges are to be generally examined. Where the protective coating is found to be other than in GOOD condition, as defined in *Vol 1*, *Pt 1*, *Ch 3*, *1.5 Definitions 1.5.9*, or other defects are found, the examination is to be extended to other spaces of the same type.
- (b) For steel ships over twelve years of age all salt-water ballast tanks, compensated fuel tanks, integral sanitary tanks and bilges are to be generally examined.
- 3.2.3 For all ships over twelve years of age the anchors are to be partially lowered and raised using the capstan/ windlass.
- 3.2.4 Representative internal spaces including fore and aft peak spaces, plated masts, machinery spaces, bilges, etc. are to be generally examined. These spaces should include all suspect areas, see Vol 1, Pt 1, Ch 3, 1.5 Definitions 1.5.5
- 3.2.5 The Surveyor is to carry out a Close-up Survey and thickness measurement of the structure identified at the previous Special Survey as having substantial corrosion.

3.3 Machinery

- 3.3.1 Machinery and boiler spaces including tank tops, bilges and cofferdams, sea suctions and overboard discharges are to be generally examined.
- 3.3.2 Areas deemed dangerous, such as magazine spaces and spaces where low flash point oils are stored and handled and compartments adjacent to such spaces are to be examined for the following type:
- (a) Defective and non-certified safe electrical equipment.
- (b) Improperly installed, defective and dead-end wiring. An electrical insulation resistance test of the circuits terminating in, or passing through dangerous spaces is to be carried out.
- 3.3.3 Electrical generators are to be examined under working conditions to verify compliance with *Vol 2, Pt 10, Ch 1, 3 Performance requirements*.

Volume 1, Part 1, Chapter 3

Section 4

Section 4

Docking Surveys and In-water Surveys

4.1 General

4.1.1 At Docking Surveys or In-water Surveys the Surveyor is to examine the ship and machinery so far as necessary and practicable, in order to be satisfied as to the general condition.

4.2 Docking Surveys

- 4.2.1 Where a ship is in dry dock or on a slipway it is to be placed on blocks of sufficient height, and proper staging is to be erected as may be necessary for the examination of the outside of the hull, rudder(s) and underwater fittings. The outside surface of the hull is to be cleaned as may be required by the Surveyor.
- 4.2.2 The external shell plating is to be examined for excessive corrosion, structural deterioration from causes such as high stresses, chafing or contact with the ground, to areas of structural discontinuity and for undue unfairness or buckling. Special attention is to be given to the connection between the bilge strakes and the bilge keels.
- 4.2.3 The following parts of the external hull structure are to be specially examined:
- (a) For steel hulls attention is to be given to parts of the structure particularly liable to excessive corrosion and to any undue unfairness of the plating of the bottom. The coating system is to be examined and made good as necessary.
- (b) For aluminium alloy hulls attention is to be given to areas adjacent to any bimetallic connections at skin fittings, etc.
- (c) For composite hulls the gelcoat or other protective finish is to be examined for surface cracking, blistering, abrasion or other damage which may impair the efficiency of the protection to the underlying laminate.
- 4.2.4 Where fitted, the satisfactory condition, attachment and operation of the cathodic protection (active or passive) is to be confirmed.
- 4.2.5 The sea connections, scuppers and sanitary discharges, their attachments to the hull and the gratings at the sea inlets are to be examined. Where applicable, pressure testing of the rudder may be required if deemed necessary by the Surveyor.
- 4.2.6 The clearances of the rudder bearings and pintles are to be measured. Where considered necessary by the Surveyor, rudders and stabilisers are to be lifted for examination of the stock. The securing of rudder and stabiliser couplings is to be confirmed.
- 4.2.7 Special attention is to be given to the hull in way of underwater fittings such as thrusters, shaft brackets, stabilisers, rudders, rope guards, eddy plates, GRP domes, bilge keels, echo sounders, and their attachments.
- 4.2.8 Where applicable, attention is to be given to the connection and/or intersection of the cross-deck structure to the hulls of multi-hull ships.
- 4.2.9 When chain cables are ranged, the anchors and cables are to be examined by the Surveyor, see also Vol 1, Pt 1, Ch 3, 5.3 Examination and testing General 5.3.6 and Table 3.5.1 Survey preparation
- 4.2.10 For Surface Effect Ships any flexible skirts together with their attachment are to be examined.
- 4.2.11 For hydrofoil or foil assisted craft the attachment of foils is to be examined.
- 4.2.12 The Surveyor is to verify all draught markings as applicable at the time of dry-docking.
- 4.2.13 When Machinery Naval Class has been adopted, the following items are additionally applicable. The work is to be carried out in accordance with maintenance manuals and the manufacturer's recommendations for servicing and renewals observed.
- (a) The propeller and fastenings are to be examined. (Where a controllable pitch propeller is fitted, examination is to include blade fastenings and hub). The sternbush is to be examined as far as practicable.
- (b) Where propeller shafts are wrapped for corrosion protection, the condition of the wrapping is to be confirmed.
- (c) The clearance in the sternbush or the efficiency of the oil glands is to be ascertained. The clearance of any shaft bracket bearing is to be ascertained.
- (d) The inboard shaft seals or glands are to be examined. Where flexible sternglands are fitted, the satisfactory condition of the rubber hose and securing clips is to be confirmed. Where inflatable shaft seals are fitted, their condition and operation are to be verified.

Volume 1, Part 1, Chapter 3

Section 5

- (e) Visible parts of side thrusters are to be examined. Other propulsion systems which also have manoeuvring characteristics (such as directional propellers, vertical axis propellers, water jet units) are to be examined externally with focus on the condition of gear housing, propeller blades, bolt locking and other fastening arrangements. Sealing arrangements of propeller blades, propeller shaft and steering column are to be verified.
- (f) Where water jet units are fitted, the impeller, hull ducting, grating, nozzle steering and reversing arrangements are to be examined as far as practicable.
- (g) Where podded propulsion units are fitted, the bearings and sealing arrangements, steering ring and thrust bearings in the hull are to be examined as far as practicable.

4.3 In-water Surveys

- 4.3.1 The Committee will accept an In-water Survey between Special Surveys, as a Docking Survey, where suitable protection is applied to the underwater portion of the hull. If requested, the *IWS notation may be assigned on satisfactory completion of the survey, provided that the applicable requirements of the Rules are complied with.
- 4.3.2 The In-water Survey is to provide the information normally obtained from the Docking Survey, see Vol 1, Pt 1, Ch 3, 4.2 Docking Surveys 4.2.2.
- 4.3.3 The underwater part of the hull should be marked with search lines for reference purposes.
- 4.3.4 The In-water Survey is to be carried out at an agreed geographical location under the surveillance of a Surveyor to LR, with the ship in sheltered waters and with weak tidal streams and currents. The in-water visibility is to be good and the hull below the waterline is to be clean. The Surveyor is to be satisfied that the method of pictorial presentation is satisfactory by use of CCTV. There is to be good two-way communication between the Surveyor and the diver.
- 4.3.5 Prior to commencing the In-water Survey, the equipment and procedures for both observing and reporting the survey are to be agreed between the Owners, the Surveyor and the diving firm.
- 4.3.6 The In-water Survey is to be carried out by a qualified diver employed by a firm approved by LR. In addition, for certain aspects of the In-water Survey, consideration may be given to the use of a remotely operated vehicle (ROV) operated by the LR approved firm.
- 4.3.7 If the In-water Survey reveals damage or deterioration that requires early attention, the Surveyor may, in consultation with the Owner, require that the ship be dry-docked in order that a fuller survey can be undertaken and the necessary work carried out.
- 4.3.8 Where a vessel has the ***IWS** notation, the condition of the high resistant paint is to be confirmed at each dry docking in order that the ***IWS** notation can be maintained.

■ Section 5

Special Survey - Hull requirements

5.1 General

- 5.1.1 The survey is to be of sufficient extent to ensure that the hull and related equipment is in satisfactory condition and is fit for its intended purpose, subject to proper maintenance and operation and to Periodical Surveys being carried out as required by the Regulations.
- 5.1.2 The requirements of Vol 1, Pt 1, Ch 3, 2 Annual Surveys Hull, machinery and optional requirements are to be complied with so far as applicable.
- 5.1.3 A Docking Survey in accordance with the requirements of *Vol 1, Pt 1, Ch 3, 4.2 Docking Surveys* is to be carried out as part of the Special Survey.
- 5.1.4 For ships assigned the notation 'laid-up', an Underwater Examination (UWE) and general examination of hull and machinery are to be carried out in lieu of the normal Special Survey requirements.

Volume 1, Part 1, Chapter 3

Section 5

5.2 Preparation

- 5.2.1 The ship is to be prepared for survey in accordance with the requirements of *Table 3.5.1 Survey preparation* The preparation should be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, erosion, deformation, fractures, damages and other structural deterioration.
- 5.2.2 Where, in accordance with *Table 3.5.1 Survey preparation*, the ship is opened out by removal of linings, etc. and defects are found, further opening out may be required in order that the Surveyor can confirm the full extent of the defects.

5.3 Examination and testing – General

- 5.3.1 All spaces within the hull and superstructure including integral tanks are to be examined, see also Vol 1, Pt 1, Ch 3, 5.4 Examination and testing Additional items for steel ships 5.4.1 for tank examinations on steel ships. Special attention is to be paid to any suspect areas, see Vol 1, Pt 1, Ch 3, 1.5 Definitions 1.5.5 and Table 3.5.1 Survey preparation
- 5.3.2 Double bottom, deep, ballast, peak and other tanks assigned also for the carriage of salt-water ballast, are to be tested with a head of liquid to the top of air pipes or to the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lubricating oil and fresh water tanks are to be tested with a head of liquid to the maximum filling level of the tank. Tank testing of fuel oil, lubricating oil and fresh water tanks may be specially considered based upon a satisfactory external examination of the tank boundaries, and a confirmation from the Commanding Officer stating that the pressure testing has been carried out according to the requirements with satisfactory results.
- 5.3.3 Where repairs are effected to the hull or bulkheads, any integral tanks in way are to be tested to the Surveyor's satisfaction on completion of these repairs.
- 5.3.4 All decks, masts and superstructures are to be examined.
- 5.3.5 Attention is to be given to the corners of openings and other discontinuities in the hull structure.

Table 3.5.1 Survey preparation

Special Survey I (Ship 6 years old)	Special Survey II (Ship 12 years old)	Special Survey III (Ship 18 years old) and subsequent special surveys
(1) All spaces in the ship are to be cleared and cleaned as necessary, including all bilge spaces in order that the Surveyor may be satisfied as to the condition of the structure, see Vol 1, Pt 1, Ch 3, 1.5 Definitions 1.5.4 and Vol 1, Pt 1, Ch 3, 1.5 Definitions 1.5.5. A record is to be made of where equipment was removed during the survey. This record is to be retained for reference during subsequent surveys.	In addition to the requirements for Special Survey I, the following are to be complied with:	In addition to the requirements for Special Survey II the following are to be complied with:
(2) Machinery compartments are to be cleared and cleaned as necessary, and the bilges cleaned and prepared for examination. Floor plates in engine spaces are to be lifted as may be necessary for the examination of the structure below. Where necessary, pipework may be required to be removed for examination of the structure.	(1) The chain locker is to be cleared and cleaned internally for examination of the structure and examination of the cable securing arrangements. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	(1) Samples of lagging and lining are to be removed in order that the Surveyor may be satisfied as to the condition of the structure.

Volume 1, Part 1, Chapter 3

Section 5

and in refrigerated stores, a sufficient amount	examination of the rudder stock and trunk at the discretion of the Surveyor.	(2) All wood decks and sheathing, or other covering, on steel decks are to be removed in order to ascertain the condition of the structure.
(4)Tanks are to be cleaned as necessary in order to satisfy the requirements of Table 3.5.2 Tank internal examination requirements for steel ships.		

- **Note** 1. These requirements can be amended to reflect proven information concerning the performance of structure through an Owner's maintenance system such as 'Reliability Centred Maintenance'.
- **Note** 2. Where permanent ballast is fitted, samples of ballast are to be removed for examination of the structure underneath. The condition of the exposed structure is to be to the satisfaction of the Surveyor.
- 5.3.6 The anchors are to be examined, the chain cables are to be ranged and they are to be examined together with the chain locker (see *Table 3.5.1 Survey preparation*) and clench plate. If any length of chain cable is found to be reduced in mean diameter at its most worn part by 12 per cent or more from its nominal diameter, it is to be renewed. Cables are to be changed 'end-forend'. Anchor handling arrangements are to be examined.
- 5.3.7 Representative fastenings on the weatherdecks, e.g. for guardrails and spurnwaters, are to be tested to ascertain their soundness and may require to be drawn for examination at the discretion of the Surveyor.
- 5.3.8 When applicable, the Surveyor is to be satisfied as to the efficient condition of the means of escape from crew spaces, and spaces in which crew are normally employed.
- 5.3.9 The hand pumps, suctions, watertight doors, air and sounding pipes are to be examined. In addition, the Surveyor is to examine internally air pipe heads in accordance with the requirements of *Table 3.5.3 Air pipe head internal examination requirements*.
- 5.3.10 Ship side valves (i.e. sea connections, scuppers and sanitary discharges) are to be tested once reassembled.

5.4 Examination and testing – Additional items for steel ships

- 5.4.1 The requirements for tank internal examination are given in *Table 3.5.2 Tank internal examination requirements for steel ships*.
- 5.4.2 In salt-water ballast spaces, integral sanitary tanks and bilges where the protective coating is found to be other than in GOOD condition as defined in *Vol 1, Pt 1, Ch 3, 1.5 Definitions 1.5.10* and it has not been repaired, maintenance of class will be subject to the spaces in question being internally examined and gauged.
- 5.4.3 The protection of steelwork, other than as referred to in Vol 1, Pt 1, Ch 3, 5.4 Examination and testing Additional items for steel ships 5.4.2 should be examined and made good where necessary on satisfactory completion of the survey. In areas where the inner surface of the bottom plating is covered with cement, asphalt or other composition, the removal of this covering may be dispensed with, provided that it is found sound and adhering satisfactorily to the steel.

Table 3.5.2 Tank internal examination requirements for steel ships

Tank	Special Survey I (Ship 6 years old)	Special Survey II (Ship 12 years old)	Special Survey III (Ship 18 years old)	Special Survey IV (Ship 24 years old)	All Subsequent Special Surveys
Peaks	All tanks	All tanks	All tanks	All tanks	All tanks
Salt-water ballast	All tanks	All tanks	All tanks	All tanks	All tanks
Lubricating oil	None	None	None	See Notes 1 and 2 One tank	One tank

Section 5

Fresh water	None	One tank	All tanks	See Notes 1 and 2 All tanks	All tanks
Fuel oil — in way of					
(i) Machinery space	None	None	One tank	One tank	One tank
(ii) Supply (Replenishment) Oil Area	None	One tank	Two tanks — see Note 3	50% of tanks — see Notes 3 & 4	50% of tanks — see Notes 3 & 4
Fuel oil (water compensated)	All tanks	All tanks	All tanks	All tanks	All tanks
Sanitary	All tanks	All tanks	All tanks	All tanks	All tanks

- Note 1. The above requirements apply to integral tanks only.
- Note 2. Where a selected number of tanks is examined, then different tanks are to be examined at each Special Survey on a rotational basis.
- Note 3. To include one deep tank, if any.
- Note 4. Where 50% of tanks is to be examined, a minimum of two tanks are required to be examined depending upon the overall number of tanks
- **Note** 5. When examining tanks internally the Surveyor is to verify that striking plates or other additional reinforcement are fitted under sounding pipes. In the case of tanks only with remote gauging facilities, the satisfactory operation of the gauges is to be confirmed.
- Note 6. Particular care must be taken in examining structure under suctions.
- Note 7. Where testing is required, a functional test may be acceptable at the Surveyor's discretion.

Table 3.5.3 Air pipe head internal examination requirements

Special Survey I (Ships 6 years old)	Special Survey II (Ships 12 years old)	Special Survey III (Ships 18 years old) and subsequent
(1) Two air pipe heads (one port and one starboard) on exposed decks in the forward 0,25L. See Notes 1 to 5	(1) All air pipe heads on exposed decks in the forward 0,25 <i>L</i> . See Notes 1 to 5	All air pipe heads on exposed decks in the forward 0,25 <i>L</i> . See Notes 1 to 6
(2) Two air pipe heads (one port and one starboard) on the exposed decks, serving spaces aft of 0,25 <i>L</i> . See Notes 1 to 5	(2) At least 20% of air pipe heads on exposed decks, serving spaces aft of 0,25 <i>L</i> . See Notes 1 to 5	

- Note 1. Air pipe heads serving ballast tanks are to be selected where available.
- Note 2. The Surveyor is to select which air pipe heads are to be examined.
- **Note** 3. Where considered necessary by the Surveyor as a result of the examinations, the extent of examinations may be extended to include other air pipe heads on exposed decks.
- **Note** 4. Where the inner parts of the air pipe head cannot be properly examined due to its design, it is to be removed in order to allow an internal examination.
- Note 5. Particular attention is to be given to the condition of the zinc coating in heads constructed from galvanised steel.
- **Note** 6. Exemption may be considered for air pipe heads where there is documented evidence of their replacement within the previous six years.

5.4.4 Wood deck sheathing is to be examined and the caulking is to be tested and recaulked as necessary. If decay or rot is found, or the wood is excessively worn, the wood is to be renewed. Attention is to be given to the condition of the plating under wood deck sheathing or other deck covering. If it is found that such coverings are broken, or are not adhering closely to the

Volume 1, Part 1, Chapter 3

Section 6

plating, sections are to be removed as necessary to ascertain the condition of the plating, see also Vol 1, Pt 1, Ch 3, 1.2 Surveys for damage or alterations 1.2.1.

5.4.5 The structure in way of bimetallic connections, e.g. to aluminium alloy deck-houses, is to be examined and the efficiency of the insulation arrangements confirmed.

5.5 Examination and testing – Additional items for composite ships

- 5.5.1 The bonded attachments of frames, floors, bulkheads, structural joinery, engine bearers, sterntubes, rudder tubes, and integral tank boundaries are to be examined.
- 5.5.2 The hull to deck joint, together with any joints between the deck and deck-houses or superstructures, is to be examined.
- 5.5.3 The structure in way of the bolted attachment of fittings including guardrail stanchions, capstan/windlass, shaft brackets, fendering, mooring bitts, etc is to be examined.

■ Section 6

Special Survey – Thickness measurement requirements for steel ships

6.1 General

- 6.1.1 Thickness measurement requirements for steel ships are stated in Tables *Table 3.6.1 Thickness measurement of steel ships* and *Table 3.6.2 Thickness measurement Additional requirements in way of structure identified with substantial corrosion.* See also Vol 1, Pt 1, Ch 3, 1.8 Thickness measurement at surveys.
- 6.1.2 Thickness measurements may be carried out in association with the fifth Annual Survey.
- 6.1.3 In areas where substantial corrosion, as defined in *Vol 1, Pt 1, Ch 3, 1.5 Definitions*, has been noted, then additional measurements are to be carried out, as applicable, in accordance with *Table 3.6.2 Thickness measurement Additional requirements in way of structure identified with substantial corrosion* to determine the full extent of the corrosion pattern.
- 6.1.4 Where substantial corrosion is identified and not rectified, this will be subject to re-examination and gauging as necessary at Annual and Intermediate Surveys.
- 6.1.5 At each Special Survey, thickness measurements are to be taken in way of critical areas, as considered necessary by the Surveyor. Critical areas are to include locations throughout the ship that show substantial corrosion and/or are considered prone to rapid wastage.
- 6.1.6 The Surveyor may extend the scope of thickness measurement if deemed necessary.

Volume 1, Part 1, Chapter 3

Section 6

Table 3.6.1 Thickness measurement of steel ships

Special Survey I	Special Survey II	Special Survey III	Special Survey IV and subsequent (Ship 24 years old and over)
(Ship 6 years old)	(Ship 12 years old)	(Ship 18 years old)	
(1) Bottom and lower parts of chain ocker. (2) Critical and Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in GOOD condition.	of 0,5L amidships. (2) Bottom and lower parts of chain locker. (3) Critical and Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in	(1) Weatherdeck plating under wood deck planking or sheathing (2) Shell plating in way of the waterline throughout the length of the ship. (3) Two complete transverse sections of deck and shell plating within 0,5L amidships, one of which should be in way of a machinery space (4) Bottom and lower parts of chain locker. (5) Critical and Suspect areas, as required by the Surveyor and may include areas where the coatings are found to be other than in GOOD condition.	(1) All weatherdeck plating outside deck-houses or superstructures and including plating under wood deck planking or sheathing. (2) Shell plating in way of, and below, the waterline throughout the length of the ship. (3) Two complete transverse sections of deck and shell plating within 0,5L amidships, one of which should be in way of a machinery space. (4) Bottom and lower parts of chain locker. (5) Critical and Suspect areas, as required by the Surveyor and to include as applicable: (a) Areas where the coatings are found to be other than in GOOD condition. (b) Bottom shell in way of any cement, asphalt, ballast or other composition. (c) Deck plating and side shell plating in way of galleys, washrooms and refrigerated store spaces and any other wet spaces. (d) Structure in way of integral sanitary tanks.

Table 3.6.2 Thickness measurement - Additional requirements in way of structure identified with substantial corrosion

Structural member	Extent of measurement	Pattern of measurement
Plating	Suspect areas and adjacent plates	5 point pattern over 1 m ²
Stiffeners	Suspect areas	3 measurements each in line across web and flange

6.2 Thickness measurement reporting

- 6.2.1 A report is to be prepared by the approved company carrying out the thickness measurement. The report is to give the location of measurement, the thickness measured as well as the corresponding original thickness. The report is to give the date when the measurement was carried out, the type of measuring equipment, names of personnel and their qualifications and is to be signed by the operator.
- 6.2.2 The thickness measurement report is to be verified and signed by the Surveyor, and included with the Surveyor's report.

Volume 1, Part 1, Chapter 3

Section 7

■ Section 7

Machinery survey - General requirements

7.1 Annual, Intermediate and Docking Survey

- 7.1.1 For Annual, Intermediate and Docking Surveys, see Vol 1, Pt 1, Ch 3, 2 Annual Surveys Hull, machinery and optional requirements, Vol 1, Pt 1, Ch 3, 3 Intermediate Surveys Hull and machinery requirements and Vol 1, Pt 1, Ch 3, 4 Docking Surveys and In-water Surveys
- 7.1.2 For ships assigned the notation '**laid-up**', a general examination of the machinery is to be carried out in lieu of the normal Annual Survey requirements.

7.2 Complete Survey

- 7.2.1 While the ship is in dry dock, all openings to the sea in the machinery spaces, together with the valves, cocks and the fastenings with which these are connected to the hull, are to be examined.
- 7.2.2 All shafts (except screwshafts and tube shafts, for which special arrangements are detailed in *Vol 1, Pt 1, Ch 3, 13 Screwshafts, tube shafts and propellers*), thrust block and all bearings are to be examined. The lower halves of bearings need not be exposed if alignment and wear are found to be acceptable.
- 7.2.3 An examination is to be made of all reduction gears complete with all wheels, pinions, shafts, bearings and gear teeth, thrust bearings and incorporated brake and clutch arrangements where fitted.
- 7.2.4 The following auxiliaries and components are also to be examined:
- (a) Auxiliary engines, auxiliary air compressors with their intercoolers, filters and/or oil separators and safety devices, and all pumps and components used for Mobility or Ship Type systems.
- (b) Steering machinery.
- (c) Windlass and associated driving equipment, where fitted.
- (d) The holding down bolts, chocks of main and auxiliary engines, gearcases, thrust blocks and intermediate shaft bearings.
- (e) Evaporators (other than those of vacuum type) and their safety valves, which should be seen in operation under steam.
- 7.2.5 All Ancillary systems are to be examined to ensure that there have been no modifications to the system that change the category, and no degradation that impacts on other systems or basic conditions on board.
- 7.2.6 All air receivers for Mobility or Ship Type systems, together with their mountings, valves and safety devices, are to be cleaned internally and examined internally and externally. If internal examination of the air receivers is not practicable, they are to be tested hydraulically to 1,3 times the working pressure.
- 7.2.7 The valves, cocks and strainers of the bilge and salvage system including bilge injection, are to be opened up as considered necessary by the Surveyor and together with pipes, are to be examined and tested under working conditions. The fuel oil, feed, lubricating oil and cooling water systems, also the ballast connections together with all pressure filters, heaters and coolers used for Mobility or Ship Type systems, are to be opened up and examined or tested, as considered necessary by the Surveyor. All safety devices for the foregoing items are to be examined.
- 7.2.8 Fuel tanks which do not form part of the ship's structure are to be examined, and if considered necessary by the Surveyor, they are to be tested to the pressure specified for new tanks. The tanks need not be examined internally at the first survey if they are found satisfactory on external inspection. The mountings, fittings and remote controls of all fuel oil tanks are to be examined, so far as is practicable.
- 7.2.9 Where remote and/or automatic controls are fitted for Mobility or Ship Type System, they are to be tested to demonstrate that they are in good working order.
- 7.2.10 In addition to the above, detailed requirements for steam and gas turbines, engines, electrical installations and boilers are given in Vol 1, Pt 1, Ch 3, 8 Turbines Detailed requirements, Vol 1, Pt 1, Ch 3, 9 Reciprocating internal combustion engines Detailed requirements, Vol 1, Pt 1, Ch 3, 10 Electrical equipment and Vol 1, Pt 1, Ch 3, 11 Boilers respectively. In certain instances, upon application by the Owner or where indicated by the maker's servicing recommendations, LR will give consideration to the circumstances where deviation from these detailed requirements is warranted, taking account of design, appropriate indicating equipment (e.g. vibration indicators) and operational records.

Volume 1, Part 1, Chapter 3

Section 8

7.2.11 Where machinery installation includes 'lifed items' the requirements of *Vol 1, Pt 1, Ch 2, 4.5 Existing ships – Periodical Surveys 4.5.21* are applicable.

Section 8

Turbines – Detailed requirements

8.1 Complete Survey

- 8.1.1 The requirements of Vol 1, Pt 1, Ch 3, 7 Machinery survey General requirements are to be complied with.
- 8.1.2 The following parts are to be opened out and examined:
- (a) The working parts of the main turbines and of auxiliary machinery used for essential services, including bulkhead stop valves, manoeuvring valves, the blading, rotors, flexible couplings and casings.
- 8.1.3 In gas turbines the following parts are to be opened out and examined:
- (a) The impellers or blading, rotors and casings of the air compressors, the combustion chambers, burners, intercoolers, heat exchangers, gas and air piping and fittings, starting and reversing arrangements.
- 8.1.4 Condensers, steam reheaters, desuperheaters which are not incorporated in the boilers, and any other appliances used for Mobility or Ship Type systems, are to be examined to the satisfaction of the Surveyor, and if it is considered necessary, they are to be tested.
- 8.1.5 The manoeuvring of the turbines is to be tested under working conditions.

8.2 Turbine condition monitoring (TCM)

- 8.2.1 Where the main propulsion steam turbines are provided with approved vibration monitoring equipment, a machinery notation **TCM** (Turbine Condition Monitoring) may be assigned provided that the following conditions are complied with:
- (a) Vibration measurements recorded with equipment acceptable to LR are to be taken at regular intervals not exceeding six months. The records are to be retained on board and be available to the LR Surveyors for assessment at time of survey.
- (b) Rotor position indicators are to be installed permanently on each turbine. Records of these readings are to be retained on board the ship for inspection by the LR Surveyor at time of survey.
- 8.2.2 For maintenance of the **TCM** notation, the records of vibration monitoring and rotor position readings are to be audited annually.
- 8.2.3 In addition to the vibration readings at the time of the survey, it is necessary to carry out a full power trial to demonstrate to the LR Surveyor that the turbines are in good working order.
- 8.2.4 Where the notation **TCM** has been assigned the main steam turbine top casings need not be lifted for examination of the rotors and diaphragms as required by *Vol 1, Pt 1, Ch 3, 8.1 Complete Survey 8.1.2* provided the condition monitoring data are found within limits set by acceptance standards. The remaining requirements of *Vol 1, Pt 1, Ch 3, 8.1 Complete Survey 8.1.2* are to be complied with. Where the Surveyor considers that the data presented is not entirely to his satisfaction, the top casing will be required to be lifted.

Section 9

Reciprocating internal combustion engines – Detailed requirements

9.1 Scope

9.1.1 The requirements of this Section are applicable to reciprocating internal combustion engines, operating on liquid, gas or dual fuel, providing power for Mobility or Ship Type systems.

9.2 Complete Survey

9.2.1 The requirements of Vol 1, Pt 1, Ch 3, 7 Machinery survey – General requirements are to be complied with.

Volume 1, Part 1, Chapter 3

Section 10

- 9.2.2 The following parts are to be opened out and examined:
- (a) Cylinders, covers, valves and valve gear, pistons and piston rods, crossheads, guides, connecting rods and crankshafts and all bearings, crankcases, bedplates, entablatures, crankcase door fastenings and explosion relief devices, scavenge relief devices, scavenge pumps, scavenge blowers, superchargers and their associated coolers, air compressors and their intercoolers, filters and/or separators and safety devices, fuel pumps and fittings, camshaft drives and balancer units, vibration dampers or detuners, flexible couplings and clutches, reverse gears, attached pumps and cooling arrangements.
- 9.2.3 Selected pipes in the starting air system are to be removed for internal examination and are to be hammer tested. If any appreciable amount of lubricating oil is found in the pipes, the starting air system is to be thoroughly cleaned internally by steaming out, or other suitable means. Some of the pipes selected are to be those adjacent to the starting air valves at the cylinders and to the discharges from the air compressors. This requirement is only applicable to engines using compressed air directly into individual cylinders through starting air valves, it is not applicable to air motor starting systems.
- 9.2.4 The manoeuvring of engines is to be tested under working conditions. Initial starting arrangements are to be tested.
- 9.2.5 Where steam is used for Mobility or Ship Type systems, the condensing plant, feed pumps and fuel oil burning plant are to be examined and the steam pipes examined and tested as detailed in Vol 1, Pt 1, Ch 3, 12 Steam pipes

■ Section 10

Electrical equipment

10.1 Annual and Intermediate Surveys

- 10.1.1 The electrical contacts of air circuit-breakers are to be visually inspected and maintained in accordance with the manufacturer's recommendations by suitably qualified and trained personnel. Appropriate maintenance records are to be made available to the attending Surveyor on request.
- 10.1.2 Where harmonic filters are fitted, the harmonic distortion level is to be measured annually and after any modification to the electrical distribution system or associated consumers. As a minimum, harmonic distortion measurements are to be taken at the main busbar(s) under seagoing conditions, as close to the annual survey as possible, and readings are to be recorded when the greatest amount of distortion is indicated, by suitably qualified and trained personnel. Records are to include which equipment was running, including the load on it and the filters that were in service. These records are to be made available to the attending Surveyor on request.
- 10.1.3 The requirements of Vol 1, Pt 1, Ch 3, 2.3 Machinery and Vol 1, Pt 1, Ch 3, 3.3 Machinery are to be complied with as far as applicable.

10.2 Complete Surveys

- 10.2.1 An electrical insulation resistance test is to be made on the electrical equipment and cables. The installation may be sub-divided, or equipment which may be damaged disconnected, for the purpose of this test.
- 10.2.2 The fittings on the main and emergency switchboards, section boards and distribution boards are to be examined and over-current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.
- 10.2.3 Generator circuit-breakers are to be tested, so far as is practicable, to verify that protective devices including preference tripping relays, if fitted, operate satisfactorily.
- 10.2.4 Air circuit-breakers for essential or emergency services and rated at 800 A and above are to be inspected to ensure that the manufacturer's recommended number of switching options has not been exceeded. See Vol 2, Pt 9, Ch 3, 5.3 Circuit-breakers 5.3.6. Where a breaker is not fitted with an automatic counter, a written record is to be kept.
- 10.2.5 The electric cables and their securing arrangements are to be examined, so far as is practicable, without undue disturbance of fixtures or casings unless opening up is considered necessary as a result of observation or of the tests required by *Vol 1, Pt 1, Ch 3, 10.2 Complete Surveys 10.2.1* The Surveyor is also to be satisfied regarding the condition of glands at watertight and gastight bulkheads.
- 10.2.6 The generator prime movers are to be surveyed as required by Vol 1, Pt 1, Ch 3, 8 Turbines Detailed requirements and Vol 1, Pt 1, Ch 3, 9 Reciprocating internal combustion engines Detailed requirements and the governing of the engines tested. The motors concerned with essential services together with associated control and switch gear are to be examined and if

Volume 1, Part 1, Chapter 3

Section 11

considered necessary, are to be operated, so far as is practicable, under working conditions. All generators and steering gear motors are to be examined and are to be operated under working conditions, though not necessarily under full load or simultaneously.

- 10.2.7 Where transformers associated with supplies to essential services are liquid immersed, the Owner is to arrange for samples of the liquid to be taken and tested for dissolved gases, breakdown voltage, acidity and moisture, by a competent authority, in accordance with the equipment manufacturer's requirements, and a certificate giving the test results is to be made available to the Surveyor on request.
- 10.2.8 Navigation light indicators are to be tried under working conditions, and correct operation on the failure of supply or failure of navigation lights verified.
- 10.2.9 The emergency sources of electrical power, where fitted, together with their automatic arrangements and associated circuits are to be tested.
- 10.2.10 Emergency lighting, transitional emergency lighting, supplementary emergency lighting, general emergency alarm and public address systems are to be tested as far as practicable.
- 10.2.11 Where the ship is electrically propelled, the propulsion motors, generators, propulsion transformers, propulsion conversion equipment, cables, harmonic filters, neutral earthing resistors, dynamic braking resistors and all ancillary electrical equipment that forms part of the propulsion drive and control system, exciters and ventilating plant (including coolers) associated therewith are to be surveyed, and the insulation resistance to earth is to be tested. Special attention is to be given to windings, commutators and sliprings. Where practicable, the low voltage and high voltage windings of cast resin propulsion transformers are to be subjected to boroscopic inspection, to assess the physical condition of their insulation and for signs of mechanical and thermal damage. The operation of protective gear and alarm devices is to be checked, so far as is practicable. Insulating oil, if used, is to be tested in accordance with *Vol 1*, *Pt 1*, *Ch 3*, 10.2 Complete Surveys 10.2.7. Interlocks intended to prevent unsafe operations or unauthorised access are to be checked to verify that they are functioning correctly. Emergency overspeed governors are to be tested.
- 10.2.12 Where the ship has high voltage electrical equipment and associated cables used for Ship Type and Mobility systems, the Surveyor is to visually examine the condition of their insulation systems for signs of deterioration, including partial discharge activity. Where deemed necessary by the Surveyor, boroscopic and/or endoscopic inspections are to be conducted. Areas to be considered for examination are to include, but are not limited to:
- winding ends of all high voltage electrical machines;
- electrical motor core laminations; stator wedges; stator bars; space blocks; and connection rings;
- terminal connections of high voltage equipment; and
- high voltage cable connections.
- 10.2.13 Where on-line partial discharge monitoring equipment has been fitted to high voltage equipment used for the provision of ship type or mobility systems, the Surveyor is to review the test reports for signs of deteriorating performance of the insulation system, see Vol 2, Pt 9, Ch 12, 1.4 On-line partial discharge testing of high voltage rotating machines for ship type and mobility systems.
- 10.2.14 A General Examination of the electrical equipment in areas which may contain flammable gas or vapour and/or combustible dust is to be made to ensure that the integrity of the safe type electrical equipment has not been impaired owing to corrosion, missing bolts, etc. and that there is not an excessive build-up of dust on or in dust protected electrical equipment. Cable runs are to be examined for sheath and armouring defects, where practicable, and to ensure that the means of supporting the cables are in good order. Tests are to be carried out to demonstrate the effectiveness of bonding straps for the control of static electricity. Alarms and interlocks associated with pressurised equipment or spaces are to be tested for correct operation.

■ Section 11

Boilers

11.1 Frequency of survey

11.1.1 All boilers, economisers, steam receivers, steam heated steam generators, thermal oil and hot water units intended for Mobility or Ship Type systems, together with boilers used exclusively for Ancillary systems having a working pressure exceeding

Volume 1, Part 1, Chapter 3

Section 12

3,4 bar and a heating surface exceeding 4,65 m² are to be surveyed at intervals not exceeding 3 years and generally examined externally at the time of the Annual Survey of the ship.

11.2 Scope of surveys

- 11.2.1 At the surveys described in *Vol 1, Pt 1, Ch 3, 11.1 Frequency of survey* the boilers, superheaters, economisers and air heaters are to be examined internally and externally and where considered necessary, the pressure parts are to be tested by hydraulic pressure and the thickness of plates and tubes and sizes of stays are to be ascertained to determine a safe working pressure. The principal mountings on boilers, superheaters and economisers are to be opened up and examined and the safety valves are to be set under steam to a pressure not greater than the approved design pressures of the respective parts. As a working tolerance, the setting is acceptable provided that the valves lift at not more than 103 per cent of the approved design pressure. The remaining mountings are to be examined externally and if considered necessary by the Surveyor, are to be opened up for internal examination. Collision chocks, rolling stays and boiler stools are to be examined and maintained in an efficient condition.
- 11.2.2 In fired boilers employing forced circulation, the pumps used for this service are to be opened and examined at each Boiler Survey.
- 11.2.3 The fuel oil burning system is to be examined under working conditions and a General Examination made of fuel tank valves, pipes, deck controlgear and oil discharge pipes between pumps and burners.
- 11.2.4 At each survey of a cylindrical boiler which is fitted with smoke tube superheaters, the saturated steam pipes are to be examined as detailed in *Vol 1*, *Pt 1*, *Ch 3*, *12 Steam pipes*.
- 11.2.5 At the Annual General Examination referred to in Vol 1, Pt 1, Ch 3, 11.1 Frequency of survey 11.1.1 the requirements of Vol 1, Pt 1, Ch 3, 2.3 Machinery 2.3.7 and Vol 1, Pt 1, Ch 3, 2.3 Machinery 2.3.8 are to be complied with

■ Section 12

Steam pipes

12.1 Frequency of survey

- 12.1.1 Saturated steam pipes, also superheated steam pipes where the temperature of the steam at the superheater outlet is not over 450°C, are to be surveyed 12 years from the date of build (or installation) and thereafter at six-yearly intervals.
- 12.1.2 Superheated steam pipes where the temperature of the steam at the superheater outlet is over 450°C are to be surveyed after six years from the date of build (or installation) thereafter at six-yearly intervals.
- 12.1.3 At 12 years from the date of build (or installation) thereafter at six-yearly intervals, all copper or copper alloy steam pipes over 76 mm external diameter supplying steam for essential services at sea, are to be hydraulically tested to twice the working pressure.

12.2 Scope of surveys

- 12.2.1 At each survey a selected number of main steam pipes, also of auxiliary steam pipes, which:
- (a) are over 76 mm external diameter;
- (b) supply steam for essential services at sea; and
- (c) have bolted joints,

are to be removed for internal examination and are to be hydraulically tested to 1,5 times the working pressure. If these selected pipes are found satisfactory in all respects, the remainder need not be tested. So far as is practicable, the pipes are to be selected for examination and hydraulic test in rotation so that in the course of the surveys all sections of the pipeline will be tested.

12.2.2 Where main and/or auxiliary steam pipes of the category described in *Vol 1, Pt 1, Ch 3, 12.2 Scope of surveys 12.2.1* and *Vol 1, Pt 1, Ch 3, 12.2 Scope of surveys 12.2.1.(b)* have welded joints between the lengths of pipe and/or between pipes and valves, the lagging in the way of the welds is to be removed, and welds examined and if considered necessary by the Surveyor, crack detected. Pipe ranges having welded joints are to be hydraulically tested to 1,5 times the working pressure. Where lengths having ordinary bolted joints are fitted in such pipe ranges and can be readily disconnected, they are to be removed for internal examination and hydraulically tested to 1,5 times the working pressure.

Volume 1, Part 1, Chapter 3

Section 13

- 12.2.3 Where, on cylindrical boilers having smoke tube superheaters, the saturated steam pipes adjoining the saturated steam headers are situated partly in the boiler smoke boxes, all such pipes adjoining and cross-connecting these headers in the smokeboxes are, at the surveys required by *Vol 1*, *Pt 1*, *Ch 3*, 12.1 Frequency of survey to be included in the pipes selected for examination and testing as defined in *Vol 1*, *Pt 1*, *Ch 3*, 12.2 Scope of surveys 12.2.1. Where the saturated steam pipes inside the smoke boxes consist of steel castings of substantial construction, these requirements need only to be applied to a sample casting. Where steel castings are not fitted, the Surveyor is to satisfy himself of the condition of the ends of the saturated steam pipes in the smoke boxes at each Boiler Survey and if he considers it necessary, a sample pipe is to be removed for examination.
- 12.2.4 At the surveys specified in *Vol 1, Pt 1, Ch 3, 12.1 Frequency of survey 12.1.3*, any of the copper or copper alloy pipes, such as those having expansion or other bends, which may be subject to bending and/or vibration, also closing lengths adjacent to steam driven machinery, are to be annealed before being tested.
- 12.2.5 Where it is inconvenient for the Owner to fulfil all the requirements of a Steam Pipe Survey at its due date, LR will be prepared to consider postponement of the survey, either wholly or in part.

■ Section 13

Screwshafts, tube shafts and propellers

13.1 Definitions

- 13.1.1 Adequate means for protection against corrosion. An adequate means for protection against corrosion is an approved means for full protection of the shaft against sea water intrusion and subsequent corrosion attack. Such means are used for the protection of common steel material against corrosion, particularly in combination with water lubricated bearings. Typical means are for example:
- (a) continuous metallic, corrosion-resistant liners,
- (b) continuous cladding,
- (c) multiple layer synthetic coating,
- (d) multiple layers of fiberglass,
- (e) combinations of above mentioned,
- (f) rubber/elastomer covering coating.

The means for protection against corrosion are to be installed/applied according to the manufacturer's guidelines, recommendation and procedures.

- 13.1.2 **Fresh Water sample test.** At the Screwshaft Survey, a sample of the fresh water in a closed loop fresh water lubricated shaft is to be taken in the presence of a Surveyor. The requirements for Fresh Water sample tests are given in the ShipRight Procedure Machinery PlannedMaintenance and Condition Monitoring.
- 13.1.3 **Lubricating oil analysis**. Lubricating oil analysis is to be carried out at regular intervals not exceeding six months. The documentation on lubricating oil analysis is to be available on board. Oil samples, to be submitted for the analysis, are to be taken under service conditions.
- 13.1.4 **Oil sample examination**. An oil sample examination is a visual examination of the sterntube lubricating oil taken in the presence of a Surveyor, with a focus on water contamination.
- 13.1.5 **Service records**. Service records are regularly recorded data showing in-service conditions of the shaft(s) and are to include:
- (a) For Oil Lubricated Stern Bearings: lubricating oil temperature, bearing temperature, oil consumption records, water content and flow/viscosity tests.
- (b) For Closed Loop System Fresh Water Lubricated Bearings: water flow, water temperature, salinity, pH, make-up water and water pressure (depending on design).
- 13.1.6 Survey methods on closed systems. Oil Lubricated Shafts or Closed Loop System Fresh Water Lubricated Shafts:
- (a) **TS Method 1** Survey of screwshaft, tube shaft and propeller in accordance with the requirements of TS Method 1, see *Table 3.13.3 Shaft survey methods*. Primarily the shaft is withdrawn and the propeller is removed.
- (b) **TS Method 2** Survey of screwshaft, tube shaft and propeller in accordance with the requirements of TS Method 2, see *Table 3.13.3 Shaft survey methods*. Primarily records are reviewed, the propeller is removed but the shaft is not withdrawn.

Volume 1, Part 1, Chapter 3

Section 13

- (c) **TS Method 3** Survey of screwshaft, tube shaft and propeller in accordance with the requirements of TS Method 3, see *Table 3.13.3 Shaft survey methods*. Primarily records are reviewed, the shaft is not withdrawn and the propeller is not removed.
- 13.1.7 **Survey methods on open systems**. Water lubricated shafts:
- (a) **TS Method 4** Survey of screwshaft, tube shaft and propeller in accordance with the requirements of TS Method 4, see *Table 3.13.3 Shaft survey methods*. Primarily the shaft is withdrawn and the propeller is removed.
- 13.1.8 Tube shaft is a shaft placed between the intermediate shaft and propeller shaft, normally arranged within a sterntube or running in open water. It may also be called a sterntube shaft.

13.2 Closed systems – Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys

- 13.2.1 Oil lubricated shafts fitted with approved oil glands and closed loop system fresh water lubricated shafts fitted with approved adequate means of protection against corrosion or fabricated from corrosion-resistant material are to be surveyed in accordance with Vol 1, Pt 1, Ch 3, 13.2 Closed systems Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys 13.2.2 to Vol 1, Pt 1, Ch 3, 13.2 Closed systems Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys 13.2.5
- 13.2.2 Shafts with a keyless propeller connection or a flanged propeller connection (including controllable pitch propellers for main propulsion purposes) are to be surveyed at intervals of five years in accordance with TS Method 1, 2 or 3.
- 13.2.3 Shafts with a keyed propeller connection with a keyway that complies fully with the present Rules are to be surveyed at intervals of five years in accordance with TS Method 1 or 2; TS Method 3 is not permitted.
- 13.2.4 For oil lubricated keyless shafts, the maximum interval between two surveys carried out according to TS Method 1 or TS Method 2 shall not exceed 15 years, other than in the exceptional case when one extension for no more than three months is agreed.
- 13.2.5 Closed loop system fresh water lubricated shafts may be surveyed in accordance with TS Method 2 or for keyless shafts TS Method 3, only if the descriptive note **ShipRightSCM** is assigned. Notwithstanding this, the maximum interval between two surveys carried out according to TS Method 1 shall not exceed 15 years, other than in the exceptional case when one extension for no more than three months is agreed.
- 13.2.6 Shaft configurations other than those listed in Vol 1, Pt 1, Ch 3, 13.2 Closed systems Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys 13.2.1 to Vol 1, Pt 1, Ch 3, 13.2 Closed systems Oil lubricated shafts or closed loop system fresh water lubricated shafts: Frequency of surveys 13.2.5 above are to be surveyed at intervals of three years in accordance with TS Method 1.
- 13.2.7 TS Method 2 and TS Method 3 are only permitted where the prerequisite service records and data specified for those methods are to be provided as shown in *Table 3.13.3 Shaft survey methods*. If at the time of survey the attending Surveyor is not satisfied with the service records and data presented, then the shaft may be required to be withdrawn. The service records and data are to be retained onboard and audited by LR at the Annual Survey.
- 13.2.8 For oil lubricated arrangements, the descriptive note **ShipRightSCM** is not a prerequisite in order to hold TS Method 2 and TS Method 3.
- 13.2.9 In order to assign and maintain the descriptive note ShipRightSCM, the requirements of *Vol 2, Pt 3, Ch 2, 5 Control and monitoring* and *ShipRight Procedure Machinery Planned Maintenance and Condition Monitoring, Section 4*, are to be complied with, including the requirements therein for onboard maintenance of records and review of them by the attending Surveyor at Annual Survey.
- 13.2.10 For surveys completed within three months before the Shaft Survey due date, the next period will start from the Shaft Survey due date.
- 13.2.11 See Summary of Survey Intervals and Extensions for closed systems in *Table 3.13.1 Summary of survey intervals and extensions Closed systems*.

13.3 Open Systems - Water lubricated shafts: Frequency of surveys

- 13.3.1 Survey in accordance with TS Method 4 at intervals of five years is applicable to any of the following:
- (a) Single shaft operating in fresh water only,

Volume 1, Part 1, Chapter 3

Section 13

65

- (b) Single shaft provided with approved adequate means of protection against corrosion or fabricated from corrosion-resistant material,
- (c) Multiple shaft arrangements.
- 13.3.2 Single shaft configurations other than listed above are to be surveyed every three years in accordance with TS Method 4.
- 13.3.3 For shafts subject to five-yearly surveys with keyless connections, at the Surveyor's discretion removal of the propeller and NDE of the shaft taper, as required by TS Method 4, need only be carried out every 15 years, subject to a satisfactory visual inspection of all accessible parts of the shafting system at the intervening surveys.
- 13.3.4 For surveys completed within three months before the Shaft Survey due date, the next survey period will start from the Shaft Survey due date.
- 13.3.5 At the discretion of the Classification Committee, consideration may be given to accept special arrangements to monitor the condition of the screwshaft, bearings, sealing devices and the sterntube lubricant system so as to allow an extension to the interval between withdrawals of the Screwshaft required by TS Method 4. This is subject to the shaft being provided with approved adequate means of protection against corrosion or being fabricated from corrosion-resistant material.
- 13.3.6 See Summary of Survey Intervals and Extensions for open systems in *Table 3.13.2 Summary of survey intervals and extensions Open systems*.

13.4 Survey extensions

- 13.4.1 For all types of propeller connections, consideration can be given at the discretion of the Classification Committee to an extension of the interval between two consecutive surveys after the execution of an extension survey as follows:
- (a) Extension up to a maximum of two and a half years: Only permitted for closed systems. No more than one extension can be considered. No further extension, of any other type, can be considered.
- (b) Extension up to a maximum of one year: Two consecutive 'one year extensions' can be considered. Where an additional extension is agreed the requirements of the 'two and a half year extension' are to be carried out and the Shaft Survey due date, prior to the previous extension(s), is extended for a maximum of two and a half years.
- (c) Extension up to a maximum of three months: One 'three month extension' can be considered. In the event an additional extension is agreed the requirements of the 'one year extension' or 'two and a half years extension' are to be carried out and the Shaft Survey due date, prior to the previous extension, is extended for a maximum of one year or two and a half years.
- 13.4.2 If the extension survey is carried out within one month of the shaft survey due date then the extension will take effect from the Shaft Survey due date.
- 13.4.3 If the extension survey is carried out more than one month prior to the Shaft Survey due date, then the period of extension will take effect from the date on which the extension survey was completed.

Table 3.13.1 Summary of survey intervals and extensions – Closed systems

Oil Lubricated				
	Flanged Propeller Coupling	Keyless Propeller Coupling	Keyed Propeller Coupling (see Note 2)	
Every 5 years (see Note 1)	TS Method 1 or TS Method 2 or TS Method 3	TS Method 1 or TS Method 2 or TS Method 3 (see Note 3)	TS Method 1 or TS Method 2	
Extension 2,5 years	Yes (see Note 4)	Yes (see Note 4)	Yes (see Note 4)	
Extension 1 year	Yes (see Note 5)	Yes (see Note 5)	Yes (see Note 5)	
Extension 3 months Yes (see Note 6)		Yes (see Note 6)	Yes (see Note f6)	
Closed Loop System Fresh Water Lubricated				
	Flanged Propeller Coupling	Keyless Propeller Coupling	Keyed Propeller Coupling (see Note 2)	

Volume 1, Part 1, Chapter 3

Section 13

Every 5 years (see Note a)	TS Method 1 (see Note 7) or TS Method 2 or TS Method 3	TS Method 1 (see Note 7) or TS Method 2 or TS Method 3	TS Method 1 (see Note 7) or TS Method 2
Extension 2,5 years	Yes (see Note 4)	Yes (see Note 4)	Yes (see Note 4)
Extension 1 year	Yes (see Note 5)	Yes (see Note 5)	Yes (see Note 5)
Extension 3 months	Yes (see Note 6)	Yes (see Note 6)	Yes (see Note 6)

General notes:

For surveys (TS Method 1, or TS Method 2, or TS Method 3) completed within 3 months before the Shaft Survey due date, the next period will start from the shaft survey due date.

If the extension survey is carried out within 1 month of the shaft survey due date then the extension will take effect from the shaft survey due date.

If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date when the extension survey was completed.

Notes:

- Note 1. Unless an Extension (Extension 2,5 years, Extension one year, Extension three months) is applied in between.
- Note 2. TS Method 3 not allowed.
- Note 3. The maximum interval between two surveys carried out according to TS Method 1 or TS Method 2 shall not exceed 15 years, except in the case when one extension for no more than 3 months is agreed.
- Note 4. No more than one extension can be considered. No further extension of other type can be considered.
- **Note** 5. Two consecutive extensions can be considered. Where an additional extension is agreed the requirements of the '2,5 year extension' are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2,5 years.
- **Note** 6. Extension up to a maximum of 3 months: One '3 month extension' can be considered. In the event an additional extension is agreed the requirements of the '1 year extension' or '2,5 years extension' are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of 1 year or 2,5 years.
- Note 7. The maximum interval between two surveys carried out according to TS Method 1 shall not be more than 15 years, other than in the exceptional case when one extension for no more than 3 months is agreed.

Table 3.13.2 Summary of survey intervals and extensions – Open systems

 Single shaft operating exclusively in fresh water. Single shaft provided with adequate means of corrosion protection, single corrosion-resistant shaft. All types of Multiple shaft arrangements. 		Other shaft configurations.	
	All types of propeller coupling (see Note d)	e All types of propeller coupling Note 4)	
Every 5 years (see Note 1)	TS Method 4	Every 3 years (see Note 1)	TS Method 4
Extension 1 year	Yes (see Note 2)	Extension 1 year	Yes (see Note 2)

Volume 1, Part 1, Chapter 3

Section 13

Extension 3 months	Yes (see Note 3)	Extension 3 months	Yes (see Note 3)

General notes:

For surveys (TS Method 4) completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

If the extension survey is carried out within 1 month of the shaft survey due date then the extension will take effect from the shaft survey due date.

If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date when the extension survey was completed.

Notes

- Note 1. Unless an Extension (Extension 1 year, Extension 3 months) is applied in between.
- Note 2. No more than one extension can be considered. No further extension, of any other type, can be considered.
- **Note** 3. One extension can be considered. In the event an additional extension is agreed the requirements of the 1 year extension are to be carried out and the shaft survey due date prior to the previous extension is extended for a maximum of 1 year.

Note Note 4. For keyless propeller connections the maximum interval between two consecutive dismantling and verifications of the shaft cone by means of non-destructive examination (NDE) shall not exceed 15 years.

13.5 Shaft Survey Methods

13.5.1 For the survey methods see *Table 3.13.3 Shaft survey methods* below.

Table 3.13.3 Shaft survey methods

	TS METHOD 1	TS METHOD 2	TS METHOD 3	TS METHOD 4
GENERAL				
Drawing the shaft and examining the entire shaft (including liners, corrosion protection system and stress reducing features, where provided), sealing system and bearings	X			X
SHAFT				
Visual examination of all accessible parts of the shafting system in situ		X	Х	
For keyed and keyless propeller connections, removing the propeller to expose the forward end of the taper	X	X		X

Volume 1, Part 1, Chapter 3 Section 13

For keyed and keyless propeller connections, perform a non-destructive examination (NDE) by an approved surface crackdetection method around the after end of the cylindrical part of the shaft and the forward one-third of the shaft cone, including the keyway with the key removed (if fitted); for shafts provided with liners the NDE shall be extended to the after edge of the liner	X	X		X
For flanged connections, whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs, or when deemed necessary by the Surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack detection method	X	X	X	X
Visual examination of all accessible parts of the shafting system following re-installation of the shaft	Х			Х
PROPELLER				
Examination of the propeller	X	Х	Х	X
Controllable pitch propellers, where fitted, are to be opened up and the working parts examined, together with the control gear. Propeller to be examined upon reassembly	X	X		X
Where a controllable pitch propeller is fitted, at least one of the blades is to be dismantled completely for examination of the working parts and the control gear. Propeller to be examined upon reassembly.			X

Volume 1, Part 1, Chapter 3 Section 13

Examination of the propeller following reinstallation	Х	Х		X
BEARING CLEARANCES				
Checking, recording and verification of bearing clearances	Х			X
Recording the bearing weardown measurements after re-installation, if applicable	X			
Checking and recording the bearing weardown measurements		X	X	
SEALING SYSTEM				
Examine the inboard and outboard seals with shaft removed and following the re-installation of the shaft and propeller	Х			X
Examine the inboard and outboard seals		Х	Х	
Examination of seal liner		X	X	
OTHERS				
Stationary supporting structures and any erosion protection inserts or doublers are to be examined in way of any propulsion devices	Х	X	X	X
Verification of no unapproved repairs by grinding or welding of shaft and/or propeller	X	X	X	×
SERVICE RECORDS				
Review of service records		X	X	
Review of test records of Lubricating Oil Analysis (for oil lubricated shafts), or Fresh Water Sample Test (for closed system fresh water lubricated shafts)		X	X	
Oil Sample Examination (for oil lubricated shafts), or Fresh Water Sample Test (for closed system fresh water lubricated).		Х	Х	

Volume 1, Part 1, Chapter 3

Section 14

13.6 Other systems

- 13.6.1 Directional propeller and podded propulsion units for main propulsion purposes, inclusive of the propellers, shafts, gearing, control gear and the primary electrical components including any control and protection devices, are to be surveyed at intervals not exceeding five years. They are to be dismantled if considered necessary and generally examined as far as practicable. Non-destructive examination is to be carried out as considered necessary by the Surveyor on blade/fin roots. Consideration may be given to condition monitoring schemes for determining the condition of the unit.
- 13.6.2 Podded propulsion unit screwshaft roller bearings are to be renewed when the calculated life at the maximum continuous rating no longer exceeds the survey interval, see Vol 2, Pt 4, Ch 4, 5.3 Propulsion shafting 5.3.7.
- 13.6.3 Dynamic positioning and/or thruster-assisted mooring and athwartship thrust propellers and shaftings are to be surveyed at intervals not exceeding five years. They are to be generally examined so far as possible in dry dock and tested under working conditions afloat for satisfactory operation. All accessible parts, including sealing, locking and bearing faces, and any other moving parts are to be examined. Non-destructive examination is to be carried out as considered necessary by the Surveyor on blade/fin roots. Consideration may be given to condition monitoring schemes for determining the condition of the unit.
- 13.6.4 Water jet units for main propulsion purposes, including the impeller, casing, shaft, shaft seal, shaft bearing, inlet and outlet channels, steering nozzle, reversing arrangements, and control gear are to be surveyed at intervals not exceeding five years, provided the impeller shafts are made of approved corrosion-resistant material or have approved equivalent arrangements. They are to be generally examined so far as practicable.
- 13.6.5 Stationary supporting structure and any erosion protection inserts or doublers are to be examined in way of any propulsion devices.
- 13.6.6 Where fitted, a shaft grounding device is to be verified as working satisfactorily during Annual Surveys and Docking Surveys.

13.7 Alternative arrangements

13.7.1 The Classification Committee will be prepared to give consideration to the circumstances of any special case upon application by the Owner, where the level of safety achieved is equivalent to that obtained by the survey methods described in this section.

■ Section 14

Machinery planned maintenance and condition monitoring, MPMS, MCM and RCM

14.1 Introduction

- 14.1.1 Within the scope of Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.18 and Vol 1, Pt 1, Ch 2, 4.5 Existing ships Periodical Surveys 4.5.19, an approved Planned Maintenance Scheme (**MPMS**) and Condition Monitoring (**MCM**) can be accepted as an integral part of LR's Continuous Survey Machinery (**CSM**) cycle.
- 14.1.2 Planned maintenance systems may be based on calendar or running hours calling for items to be opened out for inspection and overhaul at specified periods. Alternatively the machinery may be monitored for condition and performance, whereby items need only be opened out for examination when readings indicate deterioration.
- 14.1.3 Navies who operate a planned maintenance scheme that meets the LR requirements will benefit from enhanced arrangements for dealing with machinery surveys. The arrangements provide the following advantages:
- (a) A more flexible approach to dealing with Classification Surveys of machinery items. The condition as observed and reported by an LR approved Marine Engineer Officer will, subject to annual audit, be sufficient to credit the items for survey.
- (b) A single system can be operated by the Navy covering maintenance, spare parts' supply and survey requirements.
- (c) The schemes allow the application of condition monitoring techniques to main and auxiliary items of machinery.
- 14.1.4 When a Navy decides to apply such arrangements to limit the opening out normally required for survey under **CSM** then **MPMS, MCM** (including Condition Monitoring) or **RCM** (including Reliability Centred Maintenance) class notations can be assigned where the schemes have been approved by LR.

Volume 1, Part 1, Chapter 3

Section 14

14.2 Master list items

14.2.1 A list of typical machinery master list items that can be surveyed by authorised personnel and those items that remain to be dealt with by LR Surveyors can be obtained from LR's Southampton GTC Office. It should be noted that LR will continue to inspect, as necessary, where there is a history of mechanical, electrical or control engineering defects in a particular area, either on the ship or on a similar ship.

14.3 The planned maintenance approach

- 14.3.1 Types of maintenance are defined as:
- (a) **Preventive maintenance.** This calls for items to be opened out for inspection and overhaul at specified time periods or after a specified number of running hours in order to keep the machine/equipment/system in a satisfactory operational condition.
- (b) **Condition based maintenance.** This is dictated by the performance or physical state of the machine/equipment/ system, determined by regular or continuous checks of applicable parameters. Maintenance is only undertaken when conditions have approached or reached the lowest acceptable standard and before breakdown or failure occurs.
- (c) **Reliability centred maintenance.** This calls for a structured analysis of a system's capability to perform its functions from design through operation to decommissioning. The primary objective is to ensure the functionality of a system and this is achieved through a planned maintenance strategy determined from the detailed analysis. The strategy may include the use of prevention and condition based maintenance.
- 14.3.2 The types of maintenance described in *Vol 1, Pt 1, Ch 3, 14.3 The planned maintenance approach 14.3.1* are the foundations of a Machinery Planned Maintenence System acceptable to LR. Many schemes are made up with a combination of the three methods of control. In addition, to deal with unforeseen circumstances, any Machinery Planned Maintenence System must also be able to deal effectively with breakdown or corrective maintenance, i.e. unscheduled maintenance.

14.4 Basic requirements for approval of MPMS, MCM and RCM schemes

- 14.4.1 To obtain approval of a **MPMS**, the Navy is required to make a formal request through either a local office of LR or direct to LR in the Southampton GTC office. The request is to be accompanied by the following information:
- (a) A numbered index of the items to be included in the scheme. This index is to include at least all CSM items that appear on the Master List of Surveyable Items. The scheme can also cover many items that are not required for classification. The indexing system is to be such that ready cross-reference to the numbers in the LR Master List of Surveyable items can be made. It is also to indicate those items to be dealt with by preventive maintenance, by condition-based maintenance and by reliability centred maintenance.
- (b) The maintenance and monitoring methods to be used, the time schedules for each item and limits of acceptance/ condition where applicable. Maintenance descriptions are to cover at least the minimum opening out necessary to demonstrate that a satisfactory examination of the item will be made. The extent of the work to be undertaken is to be indicated but it is not necessary for approval purposes to include every detailed job description. A few sample job descriptions will suffice to demonstrate how the system works. Machinery on preventive maintenance must be examined completely for survey purposes at intervals not exceeding six years, although in practice many items will be maintained much more frequently.
- (c) A system for reporting to the Navy and recording on board ship and at the Navy's headquarters, details of maintenance carried out, the condition as found and any repairs effected, together with a list of spare parts used. The reporting and recording procedures are to be sufficiently comprehensive to demonstrate that both the Navy and the LR Surveyor can verify correct operation of the planned maintenance system at the time of the survey.
- (d) A description of the scheme regarding its application on board ship and the proposed flow of maintenance documents and method of filing same. The application of the scheme may take the form of simple planning charts or the more complex interactive computer based systems. The language of the **MPMS** is to be English.
- 14.4.2 Where a Navy has requested approval of a Reliability Centred Maintenance study, the requirements of *Vol 1, Pt 1, Ch 3, 14.4 Basic requirements for approval of MPMS, MCM and RCM schemes 14.4.3* are to be complied with.
- 14.4.3 The following information is to be submitted to LR for review:
- (a) Hard or soft copy (with operating systems if necessary) of the studies, conducted in accordance with a relevant national or international Standard, such as ISO 17359, Condition monitoring and diagnostics of machines – General guidelines. This is to include, operating context, details of study team, Risk Assessment (RA, see also Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)), algorithm decision sheets, summary of maintenance tasks, summary of 'level of repair analysis', identification of 'critical' spares.
- (b) Details of system/equipment covered by the study.

Volume 1, Part 1, Chapter 3

Section 14

- (c) Confirmation that maintenance studies have included where possible, OEM data on failure rates, OEM maintenance recommendations, and associated information necessary to ensure that risk associated with component failure is accounted for accurately.
- 14.4.4 LR will verify by audit that the following items have been complied with:
- (a) Study has been undertaken in full compliance of the methodology embodied in an acceptable and applicable standard for **RCM**
- (b) Study team members have adequate experience both of undertaking **RCM** studies and the systems/equipment under review.
- (c) Study team members have been present during the study for sufficient time (percentage of total time taken) to contribute properly to the study.
- (d) No 'Mandatory Redesign' requirements are outstanding.
- (e) Where spares have been identified as 'Critical', they have been properly identified in the management systems on board.
- (f) Procedures for collection of condition monitoring information have been established and reporting procedures for submission of this as part of the approved **MPMS** are clearly documented.
- (g) Where Standard Operating Procedures have been identified, that an adequate management system is in place to ensure that they are complied with.
- (h) The **RA**, see Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA), is in compliance with an acceptable standard, good marine engineering practice and application of valid reliability data.
- 14.4.5 A technical audit by LR of individual RCM studies selected by LR will follow the following methodology:
- (a) Verification that the study covers the entire function being addressed.
- (b) For each individual study (sub function) within a group function, verification that there is a list that includes the individual assets items, including controls, instrumentation and protective/ emergency devices.
- (c) Verification that an expected maintenance task list has been drafted, based on typical tasks that would be expected for the relevant item, under any maintenance regime. These would include, but may not be limited to, system performance analysis checks, standard condition monitoring checks (vibration, electrical characteristics, thermography, etc), inspections of items liable to wear or other age related degradation, i.e. fouling, periodic tests of protective devices, operation of reversionary modes of operation, etc.
- (d) Confirm that the standard tasks have been identified for each sub function.
- (e) Review the study for justification for items or systems with no scheduled maintenance for tasks not identified.
- (f) Review any inconsistencies in periodicity for tasks included in maintenance schedule.
- (g) Carry out a review of **RCM** logic applied for one sub function. If the review is acceptable and in accordance with the standard for RCM, others will not be fully reviewed. If considered unacceptable, a review of another will be carried out for confirmation. If second also unacceptable, LR will require a complete review of all other sub functions for acceptance.
- (h) Review LR Master List Surveyable items to verify that all Class items have a maintenance programme associated with credit as part of **RCM**.
- 14.4.6 As an alternative to LR carrying out post study audits required by Vol 1, Pt 1, Ch 3, 14.4 Basic requirements for approval of MPMS, MCM and RCM schemes 14.4.4 and Vol 1, Pt 1, Ch 3, 14.4 Basic requirements for approval of MPMS, MCM and RCM schemes 14.4.5, LR can, if requested, provide direct input and advice to the study team(s) on either a full or part time basis to supplement the technical/survey requirement input. If this is undertaken, the scope of the audit will be reduced accordingly.
- 14.4.7 Where machinery items are maintained on a condition basis the following additional information is required to be submitted:
- (a) A description of the applicable monitoring techniques and monitoring equipment to be used.
- (b) A statement as to the acceptable limits of deteriorated condition. These should be derived from the manufacturer's recommendations, applicable severity criteria as defined in recognised Standards, or the Navy's required limits when these are more severe. Rotating machinery on condition based maintenance may be accepted for survey on the basis of the monitored readings without opening out if the condition is shown to be good.
- 14.4.8 If the planned maintenance scheme is considered to be acceptable to LR a 'Certificate for Operation of an Approved Planned Maintenance Scheme' will be issued. The Certificate is to be retained on board the subject ship for the information of the Commanding Officer, Marine Engineer Officer and LR's Surveyors.
- 14.4.9 The Marine Engineer Officer operating the Scheme on a ship must hold a valid LR Certificate of Authorisation.

Volume 1, Part 1, Chapter 3

Section 14

14.5 Conditions of operation

- 14.5.1 It is a condition of the Scheme that the Navy arranges for LR Surveyors to carry out an Annual audit of the machinery maintenance and monitoring records. Annual audits are to be held within three months before or after the due date and it is recommended that they are harmonised with the ship's Annual Survey.
- 14.5.2 Marine Engineer Officers may carry out surveys of all the machinery items for which they are authorised, at sea or in port, whichever is the most convenient. The following machinery items remain to be dealt with by an LR Surveyor, unless special arrangements have been agreed with the Navy:
- Machinery damage, repairs and alterations, see Vol 1, Pt 1, Ch 3, 14.6 Breakdown or corrective maintenance
- Gas turbines for propulsion and electrical supplies.
- Engines for propulsion and electrical supplies.
- Steam turbines and boilers for propulsion and electrical supplies.
- Control, alarm and safety devices associated with the above main and auxiliary machinery.
- Reduction/increase gearing, flexible couplings and clutches.
- Holding down bolts and chocks.
- Steam pipes and valves on ships with steam turbine installations.
- Air receivers and other pressure vessels.
- Starting air pipes.
- Steering machinery.
- Pumping arrangements for bilge and dewatering systems.
- Electrical equipment other than auxiliary motors.
- Screwshafts, stern bearings and propellers.
- Sea connections.
- Machinery controls and controls associated with Class Notations, e.g. UMS, CCS, ICC and IP.
- Engine Trial.
- First start arrangement trial.
- 14.5.3 The confirmatory survey carried out at the time of the annual audit by LR's Surveyor will comprise of checks of the condition monitoring records and, if considered necessary, an examination of selected main and auxiliary machinery under working conditions.

14.6 Breakdown or corrective maintenance

- 14.6.1 LR is required to be notified when a breakdown or defect occurs and has a major effect that affects the Provisions of Classification and repairs are necessary. A major effect is an effect that produces:
- (a) a significant increase in the operational duties of the crew or in their difficulty in performing their duties which by itself should not be outside the capability of a competent crew provided that another major effect does not occur at the same time; or
- (b) significant degradation in the operational capability of the ship; or
- (c) significant modification of the permissible operating conditions, but will not remove the capability to complete a safe journey without demanding more than normal skill on the part of the operating crew.
- 14.6.2 In discussion with the Navy and the Marine Engineer Officer, LR will advise what repairs and/or renewals are necessary for classification purposes, with the issue of an Interim Certificate of Class.
- 14.6.3 The required repair and time scale for completion will be the subject of discussion and agreement with LR and the Navy. It is the responsibility of the Navy to decide whether the ship's mission/operational tasking is more important than completing the repairs within the agreed time. It is accepted that such circumstances are occasionally inevitable, and LR would provide advice on the interim measures that could be introduced until such time as the required repairs are carried out and the implications on a ship's operating capability of delays in effecting repairs.

14.7 Annual audit and survey

- 14.7.1 At the annual audit the Marine Engineer Officer is required to make available the maintenance and monitoring records. These records may be in a hard or soft format and should include:
- (a) Appropriate records of machinery or equipment surveyed under the supervision of the Marine Engineer Officer that are listed in the Master List of Surveyable Items. These statements should give details of repairs carried out and spare parts used.

Volume 1, Part 1, Chapter 3

Section 15

(b) Written details of any breakdown or malfunction of essential machinery. Such details should include the main cause of failure.

These records will be examined in sufficient depth by the LR Surveyors to ensure that the scheme has been correctly operated and that the machinery has functioned satisfactorily since the previous survey. The records should indicate that all scheduled maintenance has been carried out. Any items not dealt with as per schedule will be discussed with the Marine Engineer Officer.

- 14.7.2 Where condition monitoring of main or auxiliary machinery is incorporated in the PMS the LR Surveyor will examine the records to verify that vibration levels, performance criteria, etc. are within the approved specified limits. The LR Surveyor may require confirmatory readings on available running machinery to be taken for comparison with the ship's records.
- 14.7.3 As part of the audit, LR Surveyors carry out a general examination of the machinery. As far as is practicable machinery to be credited for survey will be examined under working conditions. If the LR Surveyor is not satisfied with the condition as found he might require to have any items opened out for inspection.
- 14.7.4 The dates of items to be credited for Class will be aligned to the date of the confirmatory survey regardless of when the Marine Engineer Officer carried out his survey. Any other surveyable items of machinery not covered by the Scheme will be surveyed and credited in the normal way.
- 14.7.5 For items which the Marine Engineer Officer is authorised to survey and become due for survey between Annual Audits these will be shown as 'OVERDUE' on the survey status until the Annual Audit has been held and reported.
- 14.7.6 In the event of the Surveyor not being satisfied that the planned maintenance scheme is being correctly followed, either from the maintenance records or from the general condition of the machinery, a report will be forwarded to LR recommending that the special arrangements for dealing with machinery surveys be suspended.

■ Section 15

Classification of ships not built under LR survey

15.1 General

- 15.1.1 When classification is desired for a ship not built under the supervision of LR Surveyors, application should be made in writing. The scope of classification will include hull and machinery aspects, as defined in *Vol 1, Pt 1, Ch 3, 15.2 Hull and equipment* and *Vol 1, Pt 1, Ch 3, 15.3 Machinery*, in addition to any additional notations requested, but may be limited to hull-only aspects on request.
- 15.1.2 Periodical Surveys of ships not built under survey, when classed, are subsequently to be held as in the case of ships built under survey
- 15.1.3 Where classification is desired for a ship which has not been designed, constructed and maintained to appropriate standards recognised by the Naval Authority, special consideration will be given to the requirements of this Section.
- 15.1.4 Where classification is desired for a ship which is classed by another recognised Society, special consideration will be given to the requirements of this Section.

15.2 Hull and equipment

- 15.2.1 Plans showing the main scantlings, corrosion margins and arrangements of the actual ship together with any proposed alterations are to be submitted. As a minimum the plans are to comprise a midship section, longitudinal section and decks. LR may request further plans. Documents demonstrating compliance with appropriate standards recognised by the Naval Authority are to be submitted. In the absence of such documentation, an appraisal may be required to the satisfaction of LR. For vessels which have generated sufficient evidence of satisfactory in-service experience LR may consider this in lieu of compliance documentation or an appraisal. If plans cannot be obtained or prepared by the Owner, facilities are to be given for LR's Surveyor to obtain the necessary information from the ship.
- 15.2.2 Particulars of the process of manufacture and the testing of the material of construction are to be supplied. The requirements for composite ships will be specially considered.
- 15.2.3 The full requirements of Vol 1, Pt 1, Ch 3, 5 Special Survey Hull requirements and Vol 1, Pt 1, Ch 3, 6 Special Survey Thickness measurement requirements for steel shipsare to be carried out as applicable. Ships of recent construction will receive special consideration.

Volume 1, Part 1, Chapter 3

Section 15

75

15.2.4 During the survey, the Surveyors are to satisfy themselves regarding the workmanship and verify the approved scantlings and arrangements. For this purpose, and also in order to ascertain the amount of any deterioration of a steel ship, parts of the structure will require to be gauged as necessary. Full particulars of the anchors, chain cables and equipment are to be submitted.

15.2.5 When the full survey requirements indicated in *Vol 1, Pt 1, Ch 3, 15.2 Hull and equipment 15.2.3* and *Vol 1, Pt 1, Ch 3, 15.2 Hull and equipment 15.2.4* cannot be completed at one time, LR may consider granting an interim record for a limited period. The conditions regarding the completion of the survey will depend on the merit of each particular case, which should be submitted for consideration.

15.3 Machinery

15.3.1 Plans of the following items (plans of piping are to be diagrammatic), together with the particulars of the materials used in the construction of the boilers, air receivers and important forgings are to be submitted. Documents demonstrating compliance with appropriate Standards recognised by the Naval Authority are to be submitted. In the absence of such documentation, an appraisal may be required to the satisfaction of LR. For vessels which have generated sufficient evidence of satisfactory in-service experience LR may consider this in lieu of compliance documentation or an appraisal:

General piping system arrangements, including air and sounding pipes (Builder's plan).

Bilge, dewatering, ballast and fuel oil piping arrangements including the capacities of the pumps on bilge service.

Arrangement and dimensions of main steam pipes.

Arrangement of fuel oil pipes and fittings at settling and service tanks.

Arrangement of fuel oil piping in connection with oil burning installations.

fuel oil overflow systems, where these are fitted.

Arrangement of boiler feed systems.

fuel oil settling, service and other fuel oil tanks not forming part of the ship's structure.

Boilers, superheaters and economisers.

Air receivers.

Crank, thrust, intermediate and screw shafting.

Clutch and reversing gear with methods of control.

Reduction gearing.

Propeller (including spare propeller if supplied).

Electrical circuits, as listed in Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.4, Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.6 and Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review 1.4.7

Arrangement of compressed air systems for main and auxiliary services.

Arrangement of lubricating oil, hydraulic oil, thermal oil and other systems containing flammable liquids.

Arrangements of cooling water systems for main and auxiliary services.

Steering gear system and piping arrangements together with manufacturer, model and rating information.

Aircraft/helicopter and vehicle fuel storage and distribution systems.

Chilled water systems.

High pressure sea-water systems.

Heating and ventilation systems.

Made and fresh water systems.

Hydraulic power actuating systems.

Propulsion engine details including manufacturer, model and rating information.

Electrical generator engine details including manufacturer, model and rating information.

For **UMS** notation the following plans are to be submitted for appraisal:

- Fire alarm system.
- Instrumentation list.
- Plans for systematic maintenance and function testing.
- Test schedule.

Where an Ice Class notation is required the following plans are to be submitted for appraisal:

Volume 1, Part 1, Chapter 3

Section 16

- Main propulsion line shafting.
- Reduction gears.
- Propeller.
- Details of any clutch system in the propulsion line.

Replenishment at sea arrangements where a **RAS** notation is requested.

- 15.3.2 Plans additional to those detailed in *Vol 1, Pt 1, Ch 3, 15.3 Machinery 15.3.1* are not to be submitted unless the machinery is of a novel or special character affecting classification.
- 15.3.3 Where remote and/or automatic controls are fitted to propulsion machinery and essential auxiliaries, a description of the scheme is to be submitted.
- 15.3.4 For new ships and ships which have been in service less than two years, calculations of the torsional vibration characteristics of the propelling machinery are to be submitted for consideration, as required for ships constructed under Special Survey. For older ships the circumstances will be specially considered in relation to their service record and type of machinery installed. Where calculations are not submitted, LR may require that the machinery certificate be endorsed to this effect. When desired by the Owner, the calculations and investigation of the torsional vibration characteristics of the machinery may be carried out by LR upon special request.
- 15.3.5 The main and auxiliary machinery, feed pipes, compressed air pipes and boilers are to be examined as required at Complete Surveys. Working pressures are to be determined from the actual scantlings in accordance with the Rules.
- 15.3.6 The screwshaft is to be drawn and examined.
- 15.3.7 The steam pipes are to be examined and tested as required by Vol 1, Pt 1, Ch 3, 12 Steam pipes
- 15.3.8 The bilge, dewatering, ballast and fuel oil pumping arrangements are to be examined and amended, as necessary, to comply with the Rules.
- 15.3.9 Oil burning installations are to be examined as required at Complete Surveys and found, or modified, to comply with the requirements of the Rules; they are also to be tested under working conditions.
- 15.3.10 The electrical equipment is to be examined as required at Complete Surveys.
- 15.3.11 The whole of the machinery, including essential controls, is to be tested under working conditions to the Surveyor's satisfaction.
- 15.3.12 Relevant reports are to be prepared by the Surveyors.

■ Section 16

Classification of ships built under survey to LR Classification Rules and Regulations other than LR Naval Ship Rules and Regulations

16.1 General

- 16.1.1 When Naval ship classification is desired for an existing ship built under the supervision of LR Surveyors to Classification Rules and Regulations other than LR Naval Ship Rules, application should be made in writing.
- 16.1.2 Periodical Surveys of such ships, when classed to the LR Naval Ship Rules are subsequently to be held as in the case of ships built under survey to the Naval Ship Rules. All features of the extant survey regime for hull and machinery are to be included in the Survey scheme under the Naval Ship Rules.

16.2 Hull and equipment

16.2.1 Plans showing the features of the ship not covered by the other Classification Rules against which the ship is classed are to be submitted. These may include the following items. For these items, documents demonstrating compliance with appropriate Standards recognised by the Naval Authority are to be submitted. In the absence of such documentation, an appraisal may be required to the satisfaction of LR. For vessels which have generated sufficient evidence of satisfactory in-service experience LR may consider this in lieu of compliance documentation or an appraisal. Where an appraisal is undertaken, strength and, where appropriate, stiffness aspects are to be addressed:

Volume 1, Part 1, Chapter 3

Section 16

- Masts.
- Weapon system seats.
- RAS seats, landing areas.
- Aircraft landing guides.
- Towing points.
- Military loads.
- Beaching.
- Material grades.
- Watertight integrity.
- Strength of watertight structure.

If plans cannot be obtained or prepared by the Owner, facilities are to be given for LR's Surveyor to obtain the necessary information from the ship.

16.2.2 Suitable documentation should be presented to demonstrate that the following aspects are addressed by the appropriate Naval Authority:

- Stability.
- Magazine safety.
- Lifts, ramps, shell doors.
- Fire safety.
- 16.2.3 During the survey, the Surveyors are to satisfy themselves regarding the workmanship and verify the approved scantlings and arrangements of additional features covered by the Rules. For this purpose, and also in order to ascertain the amount of any deterioration of a steel ship, parts of the structure may need to be gauged as necessary.
- 16.2.4 When the full survey requirements indicated in *Vol 1, Pt 1, Ch 3, 7.2 Complete Survey 7.2.4* cannot be completed at one time, LR may consider granting an interim record for a limited period. The conditions regarding the completion of the survey will depend on the merit of each particular case, which should be submitted for consideration.

16.3 Machinery

- 16.3.1 Plans of systems not covered by the other Classification Rules against which the ship is classed are to be submitted to LR. For these systems, documents demonstrating compliance with appropriate Standards recognised by the Naval Authority are to be submitted. In the absence of such documentation, an appraisal may be required to the satisfaction of LR. For vessels which have generated sufficient evidence of satisfactory in-service experience LR may consider this in lieu of compliance documentation or an appraisal:
- (a) Aircraft/helicopter and vehicle fuel storage and distribution systems.
- (b) Chilled water systems.
- (c) High pressure sea-water systems.
- (d) High and low pressure compressed air systems.
- (e) Hydraulic power actuating systems.
- (f) Made and fresh water systems.
- (g) Heating, ventilation and cooling arrangements.
- (h) Replenishment at sea arrangements where a **RAS** notation is requested.
- 16.3.2 Details additional to those detailed in *Vol 1, Pt 1, Ch 3, 16.3 Machinery 16.3.1* are not to be submitted unless the machinery or installation is of a novel or special character affecting Mobility, Ship Type or Ancillary category systems for Machinery Naval Classification.
- 16.3.3 The whole of the machinery, including essential controls and safety arrangements, is to be tested to an agreed test plan under working conditions to the Surveyor's satisfaction.
- 16.3.4 Relevant reports on the submitted information and testing are to be prepared by the Surveyors.

Materials

Volume 1, Part 2, Chapter 1

Section 1

Section

7 Rules for the Manufacture Testing and Certification of Materials

Section 1

Rules for the Manufacture Testing and Certification of Materials

1.1 Reference

Please see Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2

Volume 1, Part 3, Chapter 1

Section 1

79

Section

- 7 Rules application
- 2 Direct calculations
- 3 Equivalents
- 4 Information required
- 5 **Definitions**
- 6 Building tolerances and associated repairs
- 7 Inspection and testing

■ Section 1

Rules application

1.1 General

1.1.1 The Rules apply in general to ships of normal form, proportions and speed. Although the Rules are, in general, for steel ships of all welded construction, other materials for use in the construction will be considered.

1.2 Exceptions

1.2.1 Ships of unusual form, proportions or speed, or for special or restricted service, or purposes not covered specifically by the Rules, will receive individual consideration based on the general standards of the Rules.

1.3 Loading

1.3.1 The Rules are framed on the understanding that ships will be properly handled. The Committee may require additional strengthening to be fitted in any ship which, in their opinion, would otherwise be subjected to severe stresses due to particular features of the design, or where it is desired to make provision for exceptional load or ballast conditions.

1.4 Advisory services

1.4.1 The Rules do not cover certain technical characteristics, such as stability except as mentioned in *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.8*, trim, vibration (other than local panel) and docking arrangements, etc. The Committee cannot assume responsibility for these matters but is willing to advise upon them on request.

1.5 Interpretation

- 1.5.1 The interpretation of the Rules is the sole responsibility and at the sole discretion of Lloyd's Register (hereinafter referred to as 'LR'). Where there is any doubt regarding the interpretation of the Rules it is the designers' responsibility to obtain clarification from LR prior to submission of plans and data for appraisal. Similarly, where there is any doubt regarding the interpretation of the Owners' requirements it is the designers' responsibility to obtain clarification from the Owners prior to the submission of plans.
- 1.5.2 Attention is drawn to the fact that Codes of Practice issued by IMO contain requirements which are outside classification as defined in these Rules. Whilst they may not be mandatory for naval ships they will be adopted when specified.

1.6 Aesthetics

1.6.1 LR is not concerned with the general arrangement, layout and appearance of the ship; the responsibility for such matters remains with the Builders and/or designers to ensure that the agreed specification is complied with. LR is however concerned with the quality of workmanship, in this respect the acceptance criteria as required by Rules, LR Survey Procedures or equivalent are to be complied with.

Volume 1, Part 3, Chapter 1

Section 2

1.7 Constructional configuration

1.7.1 The Rules provide for a basic structural configuration of a multi-deck or a single deck hull which includes a double bottom, or a single bottom arrangement. The structural configuration may also include a single or multiple arrangement of deck openings, and tanks.

■ Section 2

Direct calculations

2.1 General

- 2.1.1 Direct calculations may be specifically required by the Rules or may be required for ships having novel design features, as defined in *Vol 1, Pt 3, Ch 1, 1.2 Exceptions*, or may be submitted in support of alternative arrangements and scantlings. LR may, when requested, undertake calculations on behalf of designers and make recommendations in regard to suitability of any required model tests.
- 2.1.2 Where model testing is undertaken to complement direct calculations the following details would normally be required to be submitted: schedule of tests, details of test equipment, input data, analysis and calibration procedure together with tabulated and plotted output.

2.2 Submission of direct calculations

- 2.2.1 In cases where direct calculations have been carried out, the following supporting information should be submitted as applicable:
- (a) Reference to the direct calculation procedure and technical program used.
- (b) A description of the structural modelling.
- (c) A summary of analysis parameters including properties and boundary conditions.
- (d) Details of the loading conditions and the means of applying loads.
- (e) A comprehensive summary of calculation results. Sample calculations should be submitted where appropriate.
- 2.2.2 In general, submission of large volumes of input and output data associated with such programs as finite element analysis will not be necessary.
- 2.2.3 The responsibility for error free specification and input of program data and the subsequent correct transposition of output rests with the designer.

■ Section 3

Equivalents

3.1 Alternative arrangements and calculation methods

- 3.1.1 In addition to cases where direct calculations are specifically required by the Rules, LR will consider alternative scantlings which have been derived by direct calculations in lieu of specific Rule requirements. All direct calculations are to be submitted for examination.
- 3.1.2 Where calculation procedures are employed, supporting documentation is to be submitted for appraisal and this is to include details of the following:
- calculation methods;
- assumptions and references;
- loading;
- structural modelling;
- design criteria and their derivation, e.g. permissible stresses, factors of safety against plate panel instability, etc.
- 3.1.3 LR will be ready to consider the use of Builder's programs for direct calculations in the following cases:

80

Volume 1, Part 3, Chapter 1

Section 4

- (a) Where it can be established that the program has previously been satisfactorily used to perform a direct calculation similar to that now submitted.
- (b) Where sufficient information and evidence of satisfactory performance is submitted to substantiate the validity of the computation performed by the program.
- 3.1.4 Alternative arrangements or fittings which are considered to be equivalent to the Rule requirements will be accepted, in accordance with Vol 1, Pt 1, Ch 2, 3.2 Tailoring Departures from the Rules and Rule additions.
- 3.1.5 Where no special reference is made in this Part to specific requirements, the construction is to be efficient for the intended purpose and to conform to good practice.
- 3.1.6 Where items are of a novel or unconventional design or manufacture, it is the responsibility of the designer to demonstrate their suitability and equivalence to the Rule requirements.

■ Section 4

Information required

4.1 Submission of plans and data

- 4.1.1 Plans and data required to be submitted are indicated in Vol 1, Pt 4, Ch 1, 1.2 Plans and Vol 1, Pt 6, Ch 1, 2.2 Plans to be submitted.
- 4.1.2 Plans are generally to be submitted in triplicate, but one copy only is necessary for supporting documents and calculations.
- 4.1.3 Plans are to contain all necessary information to fully define the structure, including construction details, equipment and systems as appropriate.

4.2 Standard designs

- 4.2.1 Where a ship is a standard design produced in several versions, the plans and data are to clearly define the differences between each version.
- 4.2.2 Where the ship is a Builder's standard design to be built from previously approved plans and data, a schedule of applicable plans, etc. is to accompany the Request for Survey. Plans of any proposed modifications and changes to the previously approved plans are to be submitted for approval prior to the commencement of any work.
- 4.2.3 Plan approval of standard designs is only valid so long as no applicable Rule changes take place. When the Rules are amended, the plans for standard types are to be submitted for re-approval.

4.3 Plans and data to be supplied to the ship

- 4.3.1 A copy of the final Loading Manual or stability information book, (where applicable) when approved, and details of the loadings applicable to approved decks, are to be placed on board the ship.
- 4.3.2 Copies of all main scantling plans are to be readily available on board ship for the purposes of repairs, identifying materials and condition assessment.
- 4.3.3 Details of any corrosion control system fitted are to be placed on board the ship.
- 4.3.4 Where in-water surveys are required, approved plans and information covering the items detailed in *Vol 1, Pt 6, Ch 1, 2.2 Plans to be submitted* are to be placed on board.

Section 5

Definitions

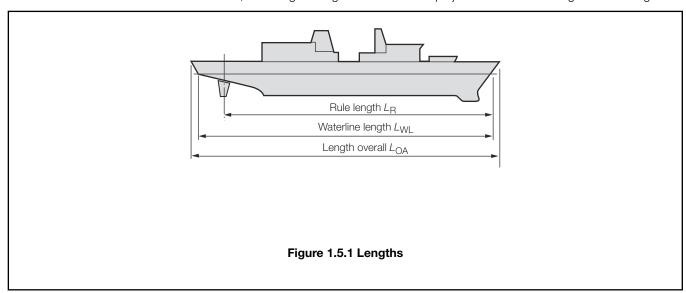

5.1 General

5.1.1 The following definitions apply except where they are inappropriate or where specifically defined otherwise.

Section 5

5.2 Principal particulars

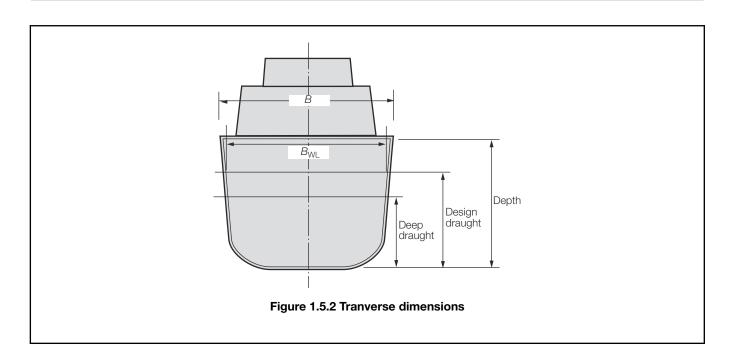

- 5.2.1 **Length waterline**, L_{WL} , is the distance, in metres, measured on a waterline at the design draught from the fore side of the stem to the after side of the stern or transom as shown in *Figure 1.5.1 Lengths*
- **Rule length**, $L_{\rm R}$, is the distance, in metres, on a waterline at the design draught from the forward side of the stem to the after side of the rudder post or to the centre of the rudder stock if there is no rudder post. $L_{\rm R}$ is to be not less than 96 per cent, and need not be greater than 97 per cent, of the extreme length on a waterline at the design draught. In vessels without rudders, the Rule length, $L_{\rm R}$, is to be taken as 97 per cent of the extreme length on a waterline at the design draught. In vessels with unusual stem or stern arrangements, the Rule length will be specially considered.
- 5.2.3 All references to longitudinal locations in the Rules are to be taken as forward of the aft end of L_R unless otherwise stated, e.g. 0,75 L_R is 75 per cent of L_R forward of the aft end of L_R .
- 5.2.4 **Length between perpendiculars**, L_{PP} , is the distance, in metres, on the waterline at the design draught from the forward to the after perpendicular.
- 5.2.5 **Forward perpendicular**, F.P., is the perpendicular at the intersection of the waterline at the design draught with the fore side of the stem.
- 5.2.6 **After perpendicular**, A.P., is the perpendicular at the intersection of the waterline at the design draught with the after side of the rudder post or to the centre of the rudder stock for vessels without a rudder post or to the intersection with the transom profile on the centreline.
- **Length overall**, L_{OA} , is the distance, in metres, measured parallel to the deep load waterline from the fore side of the stem to the after side of the stern or transom, excluding rubbing strakes and other projections as shown in *Figure 1.5.1 Lengths*.

5.2.8 **Waterline breadth**, B_{WL} , is generally the greatest moulded breadth, in metres, measured at the design draught, as shown in *Figure 1.5.2 Tranverse dimensions*.

Section 5

83

- 5.2.9 **Breadth**, *B*, is generally the greatest moulded breadth, in metres, throughout the depth of the ship or as defined in appropriate Chapters. For vessels of unusual cross-section the breadth will be specially considered.
- 5.2.10 **Depth,** D, is measured, in metres, at amidships, from top of keel plate to the moulded deck line at side on the uppermost continuous deck, or as defined in appropriate Chapters or standards. When a rounded gunwale is arranged, the depth D is to be measured to the continuation of the moulded deck line at side.
- 5.2.11 **Draught**, *T*, is the design draught, in metres, measured from moulded baseline.
- 5.2.12 **Block coefficient**, C_b , is the block coefficient at draught T corresponding to a waterline at the design draught, based on Rule length L_R and breadth B_{WL} , as follows:

$$C_b = \frac{\text{moulded displacement } (\text{m}^3) \text{ at draught } T}{L_R B_{\text{WL}} T}$$

- 5.2.13 Design draught may be determined from the waterline when the vessel is in a deep condition plus any specified margins. Where specified a higher waterline may be used.
- 5.2.14 Deep draught is measured at a displacement such that the ship is in all respects complete, and is fully loaded with full complement, stores, fuel, water and payload.
- 5.2.15 Payload is the equipment and stores that are carried by the vessel for the purposes of fulfilling its operational requirements.

5.3 Margins

- 5.3.1 Design margin is an allowance for uncertainties used in the estimation of weight for design purposes.
- 5.3.2 Build margin is an allowance for unforeseen changes that may need to be made by the builder of the vessel.
- 5.3.3 Admiralty board margin is an allowance to cater for modifications made by the Owner to the vessel or equipment during the design and build stages.
- 5.3.4 Growth margin is an allowance for future controlled and uncontrolled weight growth during the life of the ship.
- 5.3.5 In the absence of any specific requirements, the sum of the margins is be taken as 15 per cent of the displacement at the deep draught.

Section 5

5.4 Decks

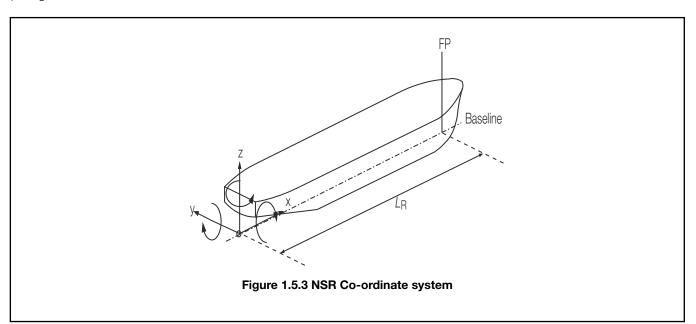

- 5.4.1 Strength deck is normally the uppermost continuous deck. Other decks may be considered as the strength deck provided that such decks are structurally effective. Where the upper deck is stepped, as in the case of vessels with a quarter deck, the strength deck is stepped, see *Vol 1*, *Pt 6*, *Ch 4*, *1 General*.
- 5.4.2 The weather deck is generally the lowest continuous deck exposed to sea and weather loads. It is to be defined at the early stages of design in conjunction with LR and the Builder.
- 5.4.3 Other decks that are exposed to sea loads are to be assessed in accordance with the requirements for weather decks.
- 5.4.4 The damage control deck is the lowest deck on which continuous fore and aft access is provided to aid communications and recovery following damage. It is normally above the lowest vertical limit of watertight integrity, the exact location being determined by the relevant subdivision and watertight integrity standard.

5.5 Co-ordinate system

5.5.1 Unless otherwise stated, the co-ordinate system is as shown in *Figure 1.5.3 NSR Co-ordinate system*, that is, a right-hand co-ordinate system with the X axis positive forward, the Y axis positive to port and the Z axis positive upwards. Angular motions are considered positive in a clockwise direction about the X, Y or Z axes.

5.6 Superstructure

5.6.1 For the purposes of strength assessment a superstructure is defined as a decked structure on the strength deck, extending from side to side of the vessel, or with its side plating being less than four per cent of the breadth, *B*, inboard of the shell plating.

5.7 Deckhouse

5.7.1 A deckhouse is in general defined as a decked structure on or above the strength deck with its side plating being four per cent or more of the breadth, *B*, inboard of the shell plating.

5.8 Weathertight

5.8.1 A boundary or closing appliance is considered weathertight if it is capable of preventing the passage of water into the ship in any sea conditions.

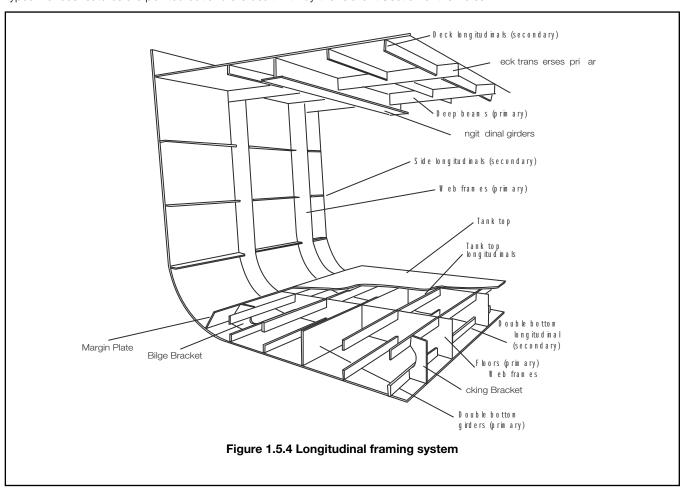

5.9 Watertight

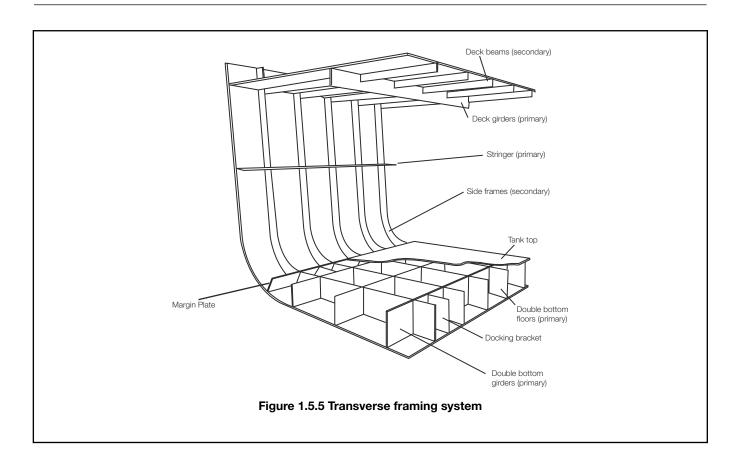

5.9.1 A boundary or closing appliance is considered watertight if it is capable of preventing the passage of water in either direction under a head of water for which the surrounding structure is designed.

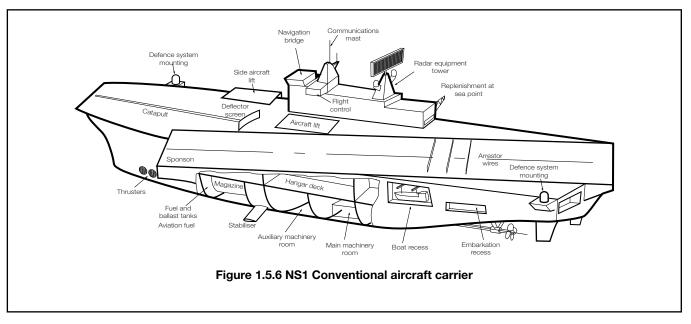

Section 5

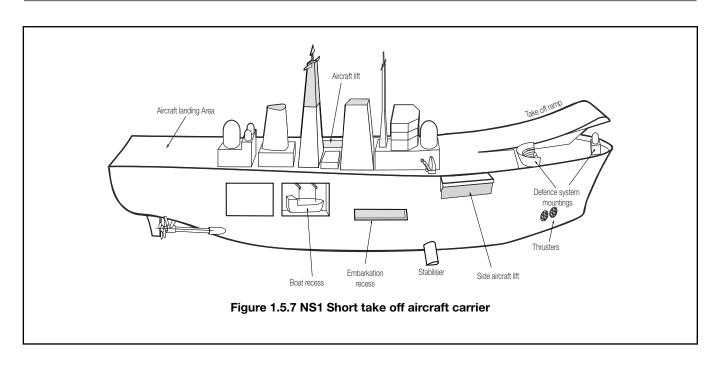

5.10 Terminology

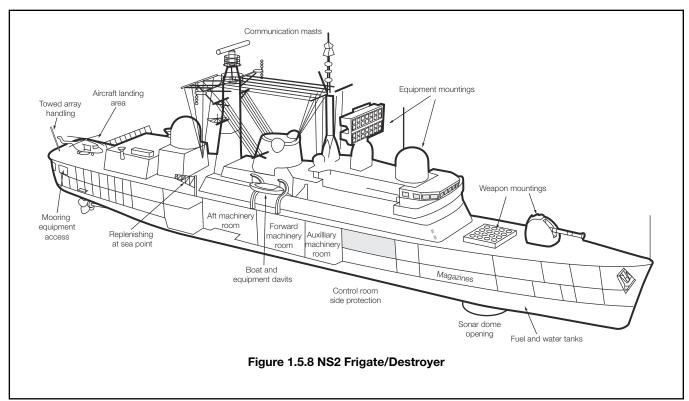

- 5.10.1 *Figure 1.5.4 Longitudinal framing system* shows the general terminology adopted for structural items for a longitudinally framed ship.
- 5.10.2 *Vol 1, Pt 3, Ch 1, 5.10 Terminology 5.10.3* shows the general terminology adopted for structural items for a transversely framed ship.
- 5.10.3 Figure 1.5.6 NS1 Conventional aircraft carrier shows the general configuration of Naval ships of the NS1 and NS2 types. Various features are pointed out and are dealt with by the relevant Section of the Rules.

5.11 Extent of watertight subdivision

- 5.11.1 The minimum extent of watertight subdivision (internal), and integrity (internal and external), is to be in accordance with the specified subdivision and stability standard(s).
- 5.11.2 The minimum extent of watertight subdivision may be defined by a combination of decks, side shell and bulkheads or by a single deck.
- 5.11.3 Weathertight and watertight fittings and closing appliances are to be fitted in accordance with the requirements of the boundary on which they are placed.

Volume 1, Part 3, Chapter 1

Section 5

5.11.4 For the calculation of watertight structural scantlings the pressure head is to be taken from the vertical limits of weathertightness determined by either intact or damage stability considerations in accordance with the specified subdivision and stability standard(s), see Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity and Vol 1, Pt 5, Ch 3, 5.5 Loads for deckhouses, bulwarks and superstructures, Pdh

5.12 Critical compartments

- 5.12.1 A critical compartment is one which, at battle stations, contains equipment or personnel without whom functions critical to combat survivability would be lost. These functions include the ability to fight, manoeuvre or communicate.
- 5.12.2 Critical compartments are typically the chart room, operations room, conning position, ship's control room and main communications office. Other compartments may be considered critical depending on ship's layout and design. The need for protecting critical compartments can be reduced by avoiding single point failure nodes and by concentrating and protecting those which cannot be avoided. A vulnerability analysis can be used to identify vulnerable critical compartments and the essential pieces of equipment or systems that are required to be protected, see *Vol 1, Pt 3, Ch 1, 2.2 Submission of direct calculations*.
- 5.12.3 Critical pipe and cable runs are routes in which the connections for survivability critical components run. They can cover individual routes or concentrated areas. An example is a run containing wave guides and signal cables for all the above water sensors on the mast.

5.13 Units system

5.13.1 Unless otherwise stated, the variables used in the Rules are expressed in the following units.

5.13.2 **General**

Distances m
Primary spacings m
Secondary spacings mm

5.13.3 Hull girder properties

 $\begin{array}{lll} \mbox{Dimensions} & \mbox{m} \\ \mbox{Area} & \mbox{m}^2 \\ \mbox{Section modulus} & \mbox{m}^3 \\ \mbox{Inertia} & \mbox{m}^4 \\ \mbox{Area-moment} & \mbox{m}^3 \end{array}$

5.13.4 **Stiffeners**

Area cm²

Dimensions mm

Inertia cm⁴

Section modulus cm³

Length/length effective m

5.13.5 **Plating**

Breadth mm Length m Thickness mm

5.13.6 **Loads**

Pressures kN/m²
Loads kN
Bending moment kN-m
Shear force kN

5.13.7 Other items

Section 6

Yield strength N/mm²
Stress N/mm²
Deflections mm
Modulus of Elasticity N/mm²

■ Section 6

Building tolerances and associated repairs

6.1 Overview

- 6.1.1 The general tolerances for new building and subsequent repairs are to be in accordance with the requirements of the *Naval Survey Guidance for Steel Ships*, or an otherwise specified and agreed standard.
- 6.1.2 Tolerances to be used for constructional misalignment for all materials are to be discussed between Owners/Builders and the Surveyor and the Standards agreed subject to the requirements of *Vol 1, Pt 3, Ch 1, 6.1 Overview 6.1.1*. The permitted degree of inaccuracy/misalignment will vary according to whether the defect is:
- (a) In primary structure.
- (b) In secondary structure.
- (c) Equipment supporting structure or underwater plate near acoustic equipment.
- (d) Aesthetically pleasing
- 6.1.3 The requirements of these Rules are primarily concerned with ensuring items Vol 1, Pt 3, Ch 1, 6.1 Overview 6.1.2 and Vol 1, Pt 3, Ch 1, 6.1 Overview 6.1.2.(b). The equipment manufacturer will be able to give advice on the maximum noise or misalignment that can be tolerated from item Vol 1, Pt 3, Ch 1, 6.1 Overview 6.1.2.(c). Aesthetics, item Vol 1, Pt 3, Ch 1, 6.1 Overview 6.1.2.(d), are at the discretion of the Owner.

■ Section 7

Inspection and testing

7.1 Overview

- 7.1.1 The general requirements for testing and inspection of structural items are to be in accordance with the requirements of *Vol 1, Pt 6, Ch 6, 7 Inspection and testing procedures* and LR's *Naval Survey Guidance for Steel Ships*.
- 7.1.2 Adequate facilities are to be provided to enable the Surveyor to carry out a satisfactory inspection and testing of all components during each stage of prefabrication and construction.

- 8 Pillars and pillar bulkheads

■ Section 1

General

1.1 Application

- 1.1.1 This Chapter illustrates the general principles to be adopted in the design of naval ships. Principles for subdivision and for maintaining watertight integrity are also covered.
- 1.1.2 Where additional requirements relating to particular ship types apply, these requirements are indicated in the appropriate Parts and are to be complied with as necessary.
- 1.1.3 These Rules are to be applied with reference to the operational conditions defined in the Concept of Operations, see *Vol* 1, *Pt* 1, *Ch* 2, 2.2 *Definitions*.

1.2 Definitions

- 1.2.1 The Down flooding angle is the least angle of heel at which openings in the hull, superstructure or deckhouses, which cannot be closed weathertight, immerse and allow flooding to occur.
- 1.2.2 The minimum required angle of down flooding, θ_{df} , is to be taken as 40° except when a higher minimum angle is required in accordance with the specified subdivision and stability standard(s), see Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.9

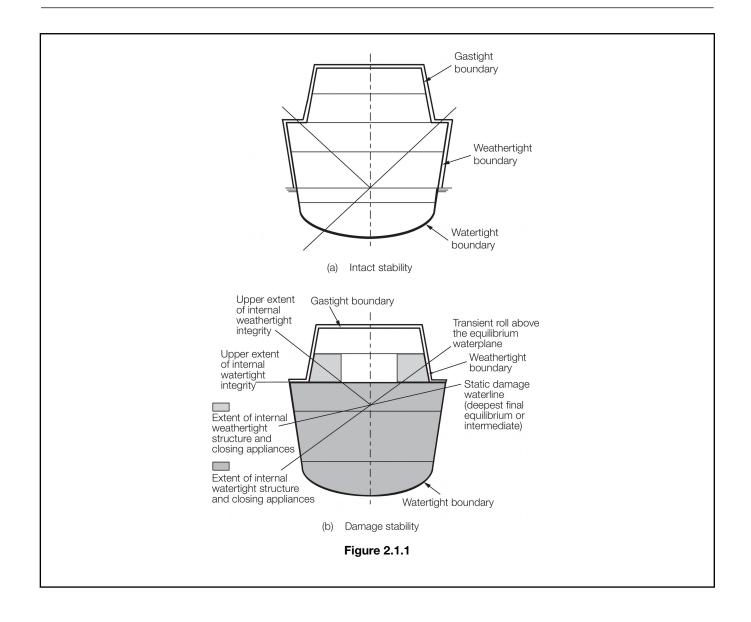

1.3 Watertight and weathertight integrity

1.3.1 The extents of the external and internal watertight and weathertight integrity are defined by the intact and damage stability requirements, see Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.9. From these extents, the design pressure heads for bulkheads and other boundaries can be derived as well as the closing arrangement requirements for openings. Weathertight and watertight integrity are defined in Vol 1, Pt 3, Ch 1, 5 Definitions and see Vol 1, Pt 3, Ch 4 Closing Arrangements and Outfit for the requirements for closing arrangements.

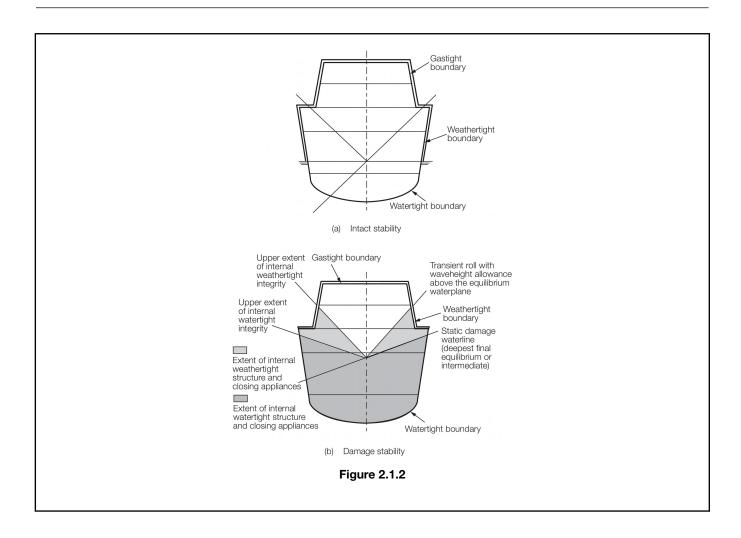

1.3.2 **Intact stability**

1.3.3 Intact stability calculations to satisfy the applicable criteria may be based on the buoyancy of the main hull, together with any superstructures that have watertight and weathertight boundaries, see *Figure 2.1.1* and *Figure 2.1.2*.

Section 1

Section 1

- 1.3.4 Doors, hatches, ventilators, windows, sidelights, etc. provided with closing appliances which can be secured weathertight, and small openings through which progressive flooding cannot take place are not considered as down flooding points.
- 1.3.5 If the angle of down flooding is less than θ_{df} , see Vol 1, Pt 3, Ch 2, 1.2 Definitions 1.2.2, with the ship at its design draught, it is necessary to establish whether there is sufficient area under the righting lever curve up to the angle of down flooding. If there is insufficient area, then the opening which is causing down flooding to occur is to be provided with a weathertight closing appliance, or be repositioned.

1.3.6 **Damage stability**

- 1.3.7 Typically there are two approaches to defining the limits of watertight and weathertight integrity:
- (a) One where the watertight integrity is defined by the bulkhead or freeboard deck, in accordance with normal SOLAS International Convention for the Safety of Life at Sea requirements.
- (b) The other is based on watertight integrity up to a damaged stability draft and heel envelope, the latter is commonly used by Navies.

These two approaches are illustrated in Figure 2.1.1 and Figure 2.1.2 respectively.

- 1.3.8 Figure 2.1.1 represents the SOLAS International Convention for the Safety of Life at Sea style requirements.
- Below the limit of watertight integrity the boundary structure is to be watertight.
- Below the limit of weathertight integrity defined by the transient roll angle the boundary structure is to be weathertight, in order to prevent ingress of water into the enclosed volume considered buoyant in the stability calculations and prevent downflooding.
- Above the limit of weathertight integrity the boundary structure, or some other internal boundary, may need to be gas-tight for CBRN protection.

92

Volume 1, Part 3, Chapter 2

Section 1

- Below the limit of watertight integrity defined by the top of the watertight bulkhead, the bulkhead is to be designed as watertight.
- Below the limit of weathertight integrity defined by the transient roll angle and above the limit of watertight integrity the internal structure is to be designed to prevent progressive flooding of water into other compartments.
- 1.3.9 Figure 2.1.2 represents a standard based on damaged stability draft and heel envelope approach commonly used by Navies.
- Below the limit of watertight integrity the boundary structure is to be watertight.
- Below the limit of weathertight integrity defined by the transient roll angle the boundary structure is to be weathertight.
- Above the limit of weathertight integrity the boundary structure, or some other internal boundary, may need to be gastight for CBRN protection.
- Below the limit of watertight integrity defined by the locii of static damage waterlines the watertight bulkheads are to be designed as watertight.
- Below the limit of weathertight integrity defined by the transient roll angle and above the limit of watertight integrity the internal structure is to be weathertight in order to prevent progressive flooding of water into other compartments.
- 1.3.10 In the absence of specific information on the vertical limit of watertight integrity, the upper extent of the watertight boundary may be assumed with the apex of the triangle on the damage control deck at the location under consideration, see Figure 2.1.2 and Vol 1, Pt 3, Ch 1, 5.4 Decks 5.4.4.

1.4 Structural redundancy

- 1.4.1 The role and duty of a naval ship dictates that a certain degree of structural redundancy should be incorporated in the design. It is recommended that, as a minimum standard, a basic level of structural redundancy is included where practicable. This is normally achieved by considering likely damage scenarios, identifying the effects on structure, assessing the new loads and ensuring that the remaining structure will be satisfactory.
- 1.4.2 These Rules will not automatically ensure that a ship has structural redundancy. It is the responsibility of the designer to consider and design for the possible loads on a structure from damage scenarios. The **RSA** notation can be used to define residual strength requirements.
- 1.4.3 At a very basic level structural redundancy can be achieved by considering the removal of appropriate items of structure and re-evaluating the strength of remaining members using the loads presented in these Rules. Alternatively, the overall structural redundancy can be formally assessed and a notation assigned using the residual strength analysis detailed in *Vol 1*, *Pt 3*, *Ch 2*, *1.5 Residual Strength Assessment, RSA*.

1.5 Residual Strength Assessment, RSA

- 1.5.1 The design of a naval ship necessitates the reliable evaluation of its structural vulnerability to ensure the existence of adequate residual strength in the event of structural damage following a contact/collision incident or as a result of wartime activities. This strength assessment is additional to that required to cope with the design bending moments derived from environmental sea-state loading. The **RSA** notation within the Rules may be used to formally assess the overall structural redundancy.
- 1.5.2 The Owner may specify that a residual strength assessment is not required. In this case, the residual strength notation and all other notations which require the residual strength notation will not be assigned.
- 1.5.3 The capability to survive is to be judged on the residual structural strength after damage being able to meet specified global strength requirements and also local strength requirements in the event of damage leading to flooding, see *Vol 1*, *Pt 6*, *Ch 4*, *4 Residual Strength Assessment*, *RSA*.
- 1.5.4 A residual strength assessment performed as defined in the Rules assumes that a ship can remain operational for a limited period of time in reduced sea states, see Vol 1, Pt 6, Ch 4, 1.2 Hull girder strength notations. Where a higher operational capability following damage is specified, special consideration will need to be given and revised criteria set.
- 1.5.5 The Owner may specify an alternative mission statement, in which case the requirements of the residual strength assessment procedure will be modified.
- 1.5.6 The residual strength assessment as defined in the Rules considers three main definitions of damage:
- Peacetime damage extents, see Vol 1, Pt 6, Ch 4, 2 Hull girder strength.
- Military threats, see Vol 1, Pt 4, Ch 2, 7 Residual strength

Volume 1, Part 3, Chapter 2

Section 2

- As defined by the Owner.
- 1.5.7 The environmental parameters for the residual strength assessment procedure are given in Vol 1, Pt 5, Ch 2 Environmental Conditions. The local and global loads for use in the **RSA** assessment procedure are given in Vol 1, Pt 5, Ch 3, 5 Local design loads for decks and bulkheads and Vol 1, Pt 5, Ch 4, 5 Residual strength hull girder loads respectively.
- 1.5.8 **RSA** notation assessment levels are given in *Vol 1, Pt 4, Ch 2, 7 Residual strength*. The acceptance criteria and procedures to be adopted for the application of the residual strength notation are given in *Vol 1, Pt 6, Ch 4, 4 Residual Strength Assessment, RSA. See also Vol 1, Pt 1, Ch 2, 3.6 Service area notations 3.6.1.*
- 1.5.9 Further guidance for undertaking residual strength analysis for the determination of a residual strength notation is given in LR's Naval Ship Guidance Notes.

■ Section 2

Rule structural concept

2.1 General

- 2.1.1 The Rules are based on the concept that the structural and watertight integrity and general safe operation of the ship will not be compromised by static and dynamic loads experienced during normal operating conditions.
- 2.1.2 For derivation of scantlings of stiffeners, beams, girders, etc. the formulae in the Rules are normally based on elastic or plastic theory using simple beam models supported at one or more points and with varying degrees of fixity at the ends, associated with an appropriate concentrated or distributed load. Alternative methods will be considered.

2.2 Scantlings

- 2.2.1 Scantlings are generally based on the strength required to withstand loads imposed by the sea, payload, ballast, fuel and other operational loads. However, the Rules assume that the nature and stowage of the payload, ballast, etc. are such as to avoid excessive structural stresses, and deformation.
- 2.2.2 The design loads and pressures given in *Vol 1, Pt 5 Environmental Loads* are to be used with scantling formulae or direct calculation methods to derive scantlings based on maximum allowable stress or other suitable strength criteria.
- 2.2.3 Hull structural vibration resulting from cyclic loadings arising from the sea and other sources are to be such that the normal operation and structural integrity of the ship are not impaired.
- 2.2.4 Static loads are based on standard conditions defined in *Vol 1, Pt 5 Environmental Loads*, or determined from loading conditions submitted by the Builder.
- 2.2.5 Dynamic loadings are examined for both the local and global structures. These loadings are based upon the designer's stated operational and environmental conditions or the Rule minimum criteria, whichever is the greater.
- 2.2.6 Wave induced loads are considered both in the static condition, i.e. hydrostatic and pitching pressures, and in the dynamic mode, i.e. impact, slamming and hogging and sagging wave loading conditions.
- 2.2.7 Hull girder strength will in general require to be investigated dependent upon the length, configuration, proportions, proposed scenarios, etc. of the ship.
- 2.2.8 Structure in way of Replenishment at Sea, **RAS**, positions, cranes, heavy lift route points, weapon handling, etc. are to be designed in accordance with *Vol 1*, *Pt 4*, *Ch 1*, *5 Military design requirements*. The equipment is to be designed in accordance with a specified standard(s), see *Vol 1*, *Pt 1*, *Ch 2*, *1 Conditions for Classification*.
- 2.2.9 Scantling requirements in respect of miscellaneous items of structure such as local foundations, base plates, insert plates, bollards, etc. are not specifically indicated within these Rules. However, the acceptance of such items will be specially considered on the basis of experience, good practice and direct calculation where appropriate.

2.3 Definitions and structural terms

2.3.1 For the purpose of clarifying the nomenclature of items of structure referred to throughout the Rules, the following definitions are given:

Volume 1, Part 3, Chapter 2

Section 3

- Secondary members are stiffeners supporting shell, deck or bulkhead plating, e.g. side/bottom/deck longitudinals, frames and beams, and transverse/ longitudinal bulkhead stiffeners.
- Primary members are those members supporting secondary members and will be the predominant members in grillage systems, e.g:
 - Bottom structure floors, bottom and inner bottom transverse and girders.
 - Deck structure deck transverses and girders.
 - Side structure side transverses and side stringers.
 - Bulkheads vertical webs and bulkhead stringers.

Deep web frames are members supporting primary members between bulkheads or decks, where additional support is necessary.

- 2.3.2 The fore end region structure is considered to include all structure forward of 0,7L _B.
- 2.3.3 The aft end region structure is considered to include all structure aft of $0.3L_{\rm R}$.
- 2.3.4 Critical structure is structure where the loss of a single element, such as a pillar, or section of deck or bulkhead between primary members, could lead to a collapse of the hull girder or a main deck.

■ Section 3

Main hull structure

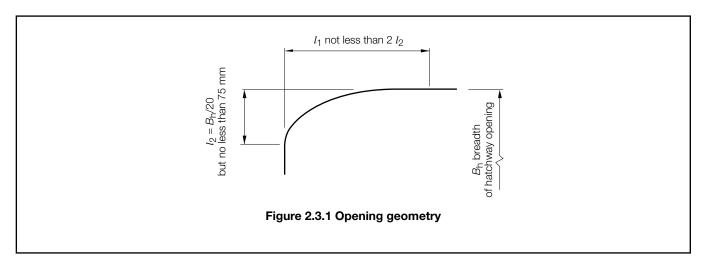

3.1 General

- 3.1.1 The Rules are formulated to provide for scantling derivation for designs comprising the following structural framing systems. Details of the requirements are given in *Vol 1, Pt 6, Ch 2 Design Tools*.
- (a) Primary/secondary stiffener systems where, due to the relative differences in stiffness of the members, the secondary members are considered to act independently of, and are supported by, the primary members.
- (a) Grillage systems where the relative stiffness of the orthogonal stiffening is similar and work together to support the applied loads. The grillage system is in turn supported by major structural members such as bulkheads or decks.
- 3.1.3 For practical reasons of fabrication and continuity of structure, orthogonal systems using members of the same depth should not be employed. A minimum web depth difference of 40 mm is generally to be used to allow for the passage through the web at the intersections.
- 3.1.4 It is recognised that there will be a reduction in transverse 'racking' strength in association with the grillage stiffening system where the predominantly stiffer transverse web of the primary/secondary system is missing. In large areas of grillage systems the 'racking' strength, therefore, will be specially considered.
- 3.1.5 For NS1 and NS2 ships, longitudinal framing, in general, is to be adopted in the bottom shell, decks and inner bottom, with transverse or longitudinal framing at the side shell and longitudinal bulkheads. In NS3 ships, transverse or longitudinal framing may be universally adopted.
- 3.1.6 The adopted framing system whether longitudinal or transverse is required to be continuous. Where it is impracticable to comply with these requirements or where it is proposed to terminate the framing structure in way of other primary members such as the transom, bulkheads or integral tank boundaries, they are to be bracketed in way of their end connections to maintain the continuity of structural strength. Particular care is to be taken to ensure accurate alignment of the brackets. Brackets are in general to have soft toes and to terminate on structure that is capable of supporting the transmitted bending moment and forces.
- 3.1.7 The arrangement of the connection between any stiffener and bracket is to be such that at no point in the connection are the section modulus and inertia reduced to less than that of the stiffener with associated plating.
- 3.1.8 The arrangement of material is to be such as will ensure structural continuity. Abrupt changes of shape or section, sharp corners and points of stress concentration are to be avoided.
- 3.1.9 Where members abut on both sides of a bulkhead or similar structure, care is to be taken to ensure good alignment and continuity of strength.
- 3.1.10 The fitting of pillar bulkheads is preferable to pillars. The fitting of pillars is to be avoided in hangar and vehicle decks and where connected to the inner bottom. Where enhanced shock and blast requirements are specified, only pillar bulkheads may be

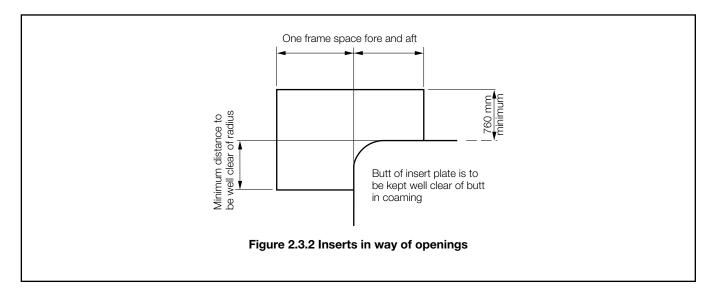

Section 3

fitted. When fitted, pillars and pillar bulkheads are to be in the same vertical line wherever possible, and elsewhere arrangements are to be made to transmit the out of line forces satisfactorily. The load at head and heel of pillars is to be effectively distributed and arrangements are to be made to ensure the adequacy and lateral stability of the supporting members.

- 3.1.11 End connections of structural members are to provide adequate end fixity and effective distribution of the load into the supporting structure.
- 3.1.12 The corners of large openings in the shell and decks from $0.25L_{\rm R}$ to $0.75L_{\rm R}$ are to be elliptical, parabolic or circular. Where predominantly unidirectional stress fields are anticipated, elliptical or parabolic corners are recommended. Where biaxial or torsional stress fields are expected, circular corners are recommended.
- 3.1.13 Where elliptical corners are arranged the major axis is to be fore and aft, the ratio of the major to minor axis is to be not less than 2 to 1 nor greater than 2,5 to 1, and the minimum half-length of the major axis is to be defined by I_1 in Figure 2.3.1 Opening geometry Where parabolic corners are arranged, the dimensions are also to be as shown in Figure 2.3.1 Opening geometry. An increase in plate thickness will not generally be required.

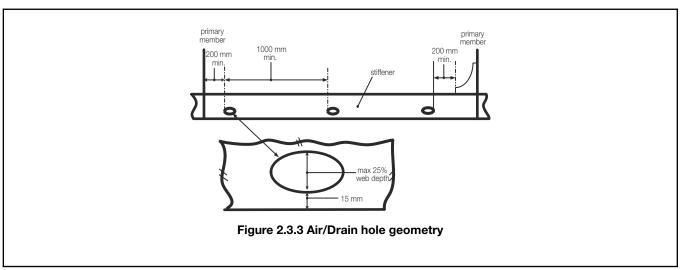

3.1.14 Where circular corners are arranged, a radius not less than 1/20 of the breadth of the opening is to be used with a minimum of 75 mm. For circular corners, inserts of the size and extent shown in *Figure 2.3.2 Inserts in way of openings* will, in general, be required. The thickness of insert plates is to be not less than 25 per cent greater than the adjacent plating with a minimum increase of 4 mm. The increase need not exceed 7 mm.

3.1.15 For other shapes of corner, inserts of the size and extent shown in *Figure 2.3.2 Inserts in way of openings* will, in general, be required.

Section 3

- 3.1.16 Manholes, lightening holes and other cut-outs are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are not to be cut in vertical or horizontal diaphragm plates in narrow cofferdams or in floors and double bottom girders close to their span ends, or below the heels of pillars, unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory. The sizes of openings are to be in accordance with *Vol* 1, *Pt* 3, *Ch* 2, 3.2 *Primary members* 3.2.9.
- 3.1.17 Manholes, lightening holes and other openings are to be suitably framed and stiffened where necessary.
- 3.1.18 Provision is made for the free passage of air and water taking into account the pumping rates required.
- 3.1.19 Particular care is to be given to the positioning of drain holes to reduce stress concentrations and ensure adequate drainage from all parts of the ship's hull to the suctions. They are to be placed as close to the bottom as practicable.
- 3.1.20 Suitable arrangements are to be made to provide free passage of air from all parts of tanks to the air pipes. They are to be placed as close to the top of the tank as practicable. Air pipes of sufficient number and area are to be fitted to each tank in accordance with *Vol 1*, *Pt 3*, *Ch 4*, *7 Air and sounding pipes*.
- 3.1.21 Air and drain holes, notches and scallops are to be kept at least 200 mm clear of the toes of end brackets and other areas of high stress. Openings are to be well rounded with smooth edges. Closely spaced scallops are not permitted.
- 3.1.22 Widely spaced air or drain holes, cut entirely in the web adjacent to, but clear of the welded connection, may be accepted, provided that they are of elliptical shape, or equivalent, to minimise stress concentrations, see *Figure 2.3.3 Air/Drain hole geometry*

3.2 Primary members

- 3.2.1 The following guidelines for the design of primary members are to be adopted. Scantling requirements for primary members are given in *Vol 1, Pt 6, Ch 3 Scantling Determination*.
- 3.2.2 Primary members are to be so arranged as to ensure effective continuity of strength, and abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead, or on other members, arrangements are to be made to ensure that they are in alignment. Primary members are to form a continuous line of support and, wherever possible, a complete ring system.
- 3.2.3 Primary members are to have adequate lateral stability and web stiffening and the stiffening structure is to be arranged to minimise hard spots and other sources of stress concentration.
- 3.2.4 Primary members are to be provided with adequate end fixity by end brackets or equivalent structure. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint and effective distribution of the load from the member. Where a deck girder or transverse is connected to a vertical member on the shell or bulkhead, the scantlings of the latter may be required to be increased to provide adequate stiffness to resist rotation of the joint.

Volume 1, Part 3, Chapter 2

Section 3

- 3.2.5 Where the primary member is supported by structure which provides only a low degree of restraint against rotation, the member is generally to be extended beyond the point of support and thereafter tapered and/or scarfed into the adjacent structure over a distance generally not less than two frame spaces.
- 3.2.6 Where primary members are subject to concentrated loads, particularly if these loads are out of line with the member web, additional strengthening may be required.
- 3.2.7 Where a member is continued over a point of support, such as a pillar or pillar bulkhead stiffener, the design of the end connection is to be such as to ensure the effective distribution of the load into the support. Brackets are generally required but alternative arrangements will be considered.
- 3.2.8 The thickness of the brackets supporting primary members is to be not less than that of the primary member web. The free edge of the bracket is to be stiffened.
- 3.2.9 Where openings are cut in the web or primary members, the depth of opening is not to exceed 50 per cent of the web depth, and the opening is to be so located that the edges are not less than 25 per cent of the web depth from the face plate. The length of opening is not to exceed the web depth or 60 per cent of the secondary member spacing, whichever is the greater, and the ends of the openings are to be equidistant from the corners of cut-outs for secondary members. Where larger openings are proposed, the arrangements and compensation required will be specially considered.
- 3.2.10 Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the panel in which they are situated.
- 3.2.11 Cut-outs for the passage of secondary members are to be designed to minimise the creation of stress concentrations. The breadth of cut-out is to be kept as small as practicable and the top edge is to be rounded, or the corner radii made as large as practicable. The extent of the direct connection to the web plating, or the scantlings of lugs or collars, is to be sufficient for the loads to be transmitted from the secondary member, see also Vol 1, Pt 6, Ch 6, 6.5 Arrangement at intersection of continuous secondary and primary members
- 3.2.12 Stiffeners in areas likely to experience slamming, impact or dynamic loads are to be lugged or bracketed to the web of the primary member at their intersections, see also Vol 1, Pt 6, Ch 6, 6.5 Arrangement at intersection of continuous secondary and primary members

3.3 Shell plating

- 3.3.1 Scantling requirements for shell plating are given in Vol 1, Pt 6, Ch 3, 5 Shell envelope plating.
- 3.3.2 The sheerstrake is generally to be taken as the side shell, locally reinforced in way of deck/hull connection. The amount of local reinforcement will be dependent upon the arrangement of structure and the proposed service.
- 3.3.3 In general, openings are not to be cut in the sheerstrake; however, if operational requirements dictate, openings that are less than 20 per cent of the depth of the sheerstrake may be accepted. Openings greater than 20 per cent of the depth of the sheerstrake will require special consideration.
- 3.3.4 Where large side shell openings, such as side aircraft lifts, are proposed, detailed calculations are to be submitted.
- 3.3.5 Where rounded gunwales are fitted, arrangements are to ensure a smooth transition from rounded gunwale to angled gunwale.
- 3.3.6 At the ends of superstructures where the side plating is extended and tapered to align with the bulwark plating, the transition plating is to be suitably stiffened and supported. Where freeing ports or other openings are essential in this plate, they are to be suitably framed and kept well clear of the free edge.
- 3.3.7 Sea-inlets, or other openings, are to have well rounded corners and, so far as is practicable, are to be kept clear of the bilge radius, chine or radiused sheerstrake. Arrangements are to be made to maintain the strength in way of the openings. Additional thickness is to be required in accordance with *Vol 1, Pt 6, Ch 3, 5.7 Sea inlet boxes*. Adequate provision is to be taken to prevent local resonance problems. Additional guidance for the design of sea-inlets or other openings, is given in *Vol 1, Pt 4, Ch 1, 8 Design guidance for the reduction of radiated noise underwater due to sea-inlets or other openings*.
- 3.3.8 Openings on or near the bilge radius may be accepted provided that they are of elliptical shape, or equivalent, to minimise stress concentrations and are, in general, to be kept clear of weld connections.
- 3.3.9 The scantlings of appendages (e.g. 'A' brackets) are covered in *Vol 1, Pt 3, Ch 3 Ship Control Systems*. However, in way of the hull penetrations, particular care will be required to be given to the strength and watertight integrity of the shell.

Volume 1, Part 3, Chapter 2

Section 3

3.4 Shell framing

- 3.4.1 The scantlings of shell structure are to be determined in accordance with Vol 1, Pt 6, Ch 3, 6 Shell envelope framing
- 3.4.2 Longitudinal framing is, in general, to be adopted in the bottom, but special consideration will be given to proposals for transverse framing in this region, see *Vol 1*, *Pt 3*, *Ch 2*, *3.1 General 3.1.5*
- 3.4.3 For NS1 and NS2 ships, the bottom and side longitudinals are to be continuous in way of both watertight and non-watertight floors, but equivalent arrangements will be specially considered.
- 3.4.4 Bottom and side longitudinals are to be supported by primary transverse structure such as bottom transverses, floors or bulkheads, generally spaced not more than 2,5 m apart in NS1 and NS2 ships, and 1,5 m in NS3 ships.
- 3.4.5 Bottom and side transverses, where fitted, are to be continuous and substantially bracketed at their end connections to side and deck transverses and bottom floors.
- 3.4.6 Bottom and side frames are to be effectively continuous and bracketed at their end connections to side frames, deck beams and bottom floors as appropriate. Side frames are to be supported by decks or stringers spaced not more than three metres apart.
- 3.4.7 Bottom girders and side stringers supporting transverse frames are to be continuous through transverse bulkheads and supporting structures. They are to be supported by deep transverse web frames, floors, bulkheads, or other primary structure, generally spaced not more than three metres apart.
- 3.4.8 For primary members the web stability, openings in the web and continuity and alignment are to be in accordance with *Vol 1, Pt 3, Ch 2, 3.2 Primary members 3.2.9*
- 3.4.9 For ships intended for beach landing operations, see Vol 1, Pt 4, Ch 2, 8 Strengthening requirements for beach landing operations.
- 3.4.10 For berthing and docking requirements, see Vol 1, Pt 3, Ch 5, 11 Launch and recovery, berthing and dry-docking arrangements
- 3.4.11 Where the shell framing is of unusual design or proportions, the scantlings are to be determined by direct calculation.

3.5 Single bottom structure

- 3.5.1 Scantling requirements for single bottom structure are given in Vol 1, Pt 6, Ch 3, 7 Single bottom structures.
- 3.5.2 The requirements of this section provide for single bottom construction in association with transverse and longitudinal framing systems, see *Vol* 1, *Pt* 3, *Ch* 2, 3.1 *General* 3.1.5
- 3.5.3 All girders are to extend as far forward and aft as necessary and care is to be taken to avoid any abrupt discontinuities. Where girders are cut at bulkheads, alignment and longitudinal strength are to be maintained.
- 3.5.4 Particular care is to be taken to ensure that the continuity of structural strength in way of the intersection of transverse floors and longitudinal girders is maintained. The face flats of such stiffening members are to be effectively connected.
- 3.5.5 The single bottom structure in way of the keel and girders is to be sufficient to withstand the forces imposed by drydocking the ship, see *Vol 1, Pt 4, Ch 2, 8 Strengthening requirements for beach landing operations*
- 3.5.6 A continuous centreline girder is, in general, to be fitted in all ships throughout the length of the hull as far forward and aft as practicable.
- 3.5.7 Where the floor breadth at the upper edge exceeds 6,0 m, side girders are to be fitted at each side of the centre girder such that the spacing between the side and centre girders or between the side girders themselves is not greater than 3 m. In general, side girders where fitted are to be continuous, extend as far forward and aft as practicable and to terminate in way of bulkheads, deep floors or other primary transverse structure. In addition, continuous intercostal longitudinal stiffeners are to be fitted where the panel size exceeds the ratio 4 to 1.
- 3.5.8 In ships with a transversely framed bottom construction, the bottom shell plating is, in general, to be reinforced with additional continuous, or intercostal, longitudinal stiffeners. Alternative arrangements to be considered.
- 3.5.9 For ships intended for beach landing operations, see Vol 1, Pt 4, Ch 2, 8 Strengthening requirements for beach landing operations
- 3.5.10 In longitudinally framed ships, plate floors are to be fitted as given in Vol 1, Pt 3, Ch 2, 3.4 Shell framing 3.4.4. The connections with side transverse web frames are to be as required by Vol 1, Pt 3, Ch 2, 3.4 Shell framing 3.4.6. Additional

Volume 1, Part 3, Chapter 2

Section 3

transverse floors or webs are in general to be fitted at the half spacing of primary transverse structure in way of engine seatings, thrust bearings, pillars, skegs, bilge keels and the bottom of the ship forward.

- 3.5.11 The tops of the floors may be level from side to side. However, in ships having considerable rise of floor the depth of floors may require to be increased to maintain the required section modulus.
- 3.5.12 In general, the floors in way of the sterntubes, shaft brackets, etc. are to provide effective support for these items.

3.6 Double bottom structure

- 3.6.1 Scantlings of double bottoms are to be in accordance with Vol 1, Pt 6, Ch 3, 8 Double bottom structures.
- 3.6.2 Double bottoms are in general to be fitted in NS1 ships and are to extend from the collision bulkhead to the aft peak bulkhead, as far as this is practicable within the design and proper working of the ship. The specified subdivision and stability standard may contain additional requirements for the height and extent of the double bottom.
- 3.6.3 A double bottom is generally not required in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not thereby impaired. Suitable scarfing arrangements are to be made to maintain continuity of the inner bottom.
- 3.6.4 The inner bottom is to be continued to the ship's side as far as practicable, in such a manner as to protect the bottom to the turn of bilge or chine.
- 3.6.5 The centreline girder and side girders are to extend as far forward and aft as practicable and care is to be taken to avoid any abrupt discontinuities. Where girders are cut at bulkheads, their alignment and longitudinal strength are to be maintained.
- 3.6.6 Small wells constructed in the double bottom structure are not to extend in depth more than necessary. A well extending to the outer bottom may, however, be permitted at the after end of the shaft tunnel of the ship. Other well arrangements (e.g. for lubricating oil under main engines) may also be considered provided they give protection equivalent to that afforded by the double bottom.
- 3.6.7 Sufficient manholes are to be cut in the inner bottom, floors and side girders to provide adequate access to, and ventilation of, all parts of the double bottom. Openings are to be in accordance with Vol 1, Pt 3, Ch 2, 3.2 Primary members 3.2.9
- 3.6.8 The number and position of manholes are to be such that access under service conditions is neither difficult nor dangerous.
- 3.6.9 Manholes and their covers are to be of an approved design or in accordance with a recognised National or International Standard.
- 3.6.10 Provision is to be made for the free passage of air and water from all parts of the tanks to the air pipes and suctions, account being taken of the pumping rates required.
- 3.6.11 Adequate access is also to be provided to all parts of the double bottom for future maintenance, surveys and repairs. The edges of all openings are to be smooth.
- 3.6.12 A plan showing the location of manholes and access openings within the double bottoms is to be submitted.
- 3.6.13 Manholes, lightening holes and other cut-outs are to be avoided in way of concentrated loads and areas of high shear. Details are given in *Vol 1, Pt 3, Ch 2, 3.1 General 3.1.16*
- 3.6.14 Air and drain holes, notches and scallops are to be in accordance with Vol 1, Pt 3, Ch 2, 3.1 General 3.1.8
- 3.6.15 The Rules are formed on the basis that access to double bottoms will be by means of manholes with bolted covers. However, alternative arrangements will be specially considered.
- 3.6.16 In way of ends of floors and girders and transverse bulkheads, the number and size of holes are to be kept to a minimum, the openings are to be circular or elliptical and edge stiffening may be required.
- 3.6.17 Holes are not to be cut in the centre girder, except in tanks at the forward and after ends of the ship or where tank widths are reduced unless additional stiffening and/or compensation is fitted to maintain the structural integrity.
- 3.6.18 Centreline and side girders are to be continuous and sufficient to withstand the forces imposed by dry-docking the ship, see *Vol 1, Pt 4 Military Design and Special Features*. Vertical stiffeners are to be fitted at every bracket floor.
- 3.6.19 Where the breadth of floor is greater than 6,0 m, additional side girders having the same thickness as the floors are to be fitted. The number of side girders is to be such that the distance between the side girders and centre girder and margin plate, or between the side girders themselves, does not exceed 3,0 m (for transversely framed ships, 5,0 m for longitudinally framed ships).

Volume 1, Part 3, Chapter 2

Section 3

- 3.6.20 Side girders where fitted are to extend as far forward and aft as practicable and are in general to terminate in way of bulkheads, deep floors or other primary transverse structure.
- 3.6.21 Plate floors are, in general, to be continuous between the centre girder and the margin plate. Vertical stiffeners are to be fitted to the floors, the number and positions of these stiffeners being dependent on the arrangement of the double bottom structure.
- 3.6.22 In longitudinally framed ships, plate floors or equivalent structure are, in general, to be fitted in accordance with *Vol 1, Pt 3, Ch 2, 3.4 Shell framing 3.4.4* and additionally at the following positions:
- (a) At every half spacing of primary transverse structure as given in Vol 1, Pt 3, Ch 2, 3.4 Shell framing 3.4.4, in way of the bottom of the ship forward of 0,8L R.
- (b) Underneath pillars and bulkheads.
- 3.6.23 In transversely framed NS3 ships, plate floors are to be fitted at every frame in the engine room, under bulkheads, in way of change in depth of double bottom and elsewhere at a spacing not exceeding 1,5 m.
- 3.6.24 Between plate floors, the shell and inner bottom are to be supported by bracket floors. The brackets are to have the same thickness as plate floors and are to be stiffened on the unsupported edge.
- 3.6.25 In longitudinally framed ships, the bracket floors are to extend from the centre girder and margin plate to the adjacent longitudinal, but in no case is the breadth of the bracket floor to be taken as less than 75 per cent of the depth of the centre girder. They are to be fitted at every frame at the margin plate, and those at the centre girder are to be spaced not more than 1,0 m apart.
- 3.6.26 In transversely framed ships, the breadth of the bracket floors, attaching the bottom and inner bottom frames to the centre girder and margin plate, is to be not less than 75 per cent of the depth of the centre girder, see *Figure 1.5.5 Transverse* framing system.
- 3.6.27 Inner bottom longitudinals are to be supported by inner bottom transverses, floors, bulkheads or other primary structure, generally spaced not more than 2,5 m apart in NS1 and NS2 ships, and 1,5 m in NS3 ships.
- 3.6.28 The inner bottom longitudinals are to be continuous through the supporting structure.
- 3.6.29 Inner bottom transverses are to be continuous and to be substantially bracketed at their end connections to bottom transverses, bottom floors and tank side brackets.
- 3.6.30 In general, whilst the fitting of pillars connecting to the inner bottom is to be avoided, where they are fitted, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Manholes are not to be cut in the floors and girders below the heels of pillars. Where longitudinal framing is adopted in the double bottom, equivalent stiffening under the heels of pillars is to be provided. Where the heels of pillars are carried on a tunnel, suitable arrangements are to be made to support the load.
- 3.6.31 Double bottoms are to be tested in accordance with the requirements of Vol 1, Pt 6, Ch 6, 7 Inspection and testing procedures of the Rules.
- 3.6.32 The Rules are formed on the basis that access to double bottoms will be by means of manholes with bolted covers. However, alternative arrangements will be specially considered.

3.7 Deck structure

- 3.7.1 Scantlings of decks are to be in accordance with the requirements of Vol 1, Pt 6, Ch 3, 10 Deck structures.
- 3.7.2 Where an inner bottom is not fitted, consideration of the ship's stability and strength following bottom damage is required. It may be appropriate to consider designing the lowest deck to be watertight. This is to be determined in conjunction with the damage stability analysis, assuming bottom damage.
- 3.7.3 The deck plating is to be supported by transverse beams with fore and aft girders; by longitudinals with deck transverses, or alternatively, by a grillage system of orthogonal and primary structure as provided for in *Vol 1, Pt 3, Ch 2, 3.1 General 3.1.1* The transverse beams and deck transverses are to align with side main frames and side transverses respectively. For NS1 and NS2 ships, longitudinal framing is generally to be adopted, see *Vol 1, Pt 3, Ch 2, 3.1 General 3.1.5*
- 3.7.4 Where transversely stiffened, beams are to be fitted at every frame and bracketed to the side frames. Deck transverses should also be fitted at the ends of large openings in the deck.
- 3.7.5 Primary stiffening members are to be continuous and substantially bracketed at their end connections to maintain continuity of structural strength.

Volume 1, Part 3, Chapter 2

Section 3

- 3.7.6 Secondary stiffening members are to be effectively continuous and bracketed at their end connections as appropriate.
- 3.7.7 The ends of beams, longitudinals, girders and transverses are to be effectively built into the adjacent structure, or equivalent arrangements provided.
- 3.7.8 Arrangements to prevent tripping are to be fitted on deep webs.
- 3.7.9 The deck plating and supporting structure are to be suitably reinforced in way of cranes, masts, and deck equipment or machinery.
- 3.7.10 Deck structures subject to concentrated loads are to be suitably reinforced. Where concentrations of loading on one side of a stiffening member may occur, such as out of line pillars, the member is to be adequately stiffened against torsion. Additional reinforcements may be required in way of localised areas of high stress.
- 3.7.11 The end connection of strength deck longitudinals to bulkheads are to provide adequate fixity and, so far as is practicable, direct continuity of longitudinal strength. For NS1 and NS2 ships, the strength deck longitudinals are to be continuous through transverse structure, including bulkheads, but alternative arrangements will be considered.
- 3.7.12 Transverses supporting deck longitudinals are, in general, to be spaced not more than 2,5 m apart in NS1 and NS2 ships, and 1,5 m in NS3 ships. They are to be aligned with primary side structure.
- 3.7.13 All openings are to be supported by an adequate framing system, pillar bulkheads or cantilevers. When cantilevers are used, the scantlings are to be determined by direct calculation.
- 3.7.14 Where stiffening members terminate in way of an opening they are to be attached to carlings, girders, transverses or coaming plates, in such a way as to minimise stress concentrations.
- 3.7.15 Other openings in the strength deck outside the line of major openings are to be kept to the minimum number consistent with operational requirements. Openings are to be arranged clear of other opening corners and, so far as possible, clear of one another. Where necessary, plate panels in which openings are cut are to be adequately stiffened against compression and shear buckling. The corners of all openings are to be well rounded and the edges smooth. Attention is to be paid to structural continuity and abrupt changes of shape, section or thickness are to be avoided.
- 3.7.16 Gutterway bars and spurn waters at the upper deck are to be so arranged that the effect of main hull stresses on them is minimised and that they do not cause stress concentrations in the deck or sheerstrake, see also Vol 1, Pt 6, Ch 3, 3.6 Local reduction factors
- 3.7.17 For flight decks, consideration should be given to the effect on fatigue life of welding attachments (e.g. cable trays and piping brackets) directly to the deck plating or stiffeners. It is recommended that attachments be made by other means or that the effect be accounted for in any fatigue analysis which may be undertaken.
- 3.7.18 It is recommended that the working areas of the weather deck have an anti-slip surface. Working areas of all decks where there is the possibility of leakage of fuel, hydraulic or other oils are to be provided with anti-slip deck coatings, or equivalent, and guard rails, as appropriate.
- 3.7.19 Where decks are sheathed with wood or other materials, details of the method of attachment are to be submitted, see also Vol 1, Pt 6 Hull Construction in Steel.
- 3.7.20 Where large or novel hatch openings are proposed, detailed calculations are to be submitted to demonstrate that the scantlings and arrangements in way of the openings are adequate to maintain continuity of structural strength.
- 3.7.21 Where large side shell openings such as side aircraft lifts are proposed, detailed calculations are to be submitted.
- 3.7.22 Pipe or cable runs through watertight decks are to be kept to a minimum and are to be fitted with suitable watertight glands of a type, approved and pressure tested for the maximum head of water indicated by any required damage stability calculations.
- 3.7.23 The specified subdivision and stability standard(s) may require all deck penetrations to be of a nominated standard.
- 3.7.24 Heat-sensitive materials are not to be used in pipe or cable runs which penetrate watertight decks, where deterioration of such systems in the event of fire would impair the watertight integrity of the deck.
- 3.7.25 The number of openings in watertight decks is to be reduced to the minimum compatible with the design and proper working of the ship. Where openings are permitted in watertight decks, they are to be provided with suitable closing devices in accordance with Vol 1, Pt 3, Ch 4, 4 Watertight doors and hatches in watertight subdivision boundaries.

Volume 1, Part 3, Chapter 2

Section 4

3.8 Deep tank structure

- 3.8.1 The scantlings of deep tank structure are to be in accordance with the relevant Sections of *Vol 1, Pt 6 Hull Construction in Steel*.
- 3.8.2 Above the top of floors, the side shell structure of deep tanks is to be effectively supported by a system of primary framing with web frames, stringers, cross ties and/or perforated flats.
- 3.8.3 The maximum spacing of side shell transverses in longitudinally framed deep tanks is generally not to exceed 2,5 m in NS1 and NS2 ships, and 1,5 m in NS3 ships.
- 3.8.4 The maximum spacing of side shell web frames in transversely framed deep tanks is generally not to exceed five frame spaces. They are to extend from the tank top to the level of the lowest deck above the design waterline.
- 3.8.5 The maximum spacing of horizontal stringers is generally not to exceed 3,0 m.
- 3.8.6 Where decks terminate at deep tanks, suitable scarfing arrangements are to be arranged and the side shell supported by a stringer at deck level. The stringer can be either fully effective or acting as part of a grillage. Bulkhead stiffeners are to be supported at the deck level against tripping.
- 3.8.7 A centreline bulkhead is, generally, to be fitted in deep tanks which extend from side to side. The bulkhead may be intact or perforated as desired. If intact, the scantlings are to comply with the requirements of *Vol 1, Pt 6 Hull Construction in Steel* for tank boundary bulkheads. If perforated, they are to comply with the requirements of *Vol 1, Pt 6 Hull Construction in Steel* for wash plates. Where brackets from horizontal girders on the boundary bulkheads terminate at the centreline bulkhead, adequate support and continuity are to be maintained.
- 3.8.8 The thickness of any longitudinal bulkheads may be required to be increased to ensure compliance with the shear strength requirements of *Vol 1, Pt 6 Hull Construction in Steel*. In the case of a centreline or perforated wing bulkhead, the proportion of the total shear force absorbed by the bulkhead will be specially considered.
- 3.8.9 The thickness of plating of wash bulkheads may also be required to be increased to take account of shear buckling.
- 3.8.10 Where longitudinal wash bulkheads support bottom transverses, the lower section of the bulkhead is to be kept free of non-essential openings for a depth equal to 1,75 times the depth of the transverses. The plating is to be assessed for local buckling requirements.

■ Section 4

Bulkhead arrangements

4.1 General

- 4.1.1 Watertight bulkheads for NS2 and NS3 ships are, in general, to extend to the uppermost continuous deck, and their construction is to be in accordance with *Vol 1*, *Pt 6*, *Ch 3*, *9 Bulkheads and deep tanks*. In the larger multidecked NS1 ships (e.g. Aircraft Carriers) the watertight bulkheads are generally to extend to the lowest continuous vertical limit of weathertightness determined by *Vol 1*, *Pt 3*, *Ch 2*, *1.3 Watertight and weathertight integrity*
- 4.1.2 Where permitted by the stability and subdivision standard, certain openings below the deck described in *Vol 1, Pt 3, Ch 2, 4.1 General 4.1.1* may be allowed, see *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.9.* In all cases these openings must be kept to a minimum and provided with means of closing to watertight standards.
- 4.1.3 The number of openings in watertight bulkheads is to be reduced to the minimum compatible with the design and proper working of the ship. Where openings are permitted in bulkheads they are to be provided with suitable closing devices in accordance with Vol 1, Pt 3, Ch 4, 4 Watertight doors and hatches in watertight subdivision boundaries
- 4.1.4 Bulkheads forming the boundaries to citadels and zones as defined in *Vol 1*, *Pt 4*, *Ch 1*, *7 Design guidance for nuclear, biological and chemical defence* other than watertight bulkheads, are usually specified to be gastight. See also *Vol 1*, *Pt 3*, *Ch 2*, 4.7 Gastight bulkheads. Where specified, LR can assess the gastight integrity of defined gastight boundaries, see *Vol 1*, *Pt 6*, *Ch 6*, 7.6 Gastight testing.
- 4.1.5 Pipe or cable runs through watertight bulkheads are to be kept to a minimum and are to be fitted with suitable watertight glands of a type, approved and pressure tested for the maximum head of water indicated by any required damage stability calculations.

Volume 1, Part 3, Chapter 2

Section 4

- 4.1.6 The specified subdivision and stability standard(s) may require all bulkhead penetrations to be of to a nominated standard.
- 4.1.7 Heat-sensitive materials are not to be used in pipe or cable runs which penetrate watertight bulkheads, where deterioration of such systems in the event of fire would impair the watertight integrity of the deck.
- 4.1.8 Partial or main bulkheads are to be located beneath the ends of superstructures and deckhouses and masts and heavy items of equipment such as weapon systems to support and transmit the static and dynamic forces into the hull structure. They are to be of sufficient strength and rigidity to carry the concentrated loads imposed on them and maintain alignment where necessary.

4.2 Number and disposition of watertight bulkheads

- 4.2.1 In general, the number and disposition of bulkheads are to be arranged to suit the requirements for subdivision, floodability and damage stability, and are to be in accordance with the specified subdivision and stability standard(s).
- 4.2.2 Main transverse watertight bulkheads are to be spaced at reasonably uniform intervals. Where non-uniform spacing is unavoidable and the length of a compartment is unusually large, the transverse strength of the ship is to be maintained by fitting of web frames, increased framing, etc. Details of the proposed arrangements are to be submitted.
- 4.2.3 All ships are to have a collision bulkhead, an after peak bulkhead and a watertight bulkhead at each end of all main and auxiliary machinery spaces. Additional watertight bulkheads are to be fitted so that the total number of bulkheads is at least in accordance with *Table 2.4.1 Minimum number of bulkheads*.

Table 2.4.1 Minimum number of bulkheads

Length, $L_{\rm R}$, in metres	Total number of bulkheads		
	Machinery amidships	Machinery aft see Note	
L _R ≤ 65	4	3	
65 < L _R ≤ 85	4	4	
85 < L _R ≤ 90	5	5	
90 < L _R ≤ 105	5	5	
105 < L _R ≤ 115	6	5	
115 < L _R ≤ 125	6	6	
125 < L _R ≤ 145	7	6	
145 < L _R ≤ 165	8	7	
165 < L _R ≤ 190	9	8	
L _R > 190	To be considered individually		

Note With after peak bulkhead forming after boundary of machinery space.

- 4.2.4 Proposals to dispense with one or more of these bulkheads will be considered, subject to suitable structural compensation, if they interfere with the operational requirements.
- 4.2.5 A main transverse bulkhead is to be located at the position where the ship sues during docking.

4.3 Collision bulkheads

4.3.1 The collision bulkhead is to be positioned as detailed in Table 2.4.2 Collision bulkhead position distance of collision bulkhead aft of fore end of LR, in metres. However, consideration will be given to proposals for the collision bulkhead to be positioned slightly further aft on an arrangement (b) ship, but not more than $0.08 L_{\rm R}$ from the fore end of $L_{\rm R}$, provided that the application is accompanied by calculations showing that flooding of the space forward of the collision bulkhead will not result in

Volume 1, Part 3, Chapter 2

Section 4

any part of the bulkhead deck becoming submerged, or any unacceptable loss of stability. The length L_R is as defined in *Table 2.4.1 Minimum number of bulkheads*.

- 4.3.2 For ships with pronounced rake of stem, the position of the collision bulkhead will be specially considered.
- 4.3.3 No accesses or ventilation ducts are to be fitted in collision bulkheads. In designs where it would be impracticable to arrange access to the fore peak other than through the collision bulkhead, access may be permitted if specified. Where accesses are provided, the openings are to be as small as practicable and positioned as far above the design waterline as possible, in any event, no lower than the damage control deck. Access is to be by manholes with bolts spaced at a watertight pitch.
- 4.3.4 Pipe runs or cable runs are only to be fitted in the collision bulkhead if specified in the subdivision and stability standard(s).

4.4 Aft peak bulkhead

4.4.1 NS1 and, where practicable, NS2 ships, are to have an aft peak bulkhead generally enclosing the sterntube and rudder trunk in a watertight compartment. In twin screw ships where the bossing ends forward of the aft peak bulkhead, the sterntubes are to be enclosed in suitable watertight spaces inside or aft of the shaft tunnels. The stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the sterntube compartment and of such volume that, if flooded by leakage through the stern gland, the ship will remain fully operational. The arrangement in NS3 ships, and in NS2 ships where it is impracticable to meet the aforementioned conditions, will be specially considered based on the integrity of the gland sealing arrangements and damage stability requirements.

Table 2.4.2 Collision bulkhead position distance of collision bulkhead aft of fore end of L R, in metres

Arrangement	Length L _R , in metres	Minimum	Maximum
(a)	≤ 200	0,05L _R	0,08L _R
	> 200	10	0,08L _R
(b)	≤ 200	0,05 <i>L</i> _R – f ₁	0,08L _R - f ₁
	> 200	10m – f ₂	0,08L _R - f ₂

Symbols and definitions

- $f_1 = G/2$ or 0,015 L_R , whichever is the lesser
- $f_2 = G/2$ or 3 m, whichever is the lesser
- G = projection of bulbous bow forward of fore perpendicular, in metres

Arrangement (a) A ship that has no part of its underwater

body extending forward of the fore

perpendicular

Arrangement (b) A ship with part of its underwater body

extending forward of the fore perpendicular,

(e.g. bulbous bow)

4.5 Height of bulkheads

- 4.5.1 The collision bulkhead is normally to extend to the uppermost continuous deck or, in the case of a ship with combined bridge and forecastle or a long superstructure which includes a forecastle, to the superstructure deck. However, if a ship is fitted with more than one complete superstructure deck, the collision bulkhead may be terminated at the first deck above the vertical limit of watertight integrity. Where the collision bulkhead extends above the vertical limit of watertight integrity, the extension need only be to weathertight standards.
- 4.5.2 The aft peak bulkhead may terminate at the first deck above the load waterline, provided that this deck is made waterlight to the stern or to a waterlight transom floor.
- 4.5.3 The remaining watertight bulkheads are to extend as required by *Vol 1, Pt 3, Ch 2, 4.1 General 4.1.1*. In ships of unusual design, the height of the bulkheads will be specially considered.

Volume 1, Part 3, Chapter 2

Section 4

4.6 Watertight recesses, flats, openings and loading ramps

- 4.6.1 Watertight recesses in bulkheads are to be avoided whenever possible.
- 4.6.2 Where watertight bulkhead stiffeners are cut in way of watertight doors in the lower part of a bulkhead, the opening is to be suitably framed and reinforced. Where stiffeners are not cut but the spacing between the stiffeners is increased on account of watertight doors, the stiffeners at the sides of the doorways are to be increased in depth and strength so that the efficiency is at least equal to that of the unpierced bulkhead, without taking the stiffness of the door frame into consideration.
- 4.6.3 In collision bulkheads, any recesses or steps in the bulkhead are to fall within the limits of bulkhead positions given in *Vol* 1, *Pt* 3, *Ch* 2, 4.3 Collision bulkheads 4.3.1. If a step occurs above the virtual limit of watertight integrity the deck need also only be to weathertight standards in way of the step, unless the step forms the crown of a tank, in which case the requirements for deep tank structures are to be complied with.
- 4.6.4 In ships fitted with bow doors, in which a sloping loading ramp forms part of the collision bulkhead above the virtual limit of watertight integrity, that part of the ramp which is more than 2,30 m above the virtual limit of watertight integrity may extend forward of the minimum limit specified in *Table 2.4.2 Collision bulkhead position distance of collision bulkhead aft of fore end of LR, in metres* Such a ramp is to be weathertight over its complete length.

4.7 Gastight bulkheads

- 4.7.1 Where an assessment of gastight integrity is required the scantlings of gastight bulkheads are to be in accordance with *Vol 1, Pt 6 Hull Construction in Steel*.
- 4.7.2 Where bulkheads are required to be gastight and where it is proposed to pierce such bulkheads for the passage of cables, pipes, vent trunking, etc. gastight glands are to be provided to maintain the gastight integrity.

4.8 Tank bulkheads

- 4.8.1 For bulkheads in way of partially filled compartments or tanks, sloshing forces may be required to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculations.
- 4.8.2 The scantlings of deep tank bulkheads are to be in accordance with Vol 1, Pt 6 Hull Construction in Steel.
- 4.8.3 Air and sounding pipes are to comply with the requirements of Vol 1, Pt 3, Ch 4, 7 Air and sounding pipes.

4.9 Separation and protection of tanks

- 4.9.1 Where the cross contamination of liquids stored in adjacent tanks is hazardous to machinery, these tanks are to be separated by cofferdams. Hazardous pairings of liquid consumables include but are not limited to the following:
- (a) Fuel oil and lubricating oil
- (b) Fuel oil and technical water (e.g. feedwater)
- (c) Lubricating oil and technical water
- (d) Fuel oil and urea.
- 4.9.2 Tanks carrying liquids for the purposes of fire-fighting (e.g. foam concentrate) are to be separated by cofferdams from adjacent tanks containing liquid fuels.
- 4.9.3 Tanks carrying fresh water for human consumption (potable water) are to be separated by cofferdams from adjacent tanks containing liquid substances harmful to human health. Fresh water for other purposes and water ballast are not considered harmful.
- 4.9.4 Where a cofferdam as specified in *Vol 1, Pt 3, Ch 2, 4.9 Separation and protection of tanks 4.9.1* is impracticable, special consideration may be given, subject to the arrangements complying with the following:
- (a) The thickness of common boundary plates is increased by 1 mm
- (b) Common boundaries have full penetration welds.
- 4.9.5 Where a corner to corner situation occurs, tanks are not considered to be adjacent.
- 4.9.6 Where fitted, cofferdams are to be suitably ventilated, provided with a suitable drainage arrangement, see *Vol 2, Pt 7, Ch 2, 3.2 Tanks and cofferdams*, and be of sufficient size to allow proper inspection, maintenance and safe evacuation.
- 4.9.7 If fuel oil tanks are necessarily located within or adjacent to the machinery spaces, their arrangement is to be such as to avoid direct exposure of the bottom from rising heat resulting from a machinery or hazardous space fire.

Volume 1, Part 3, Chapter 2

Section 5

4.10 Watertight tunnels and passageways

4.10.1 Sterntubes are to be enclosed in watertight spaces of moderate volume. In addition, arrangements are to be made to minimise the danger of water penetrating into the ship in case of damage to the sterntube. Normally the stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the sterntube compartment and of such volume that, if flooded by leakage through the stern gland, the vertical limit of watertight integrity, see Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity, will not be submerged.

4.11 Means of escape

4.11.1 The arrangement of the hull is to be such that all under deck compartments are as accessible as practicable and provided with a satisfactory means of escape in accordance with a specified standard(s). Access and escape hatches to the machinery and tanks are not to be obstructed by deck coverings or furniture.

4.12 Carriage of low flash point fuels

4.12.1 For ships having fuel oil with a flash point below 60°C the arrangement for the storage, distribution and utilisation of the fuel oil is to be such that the safety of the ship and persons on board is preserved, having regard to the fire and explosion hazards. See Vol 2, Pt 7, Ch 3, 2 Fuel oil - General requirements

■ Section 5

Fore and aft end arrangements

5.1 General

- 5.1.1 In general the main hull structural arrangements as defined in *Vol 1, Pt 3, Ch 2, 3.3 Shell plating* are to extend as far forward and aft as possible.
- 5.1.2 The requirements of this Section apply to the fore and aft ends and relate to structure situated in the region forward of $0.7L_{\rm R}$ and aft of $0.3L_{\rm R}$ respectively.
- 5.1.3 Certain ships will require additional strengthening for bottom forward slamming and bow flare slamming. The scantlings of the hull structure forward are to be determined from *Vol 1, Pt 6 Hull Construction in Steel*, using the loads specified in *Vol 1, Pt 5, Ch 3, 3 Loads on shell envelope*.
- 5.1.4 Where the stern overhang is significant, or large masses are placed on the stern, the strength of the aft end structure will be specially considered, see *Vol 1, Pt 3, Ch 5, 11.4 Dry-docking loads*

5.2 Structural continuity

- 5.2.1 The Rules provide for both longitudinal and transverse framing systems.
- 5.2.2 Where the shell, deck and inner bottom are longitudinally framed in the midship region, this system of framing is to be carried forward and aft as far as possible.
- 5.2.3 End connections of longitudinals to bulkheads are to provide adequate fixity, lateral support and as far as practicable, direct continuity of longitudinal strength, see also Vol 1, Pt 3, Ch 2, 3 Main hull structure.
- 5.2.4 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt structural changes.
- 5.2.5 Where longitudinal framing terminates and is replaced by a transverse system, adequate arrangements are to be made to avoid an abrupt changeover. Where a forecastle is fitted extending forward from $0.85L_{\rm R}$, longitudinal framing at the upper deck and topsides is generally to be continued forward of the aft bulkhead of this superstructure.
- 5.2.6 Where a superstructure or poop is fitted extending forward of 0,15*L*_R, longitudinal framing at the upper deck and topsides is generally to be continued aft of the forward bulkhead of this superstructure.
- 5.2.7 The forecastle side plating may be a continuation of the side shell plating or fitted as a separate assembly. The side plating is to be stiffened by side frames effectively connected to the deck structure. Deep webs are to be fitted to ensure overall rigidity.

Volume 1, Part 3, Chapter 2

Section 5

5.2.8 Forecastles and bulwarks are to be constructed in accordance with the scantlings indicated in *Vol 1, Pt 6, Ch 3, 1 General*

5.3 Minimum bow height and extent of forecastle

- 5.3.1 The requirements regarding minimum bow height given in Vol 1, Pt 3, Ch 2, 5.3 Minimum bow height and extent of forecastle 5.3.2 are to be complied with. Only in exceptional circumstances and in specialist ships will any relaxation be given to this requirement where it interferes with the safe operation of the vessel. In such cases, due consideration is to be given to the clearing of seawater from the forecastle deck. The effects on strength and stability are also to be considered.
- 5.3.2 All sea-going ships are to be fitted with forecastles, or increased sheer on the upper deck or equivalent, such that the distance from the waterline design draught to the top of the exposed deck at side at the F.P. is not less than:

$$\begin{split} H_{\rm b} = & \left(6075 \left(\frac{L_{\rm R}}{100}\right) - 1875 \left(\frac{L_{\rm R}}{100}\right)^2 + 200 \left(\frac{L_{\rm R}}{100}\right)^3\right) \times \\ & \left(2,08+0,609C_{\rm b} - 1,603C_{\rm wf} - 0,0129 \left(\frac{L_{\rm R}}{\rm d_I}\right)\right) \end{split}$$

where

 $C_{\rm b}$ = block coefficient

 L_{R} = Rule length, in m

 H_{b} = minimum bow height, in mm

 d_1 = draught at 85 per cent of the depth, D, see Vol 1, Pt 3, Ch 1, 5.2 Principal particulars 5.2.10.

 $C_{\text{wf}} = \text{waterplane area coefficient forward of midships } A_{\text{wf}} / \{(L_{\text{R}}/2) \times B\}$

B = moulded breadth, in m

 $A_{\rm wf}$ = is the forward waterplane area at draught d_1 , in m².

- 5.3.3 Ships shall have additional reserve of buoyancy in the fore end region to ensure sufficient longitudinal righting energy to recover from bow immersion in a seaway and be designed to prevent the excessive shipping of green seas.
- 5.3.4 Ships which are designed to suit exceptional operational requirements, restricted in their service to service area **SA4**, or of novel configuration will be specially considered on the basis of the Rules.
- 5.3.5 Where the bow height required in *Vol 1, Pt 3, Ch 2, 5.3 Minimum bow height and extent of forecastle 5.3.2* is obtained by increased sheer, the sheer shall extend for at least 15 per cent of the length of the ship measured abaft the forward end of L_R . Where it is obtained by fitting a forecastle, the forecastle shall extend from the stem to a point at least 0,07 L_R abaft the forward end of L_R .

5.4 Bow crumple zone

5.4.1 In general the bow crumple zone is that space forward of the collision bulkhead. Embarked personnel or crew accommodation and the carriage of fuel, hazardous materials and other oils are not permitted in the bow crumple zone.

5.5 Deck structure

- 5.5.1 The scantlings of the deck structure are to comply with Vol 1, Pt 6, Ch 3, 10 Deck structures.
- 5.5.2 The deck plating thickness and supporting structure are to be suitably reinforced in way of anchor windlass, other deck machinery, and in way of cranes, masts or derrick posts, RAS stump masts, and weapon launching positions, etc.
- 5.5.3 Where large openings are arranged at lower decks near the side shell, it may be necessary to increase the adjacent deck structure to ensure effective support for side framing.
- 5.5.4 In NS1 and NS2 ships, on decks aft of the after cutup, deep beams are generally to be fitted in way of web frames. Deck girders are generally to be spaced not more than 3,0 m apart and integrated with the primary structure forward.
- 5.5.5 Requirements for the arrangement and geometry of deck openings are given in Vol 1, Pt 3, Ch 1, 3.1 Alternative arrangements and calculation methods and Vol 1, Pt 3, Ch 1, 3.1 Alternative arrangements and calculation methods. The scantlings of any inserts required are to be in accordance with Vol 1, Pt 6 Hull Construction in Steel.

108

Volume 1, Part 3, Chapter 2

Section 5

5.6 Shell envelope plating and framing

- 5.6.1 The scantlings of bar keels in the forward end are to be the same as that required in the midship region, see *Table 3.2.1 Minimum structural requirements*
- 5.6.2 The thickness and width of plate keels in the forward region are to be the same as that required in the midship region.
- 5.6.3 The scantlings of plate stems are to be determined from *Vol 1, Pt 6, Ch 3, 5 Shell envelope plating* Plate stems are to be supported by horizontal diaphragms positioned in line with the side stringers or perforated flats with intermediate breasthook diaphragms. Diaphragms are to be spaced not more than 1,5 m apart, measured along the stem. Where the stem plate radius is large, a centreline stiffener or web will be required.
- 5.6.4 The thickness of side shell and sheerstrake plating in the forward region is to be not less than the values required by *Vol* 1, *Pt* 6, *Ch* 3, 5 *Shell envelope plating*, but may be required to be increased locally on account of high shear forces, in accordance with *Vol* 1, *Pt* 6, *Ch* 4, 3.2 *Determination of critical sections*
- 5.6.5 The shell plating may be required to be increased in thickness locally in way of openings such as hawse pipes and sonar domes, where fitted.
- 5.6.6 The shell plating is to be increased in thickness locally in way of a bulbous bow, see Vol 1, Pt 3, Ch 2, 5.10 Bulbous bows.
- 5.6.7 Sea inlet and other openings are to be in accordance with Vol 1, Pt 3, Ch 2, 3.3 Shell plating 3.3.6
- 5.6.8 The bottom longitudinals are to be continuous in way of both watertight and non-watertight floors.
- 5.6.9 Where the shape of the after hull is such that there are large flat areas, particularly in the vicinity of the propellers, additional primary supports for the secondary stiffening may be required. Their extent and scantlings will be specially considered.

5.7 Single and double bottom structure

- 5.7.1 The general requirements of Vol 1, Pt 3, Ch 2, 3.5 Single bottom structure and Vol 1, Pt 3, Ch 2, 3.6 Double bottom structure apply.
- 5.7.2 The minimum depth of centre girder forward is generally to be the same as that required in the midship region.
- 5.7.3 Where the height of the double bottom varies, structural continuity is to be maintained. An inner bottom where fitted is to be gradually sloped over an adequate longitudinal extent. Knuckles in the plating are to be arranged close to plate floors. Otherwise, suitable scarfing arrangements are to be made.
- 5.7.4 For ships of full form, in fore peak and deep tank spaces, the floors and bottom transverses are to be supported by a centreline girder or a centreline wash bulkhead. In other cases the centreline girder is to be carried as far forward as practicable. The floor panels and the upper edges of the floors and centreline girder are to be suitably stiffened.
- 5.7.5 In aft peak spaces, floors are to be arranged at every frame. For details and scantlings, see Vol 1, Pt 6, Ch 3, 7.5 Single bottom structure in machinery spaces
- 5.7.6 Provision is to be made for the free passage of water and air from all parts of single or double bottoms as required by *Vol 1, Pt 3, Ch 2, 3.1 General 3.1.18*.

5.8 Fore peak structure

- 5.8.1 The requirements given in this Section apply to the arrangement of primary structure supporting the fore peak side shell and bulbous bow, the arrangement of wash bulkheads and perforated flats. The scantlings of structure in the fore peak is to be in accordance with the relevant Sections of *Vol 1*, *Pt 6 Hull Construction in Steel*.
- 5.8.2 The bottom of the peak space is generally to be transversely framed. Longitudinally framed bottom structure will be specially considered.
- 5.8.3 Above the floors, transverse side framing is to be supported by horizontal side stringers, cross ties and/or perforated flats.
- 5.8.4 Suitable transverses or deep beams are to be arranged at the top of the tank and at perforated flats to provide end rigidity to the side transverses.
- 5.8.5 Wash bulkheads are to have an area of perforations not less than five per cent nor more than 10 per cent of the area of the bulkhead. The plating is to be suitably stiffened in way of openings. Stiffeners are to be bracketed at top and bottom.

Volume 1, Part 3, Chapter 2

Section 6

5.9 Aft peak structure

- 5.9.1 The scantlings of aft peak structure are to be as required by the relevant Sections of *Vol 1, Pt 6 Hull Construction in Steel.* The plating thickness is to be increased locally in way of the sterntube gland.
- 5.9.2 Floors are to be arranged at every frame space and are to be carried to a suitable height, and at least to above the sterntube, where fitted. Floors are to be adequately stiffened. In way of propeller shaft brackets, rudder post or rudder horn, the floors are generally to be carried to the top of the space and are to be of increased thickness. The extent and amount of the increase will be specially considered, account being taken of the arrangements proposed.
- 5.9.3 Above the floors, transverse side framing is to be supported by horizontal stringers, cross ties and/or perforated flats.
- 5.9.4 Suitable transverses or deep beams are to be arranged at the top of the tank to provide end rigidity to the side transverses.
- 5.9.5 A centreline wash bulkhead is to be arranged in the upper part of the aft peak space. Additional wash bulkheads are to be fitted port and starboard where the width of the tank exceeds 20 m.
- 5.9.6 The plating is to be suitably stiffened in way of openings, and the arrangement of openings is to be such as to maintain adequate shear rigidity.
- 5.9.7 The position and height of the after peak bulkhead are to be in accordance with the requirements of *Vol 1, Pt 3, Ch 2, 4.4 Aft peak bulkhead*.
- 5.9.8 Centre and side girders where fitted are to be bracketed to the transom framing members by substantial knees. Hard spots are to be avoided in way of the end connections and care is to be taken to ensure that the stiffening member to which the transom knee is attached can satisfactorily carry the load.

5.10 Bulbous bows

- 5.10.1 Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.
- 5.10.2 At the fore end of the bulb the structure is generally to be supported by horizontal diaphragm plates spaced generally 1,0 m apart in conjunction with a deep centreline web.
- 5.10.3 In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the bulb framing.
- 5.10.4 In way of a wide bulb, additional strengthening in the form of a centreline wash bulkhead is generally to be fitted.
- 5.10.5 In way of a long bulb, additional strengthening in the form of transverse wash bulkheads or substantial web frames spaced about five frame spaces apart are generally to be fitted.
- 5.10.6 The shell plating is to be increased in thickness at the fore end of the bulb and in other areas likely to be damaged by the anchors and chain cables. The increased plate thickness is to be the same as that required for plated stems.

■ Section 6

Machinery space arrangements

6.1 General

- 6.1.1 Requirements particular to machinery spaces, including protected machinery casings and engine seatings only, are given in this Section. For other scantlings and arrangement requirements, see the relevant section in this Chapter.
- 6.1.2 Requirements for the scantlings of structure in machinery spaces are to be in accordance with the relevant sections of *Vol 1, Pt 6, Ch 3, 13 Machinery and raft seatings*.
- 6.1.3 In addition, the requirements of Vol 2, Pt 1, Ch 3, 5.1 Machinery spaces 5.1.4 are to be complied with.

6.2 Structural configuration

6.2.1 Requirements are given for ships constructed using either a transverse or longitudinal framing system, or a combination of the two.

Volume 1, Part 3, Chapter 2

Section 6

6.2.2 Machinery space stiffening is generally to be arranged in the same manner as structure immediately forward and aft of the space. For NS1 and NS2 ships this will generally be longitudinal. Machinery spaces adjacent to the aft peak bulkhead may be constructed using a transverse framing system or a combination of longitudinal and transverse.

6.3 Structural continuity

- 6.3.1 Suitable scarfing arrangements are to be made to ensure continuity of strength and the avoidance of abrupt discontinuities where structure which contributes to the main longitudinal strength of the ship is omitted in way of a machinery space.
- 6.3.2 Where the longitudinal framing terminates and is replaced by transverse framing, a suitable scarfing arrangement of the longitudinal framing is to be arranged.

6.4 Deck structure

- 6.4.1 The corners of machinery space openings are to be of suitable shape and design to minimise stress concentrations.
- 6.4.2 Where a transverse framing system is adopted, deck beams are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Deep beams are to be arranged in way of the ends of engine casings and also in line with side web frames where fitted.
- 6.4.3 Where a longitudinal framing system is adopted, deck longitudinals are to be supported by deck transverses in association with pillars or pillar bulkheads. The maximum spacing of transverses is given in *Vol 1, Pt 3, Ch 2, 6.5 Side shell structure 6.5.2*. Deck transverses are to be in line with side transverses or web frames.
- 6.4.4 Machinery casings are to be supported in accordance with the requirements of Vol 1, Pt 3, Ch 2, 6.7 Machinery casings.
- 6.4.5 The scantlings of lower decks or flats are generally to be as given in *Vol 1, Pt 6, Ch 3, 10 Deck structures*. However, in way of concentrated loads such as those from boiler bearers or heavy auxiliary machinery, etc. the scantlings of deck structure will be specially considered, taking account of the actual loading.
- 6.4.6 In way of machinery space openings, etc. particularly towards the aft end, decks or flats are to have sufficient strength where they are intended to provide effective primary support to side framing, webs or transverses.
- 6.4.7 Where decks terminate at a machinery space bulkhead, suitable scarfing arrangements are to be arranged. The side shell of the machinery space is generally to be supported by a stringer at deck level. The stringer can be either fully effective or acting as part of a grillage. Bulkhead stiffeners at the deck level are to be supported against tripping.
- 6.4.8 Machinery space bulkheads with no supporting decks are to have suitable primary stiffening similar to that provided for the side shell in *Vol 1*, *Pt 3*, *Ch 2*, *6.5 Side shell structure* .

6.5 Side shell structure

- 6.5.1 The side shell structure of machinery spaces is to be effectively supported by a system of primary framing with web frames and stringers. General requirements for web frames are given in this Section for both longitudinal and transverse framing systems.
- 6.5.2 The maximum spacing of side shell transverses in longitudinally framed machinery spaces is generally not to exceed 2,5 m in NS1 and NS2 ships, and 1,5 m in NS3 ships.
- 6.5.3 The maximum spacing of side shell web frames in transversely framed machinery spaces is generally not to exceed five frame spaces. They are to extend from the tank top to the level of the lowest deck above the design waterline.
- 6.5.4 The maximum spacing of stringers is generally not to exceed 3,0 m.

6.6 Double and single bottom structure

- 6.6.1 For the required extent of double bottom structure, see Vol 1, Pt 3, Ch 2, 3.6 Double bottom structure.
- 6.6.2 In the bottom structure sufficient fore and aft girders are to be arranged in way of the main machinery to effectively distribute its weight and to ensure adequate rigidity of the structure. In midship machinery spaces these girders are to extend for the full length of the space and are to be carried aft to support the foremost shaft tunnel bearing. This extension beyond the after bulkhead of the machinery space is to be for at least three transverse frame spaces, aft of which the girders are to scarf into the structure. Forward of the forward machinery space bulkhead, the girders are to be tapered off over three frame spaces and effectively scarfed into the structure. In machinery spaces in the aft end of the ship the girders are to be carried as far aft as

Volume 1, Part 3, Chapter 2

Section 6

practicable and the ends effectively supported by web frames or transverses. Care is to be taken to avoid any abrupt changes or discontinuities.

- 6.6.3 Where, in NS3 ships, the bottom is transversely framed, plate floors are to be fitted at every frame in the machinery space and under the main machinery, rafts, seatings and thrust bearing.
- 6.6.4 Where the bottom is longitudinally framed, plate floors are to be fitted at a maximum spacing of 2,5 m in NS1 and NS2 ships, and 1,5 m in NS3 ships in the machinery space under the main machinery, rafts, seatings and thrust bearing.
- 6.6.5 The minimum depth of the centre girder and its thickness are to be at least the same as required in way of other spaces amidships. Where the height of inner bottom in the machinery spaces differs from that in adjacent spaces, continuity of longitudinal material is to be maintained. In ships with a double bottom it is to be achieved by sloping the inner bottom over an adequate longitudinal extent. The knuckles in the plating are to be arranged close to plate floors.
- 6.6.6 Margin plates and drainage wells are to be provided as necessary and will be subject to special consideration.
- 6.6.7 Suitable arrangements are to be made to provide free passage of water from all parts of the bilge to the pump suctions. General requirements are given in *Vol 1, Pt 3, Ch 2, 3.1 General 3.1.18*.
- 6.6.8 Watertight floors, or floors forming boundaries of tank spaces, are also to comply with *Vol 1, Pt 3, Ch 2, 6.8 Integral fuel tanks*.
- 6.6.9 Where practicable, side girders outboard of the engines are to be fitted and are to line up with the side girders in adjacent spaces.

6.7 Machinery casings

- 6.7.1 The scantlings and arrangements of exposed casings protecting machinery openings are to be in accordance with *Vol* 1, *Pt* 6, *Ch* 3, 11 Superstructures, deckhouses and bulwarks.
- 6.7.2 Where casing sides act as girders supporting decks over, care is to be taken that access openings do not seriously weaken the structure. Openings are to be effectively framed and reinforced if necessary. Particular care is to be paid to stiffening where the casing supports the funnel or exhaust uptakes.
- 6.7.3 Machinery casings are to be supported by a suitable arrangement of deep beams or transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required, and these are to be arranged in line with deep beams or transverses. Where casing stiffeners carry loads from deck transverses, girders, etc. or where they are in line with pillars below, they are to be suitably reinforced.
- 6.7.4 Casing bulkheads are to be made gastight and the access doors are to be of a gastight self-closing type.

6.8 Integral fuel tanks

- 6.8.1 The scantlings of deep tank bulkheads are to be in accordance with Vol 1, Pt 6, Ch 3, 9 Bulkheads and deep tanks.
- 6.8.2 Fuel oil tanks situated within the machinery space are generally to comply with the requirements given in *Vol 1, Pt 6 Hull Construction in Steel*

6.9 Machinery seatings

- 6.9.1 Requirements on the scantlings of structure for machinery seatings are given in *Vol 1, Pt 6, Ch 3, 13 Machinery and raft* seatings.
- 6.9.2 This section applies to machinery or machinery raft seatings that are directly supported by the ship's hull. They are to be effectively secured to the hull and to be of adequate scantlings to resist the various gravitational, thrust, torque, dynamic and vibratory forces which may be imposed on them. Due attention is to be paid to the stiffness requirements of the machinery or raft supported.
- 6.9.3 Seatings are to be of substantial construction and efficiently supported by transverse and horizontal brackets or gusset plates. These should generally be arranged in line with plate floors and girders in a double bottom or with suitable deep beams or transverses and girders at upper decks. Where applicable, seats are to be designed to ensure proper alignment with gearing and allow for thermal expansion effects.
- 6.9.4 In general seats are not to be arranged in way of breaks or recesses in the bottom structure.
- 6.9.5 Main machinery or raft holding-down bolts are to be arranged as near as practicable to floors and longitudinal girders. When this cannot be achieved, additional floors are to be fitted.

Volume 1, Part 3, Chapter 2

Section 7

6.9.6 Auxiliary machinery is to be secured on seating of adequate scantlings, so arranged as to distribute the loadings evenly into the supporting structure.

Section 7

Superstructures, deckhouses, bulwarks, sponsons and appendages

7.1 General

- 7.1.1 Superstructures, deckhouses, forecastles and bulwarks are to be constructed in accordance with the scantlings indicated in *Vol 1, Pt 6, Ch 3, 11 Superstructures, deckhouses and bulwarks*
- 7.1.2 For requirements relating to companionways, doors, accesses and skylights, see Vol 1, Pt 3, Ch 4 Closing Arrangements and Outfit
- 7.1.3 Requirements for machinery casings are given in Vol 1, Pt 3, Ch 2, 6.7 Machinery casings
- 7.1.4 For closing arrangements and outfit the requirements are given in Vol 1, Pt 3, Ch 4 Closing Arrangements and Outfit.

7.2 Definitions

- 7.2.1 The term 'house' is used to include both superstructures and deckhouses.
- 7.2.2 The lowest, or first tier of a house, is normally that which is directly situated on the deck to which *D*, is measured. The second tier is the next tier above the lowest tier and so on.

7.3 Structural requirements

- 7.3.1 The plating and supporting structure are to be suitably reinforced in way of localised areas of high stress such as corners of openings, cranes, masts, equipment, fittings and other heavy or vibrating loads.
- 7.3.2 Structures subject to concentrated loads are to be suitably reinforced. Where a concentration of loading on one side of a stiffener may occur, such as pillars out of line, the stiffener is to be adequately stiffened against torsion.
- 7.3.3 Primary stiffening members are to be continuous and substantially bracketed at their end connections to maintain continuity of structural strength.
- 7.3.4 Secondary stiffening members are to be effectively continuous and bracketed at their end connections as appropriate.
- 7.3.5 Transverse rigidity is to be maintained throughout the length of the house by means of web frames, bulkheads or partial bulkheads. Particular care is to be paid when an upper tier is wider than its supporting tier and when significant loads are carried on the house top.
- 7.3.6 Web frames or partial bulkheads are to be fitted in line with bulkheads or deep primary stiffeners below.
- 7.3.7 Special attention is to be given to the connection of the erection to the deck in order to provide an adequate load distribution and avoid stress concentrations. The house stiffening is to align with main hull stiffening wherever possible.
- 7.3.8 Where aluminium erections are arranged above a steel hull, details of the arrangements in way of the bimetallic connections are to be submitted.
- 7.3.9 Adequate support under the ends of houses is to be provided in the form of webs, pillars and diaphragms or bulkheads in conjunction with reinforced deck beams. At the corners of houses and in way of supporting structures attention is to be given to the connection to the decks and inserts or equivalent arrangements should generally be fitted.

7.4 Openings

- 7.4.1 All openings are to be substantially framed and have well rounded corners. Arrangements are to be made to minimise the effect of discontinuities in houses. Continuous coamings or girders are to be fitted below and above doors and similar openings. House tops are to be strengthened in way of davits and cranes.
- 7.4.2 Particular care is to be paid to the effectiveness of end bulkheads and the upper deck stiffening in way when large openings are fitted.

Volume 1, Part 3, Chapter 2

Section 8

- 7.4.3 Special care is to be taken to minimise the size and number of openings in the sides or longitudinal bulkheads of houses which end within 0,25*L* _B to 0,75*L* _B. Account is to be taken of the high vertical shear loading which can occur in these areas.
- 7.4.4 Windows, ventilators and other superstructure openings are to be suitably framed and mullions will in general be required.

7.5 Effective structure

- 7.5.1 For ships where L_R exceeds 40 m or for designs where the superstructure is designed to absorb global loads the effectiveness of superstructures to carry these loads is to be determined. The effectiveness may be assessed in accordance with Vol 1, Pt 6, Ch 4, 2.5 Superstructures global strength
- 7.5.2 When large openings or a large number of smaller openings are cut in the superstructure sides, reducing the capability to transmit shear force between decks, an assessment of structural efficiency may be required. The scantlings of the side structure in way of these areas may also be required to be increased.

7.6 Sponsons and appendages

- 7.6.1 Primary structure supporting sponsons is to be effectively integrated into the main hull structure. This is to be achieved by extending the primary framing system or by suitable scarfing the sponson primary structure over at least five frame spaces.
- 7.6.2 The scantlings of sponson structure are to be as required by the relevant parts of *Vol 1, Pt 6 Hull Construction in Steel*, for decks or side shell. Decks used for aircraft operations or wheeled vehicles are to comply with *Vol 1, Pt 4 Military Design and Special Features* and *Vol 1, Pt 6 Hull Construction in Steel* respectively.
- 7.6.3 Where sponsons are located outside of $0.4L_R$ amidships and extend outside of the waterline breadth, B_{WL} , of the ship the effects of wave impacts are to be considered. The loads are to be derived in accordance with the bow flare slamming requirements in Vol 1, Pt 5, Ch 3, 3 Loads on shell envelope
- 7.6.4 The strength and arrangement of large bilge keels, stabilisers and other protrusions that may impinge on icebergs or flows are to be specially considered. In some cases the speed for operation in ice may be restricted.

7.7 Unusual designs

7.7.1 Ships or structural arrangements which are of unusual design, form or proportions will be individually considered.

Section 8

Pillars and pillar bulkheads

8.1 General

- 8.1.1 Pillars and pillar bulkheads are to be constructed in accordance with the scantlings indicated in Vol 1, Pt 6, Ch 3, 12 Pillars and pillar bulkheads
- 8.1.2 Pillars are to be arranged to transmit loads from decks and superstructures into the bottom structure. Pillars are generally to be constructed from solid, tubular or I beam section. A pillar may be a fabricated trunk or partial bulkhead.
- 8.1.3 Where a residual strength assessment is required, this is to include an additional assessment for any pillars or pillar bulkheads identified as critical structure, see Vol 1, Pt 6, Ch 4, 4.1 Application 4.1.9.

8.2 Head and heel connections

8.2.1 Pillars are to be attached at their heads to plates supported by efficient brackets, in order to transmit the load effectively. Doubling or insert plates are to be fitted to decks under large pillars and to the inner bottom under the heels of tubular or hollow square pillars. The pillars are to have a bearing fit and are to be attached to the head and heel plates by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be well distributed by means of longitudinal and transverse brackets.

Volume 1, Part 3, Chapter 2

Section 8

8.3 Alignment and arrangement

- 8.3.1 Pillars are to be located on main structural members. They are in general to be fitted below windlasses, winches, capstans, the corners of deckhouses, large items of equipment and elsewhere where considered necessary.
- 8.3.2 Wherever possible, deck pillars are to be fitted in the same vertical line as pillars above and below, and effective arrangements are to be made to distribute the load at the heads and heels of all pillars.
- 8.3.3 Where pillars support eccentric loads, or are subjected to lateral pressures, they are to be suitably strengthened for the additional bending moment imposed upon them.
- 8.3.4 Doublers are generally to be fitted on decks and inner bottoms, other than within tanks where doublers are not allowed. Brackets or insert plates may be used instead of doublers.
- 8.3.5 In double bottoms under widely spaced pillars, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Holes are not to be cut in the floors and girders below the heels of pillars. Where longitudinal framing is adopted in the double bottom, equivalent stiffening under the heels of pillars is to be provided, and where the heels of pillars are carried on a tunnel, suitable arrangements are to be made to support the load.

8.4 Pillars in tanks

8.4.1 In no circumstances are pillars to pass through tanks. Where loads are to be transmitted through tanks, pillars within the tanks are to be carefully aligned with the external pillars. The tensile stress in the pillar and its end connections is not to exceed 108 N/mm² at the tank test pressure. Such pillars are in general to be of built sections and end brackets may be required.

8.5 Fire aspects

8.5.1 Pillars and pillar bulkheads are to be suitably protected against fire, and capable of resisting fire damage. They are not to be constructed of aluminium.

Volume 1, Part 3, Chapter 3

- 2 Rudders
- 3 Stabiliser arrangements
- 4 Rudder horns and appendages
- 5 Fixed and steering nozzles, bow and stern thrust units, ducted propellers
- 6 Waterjet propulsion systems

■ Section 1

General

1.1 Application

1.1.1 This Chapter applies to all of the ships detailed in the Rules, and requirements are given for rudders, stabilisers, and appendages, nozzles, steering gear, bow and stern thrust unit structure and waterjet propulsion systems. For podded propulsion systems, see Vol 2, Pt 4, Ch 4 Podded Propulsion Units.

1.2 General

- 1.2.1 The following symbols and definitions are applicable to this Chapter, unless otherwise stated:
 - σ_0 = minimum yield stress or 0,5 per cent proof stress of the material, in N/mm² and is not to be taken greater than 0,7 σ_u or 450N/mm², whichever is the lesser

where

 σ_u = ultimate tensile strength of the material, in N/mm²

1.3 Navigation in ice

1.3.1 Where an ice class notation is to be included in the class of a ship, the requirements of *Vol 1, Pt 5, Ch 2, 4 Guidance for ice environment* are to be complied with.

■ Section 2

Rudders

2.1 Application

2.1.1 This Section applies to ordinary profile rudders, and to some enhanced profile rudders with special arrangements for increasing the rudder force, as defined in *Table 3.2.2 Rudder profiles*.

2.2 Design considerations

- 2.2.1 Effective means are to be provided for supporting the weight of the rudder without excessive bearing pressure, e.g. by a rudder carrier attached to the upper part of the rudder stock. The hull structure in way of the rudder carrier is to be suitably strengthened.
- 2.2.2 Suitable arrangements are to be provided to prevent the rudder from lifting.
- 2.2.3 In rudder trunks which are open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline, to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If

Volume 1, Part 3, Chapter 3

Section 2

the top of the rudder trunk is below the deepest load waterline, two separate stuffing boxes are to be provided. Rudder trunk boundaries, where exposed to the sea, are to have a corrosion protection coating applied in accordance with the manufacturer's instructions.

- 2.2.4 Where the top of the rudder tube is significantly higher than the deepest load waterline a lesser arrangement of watertightness, such as 'O' rings may be accepted.
- 2.2.5 The watertight gland body may be formed by the top of the fabricated or cast rudder tube; the gland packing being retained against the top bearing or a check in the wall of the rudder tube and is compressed by a gland packet which may be of the flange type, screwed cap or other suitable arrangement.
- 2.2.6 Alternative arrangements utilising lip seals or 'O' rings either in isolation or in combination with one or other of the alternative seal arrangements will be the subject of special consideration.

2.3 Materials

- 2.3.1 The requirements for materials are contained in the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*
- 2.3.2 Stern frames, rudder horns, shaft brackets, rudder stocks, pintles, coupling bolts, keys, and other rudder members are to be made of rolled, forged or cast carbon-manganese steel in accordance with *Ch 3 Rolled Steel Plates, Strip, Sections and Bars, Ch 4 Steel Castings* and *Ch 5 Steel Forgings* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*
- 2.3.3 For rudder stocks, pintles, coupling bolts and keys the minimum yield stress is not to be less than 200 N/mm².
- 2.3.4 For all parts of the rudder, including rudder stocks, pintles, coupling bolts and keys having a specified minimum yield stress differing from 235 N/mm², the material factor, k is to be determined in accordance with *Table 3.2.1 Rudder material factor*, k

Table 3.2.1 Rudder material factor, k

Specified minimum yield stress, σ_{o} (N/mm ²)	k
$\sigma_0 > 235$	$k = \left(\frac{235}{\sigma_0}\right)^{0,75}$
$\sigma_{o} \leq 235$	$k = \frac{235}{\sigma_0}$

Note 1. The specified minimum yield stress is not to be taken as greater than 70 per cent of the ultimate tensile strength.

Note 2. The specified minimum yield stress is not to be taken as greater than 450 N/mm².

2.4 Welding and design details

- 2.4.1 Slot-welding is to be limited as far as possible. Slot welding is not to be used in areas subject to large in-plane stresses transverse to the slots or in way of cut-outs of semi-spade rudders. Continuous butt welding with backing may be accepted in lieu of slot welds. When continuous butt welding is applied, the root gap is to be between 6-10 mm. The bevel angle is to be at least 15°.
- 2.4.2 When slot welding is applied, the length of individual slots is to be not less than 75 mm with a minimum breadth of 2 times the plate thickness. The distance between ends of adjacent slots is to be not greater than 125 mm. The slots are to be filled welded around the edges and filled with a suitable compound, e.g. epoxy putty. Slots are not to be filled with weld. The ends of slots are to be rounded.
- 2.4.3 The rudder, in way of rudder horn recesses of semi-spade rudders, are to have well radiused corners. The corner radii are not to be less than 5 times the local rudder plate thickness, but in no case less than 100 mm. Welding in the rudder side plating is to be positioned away from these corner radii. The weld connecting the side plate and the leading edge plate in way of these radiused corners is to be ground smooth.
- 2.4.4 Welds between plates and forged or cast parts or very thick plating are to be made as full penetration welds. In way of highly stressed areas e.g. cut-outs of semi-spade rudders and upper parts of spade rudders, cast or welded on ribs are to be arranged. Two sided full penetration welding is normally to be arranged. Where back welding is impossible welding is to be

Volume 1, Part 3, Chapter 3

Section 2

performed against ceramic backing bars or equivalent. Steel backing bars may be used and are to be continuously welded on one side to the heavy piece.

2.5 Equivalence

- 2.5.1 Lloyd's Register (hereinafter referred to as LR) may accept alternatives to the requirements given in this Section, provided they are deemed to be equivalent.
- 2.5.2 Direct analyses adopted to justify an alternative design are to take into consideration all relevant modes of failure, on a case by case basis. These failure modes may include, amongst others: yielding, fatigue, buckling and fracture. Possible damages caused by cavitation are also to be considered.
- 2.5.3 If deemed necessary by LR, lab tests, or full scale tests may be requested to validate the alternative design approach.

2.6 Rudder force

2.6.1 The lateral rudder force at the centre of pressure is to be determined for both ahead and astern conditions as follows:

$$C_{\rm B} = 132 K_1 K_2 K_3 A V^2 N$$

where

 $A = \text{rudder blade area, in } m^2.$

V = maximum service speed, in knots, for both the ahead and astern conditions.

= V_{ahead} is to be taken as the maximum design speed for short term high power operations. Where this speed is less than 10 knots, V_{ahead} is to be replaced by the following expression:

$$V_{\min} = \frac{V_{\text{ahead}} + 20}{3}$$

= V_{astern} , is to be taken as the maximum astern speed or $0.5V_{\text{ahead}}$, whichever is the greater.

 K_1 = aspect ratio correction factor

$$=\frac{\lambda+2}{3}$$

$$\lambda = \frac{h_{\rm R}^{-2}}{A_{\rm t}}$$
 but is not to be taken greater than 2.

 $h_{\rm R}={\rm mean\ height}$, in m, of the rudder blade, see Figure 3.2.1 Rudder co-ordinate system;

 $A_{\rm t} = {\rm sum}$ of rudder blade area A and area of rudder post or rudder horn, if any, within the mean height $h_{\rm R}$, in m².

 K_2 = rudder profile coefficient, see Table 3.2.2 Rudder profiles;

 $K_3 = 0.8$ for rudders outside the propeller jet.

= 1,15 for rudders behind a fixed propeller nozzle.

= 1,0 otherwise.

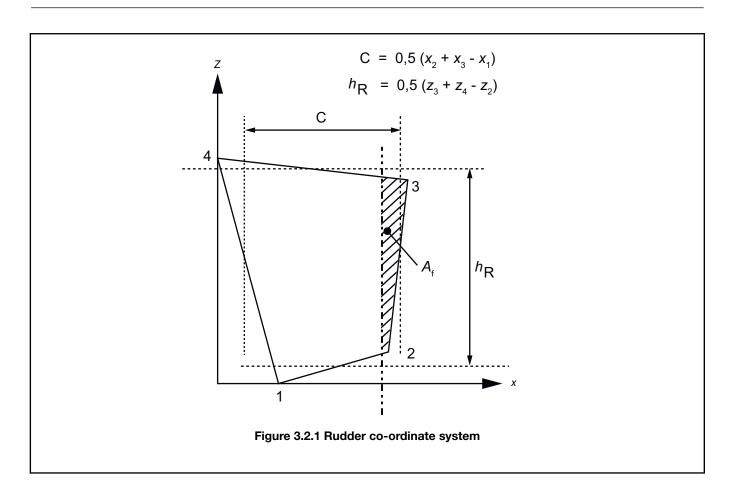

Table 3.2.2 Rudder profiles

Due Ella Tira	K2		
Profile Type	Ahead condition	Astern condition	
NACA-00 series			
	1,10	0,80	
Flat sided			
	1,10	0,90	
Hollow			
	1,35	0,90	
High lift rudders			
	1,70	To be specially considered	

Volume 1, Part 3, Chapter 3

Section 2

Fish tail	1,40	0,80
Single plate	1,00	1,00
Mixed profiles	1,21	0,90

Note For rudder profiles not defined above, the value of K_2 may be determined on the basis of experimental results. These results are to be submitted for consideration.

2.7 Rudder torque for rudder blades without cut-outs

2.7.1 The maximum rudder torque, $Q_{\rm B}$, is to be determined from both the ahead and astern conditions as follows:

$$Q_{R} = C_{R} r Nm$$

where

 $C_{\rm R} = {\rm lateral}$ force acting on the rudder, as defined in Vol 1, Pt 3, Ch 3, 2.6 Rudder force 2.6.1.

r = distance from the centre of pressure to the centreline of the rudder stock.

 $= c(\alpha - k_1)$, in m.

c = mean breadth of the rudder blade, (the mean chord length), in m, see Figure 3.2.1 Rudder co-ordinate system.

 α = relative centre of pressure along the chord length, see *Table 3.2.3 Relative centre of pressure along the chord length, a.*

 K_1 = ratio of the rudder blade area forward of the rudder stock centreline, to the rudder blade area:

$$=\frac{A_f}{A}$$

 $A_{\rm f}$ = portion of the rudder blade area situated ahead of the centreline of the rudder stock.

For the ahead condition the rudder torque, Q_R is not to be taken less than:

$$Q_{\rm R} = 0.1cC_{\rm R} \, \rm Nm$$

Table 3.2.3 Relative centre of pressure along the chord length, $\boldsymbol{\alpha}$

Condition	Behind fixed structure	Not behind a fixed structure
Ahead	0,25	0,33
Astern	0,55	0,66

Note Fixed structure is defined as any relatively stationary structure immediately ahead of the rudder, for example rudder horns of semi-spade rudders.

2.8 Rudder torque for rudder blades with cut-outs (semi-spade rudders)

2.8.1 The maximum rudder torque, $Q_{\rm R}$, is to be determined from both the ahead and astern conditions, for rudder blades with cut-outs, as follows. The pressure distribution for rudder blades with cut-outs is assumed to be proportional to the areas above and below the base of the cut-out. The rudder blade area, A, is to be divided into parts as per *Figure 3.2.2 Rudder Areas*.

Volume 1, Part 3, Chapter 3

Section 2

$$Q_{\rm R} = Q_{\rm R1} + Q_{\rm R2} \, \rm Nm$$

where

 $Q_{\rm R1} = C_{\rm R1} r_1.$

 $Q_{R2} = C_{R2} r_2.$

 C_{R} = lateral force acting on the rudder, as defined in Vol 1, Pt 3, Ch 3, 2.6 Rudder force 2.6.1

$$C_{R1} = C_R \frac{A_1}{A}$$

$$C_{R2} = C_R \frac{A_2}{A}$$

 $r_1 = c_1(\alpha - k_1)$, in m.

 $r_2 = c_2(\alpha - k_2)$, in m.

 c_1 = mean breadth, in m, of partial area A_1 .

 c_2 = mean breadth, in m, of partial area A_2 .

 α = relative centre of pressure along the chord length, see *Table 3.2.3 Relative centre of pressure along the chord length*, α .

$$K_1 = \frac{A_{1f}}{A_1}$$

$$K_2 = \frac{A_{2f}}{A_2}$$

For the ahead condition the rudder torque, $Q_{\mbox{\scriptsize R}}$ is not to be taken less than:

$$Q_{\rm R} = 0, 1 \frac{A_1 c_1 + A_2 c_2}{A} C_R \, \text{Nm}$$

2.9 Rudder strength calculation

- 2.9.1 The rudder force and resulting rudder torques as given in Vol 1, Pt 3, Ch 3, 2.6 Rudder force, Vol 1, Pt 3, Ch 3, 2.7 Rudder torque for rudder blades without cut-outs or Vol 1, Pt 3, Ch 3, 2.8 Rudder torque for rudder blades with cut-outs (semi-spade rudders), cause bending moments and shear forces in the rudder body, bending moments and torques in the rudder stock, supporting forces in pintle bearings and rudder stock bearings and bending moments, shear forces and torques in rudder horns and heel pieces. The rudder body is to be stiffened by horizontal and vertical webs enabling it to act as a bending girder.
- 2.9.2 The bending moments, shear forces and torques as well as the reaction forces described in *Vol 1, Pt 3, Ch 3, 2.9 Rudder strength calculation 2.9.1* are to be determined by direct calculations or where otherwise stated by an approximate simplified formulae. For rudders supported by sole pieces or rudder horns these structures are to be included in the calculation model in order to account for the elastic support of the rudder body.

2.10 Rudder stock scantlings

- 2.10.1 The scantlings of the rudder stock are to be not less than required by *Table 3.2.4 Rudder stock diameter*.
- 2.10.2 The rudder stock diameter is to be dimensioned such that the stresses do not exceed the permissible stresses given in *Table 3.2.5 Rudder stock permissible stresses*.
- 2.10.3 Before significant reductions in rudder stock diameter due to the application of steels with yield stresses exceeding 235 N/mm² are granted, LR may require the evaluation of the rudder stock deformations. Large deformations of the rudder stock are to be avoided in order to avoid excessive edge pressures in way of bearings.
- 2.10.4 For spade rudders the stock diameter corrected for higher tensile steel is to be greater than 90 per cent of the uncorrected stock diameter unless direct calculations are submitted showing that the slope of the stock at the lowest main bearing does not exceed 0,0035 when the rudder blade is loaded by a lateral force of $C_{\rm R}$, as defined in *Vol 1*, *Pt 3*, *Ch 3*, *2.6 Rudder force 2.6.1*, acting at the centre of pressure.

122

Volume 1, Part 3, Chapter 3

Section 2

- 2.10.5 For rudders having an increased diameter of the rudder stock in way of the rudder, the increased diameter is to be maintained to a point as far as practicable above the top of the lowest bearing. The diameter may then be tapered to the diameter required in way of the tiller. The length of the taper is to be at least three times the reduction in diameter. Particular care is to be taken to avoid the formation of a notch at the upper end of the taper, see *Figure 3.2.3 Rudder stock taper*.
- 2.10.6 Sudden changes of section or sharp corners in way of the rudder coupling, jumping collars and shoulders for rudder carriers, are to be avoided. Jumping collars are not to be welded to the rudder stock. Keyways in the rudder stock are to have rounded ends and the corners at the base of the keyway are to be radiused.

Table 3.2.4 Rudder stock diameter

Item	Requirement
(1) Rudder stock diameter due to combined loads	$d_c = d_t \sqrt[6]{1 + \frac{4}{3} \left(\frac{M}{Q_R}\right)^2}$
(2) Rudder stock diameter required for transmission of the rudder torque (e.g. in way of tiller)	$d_t = 4.2\sqrt[3]{Q_R k}$

Symbols

 $Q_{\rm R}$ = maximum rudder torque, in Nm, as calculated in Vol 1, Pt 3, Ch 3, 2.8 Rudder torque for rudder blades with cut-outs (semi-spade rudders)

M = bending moment, in Nm, at the section of the rudder stock under consideration, see Vol 1, Pt 3, Ch 3, 2.9 Rudder strength calculation 2.9.2.

Note 1. If direct calculations are not carried out, then the following approximate formulae may be applied:

For rudders with a heel support;

$$M = \frac{h_{\rm R}}{10\left(\frac{c^2}{A}\right)} C_{\rm R}$$

For spade rudders;

$$M = C_{\mathbf{R}} h_{\mathbf{c}}$$

For semi-spade rudders;

$$M = \frac{h_{\rm R}}{10\left(1 + \frac{c^2}{A}\right)} C_{\rm R}$$

where

 $h_{\rm R}$ = mean height, in m, of the rudder blade, see Figure 3.2.1 Rudder co-ordinate system.

 $h_{\rm C}$ = the distance, in m, from the centroid of the rudder blade area to the centre of the lowest main bearing;

c= mean breadth of the rudder blade, (the mean chord length), in m, see Figure 3.2.1 Rudder co-ordinate system.

 $A = \text{rudder blade area, in m}^2$.

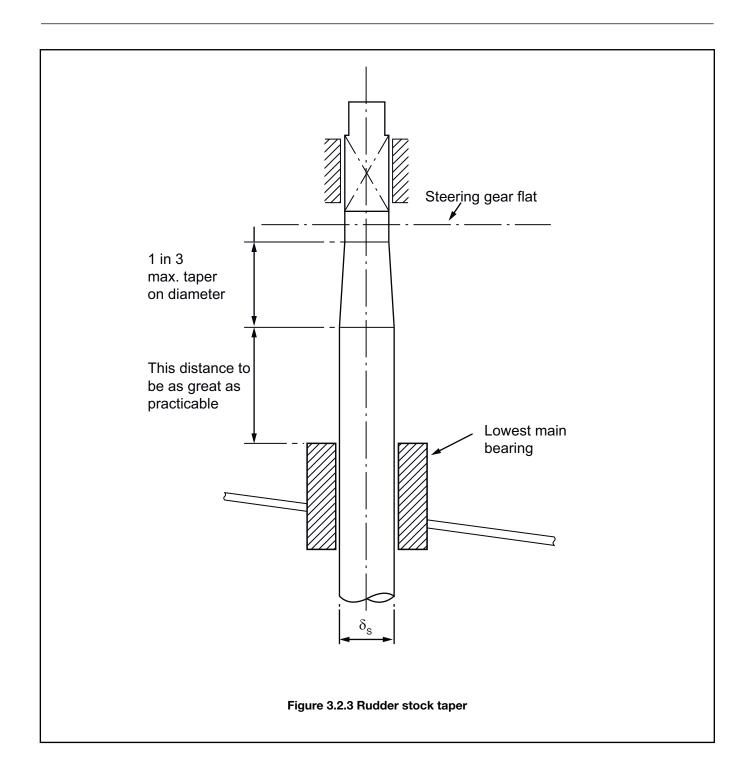

Table 3.2.5 Rudder stock permissible stresses

Mode	Permissible stress, N/mm²
(1) Torsional shear stress, τ_t	$\frac{68}{k}$
(2) Equivalent stress, $\sigma_{\text{\tiny C}}$	$\frac{118}{k}$
Symbols	

Volume 1, Part 3, Chapter 3

Section 2

Equivalent stress:

$$\sigma_c = \sqrt{\sigma_b^2 + 3\tau_t^2} ~N/mm^2$$

Bending stress:

$$\sigma_{\rm b} = 10, 2 \times 10^3 \, \frac{M}{d_{\rm c}^3} \quad \text{N/mm}^2$$

Torsional stress:

$$\tau_{\rm t} = 5.1 \times 10^3 \frac{Q_{\rm R}}{d_{\rm c}^3} \quad \text{N/mm}^2$$

M = bending moment, in Nm, at the section of the rudder stock under consideration, see Vol 1, Pt 3, Ch 3, 2.9 Rudder strength calculation 2.9.2.

 d_{c} = actual stock diameter, in mm.

2.11 Rudder blade

- 2.11.1 The scantlings of a double plated rudder are to be not less than required by *Table 3.2.6 Double plated rudder construction*.
- 2.11.2 The scantlings of single plate rudders are to be not less than required by *Table 3.2.7 Single plate rudder construction*.
- 2.11.3 All rudders are to be dimensioned such that the stresses do not exceed the permissible stresses given in *Table 3.2.8* Rudder blade permissible stresses.
- 2.11.4 In way of rudder couplings, pintles, and cut-outs of semi-spade rudders the plating thickness is to be suitably increased. Adequate hand or access holes are to be arranged in the rudder plating in way of pintles as required, and the rudder plating is to be reinforced locally in way of these openings, see *Table 3.2.9 Thickness of side plating and vertical web plates in way of solid parts*.
- 2.11.5 For spade rudders fitted with a fabricated rectangular mainpiece, the mainpiece is to be designed with its forward and aft transverse sections at similar distances forward and aft of the rudder stock transverse axis.
- 2.11.6 Internal surfaces of double plate rudders are to be efficiently coated. Alternatively, where it is intended to fill the rudder with plastic foam or use a corrosion inhibitor, details are to be submitted. Means for draining the rudder are to be provided.

Table 3.2.6 Double plated rudder construction

Item		Requi	Requirement	
(1) Rudder side, top and bottom plating		$t = 5, 5 \ s\beta \sqrt{k \left(T + \frac{C_R 10^{-4}}{A}\right)} + 2, 5 \text{ mm}$		
(2) Webs, vertical and horizontal $t_{\rm W} \ge 0.7$ t but is not to be less than 8 mm				
(3) Nose plate		$t_{\rm n} \ge$ 1,25t but need not exceed 22 mm		
(4) Mainpiece, (see Notes 1 and 2)	Rectangular (fabricated)	Breadth and width $\geq d_{\rm C}$ The side plating of the mainpiece is to extend 0,2c and is to be in accordance with (1) and the vertical webs as per (2), but in no case are either to be less than $t_{\rm M}$.	$t_{\rm M} \ge 8.5 + 0.56 \sqrt{d_c} \sqrt[3]{K_{\rm L}} \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \$	
	Tubular	Inside diameter $\geq d_{\rm C}$		
	Symbols			

T = draught, in m, as given in Vol 1, Pt 3, Ch 1, 5.1 General;

 $C_{\rm B}$ = rudder force, in N, as defined in Vol 1, Pt 3, Ch 3, 2.6 Rudder force 2.6.1;

Volume 1, Part 3, Chapter 3

Section 2

 $A = \text{rudder area, in } m^2;$

$$\beta = \sqrt{1, 1 - 0, 5\left(\frac{s}{b}\right)^2}$$
; max. 1,00 if b/s $\ge 2,5$

k = material factor, as defined in Vol 1, Pt 3, Ch 3, 2.3 Materials 2.3.4

s =smallest unsupported width of plating in m

b = greatest unsupported width of plating in m

c = chord length in m, as defined in Figure 3.2.1 Rudder co-ordinate system.

Note 1. The mainpiece bending stresses are to be not greater than those in Table 3.2.8 Rudder blade permissible stresses.

Note 2. The mainpiece plating attached to solid forged or cast parts, is not to be less than that required by Vol 1, Pt 3, Ch 3, 2.12 Connections of rudder blade structure with solid parts.

Note 3. The stock diameter to be used for calculating the mainpiece plate thickness is to be based on the mild steel stock scantlings, as given in *Table 3.2.4 Rudder stock diameter*.

Note 4. The requirement of $t_{\rm M}$ need only be applied to the upper part of the rudder plate:

- (a) for semi spade rudders; above a point midway between the lowest pintle and the bottom of the rudder.
- (b) for spade rudders; above a point one third of the height of the rudder above the base.

Table 3.2.7 Single plate rudder construction

Item	Requirement
(1) Blade thickness	The greater of; $t_b = 1.5 \text{ sV}\sqrt{k+2.5}$; or 10 mm.
(2) Arms	$t_{\rm a} = t_{\rm b}$
	The section modulus is not to be less than:
	$Z_{\rm a} = 0.5 {\rm s} {\rm C_1}^2 {\rm V^2 k} {\rm cm}^3$
(3) Mainpiece, see Note 1	As per Table 3.2.4 Rudder stock diameter
Symbols	

s =spacing of stiffening arms, in m, but is not to exceed 1 m.

V = speed in knots, as defined in Vol 1, Pt 3, Ch 3, 2.6 Rudder force 2.6.1.

 C_1 = horizontal distance from the aft edge of the rudder to the centreline of the rudder stock, in m.

Note 1. For spade rudders the lower third may be taper down to 0,75 d_c .

Table 3.2.8 Rudder blade permissible stresses

Item	Permissible stress, N/mm²		
	Bending stress, σ _b	Shear stress, τ	Equivalent stress, σ_{c}
Rudder blade, clear off cut-outs	$\frac{110}{k}$	$\frac{50}{k}$	$\frac{120}{k}$
Rudder blade in way of cut-outs, of semi-spade rudders	75	50	100

2.12 Connections of rudder blade structure with solid parts

2.12.1 Solid parts in forged or cast steel, which house the rudder stock or the pintle, are to be provided with protrusions, except as follows, see *Figure 3.2.4 Cross-section of the connection between rudder blade structure and rudder stock housing*. These protrusions are not required when the web plate thickness is less than:

Volume 1, Part 3, Chapter 3

Section 2

- (a) 10 mm for web plates welded to the solid part on which the lower pintle of a semi-spade rudder is housed and for vertical web plates welded to the solid part of the rudder stock coupling of spade rudders.
- (b) 20 mm for other web plates.
- 2.12.2 The solid parts are in general to be connected to the rudder structure by means of two horizontal web plates and two vertical web plates, see *Figure 3.2.4 Cross-section of the connection between rudder blade structure and rudder stock housing*.
- 2.12.3 The minimum section modulus of the cross-section of the structure of the rudder blade formed by vertical web plates and rudder plating, which is connected with the solid part where the rudder stock is housed is to be not less than:

$$w_{\rm s} = c_{\rm s} d_{\rm c}^{3} \left(\frac{H_{\rm E-H_{\rm x}}}{H_{\rm E}}\right)^{2} \frac{k}{k_{\rm s}} 10^{-4} \text{ cm}^{3}$$

where

 c_s = coefficient, to be taken equal to:

= 1,0 if there is no opening in the rudder plating or if such openings are closed by a full penetration welded plate.

= 1,5 if there is an opening in the considered cross-section of the rudder.

 $d_{\rm C}$ = rudder stock diameter, in mm.

H_E = vertical distance between the lower edge of the rudder blade and the upper edge of the solid part, in m.

 H_X = vertical distance between the considered cross-section and the upper edge of the solid part, in m.

k = material factor for the rudder blade plating, see Vol 1, Pt 3, Ch 3, 2.3 Materials 2.3.4.

 k_s = material factor for the rudder stock, see Vol 1, Pt 3, Ch 3, 2.3 Materials 2.3.4.

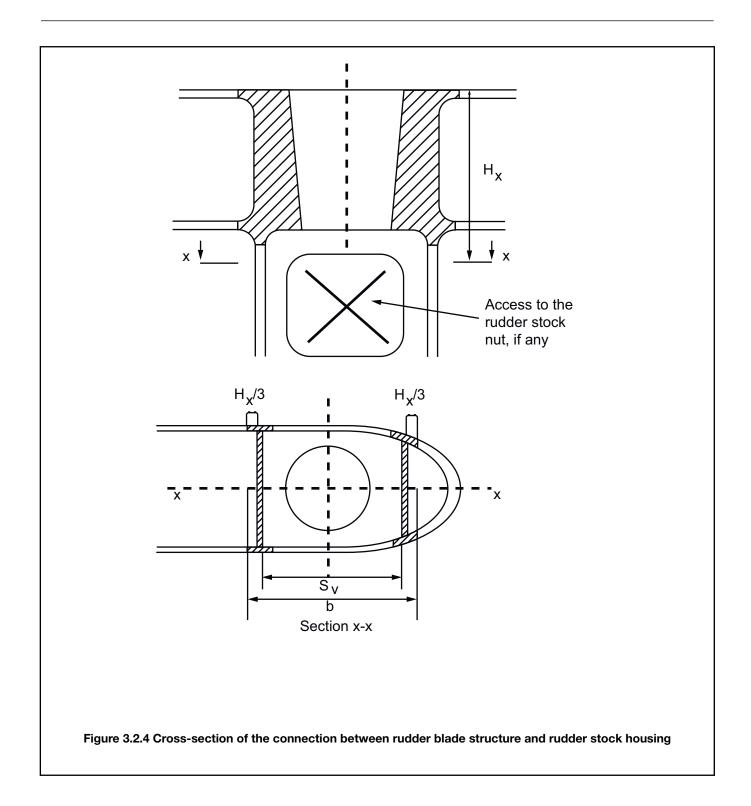

2.12.4 The actual section modulus of the cross-section of the structure of the rudder blade is to be calculated with respect to the symmetrical axis of the rudder, see the x-x axis in *Figure 3.2.4 Cross-section of the connection between rudder blade structure* and rudder stock housing. The breadth of the rudder plating to be considered for the calculation of section modulus is to be not greater than:

$$b = s_{\rm v} + \frac{2H_{\rm x}}{3} \qquad \text{m}$$

where

 s_v = spacing between the two vertical webs, in m.

Where openings for access to the rudder stock nut are not closed by a full penetration welded plate, they are not to be included in the section modulus calculations.

2.12.5 The thickness of the horizontal web plates connected to the solid parts as well as that of the rudder blade plating between these webs, is to be not less than the greater of the following values:

$$t_{\rm H} = 1.2 t \, \text{mm}$$

$$t_{\rm H} = \frac{d_{\rm s}^2}{0.045 \, \frac{d_{\rm s}^2}{S_{\rm H}}} \, \text{mm}$$

where

Volume 1, Part 3, Chapter 3

Section 2

t = as calculated in Table 3.2.6 Double plated rudder construction

 d_{S} = stock diameter, in mm, to be taken equal to:

- $= d_c$, for the solid part housing the rudder stock, as calculated in *Table 3.2.4 Rudder stock diameter*.
- = d_p , for the solid part housing the pintle, as calculated in *Table 3.2.12 Pintle requirements*.
- S_{H} = spacing between the two horizontal web plates, in mm

The increased thickness of the horizontal webs is to extend fore and aft of the solid part at least to the next vertical web.

2.12.6 The thickness of the vertical web plates welded to the solid part where the rudder stock is housed as well as the thickness of the rudder side plating above and below this solid part is to be not less than the values obtained from *Table 3.2.9 Thickness of side plating and vertical web plates in way of solid parts*. The increased thickness is to extend above and below the solid piece at least to the next horizontal web.

Table 3.2.9 Thickness of side plating and vertical web plates in way of solid parts

	Thickness of vertical web plates, in mm		Thickness of rudder plating, in mm, see Note 1	
Type of rudder	Rudder blade without opening	Rudder blade with opening	Rudder blade without opening	Area with opening
Rudder supported by sole piece	1,2 t	1,6 t	1,2 t	1,4 t
Semi-spade and spade rudders	1,4 t	2,0 t	1,3 t	1,6 t
Combala				

Symbols

Note 1. The side plating of the mainpiece is to extend at least 0,2c.

2.13 Rudder stock flange couplings

- 2.13.1 Rudder stock horizontal and vertical flange couplings are to be in accordance with *Table 3.2.10 Horizontal and Vertical flange couplings*.
- 2.13.2 For rudders with horizontal coupling arrangements the rudder stock should be forged when the stock diameter exceeds 350 mm. Where the stock diameter does not exceed 350 mm the rudder stock may be either forged or fabricated. Where the upper flange is welded to the rudder stock, a full penetration weld is required and its integrity is to be confirmed by non-destructive examination. The flange material is to be from the same welding materials group as the stock. Such rudder stocks are to be subjected to a furnace post-weld heat treatment (PWHT) after completion of all welding operations. For carbon or carbon manganese steels, the PWHT temperature is not to be less than 600°C.
- 2.13.3 For a horizontal flange coupling of a spade rudder, the palm radius, between the rudder stock and the flange, is not to be less than that calculated from Figure 3.2.5 Rudder stock horizontal flange palm radius for spade rudders, see also Figure 3.2.7 Rudder stock horizontal flange coupling.

where

 d_{c} , R, t_{f} are defined in Table 3.2.10 Horizontal and Vertical flange couplings

 b_f = breadth of flange, in mm.

- 2.13.4 For all rudder types, with a horizontal welded flange connection to the rudder stock, the connection details are in general to be in accordance with Figure 3.2.6 Welded joint between rudder stock and coupling flange.
- 2.13.5 The connecting bolts for coupling the rudder to the rudder stock are to be positioned with sufficient clearance to allow the fitting and removal of the bolts and nuts without contacting the palm radius. The surface forming the palm radius is to be free

t = thickness of the rudder plating, in mm, as calculated in Table 3.2.6 Double plated rudder construction

c = chord length in m, as defined in Figure 3.2.1 Rudder co-ordinate system.

Volume 1, Part 3, Chapter 3

Section 2

of hard and sharp corners and is to be machined smooth to the Surveyor's satisfaction. The surface in way of bolts and nuts is to be machined smooth to the Surveyor's satisfaction.

2.13.6 Coupling bolts are to be fitted bolts and their nuts are to be locked effectively.

Table 3.2.10 Horizontal and Vertical flange couplings

Item	Requirement	
	Horizontal coupling	Vertical coupling
Number of coupling bolts	n ≥ 6	$n \ge 8$
Diameter of coupling bolts, in mm	$d_{b} = 0,62\sqrt{\frac{d_{c}^{3} k_{b}}{ne_{m}^{k} s}}$	$d_b = 0.81 d_c \sqrt{\frac{k_b}{nk_s}}$
Thickness of coupling flange, in mm	The greater of the following, (see Note 1): $(a) \ t_{\rm f} = d_{\rm b} \sqrt{\frac{k_{\rm f}}{k_{\rm b}}}$ $(b) \ t_{\rm f} = 0.9 d_{\rm b}$ (c) $t_{\rm f} = 0.33 d_{\rm c} \sqrt[3]{k_{\rm s}}$ (see Notes 2 and 3)	$t_{\rm f} = d_{\rm b}$
Width of flange material outside the bolt holes, in mm	$W_{\rm f} = 0.67 d_{\rm b}$	$W_{\rm f} = 0.67 d_{\rm b}$
First moment of area of bolts about centre of coupling, in cm ³	$m = 0,00071 nd_c d_b^2 \sqrt{\frac{k_b}{k_s}}$	$m = 0,00043d_c^3 \sqrt{\frac{k_b}{k_s}}$
Stress concentration factor for as built scantlings	$\alpha_{\text{asbuilt}} \leq \alpha_{\text{max}} \text{ (see Note 2)}$	-

Symbols

 $d_{\rm C}$ = stock diameter, in mm, as calculated in *Table 3.2.4 Rudder stock diameter*.

n = total number of bolts.

 $e_{\rm m}$ = mean distance, in mm, of the bolt axes from the centre of the bolt system.

 k_s = material factor for the stock.

 $k_{\rm b}$ = material factor for the bolts.

 $k_{\rm f}$ = material factor for flange.

 d_b = bolt diameter, in mm.

 $w_{\rm f}$ = width of flange material outside the bolt holes, in mm.

m = first moment of area of bolts about the centre of the coupling, in cm³.

 $\alpha_{\text{asbuilt}} = \text{stress}$ concentration factor for as built scantlings.

$$\alpha_{\text{asbuilt}} = \frac{0.73}{\sqrt{\frac{R}{d}}}$$

 α_{max} = maximum allowable stress concentration factor.

130

Volume 1, Part 3, Chapter 3

Section 2

$$\alpha_{\text{max}} = \left(\left(53, 82 - 35, 29 \, k_{\text{max}} \right) \frac{d^3}{h \, C_{\text{R}} \cdot 10^3} \right) - \left(\left(1, 8 - 6, 3 \frac{R}{d} \right) \left(\frac{t_{\text{f}} - t_{\text{fa}}}{t_{\text{fa}}} \right) \right)$$

h = vertical distance, in m, between the centre of pressure and the centre point of the palm radius, see Figure 3.2.7 Rudder stock horizontal flange coupling.

 k_{max} = the greater of k_{S} or k_{f}

R = palm radius, in mm, between the rudder stock and connection flange.

 $t_{\rm f}$ = minimum thickness of coupling flange, in mm.

 $t_{\rm fa}$ = as built flange thickness, in mm.

Note 1. Where the value of d_b is to be calculated for a number of bolts not exceeding 8.

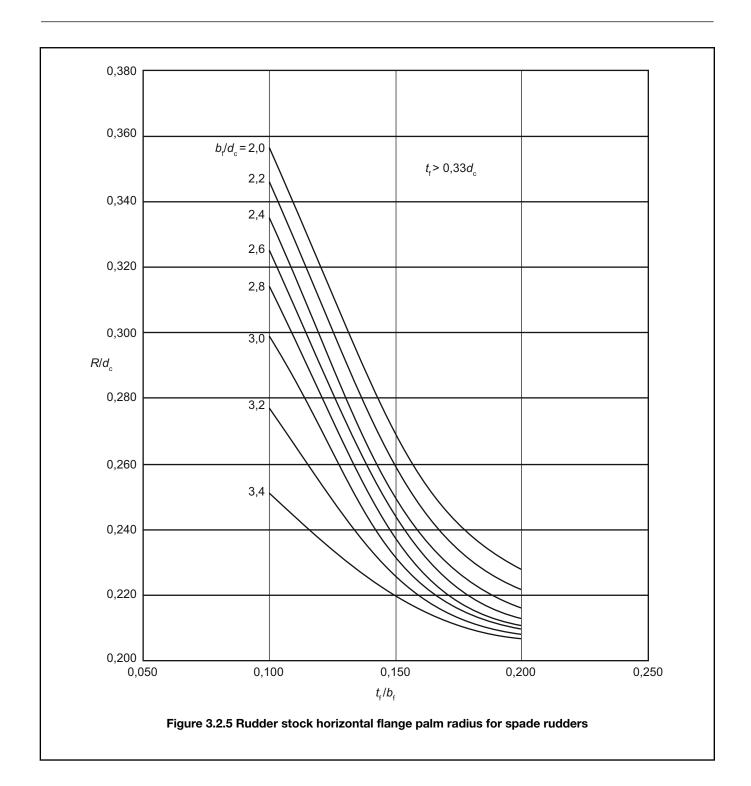

Note 2. This requirement is only applicable for spade rudders with horizontal couplings, see *Figure 3.2.7 Rudder stock horizontal flange coupling*.

Note 3. For a twin spade rudder arrangement with a single screw, and where the rudders are positioned within the slipstream of the propeller:

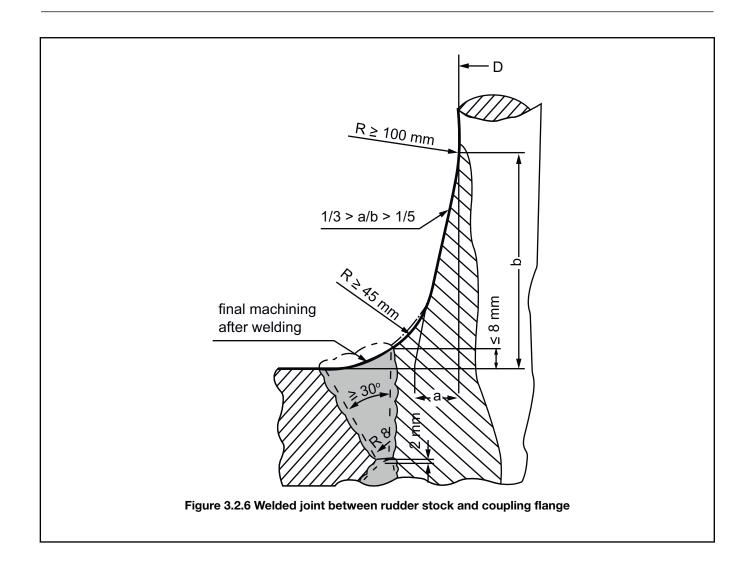

(a) the thickness of the palm plate/coupling flange is not to be less than

 $0,35d\sqrt[3]{k_s}$

(b) where the stock is welded to the palm plate, the stock diameter is to be increased by 14 per cent

132

2.14 Cone couplings with key

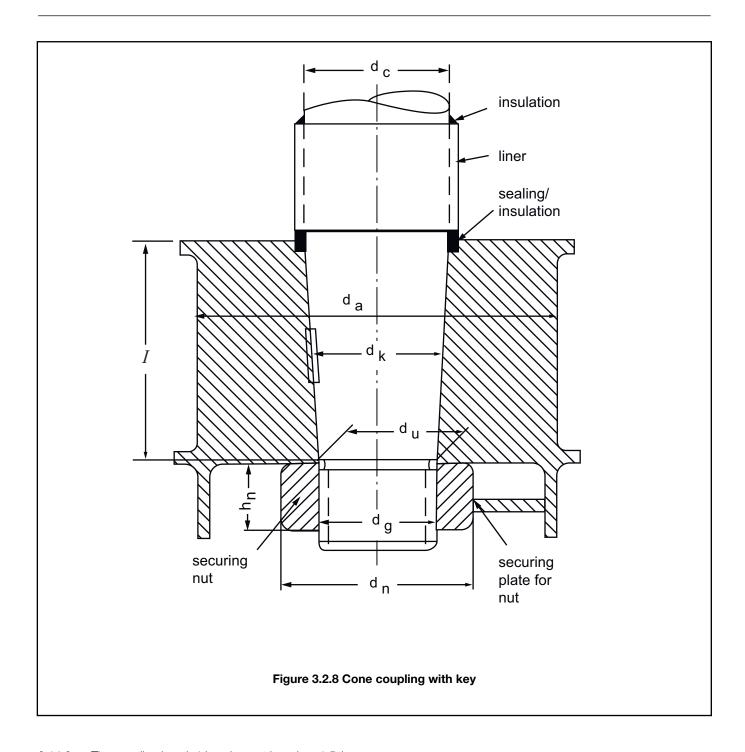

2.14.1 Cone couplings without hydraulic arrangements for mounting and dismounting the coupling are to have a taper ratio, θ_t on diameter of 1:8 to 1:12;

where

$$\theta_{t} = \frac{d_{c} - d_{u}}{I}$$

The cone shapes are to fit exactly. The cone coupling is to be secured by a nut and the nut itself is to be secured, e.g. by a securing plate, see Figure 3.2.8 Cone coupling with key.

134

- 2.14.2 The coupling length ℓ is to be, not less than 1,5 $d_{\rm c}$.
- 2.14.3 For couplings between stock and rudder where a key is provided, the shear area of the key is not to be less than:

$$a_{\rm S} = \frac{17,55Q_{\rm F}}{d_{\rm k} \sigma_{\rm F1}} \quad {\rm cm}^2$$

where

 Q_F = design yield moment of rudder stock, in Nm.

$$Q_{\rm F} = \frac{d_{\rm t}^{3}}{0,02664 \frac{d_{\rm t}^{3}}{k}}$$

135

Volume 1, Part 3, Chapter 3

Section 2

 d_t = stock diameter, in mm, as calculated in *Table 3.2.4 Rudder stock diameter*.

 d_k = mean diameter of the conical part of the rudder stock, in mm, at the key.

 σ_{E1} = minimum specified yield stress of the key material, in N/mm².

Where the actual diameter d_{ta} is greater than the calculated diameter d_{ta} , the diameter d_{ta} is to be used. However, d_{ta} need not be taken greater than 1,145 d_{t} .

2.14.4 The effective surface area of the key (without rounded edges) between key and rudder stock or cone coupling is not to be less than:

$$a_{k} = \frac{5Q_{F}}{d_{k} \sigma_{F2}} \quad cm^{2}$$

where

 σ_{F2} = minimum specified yield stress of the key, stock or coupling material, in N/mm², whichever is less.

2.14.5 The dimensions of the securing nut are to be in accordance with *Table 3.2.11 Securing nut dimensions*, see also Figure 3.2.8 Cone coupling with key:

Table 3.2.11 Securing nut dimensions

Item	Requirement	
External thread diameter	$d_{\rm g}\!\ge\!0,\!65~d_{\rm c}$	
Height	$h_{n} \ge 0.6 \ d_{g}$	
	The greater of the following:	
Outer diameter	(a) $d_n \ge 1,2 d_i,$ (b) $d_n \ge 1,5 d_u$	
	(b) $d_{\rm n} \ge 1,5 \ d_{\rm u}$	
Symbols, see Figure 3.2.8 Cone coupling with key.		

 $d_{\rm C}$ = stock diameter, in mm

 d_{q} = external thread diameter, in mm

 h_n = height of securing nut, in mm

 d_n = minimum distance across flats of securing nut, in mm

 $d_{\rm u}$ = inner diameter of securing nut, in mm

2.14.6 It is to be proved that 50 per cent of the design yield moment is solely transmitted by friction in the cone couplings. This can be done by calculating the required push-up pressure and push-up length in accordance with *Vol 1, Pt 3, Ch 3, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4* and *Vol 1, Pt 3, Ch 3, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5* for a torsional moment Q'_F = 0,5Q_F.

2.15 Cone couplings with special arrangements for mounting and dismounting the couplings

- 2.15.1 Where the stock diameter exceeds 200 mm, the press fit is recommended to be effected by a hydraulic pressure connection. In such cases the cone is to be more slender, and is to have a taper ratio, θ_t , on diameter of 1:12 to 1:20.
- 2.15.2 In the case of hydraulic pressure connections the nut is to be effectively secured against the rudder stock or the pintle.
- 2.15.3 For the safe transmission of the torsional moment by the coupling between rudder stock and rudder body the push-up pressure and the push-up length are to be determined in accordance with Vol 1, Pt 3, Ch 3, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4 and Vol 1, Pt 3, Ch 3, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5.
- 2.15.4 The push-up pressure, p_{reg} is not to be less than the greater of the two following values:

$$\rho_{\text{req1}} = \frac{2Q_{\text{F}}}{d_{\text{m}}^2 l \pi \mu_0} 10^3 \text{ N/mm}^2$$

$$p_{\text{req2}} = \frac{6M_{\text{b}}}{l^2 d_{\text{m}}} 10^3 \text{ N/mm}^2$$

where

Q_F = design yield moment of rudder stock, in Nm, as defined in Vol 1, Pt 3, Ch 3, 2.14 Cone couplings with key 2.14.3.

$$d_{\rm m} = \frac{d_{\rm u} + d_{\rm c}}{2}$$
.

I = cone length in, mm, see Figure 3.2.8 Cone coupling with key.

 μ_0 = frictional coefficient, to be taken as 0,15.

 $M_{\rm b} = {\rm bending\ moment\ in\ the\ cone\ coupling\ (e.g.\ in\ case\ of\ spade\ rudders)},\ {\rm in\ Nm}.$

 d_{u} = upper cone diameter, see Figure 3.2.8 Cone coupling with key.

 d_{c} = lower cone diameter, see Figure 3.2.8 Cone coupling with key.

It has to be proved by the designer that the push-up pressure does not exceed the permissible surface pressure in the cone. The permissible surface pressure is to be determined by the following formula:

$$p_{\text{perm}} = \frac{0.95\sigma_{\text{g}}(1-\alpha^2)}{\sqrt{3+\alpha^4}} - p_{\text{b}} \text{ N/mm}^2$$

where

$$p_{\rm b} = \frac{3.5M_{\rm b}}{d_{\rm m}l^2} 10^3$$

 σ_{q} = minimum specified yield stress of the material of the gudgeon in N/mm².

$$\alpha = \frac{d_{\rm m}}{d_{\rm a}}$$

 $d_{\rm m}$ = mean cone diameter in, mm, see Figure 3.2.8 Cone coupling with key.

 d_a = outer diameter of the gudgeon to be not less than 1,25 d_c , in mm, see Figure 3.2.8 Cone coupling with key.

I = cone length in, mm, see Figure 13.2.8 Cone coupling with key.

 $M_{\rm b}$ = bending moment in the cone coupling (e.g. in case of spade rudders), in Nm.

2.15.5 The push-up length $\Delta \ell$, is to comply with the following formula:

$$\Delta \ell_1 \leq \Delta \ell \leq \Delta \ell_2$$

where

$$\Delta \ell_1 = \frac{p_{\text{req}} d_{\text{m}}}{E\left(\frac{1-\alpha^2}{2}\right)\theta_{\text{t}}} + \frac{0.8 R_{\text{tm}}}{\theta_{\text{t}}} \text{ mm}$$

$$\Delta \ell_2 = \frac{p_{\text{perm}} d_{\text{m}}}{E\left(\frac{1-\alpha^2}{2}\right)\theta_{\text{t}}} + \frac{0.8 R_{\text{tm}}}{\theta_{\text{t}}} \text{ mm}$$

where

Volume 1, Part 3, Chapter 3

Section 2

 p_{req} , p_{perm} , α , d_{m} σ_{g} are defined in Vol 1, Pt 3, Ch 3, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4

 R_{tm} = mean roughness, in mm, taken equal to 0,01

 $E = \text{Young's modulus of the material, in N/mm}^2$

 θ_t = taper on diameter, see Vol 1, Pt 3, Ch 3, 2.14 Cone couplings with key.

2.15.6 In case of hydraulic pressure connections the required push-up force $P_{\rm e}$, for the cone may be determined by the following formula:

$$P_{\rm e} = p_{\rm req} d_{\rm m} \Pi \ell \frac{\theta_{\rm t}}{2} + 0.02 \text{ N}$$

The value 0,02 is a reference for the friction coefficient using oil pressure. It varies and depends on the mechanical treatment and roughness of the details to be fixed. Where due to the fitting procedure a partial push-up effect caused by the rudder weight is given, this may be taken into account when fixing the required push-up length, subject to approval by LR.

2.16 Pintles

- 2.16.1 Rudder pintles and their bearings are to be in accordance with the requirements of this sub-section and *Vol 1, Pt 3, Ch 3, 2.17 Bearings*.
- 2.16.2 The bottom pintle on semi-spade rudders and all pintles over 500 mm in diameter are if inserted into their sockets from below, to be keyed to the rudder or sternframe as appropriate or to be hydraulically assembled, with the nut adequately locked, see Vol 1, Pt 3, Ch 3, 2.14 Cone couplings with key and Vol 1, Pt 3, Ch 3, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings.
- 2.16.3 Where liners are fitted to pintles, they are to be shrunk on or otherwise efficiently secured. If liners are to be shrunk on, the shrinkage allowance is to be indicated on the plans. Where liners are formed by stainless steel weld deposit, the pintles are to be of weldable quality steel and details of the procedure are to be submitted, see also Vol 1, Pt 3, Ch 3, 2.17 Bearings 2.17.2.
- 2.16.4 Where an *IWS (In-water Survey) notation is to be assigned, means are to be provided for ascertaining the rudder pintle and bush clearances and for verifying the security of the pintles in their sockets with the vessel afloat.

138

Volume 1, Part 3, Chapter 3

Section 2

Table 3.2.12 Pintle requirements

Item	Requirement	
(1) Pintle diameter, in mm	$d_{\mathbf{p}} = 0,35\sqrt{Bk_{\mathbf{p}}}$	
(2) Pintle taper	Method of assembly	Taper (on diameter)
	Keyed and other manually assembled pintles applying locking by securing nut	1:8 – 1:12
	Pintles mounted with oil injection and hydraulic nut	1:12 – 1:20
(3) Pintle bearing length	$d_{p} \le I_{p} \le 1,2 \ d_{p}$	
(4) Pintle housing/gudgeon	<i>b</i> _g ≥ 0,25 <i>d</i> _p	
(5) Liner or bush in way of pintle bearings, in mm	$t = 0,01\sqrt{B}$	
Symbols		

 $k_{\rm p}$ = material factor for pintle

B =bearing force, in

 $d_{\rm p}$ = actual pintle diameter measured on the outside of liners.

 $b_{\rm q}$ = thickness of pintle housing/gudgeon in way of pintles (measured from the outside of bush if fitted).

Note 1. The length of the pintle housing in the gudgeon is not to be less than the maximum pintle diameter d_0 .

Note 2. The minimum dimensions of threads and nuts are to be determined according to Table 3.2.11 Securing nut dimensions.

2.16.5 The required push-up pressure for pintles is to be determined by the following formula:

$$\rho_{\text{req}} = 0.4 \frac{B_1 d_p}{d_m^2 l} \text{ N/mm}^2$$

where

d_m and I are defined in Vol 1, Pt 3, Ch 3, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.4

 B_1 = supporting force in the pintle, in N

 d_p = actual pintle diameter, in mm.

The push-up length is to be calculated in accordance with Vol 1, Pt 3, Ch 3, 2.15 Cone couplings with special arrangements for mounting and dismounting the couplings 2.15.5, using the required push-up pressure and properties for the pintle.

2.17 Bearings

- 2.17.1 Bearings are to comply with the requirements of *Table 3.2.13 Bearings*. The fitting of bearings is to be carried out in accordance with the manufacturer's recommendations to ensure that they remain secure under all foreseeable operating conditions.
- 2.17.2 Where it is proposed to use stainless steel for liners or bearings for rudder stocks and/or pintles, the chemical composition is to be submitted for approval. Synthetic rudder bearing materials are to be of a type approved by LR. When this type of lining material is used, arrangements to ensure an adequate supply of sea-water to the bearing are to be provided.

Volume 1, Part 3, Chapter 3

Section 2

Table 3.2.13 Bearings

ltem	Requirement	
(1) Bearing surface area	$A_{\rm B} = \frac{B}{q_{\rm a}} \rm mm^2$	
(2) Bearing length	The length/diameter ratio of the bearing surface is not to be greater than 1,2.	
(3) Clearance	Bearing material	Minimum clearance (on diameter)
	Metal	0,001 <i>d</i> + 1,0
	Synthetic	See Notes 1, 2, 3, and 4
(4) Liners and bushes	Material	Minimum thickness
	Metal and synthetic material	8 mm
	Lignum vitae	22 mm
(5) Main bearing housing wall thickness, see Note 5	Greater than 0,2d _c	
	Symbols	

 $A_{\rm B}$ = bearing surface, in mm², defined as the projected area (length x outer diameter) of liner

d = stock diameter, as calculated in *Table 3.2.4 Rudder stock diameter*, or pintle diameter as calculated in *Table 3.2.12 Pintle requirements*

B =bearing force, in N.

 q_a = allowable surface pressure, see Table 3.2.14 Maximum surface pressure.

Note 1. If non-metallic bearing material is applied, the bearing clearance is to be specially determined considering the material's swelling and thermal expansion properties. This clearance is not to be less than 1,5 mm on bearing diameter unless a smaller clearance is supported by the manufacturer's recommendation and there is documented evidence of satisfactory service history with a reduced clearance.

- Note 2. For bearings which are pressure lubricated the clearance must be restricted to enable the pressure to be maintained.
- Note 3. The value of the proposed minimum clearance is to be indicated on plans submitted for approval.
- Note 4. Proposals for higher pressures or other materials will be specially considered on the basis of satisfactory test results.
- Note 5. Where web stiffening is fitted on the bearing, a reduction in wall thickness will be considered.

Table 3.2.14 Maximum surface pressure

Bearing material	$q_{\rm a}$ (N/mm²) (see Note 1)
Lignum vitae	2,5
White metal, oil lubricated	4,5
Synthetic material with hardness between 60 and 70 Shore D (see Note 2)	5,5 (see Note 3)

Volume 1, Part 3, Chapter 3

Section 3

Steel (see Note 4) and bronze and hot-pressed bronze-graphite	7.0
materials	7,0

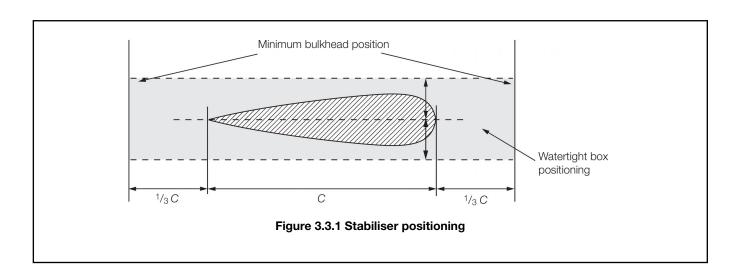

- Note 1. Proposals for higher pressures will be specially considered on the basis of satisfactory test results.
- Note 2. Indentation hardness test at 23°C and with 50 per cent moisture according to a recognised standard. Synthetic bearing materials are to be of an approved type.
- **Note** 3. Surface pressures exceeding 5,5 N/mm² may be accepted in accordance with bearing manufacturer's specification and tests, but in no case more than 10 N/mm².
- Note 4. Stainless and wear-resistant steel in an approved combination with stock liner.

■ Section 3

Stabiliser arrangements

3.1 General

- 3.1.1 This section details the requirements for fin stabilisers, stabiliser tanks and bilge keel and fins.
- 3.1.2 The effectiveness of the fin stabilisers are outwith the scope of classification; however their scantlings, arrangements, foundations, supporting structure and watertight integrity are to be examined.
- 3.1.3 Engineering systems are to comply with the appropriate requirements indicated in *Vol 2 Machinery and Engineering Systems*, as applicable.
- 3.1.4 The general structure of the fin stabiliser is to comply with the Rule requirements for rudders.
- 3.1.5 Fin stabilisers are to be contained between watertight bulkheads.
- 3.1.6 For non-retractable type stabilisers, the watertight bulkheads forming the forward and aft extent of the compartment are to be arranged not less than one third of the root chord length, *C*, from the fore and aft most extents of the stabiliser, see *Figure 3.3.1 Stabiliser positioning*. This requirement exists in order to ensure limited flooding in the event of hull damage in way of the fin. Alternate arrangements which are considered to be equivalent to the Rule requirements will be accepted.
- 3.1.7 For retractable type stabilisers, the watertight bulkheads forming the forward and aft extent of the compartment are to be arranged not less than the total length of the stabiliser (measured from the extreme end of the shaft to the blade tip) from the centreline of the stabiliser shaft.
- 3.1.8 For non-retractable type stabilisers, a separate watertight box surrounding the shell entry point may be required if the stabiliser is located adjacent to a critical compartment. No stabiliser box is needed if the compartment which it is in has adequate pumping arrangements and the ship has at least a one-compartment flooded damage capability.
- 3.1.9 Where a watertight box surrounding the shell entry point is required, it is to extend longitudinally not less than the minimum bulkhead positions defined in *Vol 1*, *Pt 3*, *Ch 3*, *3.1 General 3.1.6* and vertically to ensure complete enclosure of the machinery and allow adequate inspection, see *Figure 3.3.1 Stabiliser positioning*.

- 3.1.10 For both retractable and non-retractable type stabilisers the compartment in which the stabilisers are fitted is to contain a water ingress detector and alarm.
- 3.1.11 Fin stabiliser systems are, in general, not to extend beyond the extreme waterline breadth, $B_{\rm WL}$, of the hull or below the horizontal line of keel. However, for retractable fins, alternative arrangements may be specially considered. Where the stabiliser fin extends beyond the extreme moulded beam of the hull in the active mode, the side shell is to be permanently marked indicating the fore and aft extent of the stabiliser, when deployed. It is recommended that an appropriate symbol be placed on the hull side between the marks.
- 3.1.12 The shell plating in way of retractable stabilisers is to comply with the requirements of *Vol 1, Pt 3, Ch 3, 3.2 Fin stabilisers*. However, the longitudinal extent of the insert is to be such that it extends beyond around the hull opening in the fore/aft direction by not less than 25 per cent of the root chord length of the foil. In all other directions the extent of the insert shall be 1,25 times the root chord length of the foil over all operational lengths.
- 3.1.13 The scantlings of internal watertight bulkheads and stiffening for fixed installations are to be specified by the designer/Builder and/or fin unit manufacturer, but in no case are to be less than the scantlings for double bottoms as defined in *Vol 1*, *Pt 6*, *Ch 3 Scantling Determination*. Suitable access is to be provided to allow for maintenance and inspection purposes.
- 3.1.14 The scantlings and sealing arrangements for the pedestal and bearings will be specially considered, subject to the designer/Builder submitting the following:
- (a) Detailed structural calculations for the proposed foundation and adjacent supporting structure.
- (b) A detailed finite element analysis, if carried out.
- (c) Calculations demonstrating that the effect of damage to the stabiliser arrangement arising from the high speed impact, grounding, fouling, etc. will not compromise the structural and watertight integrity of the ship.
- (d) Maximum torque, bending moments and bearing loads expected for the proposed design.
- (e) The stabiliser fin stock material, together with its ultimate tensile shear strength values (N/mm²).
- 3.1.15 Fin bearing materials are to be of an approved type.
- 3.1.16 Where retractable stabilisers are fitted, position indicators are to be provided on the bridge and at auxiliary steering positions.
- 3.1.17 Where the fin stabiliser is of a novel design, high aspect ratio or the speed of the ship exceeds 45 knots, and the anticipated loads are likely to be significant, the scantlings of the fin and fin stock are to be determined by direct calculation methods incorporating model test results and structural analysis, where considered necessary by LR.

3.2 Fin stabilisers

3.2.1 The stabiliser machinery and surrounding structure is to be adequately supported and stiffened. Where cyclic bending stresses are induced in the structure which are likely to reduce the fatigue life the maximum stress is not to exceed 39,0 N/mm² in mild steel. Where other materials are used for the supporting structure the limiting stress values will be specially considered.

Volume 1, Part 3, Chapter 3

Section 3

- 3.2.2 The fin box into which the stabilisers are fitted is to have a perimeter plating with thickness not less than the surrounding Rule shell plating plus 2 mm, and is to be stiffened to the same standard as the adjacent hull structure. Ships constructed from materials other than steel will be specially considered.
- 3.2.3 Insert plates are to be fitted in way of stabilisers. The thickness of the insert is to be at least 50 per cent greater than the bottom shell thickness in way and is to extend over an area 1,25 times the stabiliser root chord length, covering all operational angles. In addition, for retractable stabilisers, the insert is to extend beyond the shell opening for a distance of not less than 25 per cent of the length of the root chord.
- 3.2.4 The thickness of plating in way of retractable foil recesses is to be not less than the bottom shell thickness plus 2 mm. Internal stiffening is to comply with the requirements of *Vol 1, Pt 3, Ch 3 Ship Control Systems,Vol 1, Pt 3, Ch 4 Closing Arrangements and Outfit*, as applicable.

3.3 Centre of pressure

3.3.1 The position of the centre of pressure for use in the determination of the fin torque is to be as indicated in *Table 3.3.1 Position of centre of pressure*.

Table 3.3.1 Position of centre of pressure

Design criteria	Value of x_{PF} and x_{PA}	
Rectangular fins:		
(a) Ahead condition	$x_{PF} = (0.33x_B - x_L)$, but not less than $0.12x_B$	
(b) Astern condition	$x_{PA} = (x_A - 0.25x_B)$, but not less than $0.12x_B$	
Non-rectangular fins:		
(a) Ahead condition	x PF as calculated from geometric form	
(b) Astern condition	x PA (see note) but not less than:	
	$0,12A_{\rm F}$	
	Y _F	
Symbols		

 $x_{\rm PF}=$ horizontal distance from the centreline of the fin stock, to the centre of pressure in the ahead condition, in metres

 x_{PA} = horizontal distance from the centreline of the fin stock, to the centre of pressure in the astern condition, in metres

 x_B = breadth of fin, in metres

 y_F = depth of fin at centreline of stock, in metres

 $A_{\rm F} =$ fin area, in m²

 x_{\perp} and x_{\perp} = horizontal distances from leading and after edges, respectively, of the fin to the centreline of the fin stock, in metres

 $x_{\rm S}$ = horizontal length of any rectangular strip of fin geometric form, in metres

Note For rectangular strips the centre of pressure is to be assumed to be located as follows:

Note (a) $0.33x_S$ abaft leading edge of strip for ahead condition.

Note (b) 0,25x_S from aft edge of strip for astern condition.

Volume 1, Part 3, Chapter 3

Section 3

3.4 Fin force, $F_{\rm F}$

3.4.1 The fin force, F_F , in kN, for use in the determination of the fin scantlings is to be submitted. For the astern condition the maximum astern speed, V_A , is to be used. In no case is the astern speed to be taken less than that determined from the following: $V_A \ge 0.5V$ knots.

3.5 Fin torque, Q_F

3.5.1 The fin torque, Q_F, for the ahead condition may be determined from the following formula:

$$Q_F = F_F x_{PF} kNm$$

where

 x_{PF} = horizontal distance from the centreline of the fin stock, to the centre of pressure in the ahead condition, in metres, see *Table 3.3.1 Position of centre of pressure*

 $F_{\rm F} = {\rm fin} \ {\rm force} \ {\rm as} \ {\rm defined} \ {\rm in} \ {\it Vol} \ 1, \ {\it Pt} \ 3, \ {\it Ch} \ 3, \ 3.4 \ {\it Fin} \ {\it force}, \ {\it FF} \ 3.4.1.$

3.5.2 The fin torque, Q F, for the astern condition may be determined from the following formula:

$$Q_F = F_F x_{PA} kNm$$

where

 x_{PA} = horizontal distance from the centreline of the fin stock, to the centre of pressure in the astern condition, in metres, see *Table 3.3.1 Position of centre of pressure*

F_F = fin force as defined in Vol 1, Pt 3, Ch 3, 3.4 Fin force, FF 3.4.1

3.6 Fin bending moment, $M_{\rm F}$

3.6.1 For conventional fins the bending moment, $M_{\rm F}$, may be determined from the following formula:

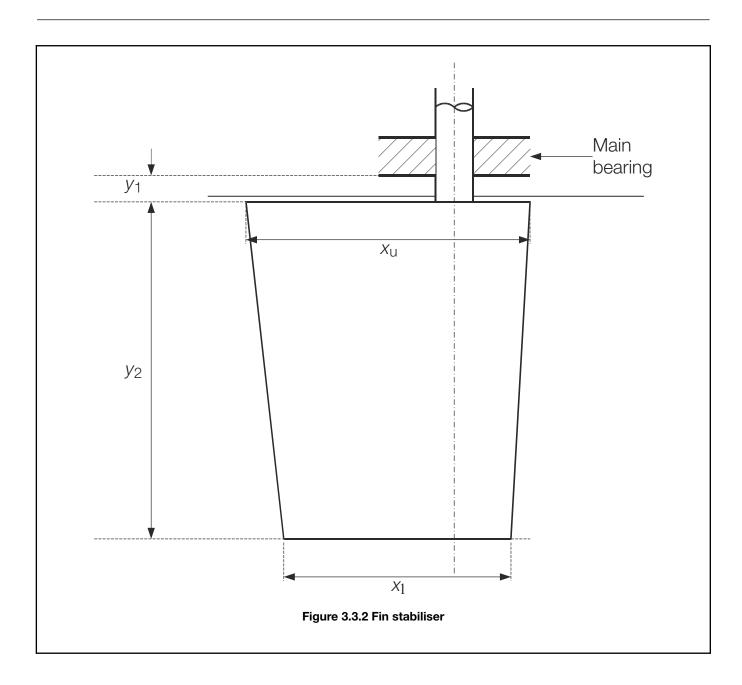

$$M_F = F_F \left(y_I + \left(\frac{y_2 (2x_I + x_u)}{3(x_I + x_u)} \right) \right) kNm$$

where

F F is as given in Vol 1, Pt 3, Ch 3, 4 Rudder horns and appendages

 \emph{y} 1, \emph{y} 3, \emph{x} 1 and \emph{x} $_{\text{u}}$ are fin dimensions, in metres

see Figure 3.3.2 Fin stabiliser

3.7 Fin stock diameter in way of tiller, d_{Fu}

3.7.1 The fin stock diameter in way of the tiller, d_{Fu} , is to be not less than that determined from the formula:

$$d_{\rm FU} = 42\sqrt[3]{Q_{\rm F}k}~{\rm mm}$$

where

 Q_F = fin torque (in the appropriate condition), in kNm, as given in 3,5

k = material factor, as defined in Vol 1, Pt 3, Ch 3, 2.3 Materials 2.3.4

3.8 Fin stock diameter, d_F

3.8.1 For a fin stock subjected to combined torque and bending, the equivalent stress in the fin stock is not to exceed that determined from the following:

Volume 1, Part 3, Chapter 3

Section 3

$$\sigma_{\rm e} \le \frac{118}{k} \text{ N/mm}^2$$

where

k = material factor, as defined in Vol 1, Pt 3, Ch 3, 2.3 Materials 2.3.4

The equivalent stress is to be determined by the formula:

$$\sigma_{\rm e} = \sqrt{\sigma_{\rm b^2}^2 + 3\tau_{\rm t^2}^2} \, \rm N/mm^2$$

Bending = stress:
$$\sigma_b = 10200 \frac{M_F}{d_{F^3}} \times 10^3 \text{ N/mm}^2$$

Torsional = stress:
$$\tau_t = 5100 \frac{Q_R}{d_{F^3}} \times 10^3 \text{ N/mm}^2$$

3.8.2 The basic fin stock diameter, $d_{\rm F}$, at and below the lowest bearing is not to be less than that determined from the following:

$$d_{\rm F} = d_{\rm Fu} \sqrt[6]{1 + \frac{4}{3} \left(\frac{M_{\rm F}}{Q_{\rm F}}\right)^2} \, {\rm mm}$$

where

 d_{Fu} = diameter of the fin stock in way of the tiller, in mm

M_F = fin bending moment, kNm, see Vol 1, Pt 3, Ch 3, 3.6 Fin bending moment, MF

Q_F = fin torque (in the appropriate condition), in kNm, as given in Vol 1, Pt 3, Ch 3, 3.5 Fin torque, QF

3.9 Fin plating

3.9.1 The thickness of the fin side plating is not to be less than that determined from the following:

$$t = 0,0224s\beta\sqrt{\frac{P_{F}k}{110}} + 2,5 \text{ mm}$$

where

s = stiffener spacing, in mm

 β = panel aspect ratio correction factor

$$= A_{R} (1 - 0.25A_{R}) \text{ for } A_{R} \le 2$$

 $= 1 \text{ for } A_{\text{R}} > 2$

 $A_{\rm R}$ = panel aspect ratio

= panel length/panel breadth

 P_{F} = fin pressure, in kN/m²

$$= 10T + \frac{F_F}{A_F} \text{ kN/mm}^2$$

T = maximum draught, in metres

Volume 1, Part 3, Chapter 3

Section 4

F = fin force, in kN, see Vol 1, Pt 3, Ch 3, 3.4 Fin force, FF

 $A_{\rm F} =$ fin area, in m²

k = material factor, as defined in Vol 1, Pt 3, Ch 3, 2.3 Materials 2.3.4

- 3.9.2 The thickness of the nose plates is not to be less than 1,25 times the thickness of the fin side plating. The thickness of web plates is not to be less than 70 per cent of the thickness of the fin side plating, or 6 mm, whichever is the greater.
- 3.9.3 Alternative materials and methods for fin stabilisers will be specially considered.

3.10 Stabiliser tanks

3.10.1 The general structure of the tank is to comply with the Rule requirements for deep tanks. Sloshing forces in the tank structure are to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculations.

3.11 Bilge keels and fins

- 3.11.1 It is recommended that bilge keels are not fitted forward of 0,7L B on ships intended to navigate in ice conditions.
- 3.11.2 Bilge keels are to be gradually tapered at the ends and arranged to finish in way of a suitable internal stiffening member. The taper is to have a length to depth ratio of at least three to one.
- 3.11.3 A plan of the bilge keels is to be submitted for approval of material grades, welded connections and detail design.
- 3.11.4 The scantlings and attachment to the hull plating for steel ships is to be in accordance with *Vol 1, Pt 6, Ch 6, 6.11 Bilge keels and ground bars*.

3.12 Novel features

3.12.1 Where the Rules do not specifically define the requirements for novel features then the scantlings and arrangements are to be determined by direct calculations. Such calculations are to be carried out on the basis of the Rules, recognised standards and good practice, and are to be submitted for consideration.

■ Section 4

Rudder horns and appendages

4.1 General

- 4.1.1 Rudder horns and boss end brackets may be constructed of cast or forged steel or fabricated from steel plate. Where shaft brackets are fitted these may be either fabricated, cast or forged from steel.
- 4.1.2 In castings, sudden changes of section or possible constrictions to the flow of metal during casting are to be avoided. All fillets are to have adequate radii, which, in general, are to be not less than 50 to 75 mm, depending on the size of the casting.
- 4.1.3 Castings and forgings are to comply with the requirements of *Ch 4 Steel Castings* and *Ch 5 Steel Forgings* of the Rules for Materials.
- 4.1.4 Rudder horns, shaft brackets, etc. are to be effectively integrated into the ship structure, and their design is to be such as to facilitate this.

4.2 Propeller boss

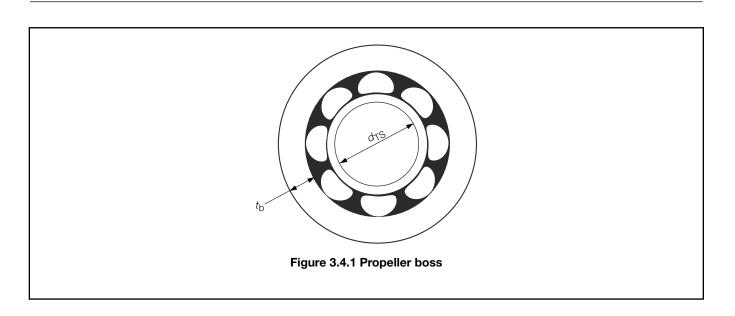

4.2.1 The thickness of the propeller boss is to be not less than:

 $0, 1d_{TS} + 56$ butneed not exceed $0, 3d_{TS}$

where

d_{TS} = diameter of tailshaft in mm, see Figure 3.4.1 Propeller boss.

Section 4

4.3 Rudder horns

4.3.1 The requirements for the scantlings and arrangements of rudder horns will be subject to special consideration and may require to be determined by direct calculations.

4.4 Shaft bossing

- 4.4.1 Where the propeller shafting is enclosed in bossings extending back to the bearings supporting the propellers, the aft end of the bossings and the bearings are to be supported by substantially constructed boss end castings or fabrications. These are to be designed to transmit the loading from the shafting efficiently into the ship's internal structure.
- 4.4.2 For shaft bossings attached to shaft brackets, the length of the boss is to be adequate to accommodate the aftermost bearing and to allow for proper connection of the shaft brackets.
- 4.4.3 Cast steel supports are to be suitably radiused where they enter the main hull to line up with the boss plating radius. Where the hull sections are narrow, the two arms are generally to be connected to each other within the ship. The arms are to be strengthened at intervals by webs.
- 4.4.4 Fabricated supports are to be carefully designed to avoid or reduce the effect of hard spots. Continuity of the arms into the ship is to be maintained, and they are to be attached to substantial floor plates or other structure. The connection of the arms to the bearing boss is to be by full penetration welding.
- 4.4.5 The scantlings of supports will be specially considered. In the case of certain high powered ships, direct calculations may be required.
- 4.4.6 The boss plating is generally to be radiused into the shell plating and supported at the aft end by diaphragms at every frame. These diaphragms are to be suitably stiffened and connected to floors or a suitable arrangement of main and deep web frames. At the forward end, the main frames may be shaped to fit the bossing, but deep webs are generally to be fitted not more than four frame spaces apart.

4.5 Shaft brackets

- 4.5.1 The scantlings of the arms of shaft brackets, based on a breadth to thickness ratio of about five, are to be determined from Vol 1, Pt 3, Ch 3, 4.6 Single arm shaft brackets ('P' brackets) 4.6.1 or Vol 1, Pt 3, Ch 3, 4.7 Double arm shaft brackets ('A' brackets) 4.7.2 as appropriate.
- 4.5.2 Where the propeller shafting is exposed to the sea for some distance clear of the main hull, it is generally to be supported adjacent to the propeller by independent brackets having two arms. In very small ships the use of single arm brackets will be considered.
- 4.5.3 Fabricated brackets are to be designed to avoid or reduce the effect of hard spots and ensure a satisfactory connection to the hull structure. The connection of the arms to the bearing boss is to be by full penetration welding.

Volume 1, Part 3, Chapter 3

Section 4

- 4.5.4 Bracket arms are in general to be carried through the shell plating, they are to be attached to floors or girders of increased thickness. The shell plating is to be increased in thickness and connected to the arms by full penetration welding.
- 4.5.5 In the case of certain high powered ships direct calculations may be required.
- 4.5.6 For shaft brackets having hollow section arms, the cross-sectional areas at the root and the boss should be not less than that required for a solid arm which satisfies the Rule section modulus having the proportions stated in *Vol 1, Pt 3, Ch 3, 4.5 Shaft brackets 4.5.1*.
- 4.5.7 The length of the shaft bracket boss, I_b , is to be sufficient to support the length of the required bearing. In general, I_b is not to be less than 4 d_t , where d_t is the Rule diameter of the screwshaft, in mm, see Vol 2, Pt 3, Ch 2, 4.4 Screwshafts and tube shafts. Proposals for a reduction in the required shaft bracket boss length will be considered in conjunction with details of the bearing material, allowable bearing operating pressure and installation arrangements, see Vol 2, Pt 3, Ch 2, 4.16 Sternbushes and sterntube arrangements 4.16.2. However, in no case is I_b to be less than the greater of:
- (a) $2d_{t}$;
- (b) that recommended by the bearing manufacturer;
- (c) as required by Vol 1, Pt 3, Ch 3, 4.4 Shaft bossing 4.4.2.
- 4.5.8 Where the shaft and the shaft bracket boss are of the same material, the thickness of the shaft bracket boss is not to be less than $d_{t}/4$. Where the shaft and the shaft bracket boss are of dissimilar materials, the thickness of the boss, t_{b} , is to be not less than:

$$t_{\rm b} = 0,75d_{\rm t} \left(\sqrt[3]{f_1} - 0,667 \right) {\rm mm}$$

Note In no case is t_b to be taken as less than 12 mm

where

 d_t = Rule diameter of the screwshaft, in the appropriate screwshaft material, in mm

 $f_1 = \sigma_S/\sigma_B$ but not less than 0,825

 $\sigma_{\rm S}$ = ultimate tensile strength of the shaft material, in N/mm²

 σ_B = ultimate tensile strength of the boss material, in N/mm²

4.5.9 The design of the shaft brackets with regard to disturbance of the hydrodynamic flow into the propeller and rudders is outwith the scope of classification

4.6 Single arm shaft brackets ('P' - brackets)

4.6.1 Single arm shaft brackets are to have a section modulus, Z_{xx} , at the palm of not less than that determined from the formula:

$$Z_{xx} = \frac{a_{\rm s} d_{\rm up}^2 f}{45000} \, \rm cm^3$$

where

 a_s = the length of the arm to be measured from the centre of the section at the palm to the centreline of the shaft boss, in mm, see *Figure 3.4.2 Single arm shaft bracket (bolted attachment)*

d up = the Rule diameter for an unprotected screwshaft, in mm, as given in Vol 2, Pt 3, Ch 2 Shafting Systems using A = 1,0

 $f = 400/\sigma_{II}$

 σ_{II} = ultimate tensile strength of arm material, in N/mm²

Volume 1, Part 3, Chapter 3

Section 4

The cross-sectional area of the bracket at the boss is to be not less than 60 per cent of the area of the bracket at the palm.

4.6.2 For single arm shaft brackets a vibration analysis may be required if deemed necessary by LR.

4.7 Double arm shaft brackets ('A' - brackets)

- 4.7.1 The angle between the arms for double arm shaft brackets is to be generally not less than 50°. Proposals for the angle between the arms to be less than 50° will be specially considered with supporting calculations to be submitted by the designers.
- 4.7.2 The arms of double arm shaft brackets are to have a section modulus, Z_{xx} , of not less than that determined from the formula:

$$Z_{xx} = 0.45 \, n^3 \, \text{cm}^3$$

where

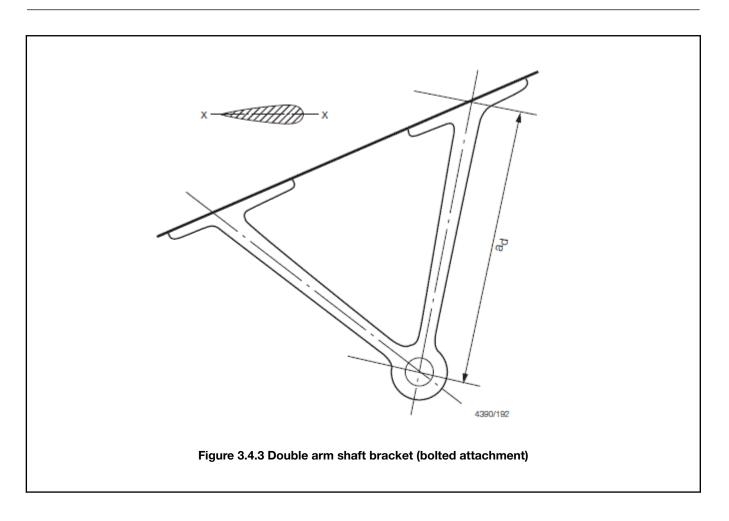

n = the minimum thickness, in cm, of a hydrofoil section obtained from:

$$n = d_{up} \sqrt{\left(\frac{f}{2000}\right) \left(1 + \sqrt{\left(1 + \left(\frac{0,0112}{f}\right) \left(\frac{a_d}{d_{up}}\right)^2\right)}\right)} cm$$

a d = the length of the longer strut, in mm, see Figure 3.4.3 Double arm shaft bracket (bolted attachment)

d up and f are as given in Vol 1, Pt 3, Ch 3, 4.6 Single arm shaft brackets ('P' - brackets) 4.6.1

150

4.8 Intermediate shaft brackets

4.8.1 The length and thickness of the shaft bracket boss are to be as required by *Vol 1, Pt 3, Ch 3, 4.5 Shaft brackets 4.5.7* or *Vol 1, Pt 3, Ch 3, 4.5 Shaft brackets 4.5.8* as appropriate. The scantlings of the arms will be specially considered on the basis of the Rules.

4.9 Attachment of shaft brackets by welding

4.9.1 Fabricated supports are to be carefully designed to avoid or reduce the effect of hard spots. Continuity of the arms into the ship is to be maintained, and they are to be attached to substantial floor plates or other structure. The connection of the arms to the bearing boss is to be by full penetration welding.

4.10 Attachment of shaft brackets by bolting

- 4.10.1 The bottom shell thickness in way of the double arm propeller bracket palms is to be increased by 50 per cent. The bottom shell thickness in way of single arm propeller brackets palms is to be doubled in thickness. The insert plates are to be additionally supported by substantial floor plates or other structure.
- 4.10.2 Where shaft brackets are attached by bolts, they are to be provided with substantial palms securely attached to the hull structure which is to be adequately stiffened in way. Where bolts are used, the nuts are to be suitably locked.
- 4.10.3 The bracket palms may be bolted directly onto the shell using a suitable bedding compound. The palms may be bolted onto suitable shims or chocking compound, of an approved type, to facilitate alignment.
- 4.10.4 Where brackets are bolted onto resin chocks, plans indicating the following information are to be submitted for approval:
- (a) The thrust and torque loads, where applicable, that will be applied to the chocked item.
- (b) The torque load to be applied to the bracket mounting bolts.
- (c) The material of the bracket mounting bolts.
- (d) The number, thread size, shank diameter and length of the mounting bolts.

Volume 1, Part 3, Chapter 3

Section 4

- 4.10.5 The minimum thickness of a resin chock is to be 12 mm.
- 4.10.6 The bracket palms are to have well radiused corners, and the faying surface to be dressed smooth. The palm thickness in way of the bolts is to be not less than the propeller bracket boss thickness from *Vol 1, Pt 3, Ch 3, 4.5 Shaft brackets 4.5.7* or *Vol 1, Pt 3, Ch 3, 4.5 Shaft brackets 4.5.8* as appropriate.
- 4.10.7 The diameter of the propeller bracket mounting bolts is to be not less than:

$$d_{b} = \sqrt{\frac{Z_{xx}}{8.75 \pi \, n \, h \times 10^{-5}}} \, \text{mm}$$

subject to $d_{\text{bmin}} \ge t_{\text{b}}$ mm

where

 Z_{XX} = the section modulus of the bracket arm determined from Vol 1, Pt 3, Ch 3, 4.6 Single arm shaft brackets ('P' – brackets) 4.6.1 or Vol 1, Pt 3, Ch 3, 4.7 Double arm shaft brackets ('A' – brackets) 4.7.2, cm³, as appropriate

n = the number of bolts in each row

h =the distance between rows of bolts, mm

 $d_{\rm b}$ = the bolt diameter in the same material as the propeller bracket, mm

 $t_{\rm b}$ = the propeller bracket boss thickness, mm.

- 4.10.8 Where the shaft bracket and the shaft bracket mounting bolts are of dissimilar materials (which are galvanically compatible), the diameter of the propeller bracket mounting bolts, as determined from *Vol 1, Pt 3, Ch 3, 4.10 Attachment of shaft brackets by bolting 4.10.7*, is to be modified in proportion to the square root of the yield strengths of the particular materials. The corrected bolt diameter of the dissimilar material is to be not less than the propeller bracket boss thickness.
- 4.10.9 The propeller bracket palms are to have fitted bolts, and suitable arrangements provided to lock the nuts.
- 4.10.10 A washer plate is to be provided, generally of equal dimensions to the bracket palm with thickness $t_b/6$ mm, subject to a minimum of 3 mm.

4.11 Alignment of shaft brackets

- 4.11.1 Particular care is to be paid to the alignment of shaft brackets to minimise vibration and cyclic loadings being transmitted from the propulsion shafting and propellers into the hull structure.
- 4.11.2 Alignment of bolted shaft brackets may be by means of suitable metallic shims or chocking resin of an approved type, see Vol 1, Pt 3, Ch 3, 4.10 Attachment of shaft brackets by bolting 4.10.2 and Vol 1, Pt 3, Ch 3, 4.10 Attachment of shaft brackets by bolting 4.10.3.
- 4.11.3 The alignment of shaft brackets connected by welding or bonding may be facilitated by boring of the bracket boss after attachment of the shaft bracket and sterntube.

4.12 Sterntubes

- 4.12.1 The sterntube scantlings are to be individually considered.
- 4.12.2 The bottom shell, in way of the sterntube, is to be additionally reinforced by means of an insert plate to increase the bottom shell thickness by 50 per cent.
- 4.12.3 The sterntube should in general be connected to the shell by welding. Bolted arrangements will be specially considered.
- 4.12.4 Where sterntubes are to be retained by bolting they are to be provided with a substantial flange securely attached to the hull structure. Where bolts are used, the nuts are to be suitably locked.
- 4.12.5 Where sterntubes are to be welded to hull insert plates full penetration welding is required.
- 4.12.6 Where sterntubes are to be installed using a resin system, of an approved type, the requirements of *Vol 1, Pt 6, Ch 6 Material and Welding Requirements* are to be complied with.

152

Volume 1, Part 3, Chapter 3

Section 4

- 4.12.7 The region where the shafting enters the ship, and the bearing in way, is to be adequately supported by floors or deep webs.
- 4.12.8 The shaft bearings are to be secured against rotation within the sterntube.
- 4.12.9 A suitable gland arrangement is to be provided at the inboard end of sterntubes.

4.13 Skegs

- 4.13.1 Skegs are to be efficiently integrated into the adjacent hull structure and their design is to facilitate this.
- 4.13.2 The scantlings of skegs are to be sufficient to withstand any docking forces imposed upon them.

4.14 Propeller hull clearances

4.14.1 Recommended minimum clearances between the propeller and the sternframe, rudder or hull are given in *Table 3.4.1* Recommended minimum propeller hull clearances. These are the minimum distances considered desirable in order to expect reasonable levels of propeller excited vibration. Attention is drawn to the importance of the local hull form characteristics, shaft power, water flow characteristics into the propeller disc and cavitation when considering the recommended clearances.

Table 3.4.1 Recommended minimum propeller hull clearances

Number of blades	Hull clearances for twin screw, in metres, see Figure 3.4.4 Propeller clearance	
	е	f
3	1,20 <i>K d</i> p	1,20 <i>K d</i> p
4	1,00 <i>K d</i> p	1,20 <i>K d</i> p
5	0,85 <i>K d</i> p	0,85 <i>K d</i> p
6	0,75 <i>K d</i> p	0,75 <i>K d</i> p
Minimum value	3 and 4 blades, 0,20 <i>d</i> p	0,15 <i>d</i>
	5 and 6 blades, 0,16 <i>d</i> p	
Symbols		

Symbols

L $_{\rm R}$ and C $_{\rm B}{\rm are}$ as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

$$K = \left(0, 1 + \frac{L_{R}}{3050}\right) \left(\frac{3,48C_{B}P_{s}}{L_{R}^{2}} + 0,3\right)$$

 $t_{\rm R}$ = thickness of rudder, in metres measured at 0,7Rp above the shaft centreline

 P_s = designed power on one shaft, in kW

 R_{p} = propeller radius, in metres

dp = propeller diameter, in metres

Note The above recommended minimum clearances also apply to semi-spade type rudders.

■ Section 5

Fixed and steering nozzles, bow and stern thrust units, ducted propellers

5.1 General

- 5.1.1 The requirements given in this Section are applicable to fixed and steering nozzles with an inner diameter of not greater than 5 metres.
- 5.1.2 For nozzles with an inner diameter greater than 5 metres, the maximum pressure acting on the nozzle is to be submitted by the designer. This pressure is to be used to determine the nozzle scantlings in accordance with the requirements of *Vol 1*, *Pt 3*, *Ch 3*, *5.3 Nozzle scantlings* to *Vol 1*, *Pt 3*, *Ch 3*, *5.4 Nozzle stock and solepiece*.
- 5.1.3 Suitable arrangements are to be provided to prevent the steering nozzle from lifting.
- 5.1.4 Effective means are to be provided for supporting the weight of the nozzle. The hull structure, in way of the nozzle supports, is to be suitably strengthened.
- 5.1.5 Care is to be taken in the manufacture of the nozzle to ensure its internal preservation and watertightness. The preservation and testing requirements are the same as for rudders, see Vol 1, Pt 3, Ch 3, 2.11 Rudder blade and Table 6.7.1 Testing requirements.

5.2 Design pressure

5.2.1 The design pressure for propeller nozzles, in kN/m², is to be determined as follows:

$$P_{d} = c_{z}P_{d0}$$

$$P_{d0} = 9 + 0.0025 N \delta_{p} \text{ for } N_{N} \le 63$$

$$P_{d0} = 13+0.002N\delta_{p}$$
 for $63 < N_{N} \le 200$

$$P_{d0} = \epsilon c_f \frac{N}{A_p} \text{ for } N_N > 200$$

where

 $N_{
m N}$ is the nozzle numeral

$$= 0.01 N\delta_{\rm p}$$

N is the maximum shaft power in kW

Volume 1, Part 3, Chapter 3

Section 5

 $A_{\rm p}$ is the propeller disc area, in ${\rm m^2}$, taken equal to:

$$A_{\mathbf{p}} = \frac{\pi \delta_{p}^{2}}{4}$$

- δ_{p} $\,$ is the propeller diameter in m
- ϵ is a factor obtained from the following formula:

$$\epsilon$$
 = 0,21 – 2 × 10 $^4\frac{N}{A_{\rm p}}$ but not to be taken less than 0,1

 c_z is a coefficient taken equal to:

 c_z = 1,0 in Zone 2 (propeller zone)

 $c_z = 0,5 \text{ in Zone 1}$

see also Figure 3.5.1 Nozzle construction

c_f is a coefficient taken equal to:

 $c_{\rm f}$ = 1,0 for fixed nozzles

 $c_{\rm f}$ = 1,25 for steering nozzles

5.3 Nozzle scantlings

5.3.1 The scantlings of propeller nozzles are to be not less than required by *Table 3.5.1 Nozzle construction*.

Table 3.5.1 Nozzle construction

Item	Requirement
(1) Nozzle plating	$t = 5 \text{s} \sqrt{P_{\text{d}} k_{\text{S}}} + t_{\text{k}}$ but not less than 7,5 mm
(2) Ring webs and web stiffeners	Not less than the attached nozzle plating in way of Zone 1

Volume 1, Part 3, Chapter 3

Section 5

(3) Webs in way of headbox and pintle support structure	$t_{\rm W} = t + 4 \text{ mm}$	
(4) Section modulus of nozzle profile about its neutral axis	$Z = n\delta_{\rm p}^2 L_{\rm d} V^2 {\rm cm}^3$	
Symbols		
$P_{\rm d}$ = nozzle design pressure, in kN/m ² , see Vol 1, Pt 3, Ch 3, 5.2 Design pressure		
t = thickness of nozzle plating, in mm		
$t_{ m w}$ = thickness of web plating, in mm		
s = spacing of web rings, in m		
$k_{ m s}$ = material factor, as defined in <i>Vol 1, Pt 6, Ch 5, 2.1 Design criteria</i>		
$t_{\rm k}$ = corrosion thickness, to be taken as:		
$t_{\rm k}$ = 2,5 in general		
$t_{\rm K}$ = 1,5 for fresh water environments		
t _k = 0 for stainless steel		
S _p = propeller diameter, in m		
L _d = nozzle length, in m		
n = coefficient taken equal to:		
n = 1,0 for steering nozzles		
n = 0.7 for fixed nozzle		
V = maximum service speed in knots		

- 5.3.2 The Zone 2 nozzle plating is to be carried well forward and aft of the propeller tips with due allowance being made on steering nozzles for the rotation of the nozzle in relation to the propeller, and is to extend at least $0.25 L_d$ in length.
- 5.3.3 Fore and aft web stiffeners are to be fitted between the inner and outer skins of the nozzle. Both sides of the headbox and pintle support structure, are to be connected to fore and aft webs of increased thickness.
- 5.3.4 The adjacent ring webs fore and aft of those connected to the headbox and pintle support structure are to be of a similar thickness to the ring webs connected to the headbox and pintle support structure.
- 5.3.5 Local stiffening is to be fitted in way of the top and bottom supports which are to be integrated with the web stiffeners and ring webs. Continuity of bending strength is to be maintained in these regions.
- 5.3.6 The plating thickness of attached fins is to be not less than the Zone 1 nozzle plating thickness and fins are to be adequately reinforced. Solid fins shall not be less than 25 mm thick.

5.4 Nozzle stock and solepiece

- 5.4.1 The requirements for the nozzle stock are to be derived, in accordance with *Vol 1, Pt 3, Ch 3, 2.10 Rudder stock scantlings*, using the lateral nozzle force and maximum nozzle torque obtained in this sub-Section.
- 5.4.2 The nozzle stock is to be dimensioned such that the stresses do not exceed the permissible stress given in *Table 3.2.5 Rudder stock permissible stresses*.
- 5.4.3 The lateral nozzle force, $C_{\rm R}$, at the centre of pressure is to be determined as follows:

$$C_{\rm R} = P_{\rm d}A_{\rm t} 10^3 \rm N$$

where

 $P_{\rm d}$ = nozzle design pressure in zone 2, in kN/m²

 $A_{\rm t}$ = total projected area of nozzle and supporting structure, in m²

 $A_{t} = A_{n} + A_{f} + A_{s}$

156

Volume 1, Part 3, Chapter 3

Section 5

where

 $A_{\rm n}$ = projected area of nozzle, in m², to be taken as 1,57 $\delta_{\rm p}L_{\rm d}$

 $A_{\rm f}$ = projected area of nozzle flap, in m²

 $A_{\rm s}$ = projected area of support structure in the longitudinal plane, in m²

where δ_{p} and L_{d} are defined in Table 3.5.1 Nozzle construction .

5.4.4 The maximum nozzle torque, $Q_{\rm R}$, is to be determined as follows:

$$Q_{R} = C_{r} \times r Nm$$

where

r = distance from the centre of pressure to the stock, in m, to be taken as:

$$c(\mathbf{a}-k_1)$$

c = nozzle length plus the length of the nozzle flap if present.

 α = relative centre of pressure along the nozzle length, to be taken as:

 $\alpha = 0.25$ for fixed nozzles

 $\alpha = 0.33$ for steering nozzles

 k_1 = ratio of the nozzle area forward of the stock centreline to the combined area of the nozzle and flap

$$k_1 = \frac{A_1}{A_n + A_f}$$

A₁ is the portion of the nozzle area located forward of the stock centreline, see also Figure 3.5.2 Nozzle geometry

C_r, A_n and A_f are given in Vol 1, Pt 3, Ch 3, 5.4 Nozzle stock and solepiece 5.4.2

5.4.5 The solepiece is to be assessed using direct calculation. Bending stresses, derived using the lateral nozzle force calculated in accordance with *Vol 1, Pt 3, Ch 3, 5.4 Nozzle stock and solepiece 5.4.3*, are not to exceed 70 N/mm².

5.5 Nozzle headbox

5.5.1 The section modulus of the headbox, Z, about the longitudinal axis is to be not less than:

$$Z = 0.143P_{d}A_{t}D_{H} \times 10^{2} \text{ cm}^{3}$$

where

 $P_{\rm d}$ = nozzle design pressure in zone 2, in kN/m²

Volume 1, Part 3, Chapter 3

Section 5

where

$$D_{H} = \delta_{h} + \frac{\delta_{p}}{2}$$

where

 δ_h = depth of headbox, in m

 δ_p = propeller diameter, in m

A_t = is given in Vol 1, Pt 3, Ch 3, 5.4 Nozzle stock and solepiece 5.4.2

5.5.2 Plans detailing the integration of the headbox into the sternframe are to be submitted.

5.6 Ancillary items

5.6.1 Requirements for ancillary items such as bearings, couplings, pintles, etc. are given in Vol 1, Pt 3, Ch 3, 2 Rudders.

5.7 Welding

- 5.7.1 Double continuous welds are to be used as far as practicable for the connection between the inner and outer nozzle plating and the internal stiffening rings and webs. Slot welding is not permitted for the inner nozzle plating.
- 5.7.2 Additional welding requirements are given in Vol 1, Pt 3, Ch 3, 2.4 Welding and design details.

5.8 Steering gear and allied systems

5.8.1 For the requirements of steering gear, see Vol 2, Pt 6, Ch 1 Steering Gear.

5.9 Thruster unit wall thickness

5.9.1 The wall thickness of the unit is, in general, to be in accordance with the manufacturer's practice, but is to be not less than the thickness of the adjacent shell plating plus 10 per cent or 2 mm whichever is the greater, subject to a minimum of 7 mm.

5.10 Thruster unit installation details

- 5.10.1 The tunnel tube is to be fitted either between a pair of deep floors or bulkheads extending to above the design waterline or in a separate watertight compartment.
- 5.10.2 The shell plating thickness is to be locally increased by 50 per cent in way of tunnel thruster connections.
- 5.10.3 For welded tube connections the welding is to be by full penetration welding.
- 5.10.4 The tunnel tube is to be framed to the same standard as the surrounding shell plating.
- 5.10.5 The unit is to be adequately supported and stiffened.

5.11 Propeller ducting

- 5.11.1 Where propellers are fitted within integral ducts/tunnels, the plating thickness in way of the blades is to be increased by 50 per cent.
- 5.11.2 The tunnel wall in way of the propeller blades is to be additionally stiffened.

5.12 Surface drive mountings

- 5.12.1 Transoms through which surface drive systems pass and which are required to carry thrust, significant weight, torque, moment, etc. are to be adequately reinforced.
- 5.12.2 The thickness of transom plating in way is to be increased by 50 per cent or as advised by the drive manufacturer, whichever is the greater.
- 5.12.3 Steering rams are to be mounted on suitably reinforced areas of plating supported by additional internal stiffening, details of which are to be submitted for consideration.

Volume 1, Part 3, Chapter 3

Section 6

5.13 Novel features

5.13.1 Where the Rules do not specifically define the requirements for novel features, then the scantlings and arrangements are to be determined by direct calculations. Such calculations are to be carried out on the basis of the Rules, recognised Standards and good practice, and are to be submitted for consideration.

■ Section 6

Waterjet propulsion systems

6.1 Construction

- 6.1.1 The requirements for the construction and installation of water jet units apply irrespective of rated power.
- 6.1.2 Water jet ducts may be fabricated as an integral part of the hull structure, or as a bolted-in unit. In either case, detailed plans indicating dimensions, scantlings and materials of construction of the following are to be submitted in triplicate.
- (a) Arrangement of the system including intended method of attachment to the hull and building-in, geometry of tunnel, shell opening, method of stiffening, reinforcement, etc.
- (b) Shaft sealing arrangements.
- (c) Details of any shafting support or guide vanes used in the water jet system.
- (d) Details and arrangements of inspection ports, their closing appliances and sealing arrangement, etc.
- (e) Details and arrangements of protection gratings and their attachments.
- 6.1.3 When submitting the plans requested in 6.1.2, details of the designers' loadings and their positions of application in the hull are to be submitted. These are to include maximum applied thrust, moments and tunnel pressures for which approval is sought.
- 6.1.4 All materials used in construction are to be manufactured and tested in accordance with the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*
- 6.1.5 Steels are to be of suitable grades in accordance with the requirements of Vol 1, Pt 6, Ch 6 Material and Welding Requirements.
- 6.1.6 Irrespective of the material used, the strength and supporting structure of all tunnels are to be examined by direct calculation procedures which are to be submitted. In no case are the scantlings to be taken as less than the Rule requirements for the surrounding structure. The strength of the hull structure in way of tunnels is to be maintained. The structure is to be adequately reinforced and compensated as necessary. All openings are to be suitably reinforced and have radiused corners.
- 6.1.7 Consideration is to be given to providing the inlet to the tunnel with a suitable guard to prevent the ingress of large objects into the rotodynamic machinery. The dimensions of the guard are to strike a balance between undue efficiency loss due to flow restriction and viscous losses, the size of object allowed to pass and susceptibility to clog with weed and other flow restricting matter.
- 6.1.8 The inlet profile of the tunnel is to be so designed as to provide a smooth uptake of water over the range of craft operating trims and avoid significant separation of the flow into the rotating machinery.
- 6.1.9 Single or multiple water jet unit installations having a total rated power in excess of 500 kW are to be contained within their own watertight compartment. Other arrangements for maintaining watertight integrity may be specially considered depending on the size and installation layout.
- 6.1.10 For details of machinery requirements, see Vol 2, Pt 4, Ch 2 Water Jet Systems.

6.2 Water jet propulsion systems - Installation

- 6.2.1 Standard units built for 'off the shelf' supply and which include the duct are to be installed strictly in accordance with the manufacturer's instructions, see also Vol 1, Pt 3, Ch 3, 6.1 Construction 6.1.4.
- 6.2.2 Integral water jet ducts are to be constructed in accordance with the manufacturer's requirements and the relevant plans submitted as required by *Vol 1*, *Pt 3*, *Ch 3*, *6.1 Construction*.
- 6.2.3 Where load is transmitted into the transom and/or bottom shell, the thickness of the plating adjacent to the jet unit is to be increased. The increase in thickness is to be not less than 50 per cent of the calculated transom and bottom plating

Volume 1, Part 3, Chapter 3

Section 6

thicknesses respectively or 8 mm, whichever is the greater. Such reinforcement is to extend beyond the surrounding stiffening structure.

- 6.2.4 For 'bolted-in' units, hull receiving rings are to be of a material compatible with the hull. Scantlings of the receiving rings are to be as required by the jet unit manufacturer and suitably edge prepared prior to welding in place. The receiving ring is to be installed using an approved welding procedure. Where a manufacturer's specification is not provided, full details are to be submitted.
- 6.2.5 Bolt sizes and spacings are to be specified by the manufacturer, and are to be of suitable marine grade, insulated as appropriate and locked by suitable means.
- 6.2.6 Where studs are proposed for the receiving ring(s), the remaining thickness below the depth of blind tap is to be not less than the bottom shell plating thickness plus 2 mm. Bottoms of all blind taps are to be free of sharp corners.
- 6.2.7 The use of approved alignment resins may be considered where accurate seating and faying surfaces are required. Details are to be submitted for consideration and approval.
- 6.2.8 Where a water jet unit forms an integral part of the hull structure, such units are to be installed using an approved weld procedure and in accordance with the manufacturer's instructions. Materials to be welded are to be of compatible specifications.
- 6.2.9 Water jet units transmitting thrust into the transom structure are to be supported by a system of radial, athwartship and vertical stiffening. Drawings are to be accompanied by a set of detailed structural calculations. Where complex installations are proposed, a finite element model may be submitted in lieu of direct calculations.
- 6.2.10 Water jet units transmitting thrust to a bottom shell connection or intermediate tunnel connection are to be supported by additional stiffening, the details of which are to be submitted.

Volume 1, Part 3, Chapter 4

Section

Section

- 1 Introduction
- 2 Hatches and miscellaneous openings on the weather deck
- 3 Doors and accesses on weather decks
- 4 Watertight doors and hatches in watertight subdivision boundaries
- 5 Side scuttles and windows
- 6 **Ventilators**
- 7 Air and sounding pipes
- 8 Scuppers and sanitary discharges
- 9 Bulwarks, guard rails, raised walkways and other means for the protection of crew and embarked personnel
- 10 Lagging and lining of structure
- 11 Lifting eyes

■ Section 1

Introduction

1.1 General

- 1.1.1 The requirements of this Chapter are applicable to all ship types. If required, reference should be made to the specified subdivision and stability standard(s)
- 1.1.2 Provisions covering acceptable arrangements for the watertight and weathertight integrity of the hull and spaces within the hull are to be read in conjunction with the limits defined in *Vol 1, Pt 3, Ch 1, 1.3 Loading*.
- 1.1.3 Requirements are given for watertight and weathertight steel hatches and doors, securing arrangements, coamings, also closing arrangements for other miscellaneous openings, ventilators, air pipes, magazine blow out plates and discharges. For side shell doors for main opening and bow doors, see *Vol 1, Pt 4, Ch 3 Special Features*.
- 1.1.4 Requirements are also given for other outfitting arrangements including protection of personnel, lagging of structure and the fixing of equipment lifting eyes.
- 1.1.5 A boundary or a closing appliance is considered weathertight if it is capable of preventing the passage of water into the ship in any sea condition. Weathertightness can be obtained, by design, where closing arrangements are constructed of steel (or equivalent) and are capable of being closed by clamping devices or bolts. The joining parts are to be gasketed and for all practical purposes have an equivalent structural integrity and tightness to the surrounding structure.
- 1.1.6 The requirements for closing appliances in this Chapter are suitable for weathertight arrangements. When closing appliances are designed to comply with the requirements for CBRN Defence, they will be considered as being equivalent to the weathertight requirements of this Chapter.
- 1.1.7 In general, closing arrangements and outfit should be positioned so as to avoid direct weapon recoil, blast or efflux loads however, where this is not the case, they are to be additionally examined for structural integrity and tightness when subject to the loads defined in *Vol 1*, *Pt 4*, *Ch 2*, 9 *Military installation and operational loads* as applicable.

Volume 1, Part 3, Chapter 4

Section 2

■ Section 2

Hatches and miscellaneous openings on the weather deck

2.1 Hatch covers

- 2.1.1 The hatch covers on the weather decks of all ships are to be steel plated, stiffened by webs or stiffeners, hinged and secured by clamping devices. Weathertightness to be achieved by means of gaskets. The means of securing are to be such that weathertightness can be maintained in any sea condition. Where toggles are fitted, their diameter and spacing are to be in accordance with ISO standards or equivalent.
- 2.1.2 The scantlings of covers are not to be less than the rule thickness for the deck at that point. Where other materials are used, equivalent scantlings are to be provided. The scantlings apply basically to rectangular covers, with the stiffening members arranged primarily in one direction and carrying a uniformly distributed load. The covers are assumed to be simply supported. Where covers are stiffened by a grillage formation, and also where point loads are applied to any type of cover, the scantlings are to be determined from direct calculations.
- 2.1.3 In the case of flush hatch covers or of covers on coamings of lesser height than required by *Vol 1, Pt 3, Ch 4, 2.3 Manholes and flush escape hatches 2.3.1*, their scantlings, the securing and sealing arrangements and the drainage of gutterways will be specially considered.
- 2.1.4 Where hatchways are trunked through one or more lower decks, and hatchway beams and covers are dispensed with at the intermediate decks, the hatchway beams, coamings and covers immediately below the trunk are to be adequately strengthened. Plans are to be submitted for approval.
- 2.1.5 Small hatches, including escape hatches, are to be situated clear of RADHAZ areas and RAS stores receiving areas and storing routes. Small hatches and their securing devices are to be easily operable by one person in the expected operating conditions; this is typically achieved if the maximum operating force does not exceed 150N. Where necessary, counterbalance weights, springs or other equivalent mechanisms are to be provided to assist the user in opening and closing the hatch. Any mechanism fitted is to be designed so as not to present a hazard to persons using the hatch. Failure of the mechanism is not to prevent the operation of the hatch.
- 2.1.6 Where practicable access hatches to below spaces are to be arranged to allow for the passage of personnel wearing breathing apparatus as well as the transfer of injured personnel. For this purpose the opening is to be a minimum of 600mm x 600mm. Hand holds and foot holds are to be located both within the space being accessed and externally in the vicinity of hatch so as to enable ease of access.
- 2.1.7 Where portable plates are required in decks for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced deck or the surrounding structure is suitably compensated. Portable plates are to be secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters or equivalent naval standard.

2.2 Hatch coamings

- 2.2.1 The height of coamings above the upper surface of the weather deck, measured above sheathing if fitted, is to be not less than 300 mm. For exposed decks immediately above the design draft, e.g. quarter decks and well decks, coaming heights are to be no less than 600 mm. Coaming of a height no less than 450 mm may be provided if the hatch cover is kept closed and a small access hatch is provided in the hatch cover.
- 2.2.2 The height of coamings of hatchways closed by steel covers fitted with gaskets and clamping devices are to be as specified in *Vol 1, Pt 3, Ch 4, 2.2 Hatch coamings 2.2.1*, but may be reduced, or the coamings may be omitted entirely, if the safety of the ship is not thereby impaired in any sea condition. Special attention will be given in such cases to the scantlings of the covers, to their gasketing and securing arrangements and to the drainage of recesses in the deck.
- 2.2.3 The height of coamings may be required to be increased on ships where this is shown to be necessary by the stability and watertight subdivision calculations required by Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity.
- 2.2.4 Vertical coamings are to have a thickness, *t*, in mm not less than the greater of the following:
- (a) $t = 0.008H_c\sqrt{k} + 1.0 \text{ mm}$
- (b) Rule thickness of the deck in the position fitted

Volume 1, Part 3, Chapter 4

Section 3

where

 H_{c} = the coaming height

k = local strength steel factor, see Vol 1, Pt 6, Ch 5 Structural Design Factors

2.2.5 Vertical coamings are to be stiffened at their upper edge by a substantial rolled or fabricated section. Additional support is to be arranged as necessary.

2.3 Manholes and flush escape hatches

- 2.3.1 Manholes are to be closed by substantial covers capable of being made watertight. The covers are to be permanently attached.
- 2.3.2 Flush escape hatches are to be closed by substantial weathertight covers capable of being opened and closed from either side unless specified otherwise for hatches that provide access to high security areas such as magazines or to prevent access from open decks. The covers are to be permanently attached.

2.4 Hatchways within enclosed superstructures or lower decks

- 2.4.1 The requirements of this Section are to be complied with where it is necessary to maintain the weathertight envelope.
- 2.4.2 Access hatches within a superstructure or deckhouse need not be provided with means for closing if all openings in the surrounding bulkheads have weathertight closing appliances.
- 2.4.3 Consideration should be given to positioning weathertight or gastight hatches on lower decks in accordance with a specified standard for CBRN purposes.

2.5 Openings on the tops and sides of enclosed structures on the weather deck

2.5.1 Openings on the tops and sides of enclosed structures on the weather deck up to a height of 2,5 m are to be weathertight. In the forward 0,25L R the height should be taken to 5 m. The height of openings may be required to be increased where this is shown necessary by the stability and watertight subdivision calculation required by Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification. The weather deck as defined in Vol 1, Pt 3, Ch 1, 5.4 Decks 5.4.2 may be stepped or recessed for the purpose of this Chapter. Special consideration will be given to the position of the weather deck of NS1 ship types.

2.6 Magazine blow out plates

- 2.6.1 Where blow out plates are required they are to be secured by sealing arrangements adequate to meet the weathertightness and operational requirements. They are to be of an equivalent strength to the deck in which they are fitted.
- 2.6.2 Blow out plates are to be permanently attached.

■ Section 3

Doors and accesses on weather decks

3.1 General

- 3.1.1 Access openings in:
- (a) superstructure bulkheads;
- (b) deckhouses protecting openings leading into enclosed superstructures or to spaces below the weather deck; and
- (c) deckhouse on a deckhouse protecting an opening leading to a space below the weather deck,

are to be fitted with doors of steel or other equivalent material, permanently and strongly attached to the bulkhead and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead, and weathertight when closed. The doors are to be gasketed and secured weathertight by means of clamping devices or equivalent arrangements, permanently attached to the bulkhead or to the door. Doors are generally to open outwards and are to be capable of being operated and secured from both sides. The sill heights are to be as required by *Vol 1, Pt 3, Ch 4, 3.1 General 3.1.3* and *Vol 1, Pt 3, Ch 4, 3.1 General 3.1.4*.

Volume 1, Part 3, Chapter 4

Section 4

- 3.1.2 Fixed lights in doors are to comply with the requirements for side scuttles lights as given in *Vol 1, Pt 3, Ch 4, 6.1 Application* Hinged steel deadlights may be external.
- 3.1.3 The height of doorway sills above the weather deck sheathing, if fitted, is to be not less than 300 mm.
- 3.1.4 For exposed decks immediately above the design draught, e.g. quarter decks and well decks, sill heights are to be no less than 450 mm.
- 3.1.5 When the closing appliances of openings in superstructures and deckhouses do not comply with *Vol 1, Pt 3, Ch 4, 3.1 General 3.1.1*, interior deck openings are to be treated as if exposed on the weather deck.
- 3.1.6 The height of door sills may be required to be increased on ships where this is shown to be necessary by the stability and watertight subdivision calculations required by *Vol 1*, *Pt 3*, *Ch 2*, *1.2 Definitions*.
- 3.1.7 Where portable plates are required for unshipping machinery, or for other similar reasons, they may be accepted provided they are of equivalent strength to the unpierced bulkhead and are secured by gaskets and close spaced bolts at a pitch not exceeding five diameters or equivalent naval standard.
- 3.1.8 The sill heights of accesses closed by covers which are secured by closely spaced bolts or otherwise kept permanently closed at sea will be specially considered.
- 3.1.9 Special consideration will be given to access on the weatherdeck where for operational purposes it is not possible to provide a sill meeting Vol 1, Pt 3, Ch 4, 3.1 General 3.1.3 or Vol 1, Pt 3, Ch 4, 3.1 General 3.1.4

3.2 Magazine blow out plates

- 3.2.1 Where blow out plates are required, they are to be secured by sealing arrangements adequate to meet the weathertightness and operational requirements. They are to be of an equivalent strength to the deck in which they are fitted.
- 3.2.2 Blow out plates are to be permanently attached.

Section 4

Watertight doors and hatches in watertight subdivision boundaries

4.1 General

- 4.1.1 Watertight doors and hatches are to be designed in accordance with a recognised Standard. They are to be manufactured under LR Survey and surveyed during installation. They are to be tested in accordance with the LR survey procedures, operated under working conditions and tested in place, see Vol 1, Pt 6, Ch 6 Material and Welding Requirements.
- 4.1.2 Doors and hatches are to be of equivalent strength to the unpierced subdivision. They are to be approved for the maximum head of water indicated by the approved damage stability calculations.
- 4.1.3 Where watertight doors of the sliding type are permitted by the subdivision and stability standard, they are to be capable of being operated by efficient hand-operated gear, both at the door itself and from an accessible position above the vertical limit of watertight integrity. Means are to be provided at the remote operating position to indicate whether the door is open or closed. The time necessary for the complete closure of the door, when operating by hand gear, is not to exceed 90 seconds with the ship in the upright position.
- 4.1.4 Power operated doors are to be capable of being opened and closed locally by both power and efficient hand operated mechanisms in accordance with *Vol 1, Pt 3, Ch 4, 4.1 General 4.1.3*.
- 4.1.5 Indicators are to be provided on the bridge, ship command centre or operations room showing whether power operated watertight doors and hatches are open or closed, see *Vol 2, Pt 9, Ch 9, 6.1 Watertight doors and hatches*.
- 4.1.6 Where manually operated hinged watertight doors are fitted, a suitable procedural system is to be implemented to ensure that such doors remain closed when at sea unless specific authorisation is sought.
- 4.1.7 Watertight doors and hatches are to be capable of being operated from both sides of the watertight division except for access to high security areas such as magazines or to prevent access from open decks.
- 4.1.8 Sliding watertight doors are to be capable of being operated up to the heel and trim angles specified in the subdivision and stability standard, but not less than 15° heel either way. Consideration is also to be given to the forces which may act on either

Volume 1, Part 3, Chapter 4

Section 5

side of the door as may be experienced when water is flowing through the opening, applying a static head equivalent to a water height of at least 1 m above the sill on the centreline of the door.

4.1.9 Where practicable watertight access hatches in vertical watertight subdivisions are to be arranged to allow for the passage of personnel wearing breathing apparatus as well as the transfer of injured personnel. For this purpose the opening is to be a minimum of 800mm x 600mm. Hand holds and foot holds are to be located on both sides of the subdivision in the vicinity of the hatch so as to enable ease of access.

Section 5

Side scuttles and windows

5.1 General

- 5.1.1 Side lights, portlights and portholes are considered to be side scuttles.
- 5.1.2 Side scuttles are defined as being round or oval openings with an area not exceeding 0,16 m².
- 5.1.3 Windows are defined as being rectangular openings generally, and round or oval openings with an area exceeding 0,16 m².
- 5.1.4 A plan showing the location of side scuttles and windows is to be submitted.
- 5.1.5 Side scuttles and windows together with their glasses and deadlights if fitted, are to be of an approved design or in accordance with a specified standard(s).
- 5.1.6 Side scuttles to spaces within enclosed superstructures, or deckhouses on or above the weather deck are to be fitted with efficient, hinged, inside deadlights and capable of being effectively closed and secured watertight.
- 5.1.7 All side scuttles are to be of the non-opening type.
- 5.1.8 Windows are not to be fitted below the lowest weather deck or in end bulkheads of superstructures.
- 5.1.9 If fitted in a deckhouse or superstructures in the forward 0,25L _R, windows are to be provided with strong, hinged, steel, weathertight storm covers. However, if there is an opening leading below deck, this opening is to be treated as being on an exposed deck and is to be protected as required by *Vol 1*, *Pt 3*, *Ch 4*, *2.2 Hatch coamings 2.2.1*
- 5.1.10 Side scuttles and windows set inboard from the shell on the weather deck, protecting direct access below, are either to be provided with strong permanently attached deadlights or, where they are accessible, strong permanently attached external steel storm covers instead of internal deadlights.
- 5.1.11 Side scuttles and windows set inboard from the shell on the weather deck, not protecting direct access below, do not require deadlights or storm covers.
- 5.1.12 Cabin bulkheads and doors are considered to provide effective protection between side scuttles or windows and access below.
- 5.1.13 Where windows are permitted in an exposed bulkhead on the weather deck in the forward $0.25L_{\rm R}$, strong external storm covers which may be portable and stored adjacent are to be provided.
- 5.1.14 Where the bridge is on, or not more than 5,0 m above, the weather deck in lieu of storm covers being provided for the bridge windows, a weathertight cover, fitted to a coaming of not less than 230 mm in height around the internal stairway opening within the bridge, may be accepted. If this arrangement is accepted, adequate means of draining the bridge are to be provided.
- 5.1.15 If necessary, for practical considerations, the storm covers may be in two parts.
- 5.1.16 Laminated toughened safety glass may also be used for windows but the total thickness will need to be greater than that required for the equivalent sized window using monolithic toughened safety glass. The equivalent thickness of laminated toughened safety glass is to be determined from the following formula:

$$T_{L1^2} + T_{L2^2} + ... T_{Ln^2} = T_{S^2}$$

where

n = number of laminates

Volume 1, Part 3, Chapter 4

Section 6

 T_{L} = thickness of glass laminate

 $T_{\rm S}$ = Rule thickness of toughened safety glass.

Alternative arrangements that do not meet the above thickness requirement will be specially considered, provided that equivalent strength and bending stiffness to that of a single, thermally toughened pane of thickness \mathcal{T}_s can be demonstrated in a four-point bending test in accordance with EN-ISO 1288-3 or an equivalent recognised National or International Standard, using no fewer than ten samples. The lower limit of the 90 per cent confidence level interval for the laminated pane shall not be less than the same for monolithic toughened safety glass. Small scale punch test or ring-in-ring test methods shall not be used.

5.1.17 Rubber frames are not acceptable for windows.

Section 6

Ventilators

6.1 Application

- 6.1.1 This Section applies to all ship types and provides requirements for ventilators. Reference should be made to the specified subdivision and stability standard(s).
- 6.1.2 For requirements regarding down flooding in connection with stability and watertight subdivision, see *Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity*.

6.2 Protection

6.2.1 In all spaces where mechanical damage is likely, all air and sounding pipes, scuppers and discharges, including their valves, controls and indicators, are to be well protected. This protection is to be of steel or other equivalent material.

6.3 General

- 6.3.1 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.
- 6.3.2 Ventilators from tunnels passing through decks are to have scantlings suitable for withstanding the pressures to which they may be subjected and are to be made watertight.

6.4 Coamings

6.4.1 The scantlings and height of ventilator coamings exposed to the weather are to be not less than required by *Table 4.6.1 Ventilator coaming requirements* but the thickness need not exceed that of the adjacent deck or bulkhead plating. In particularly exposed positions, the height of coamings and scantlings may be required to be increased.

Table 4.6.1 Ventilator coaming requirements

Height (measured above sheathing if fitted)	(1) $z_c = 900$ mm for locations defined in Note 2 $z_c = 760$ mm elsewhere
Thickness	(2) $t_c = 5.5 + 0.01 \ d_v \ \text{mm}$ where 7.5 mm $\leq t_c \leq 10.0 \ \text{mm}$
Support	(3) If $z_c > 900$ mm the coaming is to be specially supported
Symbols	

Volume 1, Part 3, Chapter 4

Section 6

 $t_{\rm C}$ = thickness of coaming, in mm

 z_c = height of coaming, in mm

 d_{v} = internal diameter of coaming, in mm

Note (1) Where the height of the ventilator exceeds that given in Item (1), the thickness given by (2) may be gradually reduced, above that height, to a minimum of 6,5 mm. The ventilator is to be adequately stayed.

Note (2) For exposed decks immediately above the design waterline, e.g. quarter decks and well decks.

- 6.4.2 The height of ventilator coamings may be required to be increased on ships where this is shown to be necessary by the stability and watertight subdivision calculations required by the specified subdivision and stability standard(s), see *Vol 1*, *Pt 1*, *Ch 2*, 1.1 Framework of Classification 1.1.9. The specified standard may require that the height of all ventilator coamings are above the angle of down flooding, see *Vol 1*, *Pt 3*, *Ch 2*, 1.2 Definitions.
- 6.4.3 For gooseneck ventilators, the coaming height is to be measured to the underside of the bend, this being the lowest point through which water on deck could pass freely to spaces below.
- 6.4.4 Where wall vents are fitted with an internal baffle which rises above the lower edge of the exterior opening, the coaming height is measured to the top of the baffle.
- 6.4.5 Ventilator coaming heights may be reduced on ships assigned a service area notation **SA4**. Coaming heights are to be as high as practicable, with a minimum height of 300 mm.

6.5 Closing appliances

- 6.5.1 All ventilator openings are to be provided with efficient weathertight closing appliances of steel or other equivalent material unless the height of the coaming is greater than 2,5 m above the weather deck or 5 m on exposed deck immediately above the design waterline, e.g. quarter decks and well decks.
- 6.5.2 Where ventilators are proposed to be led overboard through an enclosed lower deck space the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4,5 m above the damage control deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.
- 6.5.3 Mushroom ventilators closed by a head revolving on a centre spindle (screw-down head) are acceptable, but the diameter is not to exceed 300 mm.
- 6.5.4 Mushroom ventilators with a fixed head and closed by a screw-down plate (screw-down cover) may be accepted up to a diameter of 750 mm within the forward 0,25*L* _B.
- 6.5.5 Wall ventilators (jalousies) may be accepted provided they are capable of being closed weathertight by hinged steel gasketed covers secured by bolts or toggles.
- 6.5.6 A ventilator head not forming part of the closing arrangements is to be not less than 6,5 mm thick.

6.6 Machinery spaces

- 6.6.1 In general, ventilators necessary to supply the machinery space continuously are to have coamings of sufficient height to comply with *Vol 1, Pt 3, Ch 4, 6.6 Machinery spaces 6.6.1* without having to fit weathertight closing appliances. Ventilators to emergency generator rooms are to be so positioned that closing appliances are not required.
- 6.6.2 Where due to ship size and arrangement this is not practicable, lesser heights for machinery space ventilator coamings fitted with weathertight closing appliances may be permitted if specified in combination with other suitable arrangements to ensure uninterrupted, adequate supply of ventilation to these spaces.

Volume 1, Part 3, Chapter 4

Section :

■ Section 7

Air and sounding pipes

7.1 General

- 7.1.1 Air and sounding pipes are to comply with the requirements of Vol 2, Pt 7, Ch 2, 10 Air, overflow and sounding pipes
- 7.1.2 Striking plates of suitable thickness, or their equivalent, are to be fitted under all sounding pipes.
- 7.1.3 Air pipes are to be situated clear of areas where damage may occur, such as RAS landing areas and store routes or helicopter decks.

7.2 Height of air pipes

- 7.2.1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below is normally to be not less than:
- 760 mm on exposed decks immediately above the design draught, e.g. quarter decks and well decks.
- 450 mm measured above deck sheathing, where fitted elsewhere.
- 7.2.2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances as required by *Vol* 1, *Pt* 3, *Ch* 4, 7.3 *Closing appliances* 7.3.1 are to be of an approved automatic type.
- 7.2.3 The height of air pipes may be required to be increased on ships where this is shown to be necessary by the stability and watertight subdivision calculations required by *Vol 3, Pt 2, Ch 6, 2.1 Watertight integrity*. An increase in height may also be required when air pipes to fuel oil and settling tanks are situated in positions where sea water could be temporarily entrapped, e.g. in recesses in the sides and ends of superstructures or deckhouses, between hatch ends, behind high sections of bulwark, etc.. This may entail an increase in tank scantlings, see also *Vol 1, Pt 6, Ch 3 Scantling Determination*.
- 7.2.4 Air pipes are generally to be led to an exposed deck. See also Vol 2, Pt 7, Ch 2, 10.4 Termination of air pipes 10.4.4.
- 7.2.5 Where air pipes are led through the side of superstructures, the opening is to be at least 2,3 m above the design waterline.
- 7.2.6 The minimum wall thickness of air pipes in positions indicated in Vol 1, Pt 3, Ch 4, 7.2 Height of air pipes 7.2.1 is to be:
- 6,0 mm for pipes of 80 mm external diameter or smaller.
- 8,5 mm for pipes of 165 mm external diameter or greater.

(a)

Intermediate minimum thicknesses are to be determined by linear interpolation.

7.2.7 Air pipe coaming heights may be reduced on ships assigned a service area notation **SA4**. Coaming heights are to be as high as practicable, with a minimum height of 300 mm.

7.3 Closing appliances

- 7.3.1 All openings of air and sounding pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water (see also Vol 1, Pt 3, Ch 4, 7.2 Height of air pipes 7.2.2 and Vol 2, Pt 7, Ch 2, 10.6 Air pipe closing appliances 10.6.2).
- 7.3.2 Closing appliances are to be of an approved automatic type where they are below the limit of watertight integrity, see *Vol* 1, *Pt 3, Ch 2, 1.3 Watertight and weathertight integrity*. Where the limit of watertight integrity is defined by a bulkhead deck or freeboard deck, the closing appliances are to be of an approved automatic type where, with the ship at its design draught, the openings are immersed at an angle of heel of 40° or, the angle of down flooding if this is less than 40°, which may be agreed on the basis of stability requirements.
- 7.3.3 Where the closing appliances are not of an automatic type, provision is to be made for relieving the vacuum when the tanks are being pumped out.

Volume 1, Part 3, Chapter 4

Section 8

■ Section 8

Scuppers and sanitary discharges

8.1 General

- 8.1.1 Scuppers sufficient in number and size to provide effective drainage are to be fitted in all decks.
- 8.1.2 Scuppers draining weather decks and spaces within superstructures or deckhouses not fitted with efficient weathertight doors are to be led overboard.
- 8.1.3 Where the freeboard is such that the deck edge forming the vertical limit of watertight integrity is immersed when the ship heels 5° or less, scuppers and discharges which drain spaces below this deck, or spaces within intact superstructures or deckhouses on this deck fitted with efficient weathertight doors, are to be led to the bilges in the case of scuppers or to suitable sanitary tanks in the case of sanitary discharges. Where the freeboard is such that the deck edge forming the vertical limit of watertight integrity is immersed when the ship heels greater than 5° then they may be led overboard and fitted with means of preventing water from passing inboard in accordance with Vol 1, Pt 3, Ch 4, 8.2 Closing appliances.
- 8.1.4 In ships where an approved fixed pressure water spray fire-extinguishing system is fitted in vehicle, magazines or hangar spaces, deck scuppers of not less than 150 mm diameter are to be provided port and starboard, spaced about 9,0 m apart. Where the design capacity of the drencher system exceeds an application of water at a rate 5 litres per square metre of deck area by 10 per cent or more, the scupper area will require to be increased accordingly. After installation the two adjacent sections with the greatest aggregate drencher capacity are to be tested in operation to ensure that there is no build-up of water on the deck. The mouth of the scupper is to be protected by bars.
- 8.1.5 Where a sewage system is fitted, the shipside valves on the discharge pipe from the effluent tank(s) and the by-pass system are to comply with Vol 1, Pt 3, Ch 4, 8.2 Closing appliances.
- 8.1.6 The minimum wall thickness of pipes not indicated in Vol 1, Pt 3, Ch 4, 8.2 Closing appliances 8.2.6 is to be:
- 4,5 mm for pipes of 155 mm external diameter or smaller.
- 6,0 mm for pipes of 230 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation.

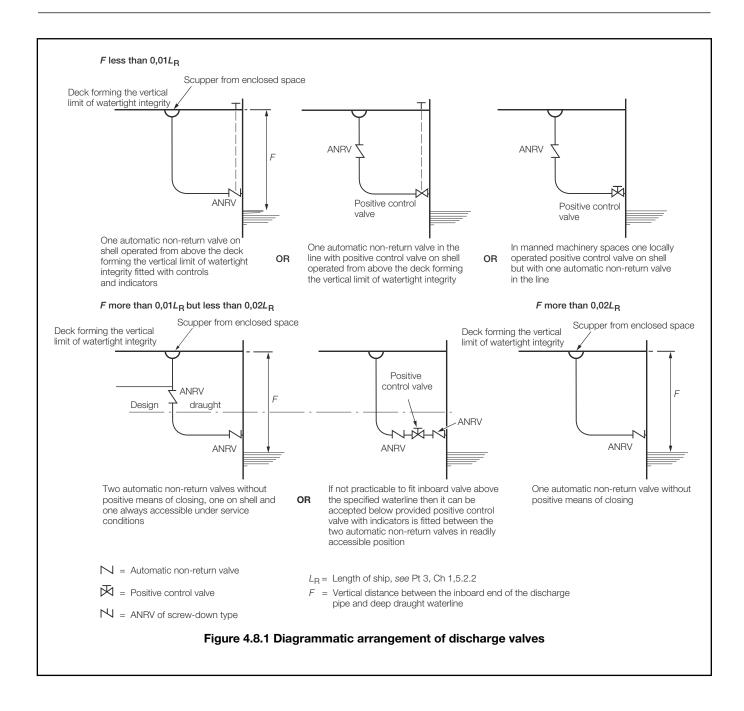

- 8.1.7 For the use of non-metallic pipe, see Vol 2, Pt 7, Ch 1, 11 Plastic pipes
- 8.1.8 Scuppers and discharge pipes should not normally pass through fuel oil tanks. Where scuppers and discharge pipes pass, unavoidably, through fuel oil tanks, and are led through the shell within the tanks, the thickness of the piping should be at least the same thickness as Rule shell plating in way, derived from the appropriate Chapters, but need not exceed 19 mm.
- 8.1.9 Piping within tanks is to be tested in accordance with *Naval Survey Guidance for Steel Ships*, or an otherwise specified and agreed standard.
- 8.1.10 All piping is to be adequately supported.

8.2 Closing appliances

- 8.2.1 In general, each separate overboard discharge is to be fitted with a screw-down non-return valve capable of being operated from a position always accessible and above the damage control deck. An indicator is to be fitted at the control position showing whether the valve is open or closed. A machinery space, whether manned or unattended (i.e. with **UMS** notation), is considered accessible. Spaces with access only by bolted manholes are not considered accessible.
- 8.2.2 Where an approved fire pressure waterspray fire-extinguishing system is provided in an enclosed vehicle space, magazines or hangar spaces, the scupper controls are to be operated from a position above the damage control deck, and outside the space protected by the fire-extinguishing system, and are to be protected from mechanical damage.
- 8.2.3 Where the vertical distance from the design draught to the inboard end of the discharge pipe exceeds $0.01L_{\rm R}$ the discharge may be fitted with two automatic non-return valves without positive means of closing, instead of the screw-down non-return valve, provided that the inboard valve is always accessible for examination under service conditions.
- 8.2.4 Where the vertical distance from the design waterline to the inboard end of the discharge pipe exceeds $0.02L_{\rm R}$, a single automatic non-return valve without positive means of closing may be fitted, see Figure 4.8.1 Diagrammatic arrangement of discharge valves

Volume 1, Part 3, Chapter 4

Section 8

- 8.2.5 The requirements for non-return valves are applicable only to those discharges which remain open during the normal operation of the ship. For discharges which are closed at sea, a single screw-down valve operated from the weather deck is considered to provide sufficient protection.
- 8.2.6 Scuppers and discharge pipes originating at any level which penetrate the shell either more than 450 mm below the deck forming the vertical limit of watertight integrity or less than 600 mm above the deep draught waterline, are to be fitted with an automatic non-return valve at the shell. This valve, unless required by *Vol 1, Pt 3, Ch 4, 8.1 General 8.1.3*, may be omitted provided the piping has a minimum wall thickness of:
- 7,0 mm for pipes of 80 mm external diameter or smaller.
- 10,0 mm for pipes of 180 mm external diameter.
- 12,5 mm for pipes of 220 mm external diameter or greater.

Intermediate minimum thicknesses are to be determined by linear interpolation. Unless required by Vol 1, Pt 3, Ch 4, 8.1 General 8.1.8, the maximum thickness need not exceed 12,5 mm.

Volume 1, Part 3, Chapter 4

Section 9

- 8.2.7 The outboard valve is to be mounted directly on the shell and secured in accordance with Vol 2, Pt 7, Ch 1 Piping Design Requirements. If this is impracticable, a short distance piece of rigid construction may be introduced between the valve and the shell.
- 8.2.8 If a valve is required by *Vol 1, Pt 3, Ch 4, 8.1 General 8.1.3*, this valve should preferably be fitted as close as possible to the point of entry of the pipe into the tank. If fitted below the weather deck, the valve is to be capable of being controlled from an easily accessible position above the weather deck. Local control is also to be arranged, unless the valve is inaccessible. An indicator is to be fitted at the control position showing whether the valve is open or closed.
- 8.2.9 Valves for maintaining watertight integrity such as ship side valves and fittings (other than those on scuppers and sanitary discharges), are to comply with the requirements of *Vol 2*, *Pt 7*, *Ch 1 Piping Design Requirements* and *Vol 2*, *Pt 7*, *Ch 2 Ship Piping Systems*.

8.3 Rubbish chutes and similar discharges

- 8.3.1 Rubbish chutes and similar discharges should be constructed of mild steel piping or plating of shell thickness. Other materials will be specially considered. Openings are to be kept clear of the sheerstrake and areas of high stress concentration.
- 8.3.2 Rubbish chute hoppers are to be provided with a hinged weathertight cover at the inboard end with an interlock so that the discharge flap and hopper cover cannot be open at the same time. The hopper cover is to be secured closed when not in use, and a suitable notice displayed at the control position.
- 8.3.3 Where the inboard end of the hopper is less than $0.01L_{\rm R}$ above the design draught, a suitable valve with positive means for closing is to be provided in addition to the cover and flap in an easily accessible position above the design draught. The valve is to be controlled from a position adjacent to the hopper and provided with an open/shut indicator. The valve is to be kept closed when not in use, and a suitable notice displayed at the valve operating position.

8.4 Materials for valves, fittings and pipes

- 8.4.1 All shell fittings and valves required by Vol 1, Pt 3, Ch 4, 8.2 Closing appliances are to be of steel, bronze or other approved ductile material; ordinary cast iron or similar material is not acceptable. Materials are to satisfy the requirements of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.
- 8.4.2 All these items, if made of steel or other approved material with low corrosion resistance, are to be suitably protected against wastage.
- 8.4.3 The lengths of pipe attached to the shell fittings, elbow pieces or valves are to be of galvanised steel or other equivalent approved material.

■ Section 9

Bulwarks, guard rails, raised walkways and other means for the protection of crew and embarked personnel

9.1 General requirements

- 9.1.1 Bulwarks or guard rails are to be provided at the boundaries of exposed decks. Bulwarks or guard rails are to be not less than 1,0 m in height measured above sheathing, and are to be constructed as required by this Section. Consideration will be given to cases where this height would interfere with the normal operation of the ship. Guard rails provided around aircraft operating areas may be of the type which drop outwards with nets which are to comply with Vol 1, Pt 3, Ch 4, 9.6 Safety nets. Droppable guard rails must be capable of being secured in both the upright and lowered position. Where bulwarks or guard rails are undesirable, e.g. for radar signature purposes, alternative equivalent arrangements will be required. Guidance on radar signatures is provided in Vol 1, Pt 4, Ch 1, 4.1 Radar signature.
- 9.1.2 The freeing arrangements in bulwarks are to be in accordance with Vol 1, Pt 3, Ch 4, 9.3 Freeing arrangements .
- 9.1.3 Guard rails fitted on superstructure and exposed decks are to have at least three courses. The opening below the lowest course of guard-rails is not to exceed 230 mm. The other courses are to be spaced not more than 380 mm apart. In the case of ships with rounded gunwales, the guard-rail supports are to be placed on the flat of the deck. In other locations, guard rails with at least two courses are to be fitted.

Volume 1, Part 3, Chapter 4

Section 9

- 9.1.4 Guard rails are to be fitted with fixed, removable or hinged stanchions fitted no more than 1,5 m apart. Removable or hinged stanchions shall be capable of being locked in the upright position. When retracted, collapsed or removed, the guard rails are not to impede access/egress. Stowage is to be provided for portable stanchions and stays, sited adjacent to where they are to be used.
- 9.1.5 At least every third stanchion is to be supported by a stay.
- 9.1.6 Where necessary for the normal operation of the ship, steel wire ropes may be accepted in lieu of guard rails. Wires are to be made taut by means of turnbuckles. Chains are only permitted in short lengths in way of access openings.
- 9.1.7 Satisfactory means for safe passage of personnel, in the form of guard rails, life-lines, handrails, gangways, underdeck passageways or other equivalent arrangements, are to be provided for the protection of the crew and embarked personnel in getting to and from their quarters, the machinery space and all other spaces used in the operation of the ship.
- 9.1.8 A well illuminated and ventilated underdeck passage (with a clear opening at least 0,8 m in width and 2 m in height) is to be provided as close as practicable to the weatherdeck, connecting and providing access to the following locations:
- between superstructures;
- from the forwardmost superstructure to the forward end of the vessel;
- from the aftmost superstructure to the aft end of the vessel.
- 9.1.9 A means of passage over obstructions such as pipes or other fittings of a permanent nature is to be provided where practicable.
- 9.1.10 To assist movement in adverse weather conditions, handrails are to be fitted to bulkheads in passageways and superstructure on weatherdecks.
- 9.1.11 Handrails are to be fitted at a height of not less than 1 m, measured from the top of the rail to the deck. Handrails should be made of steel tubes of 42,4 mm outside diameter, with a wall thickness of at least 2,6 mm.
- 9.1.12 Handrails are to be secured by way of supports that are not to be spaced more than 1,5 m apart. The supports are to hold the rails not less than 50 mm from the bulkhead, measured from the inside of the rail to the bulkhead.
- 9.1.13 Raised walkways which form escape routes or assembly areas, or provide for the transfer of heavy equipment, stores or munitions, are to comply with the requirements of *Vol 1, Pt 3, Ch 4, 9.5 Walkways*.
- 9.1.14 For additional requirements for the safety of embarked persons, see Vol 3, Pt 2, Ch 6, 2.4 Safety of embarked persons.

9.2 Bulwark construction

- 9.2.1 Plate bulwarks are to be stiffened by a strong rail section and supported by stays from the deck. The spacing of these stays forward of $0.93L_{\rm R}$ is to be not more than 1,2 m. Elsewhere, bulwark stays are to be not more then 1,83 m apart. Where bulwarks are cut to form a gangway or other opening, stays of increased strength are to be fitted at the ends of the openings. Bulwarks are to be adequately strengthened in way of eyeplates for RAS points, and in way of mooring pipes the plating is to be doubled or increased in thickness and adequately stiffened.
- 9.2.2 Bulwarks should not be cut for gangway or other openings near the breaks of superstructures, and are also to be arranged to ensure their freedom from main structural stresses. See shell plating in appropriate Chapters.
- 9.2.3 The section modulus, Z, at the bottom of the bulwark stay is to be not less than:

$$Z = (33.0 + 0.44L) h^2 s cm^3$$

where

h = height of bulwark from the top of the deck plating to the top of the rail, in metres

s = spacing of the stays, in metres, in accordance with Vol 1, Pt 3, Ch 4, 10.2 Removal for access 10.2.1

L_B = length of ship, in metres (as defined in Vol 1, Pt 3, Ch 1, 5.1 General), but to be not greater than 100 m.

9.2.4 In the calculation of the section modulus, only the material connected to the deck is to be included. The bulb or flange of the stay may be taken into account where connected to the deck, and where, at the ends of the ship, the bulwark plating is connected to the sheerstrake, a width of plating not exceeding 600 mm may also be included. The free edge of the stay is to be stiffened.

Volume 1, Part 3, Chapter 4

Section 9

9.2.5 Bulwark stays are to be supported by, or to be in line with, suitable underdeck stiffening, which is to be connected by double continuous fillet welds in way of the bulwark stay connection.

9.3 Freeing arrangements

- 9.3.1 The following requirements are applicable to all ship types.
- 9.3.2 Where bulwarks on the weather decks or superstructure decks form wells, ample provision is to be made for rapidly freeing the decks of large quantities of water by means of freeing ports, and also for draining them.
- 9.3.3 The minimum freeing area on each side of the ship, for each well on the weather deck is to be derived from the following formulae:
- (a) where the length, l, of the bulwark in the well is 20 m or less: area required = 0,7 + 0,035/ m²
- (b) where the length, I, exceeds 20 m, area required = 0,07I m²

I need not be taken greater than 0,7L B, where L B is the length of the ship as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars.

- 9.3.4 If the average height of the bulwark exceeds 1,2 m or is less than 0,9 m, the freeing area is to be increased or decreased, respectively, by 0,004 m² per metre of length of well for each 0,1 m increase or decrease in height respectively.
- 9.3.5 The minimum freeing area for each well on a superstructure is to be half the area calculated from *Vol 1, Pt 3, Ch 4, 9.3 Freeing arrangements* 9.3.3.
- 9.3.6 Two-thirds of the freeing port area required is to be provided in the half of the well nearest to the lowest point of the sheer curve.
- 9.3.7 When the deck has little or no sheer, the freeing area is to be spread along the length of the well.
- 9.3.8 In ships with no sheer the freeing area as calculated from *Vol 1, Pt 3, Ch 4, 9.3 Freeing arrangements 9.3.3* is to be increased by 50 per cent. Where the sheer is less than the standard, as given in *Table 4.9.1 Standard sheer profile*, the percentage is to be obtained by linear interpolation.

Table 4.9.1 Standard sheer profile

Position from A.P.	Ordinate (in mm)
A.P.	$25\left(\frac{L_{\rm R}}{3}+10\right)$
0,16 <i>L</i> _R	$11, 1\left(\frac{L_{\mathbf{R}}}{3} + 10\right)$
0,33 <i>L</i> _R	$2,8\left(\frac{L_{\rm R}}{3}+10\right)$
0,5L _R	0
0,67 <i>L</i> _R	$5, 6\left(\frac{L_{\mathbf{R}}}{3} + 10\right)$
0,83 <i>L</i> _R	$22, 2\left(\frac{L_{\mathbf{R}}}{3} + 10\right)$

Volume 1, Part 3, Chapter 4

Section 9

F.P. $50\left(\frac{L_{R}}{3}+10\right)$

Note 1. Sheer is measured from the deck at side to a line drawn parallel to the keel through the sheer line amidships.

Note 2. In ships with a rake of keel, the sheer is measured in relation to a reference line drawn parallel to the design waterline.

- 9.3.9 Where the length of the well is less than 10 m, or where a deckhouse occupies most of the length, the freeing port area will be specially considered but in general need not exceed 10 per cent of the bulwark area.
- 9.3.10 Where it is not practical to provide sufficient freeing port area in the bulwark, particularly in small ships, credit can be given for bollard and fairlead openings where these extend to the deck.
- 9.3.11 Where a deckhouse has a breadth less than 80 per cent of the beam of the ship, or the width of the side passageways exceeds 1,5 m, the arrangement is considered as one well. Where a deckhouse has a breadth equal to or more than 80 per cent of the beam, *B*, of the ship, or the width of the side passageways does not exceed 1,5 m, or when a screen bulkhead is fitted across the full breadth of the ship, this arrangement is considered as two wells, before and abaft the deckhouse.
- 9.3.12 Suitable provision is also to be made for the rapid freeing of water from recesses formed by superstructures and deckhouses, etc. in which water may be shipped and trapped. Deck gear is not to be stowed in such a manner as to obstruct unduly the flow of water to freeing port.
- 9.3.13 The lower edges of freeing ports are to be as near to the deck as practicable, and should not be more than 100 mm above the deck.
- 9.3.14 Where freeing ports are more than 230 mm high, vertical bars spaced 230 mm apart may be accepted as an alternative to a horizontal rail to limit the height of the freeing port.
- 9.3.15 Where shutters are fitted, the pins or bearings are to be of a non-corrodible material, with ample clearance to prevent jamming. The hinges are to be within the upper third of the port. Shutters are not to be fitted with securing appliances.
- 9.3.16 All ships are to have open rails for at least half the length of the exposed part of the weather deck. Alternatively, if a continuous bulwark is fitted, the minimum freeing area is to be at least 33 per cent of the total area of the bulwark. The freeing area is to be placed in the lower part of the bulwark.
- 9.3.17 In ships having superstructures which are open at either or both ends to wells formed by bulwarks on the open deck, adequate provision for freeing the open spaces are to be provided as follows:

The freeing port area, $A_{\rm w}$ for the open well:

$$A_{\rm W} = (0,07l + A_{\rm c})(S_{\rm c}) \left(\frac{0,5h_{\rm S}}{h_{\rm W}}\right)$$

The freeing port area, $A_{\rm s}$ for the open superstructure:

$$A_{s} = (0,07l_{t})(S_{c})\left(\frac{b_{o}}{l_{t}}\left(1 - \left(\frac{l_{w}}{l_{t}}\right)^{2}\right)\left(\frac{0,5h_{s}}{h_{w}}\right)\right)$$

where

 $I_{\rm w}$ = the length of the open deck enclosed by bulwarks, in metres.

 $I_{\rm S}$ = the length of the common space within the open superstructure, in metres

 $I_{\rm t} = I_{\rm w} + I_{\rm s}$ but if 20 m or less then the freeing area is to be calculated in accordance with *Vol 1*, *Pt 3*, *Ch 4*, 9.3 Freeing arrangements 9.3.3

S_C = sheer correction factor, maximum 1,5 as defined in Vol 1, Pt 3, Ch 4, 9.3 Freeing arrangements 9.3.8

b o = breadth of openings in the end bulkhead of the enclosed superstructure, in metres

Volume 1, Part 3, Chapter 4

Section 9

 $h_{\rm w}$ = distance of the well deck above the freeboard deck, in metres

 h_s = one standard superstructure height

 $h_{\rm b} = {\rm actual\ height\ of\ the\ bulwark,\ in\ metres}$

A_c = bulwark height correction factor taken as;

= 0 for bulwarks between 0,9 and 1,2 m in height

=
$$0.004 l_{\rm w} \left(\frac{\left(h_{\rm b}-1,2\right)}{1,0}\right) {\rm m}^2$$
 for bulwarks of height greater than 1,2 m and

=
$$0.004 l_{\rm w} \left(\frac{\left(h_{\rm b} - 0.9\right)}{1.0} \right) {\rm m}^2$$
 for bulwarks of height greater than 0.9 m

To adjust the freeing port area for the distance of the well deck above the weatherdeck, for decks located more than $0.5h_s$ above the weatherdeck, multiply by the factor $0.5 (h_s/h_w)$.

9.3.18 Where a ship operates for extended periods in a cold weather environment, see *Vol 1, Pt 5, Ch 2, 4.2 Definitions 4.2.3*, closing devices fitted to freeing port arrangements are to remain effective. The arrangement will be specially considered.

9.4 Free flow area

- 9.4.1 The effectiveness of the freeing port area in bulwarks of vessels not fitted with a continuous deck obstruction, depends on the free flow across the deck.
- 9.4.2 The free flow area is the net total longitudinal area of the transverse passageways or gaps between hatchways and superstructures or deckhouses, due account being made for any obstructions such as equipment or other fittings. The height of passageways or gaps used in the calculation of the area is the height of the bulwark.

9.5 Walkways

- 9.5.1 Walkways are to be designed to an agreed specified standard.
- 9.5.2 Plans are to be submitted showing the proposed scantlings and arrangements of the structure.
- 9.5.3 The design loads used are to be as given in *Vol 1, Pt 5, Ch 3, 5.3 Pressure on internal decks, Pin 5.3.1*. Where it is intended that the walkway be used for the transfer or storage of equipment or other substantial items, the design loads are to be agreed considering the loads given in *Vol 1, Pt 5, Ch 3, 5.3 Pressure on internal decks, Pin 5.3.1*.
- 9.5.4 For the design of the supporting structure of walkways, the applicable self weight of the walkway structure is to be added to the total load derived in *Vol 1, Pt 3, Ch 4, 9.5 Walkways 9.5.3*.

9.6 Safety nets

- 9.6.1 Safety netting used around flight decks is to be arranged so as to safely arrest the fall of personnel. For this purpose the netting is to be raised at the outboard edge by an approximate angle of 10 degrees to the horizontal. The netting is to extend a minimum of 1,25 metres in the horizontal plane. It is recommended that the outboard edge is not above the level of the landing area but in no case is it to protrude greater than 250mm. Materials for the netting are to be specially considered, due consideration is to be given to the fire resistance and weathering properties.
- 9.6.2 The design load applied to safety nets and their supporting structure is to be taken as 2,7kN per metre of netting acting at the centre of the net in addition to the self-weight of the structure. The sag of the net is to be considered when resolving this force at the inner and outer fixings of the net, see Figure 4.9.1 Safety netting sag. Where the netting terminates at a support, the full load is to be applied to the support. The stress criteria to be applied for supports and supporting structure are given in Table 4.9.2 Permissible stress.

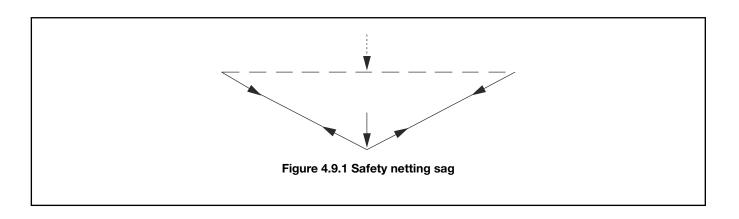

Table 4.9.2 Permissible stress

	Permissible stress
Bending and direct stress	0,8σ ₀
Shear stress	0,5σ ₀
Combined stress	0,9σ ₀
Symbols	
$\sigma_{_{\!O}}$ = specified yield stress of the material, in N/mm 2	

9.7 Ladders

- 9.7.1 Fixed ladders of any type are to be designed in accordance with an appropriate recognised Standard, e.g. BSMA 39-1 *Vertical steel ladders*, BSMA 39-2 *Sloping steel ladders*.
- 9.7.2 Ladders may be constructed from alternative materials than those specified in the standards for the purposes of satisfying radar signature requirements. Equivalent levels of usability and robustness are to be demonstrated.
- 9.7.3 When the climbing height of a single ladder is 3m or more, fall arrest features are to be provided. Where practicable, staging platforms are to be provided for climbing heights in excess of 6m so as to divide the climbing height into multiple stages.

9.8 Means of embarkation and disembarkation

- 9.8.1 A means of embarkation to and disembarkation from vessels for use in harbour or for alongside operations in open sea conditions is to be provided in accordance with an appropriate standard, e.g. IMO MSC.1/Circular.1331 Guidelines for Construction, Installation, Maintenance and Inspection/Survey of Means of Embarkation and Disembarkation (11 June 2009).
- 9.8.2 Accommodation ladders, embarkation ladders and gangways are to be in accordance with an appropriate recognised Standard, e.g. ISO 5488 Accommodation ladders, ISO 5489 Embarkation ladders or ISO 7061 Shipbuilding aluminium shore gangways for seagoing vessels.

■ Section 10

Lagging and lining of structure

10.1 General

10.1.1 Suspended floors are to be fitted and secured in such a manner as to provide access to the structure and fittings below

10.2 Removal for access

10.2.1 It is recommended that the cabin fittings and linings against the side of the ship be so fitted as to be capable of being removed when necessary. The method of attachment is not to impair the strength of the structural members.

Volume 1, Part 3, Chapter 4

Section 11

- 10.2.2 Removable linings are to be fitted in areas prone to high structural degradation and areas that are critical to the structural integrity of the hull, to permit examination of these areas.
- 10.2.3 Decorative linings are to be manufactured of materials resistant to secondary fragmentation and combustion.

Section 11

Lifting eyes

11.1 Application

- 11.1.1 The following Section covers the design appraisal, testing during construction and through-life inspection of lifting eyes, with a permissible loading of 2,5 tonnes or less, installed for the purposes of shipping and unshipping equipment and machinery, and where they do not form part of a lifting appliance. Where the requirements of this Section are complied with the optional notation **LE** may be assigned.
- 11.1.2 The Owner is to ensure that the eyes are located in appropriate locations to enable the shipping and unshipping of equipment and machinery.

11.2 Information to be submitted

- 11.2.1 The following documentation is to be submitted for approval:
- Documentation detailing the range of standard lifting points to be used, see Vol 1, Pt 3, Ch 4, 11.4 Lifting points.
- 11.2.2 The following information is also to be submitted:
- A register of all equipment and machinery which is required to be shipped or unshipped during service.
- Plans detailing the shipping and unshipping routes by compartment.
- A register of all lifting points specifying the detail type, tally information and test loads.

11.3 Materials

11.3.1 Materials are to be in accordance with an agreed specified standard.

11.4 Lifting points

- 11.4.1 Lifting eyes are to be manufactured in accordance with an agreed specified standard.
- 11.4.2 A range of standard lifting point detail designs are to be selected. The range of detail types is to be appropriate for the weight of equipment and machinery which is required to be shipped or unshipped and the method of transfer which is to be used. When considering the weight of equipment and machinery the weight of the lifting gear is to be included.
- 11.4.3 Each standard lifting point detail is to have the following information defined:
- Permissible loading Vertical lift.
- Permissible loading Along eye-plate 45 degrees lift (where applicable).
- Permissible loading Across eye-plate 45 degrees lift (where applicable).
- Material of construction.
- Method of attachment to the ship's structure.
- Method of use.
- Manufacturer's test loads.
- 11.4.4 The safe working load (SWL) for each of the standard detail designs is to be validated by calculation. The design load to be applied is as follows:
- 2 × SWL for the vertical lift case.
- 1,5 × SWL for the 45 degree lift case.

The permissible stresses in Table 4.11.1 Permissible stresses are not to be exceeded.

Section 11

Table 4.11.1 Permissible stresses

	Permissible stress			
Bending and direct stress	0,8σ ₀			
Shear stress	$0.5\sigma_0$			
Combined stress	$0.9\sigma_{0}$			
Symbols				
$\sigma_o = \text{ specified yield stress of the} \ material, in N/mm^2$				

11.4.5 The weld stresses are also to be validated by calculation and confirmed as acceptable. For this purpose a factor of 0,7 is to be used.

11.5 Supporting structure

- 11.5.1 Lifting points are to be located at the intersection of structural members wherever possible.
- 11.5.2 The strength of the supporting structure is to be validated by calculation.
- 11.5.3 Where double tallying is used, see *Vol 1, Pt 3, Ch 4, 11.6 Tallying 11.6.2*, the unused direction is to be checked at an angle of 45 degrees for a load 0,25 times the SWL.

11.6 Tallying

- 11.6.1 Each lifting point is to have a tally displayed which clearly defines the permissible methods of use, the permissible loading associated with each method, and the test status.
- 11.6.2 In general, a lifting point will have a single tally all round capability or single tally vertical lift only. A double tally is only to be used where the supporting structure would be required to be strengthened to provide all round capability but where the planned method of use does not require allround capability.
- 11.6.3 Lifting eyes may have their tallies grouped for identical lifting eyes (i.e. common signboard in each space or compartment). Where group marking is used and the space or compartment also contains non-identical lifting eyes, a colour-distinguishing system shall be used.

11.7 Survey and testing

- 11.7.1 Each lifting eye is to be supplied with a Manufacturer's Certificate stating compliance with the specified standard.
- 11.7.2 In all cases, the attachment to the ship's structure of each lifting eye is to be visually inspected by a Surveyor.
- 11.7.3 Once installed on board the vessel, lifting eyes are to be subject to a load test and representative NDE to the satisfaction of the Surveyor. Load testing is to be 2 x SWL in the vertical direction and $1.5 \times SWL$ for the 45 degree lift arrangement (where applicable). Documentation detailing the test loads and testing arrangement used is to be submitted to LR.
- 11.7.4 Alternatively, once installed on board the vessel, lifting eyes are to be subject to representative load testing in accordance with *Vol 1, Pt 3, Ch 4, 11.7 Survey and testing 11.7.3* and 100 per cent NDE.
- 11.7.5 Lifting eyes that are not tested once installed on board as per Vol 1, Pt 3, Ch 4, 11.7 Survey and testing 11.7.4 are to be clearly distinguished and subject to a load test in accordance with Vol 1, Pt 3, Ch 4, 11.7 Survey and testing 11.7.3 prior to use in service.
- 11.7.6 NDE is to be carried out by suitably qualified Operators to the satisfaction of the Surveyor and in accordance with *Ch 1*, 5 Non-destructive examination of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.
- 11.7.7 Welding is to be carried out by suitably qualified Operators in accordance with Ch 12 Welding Qualifications of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2 and in accordance with Ch 13 Requirements for Welded Construction of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.

Closing Arrangements and Outfit

Volume 1, Part 3, Chapter 4

Section 11

11.8 Inspection during service

11.8.1 A maintenance, inspection and testing manual is to be provided, detailing the following:

- Legislative requirements of the use of lifting eyes on board;
- Details of the reference standard and manufacturer's certificate;
- Description of the location, SWL, and loading direction for each lifting eye or group of lifting eyes;
- Test procedure for each loading arrangement;
- Inspection requirements;
- Test status and inspection record.

Volume 1, Part 3, Chapter 5

Se	

- 1 General
- 2 **Equipment Number**
- 3 Service area factors
- 4 **Anchors**
- **Anchor cable** 5
- 6 Mooring arrangements
- 7 **Towing arrangements**
- 8 Anchor windlass design and testing
- 9 Structural details
- Anchoring equipment in deep and unsheltered water 10
- 11 Launch and recovery, berthing and dry-docking arrangements

Section 1

General

- 1.1 **Application**
- 1.1.1 The anchoring equipment specified in this Section is suitable for ships designed for unrestricted service.
- **Definitions** 1.2
- The definitions for use throughout this Chapter are as indicated in the appropriate Section. 1.2.1
- **Character of classification** 1.3
- 1.3.1 For classification purposes the character figure 1, or the character letter E, is to be assigned.
- 1.3.2 To entitle a ship to the character 1 in its classification symbol, equipment in accordance with the requirements of Sections Vol 1, Pt 3, Ch 5, 4 Anchors, Vol 1, Pt 3, Ch 5, 5 Anchor cable, Vol 1, Pt 3, Ch 5, 6 Mooring arrangements, Vol 1, Pt 3, Ch 5, 8 Anchor windlass design and testing and Vol 1, Pt 3, Ch 5, 9 Structural details is to be provided. The regulations governing the assignment of the character figure 1 for equipment are given in Vol 1, Pt 1, Ch 2 Classification Regulations.
- Where Lloyd's Register (hereinafter referred to as 'LR') has agreed that anchoring and mooring equipment, as defined in Vol 1, Pt 3, Ch 5, 1.3 Character of classification 1.3.2, need not be fitted in view of the particular service of the ship, the character letter **E** will be assigned. See also Vol 1, Pt 1, Ch 2 Classification Regulations
- 1.3.4 For ships intended to be operated only in suitable areas or conditions, other than those included in this Section, which have been agreed by LR, (as defined in Vol 1, Pt 1, Ch 2, 3.6 Service area notations) equipment differing from these requirements may be approved if considered suitable for the particular service on which the ship is to be engaged.

Volume 1, Part 3, Chapter 5

Section 2

Equipment Number

2.1 **Equipment Number calculation**

2.1.1 The anchoring and mooring equipment specified in this Section is based on an 'Equipment Number' which is to be calculated as follows:

Equipment Number = $\Delta^{2/3} + 2, 5A_t + A/10$

where

- $A = \text{area, in m}^2$, in profile view, of the hull, superstructures, houses, masts, etc. above the design draught which are within the Rule length of the vessel and also have a breadth greater than B/4. See also Vol 1, Pt 3, Ch 5, 2.1 Equipment Number calculation 2.1.2.
- A_{t} = transverse projected area, in m², of the hull and of all superstructures, houses, masts, etc. above the design draught
- Δ = displacement, in tonnes, of the ship at its deep draft waterline.
- 2.1.2 Screens and bulwarks more than 1,5 m in height are to be regarded as parts of houses when determining A. Where a screen or bulwark is of varying height, the portion to be included is to be that length the height of which exceeds 1,5 m.
- 2.1.3 For ships which have a complex above water transverse profile due to the presence of large plated masts, mast trees, large radar equipment, etc. the equipment number may need to be specially considered.
- 2.1.4 The Equipment Number formulae for anchoring equipment as given in this Section are based on an assumed maximum current speed of 2,5 m/s, maximum wind speed of 25 m/s and a minimum scope of 6, the scope being the ratio between length of chain cable paid out and water depth. For ships with a Rule length, L_R, greater than 135 m, the required anchoring equipment is also considered adequate for a maximum current speed of 1,54 m/s, a maximum wind speed of 11 m/s and waves with maximum significant height of 2 m.
- 2.1.5 The anchoring equipment required herewith is intended for temporary mooring of a ship within a harbour or sheltered areas when the ship is awaiting berth, tide, etc. It is designed to hold a ship only in good holding ground conditions such as to avoid dragging of the anchor. In poor holding ground, the holding power of the anchors would be significantly reduced.
- 2.1.6 It is assumed that under normal circumstances a ship uses only one bower anchor and chain cable at a time.
- 2.1.7 Where Owners require equipment for anchoring at depths greater than 82,5 m and up to 120 m, it is recommended that the requirements specified in Vol 1, Pt 3, Ch 5, 10 Anchoring equipment in deep and unsheltered water shall be complied with.

2.2 Novel ship design

2.2.1 Where a ship is of unusual form and proportions the requirement for equipment will be individually considered on the basis of the Rules.

Section 3

Service area factors

- 3.1 General
- 3.1.1 For details of the service areas referred to in this Section, see Vol 1, Pt 5, Ch 2, 2.2 Service areas.
- Service Areas SA1, SA2, SA3, SA4, SAR 3.2
- For ships designed to operate in any service area, the equipment is to be in accordance with the requirements of Table 3.2.1 5.4.1 Equipment - HHP Bower anchors and chain cables and Table 5.6.1 Equipment - Kedge anchors and wires, towlines and mooring lines

Volume 1, Part 3, Chapter 5

For ships operating in service areas SA4 and SAR, the equipment may be specially considered accounting for the 3.2.2 environmental condition for the anticipated service, i.e. wind speed, current and water depth.

Section 4

Anchors

4.1 General

- The Rules are based on the use of high holding power (HHP) type anchors. 4.1.1
- When ordinary holding power anchors are used as bower anchors, the mass given in Table 5.4.1 Equipment HHP 4.1.2 Bower anchors and chain cables is to be increased by 33 per cent.
- 4.1.3 Where it is proposed to fit other types of anchor, the mass will be specially considered.
- 4.1.4 Ships are to be provided with the number of anchors as specified in Table 5.4.1 Equipment - HHP Bower anchors and chain cables on board which must be ready for immediate use. Where this is impractical, see Vol 1, Pt 3, Ch 5, 9.2 Hawse pipes and anchor recesses 9.2.4, special consideration may be given to only having one anchor ready for immediate use.
- Where there is a high degree of redundancy in propulsion and steering and where the engine can be brought to readiness quickly, consideration may be given to the fitting of a single anchor where Table 5.4.1 Equipment - HHP Bower anchors and chain cables requires the fitting of two anchors.
- Anchors are to be of an approved design. The design of all anchor heads is to be such as to minimise stress concentrations, and in particular, the radii on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.
- 4.1.7 Anchors which must be specially laid the right way up, or which require the fluke angle or profile to be adjusted for varying types of sea bed, will not generally be approved for normal ship use, but may be accepted for offshore units, floating cranes, etc. In such cases suitable tests may be required.
- 4.1.8 Where kedge anchors are specified, they are to be in accordance with Table 5.6.1 Equipment - Kedge anchors and wires, towlines and mooring lines.

4.2 Manufacture and testing of anchors

4.2.1 The requirements for the manufacture, testing and certification of anchors are contained in Ch 10 Equipment for Mooring and Anchoring of the Rules for the Manufacture, Testing and Certification of Materials (hereinafter referred to as the Rules for Materials).

4.3 **Anchor stowage**

- 4.3.1 Anchors are generally to be housed in suitable hawse pipes, or stowed in dedicated chocks on deck.
- Hawse pipes and anchor pockets are to be in accordance with Vol 1, Pt 3, Ch 5, 8.11 On-board testing. Alternatively, 4.3.2 roller fairleads of suitable design may be fitted. Where hawse pipes are not fitted, alternative arrangements will be specially considered.
- 4.3.3 It is recommended that anchor lashings, e.g. a 'devil's claw', be fitted to hold the anchor tight against the hull or the anchor pocket. Anchor lashings are to be designed to resist at least a load corresponding to twice the anchor mass plus 10 m of cable without exceeding 40 per cent of the yield strength of the material.

4.4 High Holding Power (HHP) type anchors

Anchors of designs for which approval is sought as high holding power anchors are to be tested in accordance with Ch 4.4.1 10, 1.3 Anchor holding power tests for HHP and SHHP anchors of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2. It needs to be suitable for ship's use and shall not require prior adjustment or special placement on the sea bottom.

4.5 Super High Holding Power (SHHP) type anchors

- 4.5.1 Proposals to use anchors of the SHHP type will be subject to special consideration.
- 4.5.2 Final acceptance will be dependent upon satisfactory strength and performance tests.
- 4.5.3 Anchors of designs for which approval is sought as SHHP anchors are to be tested in accordance with *Ch 10, 1.3* Anchor holding power tests for HHP and SHHP anchors of the Rules for the Manufacture, Testing and Certification of Materials,

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

July 2021, incorporating Notice No. 1 & 2. They are to have holding powers of at least four times those of approved standard stockless anchors of the same mass.

4.6 Tolerances

- 4.6.1 The mass of each bower anchor given in *Table 5.4.1 Equipment HHP Bower anchors and chain cables* is for anchors of equal mass. The masses of individual anchors may vary by ± 7 per cent of the masses given in the Table, provided that the total mass of the anchors is not less than would have been required for anchors of equal mass.
- 4.6.2 The mass of the head, including pins and fittings, of an ordinary stockless anchor is to be not less than 60 per cent of the total mass of the anchor.
- 4.6.3 When stocked bower or kedge anchors are to be used, the mass excluding the stock is to be not less than 80 per cent of the mass given in *Table 5.4.1 Equipment HHP Bower anchors and chain cables* for ordinary stockless bower anchors and *Table 5.6.1 Equipment Kedge anchors and wires, towlines and mooring lines* for kedge anchors. The mass of the stock is to be 25 per cent of the total mass of the anchor, including the shackle, etc. but excluding the stock.

4.7 Identification

4.7.1 Identification of anchors which have been tested is to be in accordance with *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials.

Section 5

Anchor cable

5.1 General

- 5.1.1 Anchor cable may be of stud link chain, short link chain or wire rope, subject to the requirements of this Section.
- 5.1.2 An easy lead of the cables from the windlass to the anchors and chain lockers is to be arranged.

5.2 Chain cable and chain locker

- 5.2.1 The length and diameter of chain cable is to be as indicated in *Table 5.4.1 Equipment HHP Bower anchors and chain cables*. The total length of chain cable given in *Table 5.4.1 Equipment HHP Bower anchors and chain cables* is to be divided into approximately equal parts between the two bower anchors.
- 5.2.2 Typically for vessels with equipment number up to 90 calculated in accordance with *Vol 1, Pt 3, Ch 5, 2.1 Equipment Number calculation*, short link chain cable may be accepted provided that the breaking load is not less than that of stud link chain cable of the diameter required by *Table 5.4.1 Equipment HHP Bower anchors and chain cables*
- 5.2.3 Where wire rope is used in lieu of chain cable for anchoring, galvanised wire rope with an independent wire core in accordance with *Ch 10, 6 Steel wire ropes* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* is to be used. Wire rope terminal fittings are to comply with an acceptable code or standard. The strength of terminations, connecting fittings, shackles or links is not to be less than that of the anchor line.
- 5.2.4 Chain cables are to be steel in accordance with the requirements of *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials.
- 5.2.5 Grade U1 material having a tensile strength of less than 400 N/mm² is not to be used in association with high holding power anchors. Grade U3 material is to be used only for chain 20,5 mm or more in diameter.
- 5.2.6 In addition to *Vol 1, Pt 3, Ch 5, 5.2 Chain cable and chain locker 5.2.4* special consideration will be given to the use of chain cable of alloy steel. Alloy steel is to be of a suitable type, details of which are to be submitted for consideration.
- 5.2.7 The form and proportion of links and shackles are to be in accordance with *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials.
- 5.2.8 Where kedge anchors are used in association with chain cable, this cable may be either stud link or short link.
- 5.2.9 Test certificates issued in accordance with *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials are to be signed by the Surveyors when the cables are placed on board the ship.

Volume 1, Part 3, Chapter 5

- Arrangements are to be provided for the safe use of cable when mooring to a buoy, securing alongside hazardous or 5.2.10 exposed jetties or preparing to be towed. Alternative arrangements to meet these requirements without the use of cable are to be submitted for consideration.
- 5211 The chain locker is to be of adequate capacity and depth to provide an easy direct lead of the cables through the chain pipes and facilitate self-stowing of the cables. The chain locker is to be provided with an internal division so that the port and starboard chain cables can be separately stowed.
- 5.2.12 The chain locker boundaries are to be watertight up to the weather deck. Where the means of access to the chain locker is located below the weather deck, the access cover and its securing arrangement in general are to be in accordance with recognised standards for watertight manhole with bolted covers (e.g. ISO 5894 Ships and marine technology - Manholes with bolted covers). Butterfly nuts and/or hinged bolts are prohibited as the securing mechanism for the access cover.
- The chain locker is to be provided with adequate drainage facilities.

5.3 Wire rope

5.3.1 Steel wire ropes are to be manufactured, tested and certified as required by Ch 10 Equipment for Mooring and Anchoring of the Rules for Materials.

5.4 Cable clench

- 5.4.1 Provision is to be made for securing the bitter end of the chain cable to the ship structure. The fastening for securing the bitter end is to be capable of withstanding a force of not less than 15 per cent and not greater than 30 per cent of the minimum breaking strength of the as fitted chain cable. It is to be provided with suitable means such that, in case of emergency, the chain cable may be easily slipped to sea from an accessible position outside the chain cable locker. Where the mechanism for slipping the chain cable to sea penetrates the chain locker bulkhead, this penetration is to be made watertight.
- 5.4.2 Alternatively the cable end connection may be accepted where it has been designed and constructed to a recognised National or International Standard.
- 5.4.3 The cable clench supporting structure is to be adequately stiffened in accordance with the breaking strength of the fastening provided.

5.5 Cable stopping and release arrangements

5.5.1 It is recommended that suitable bow chain stoppers be provided. Where cables pass through stoppers, these stoppers are to be manufactured from ductile material and be designed to minimise the possibility of damage to, or snagging of, the cable. They are to be capable of withstanding without permanent deformation a load equal to 80 per cent of the Rule breaking load of the cable passing over them. The corresponding stresses induced in the supporting structure are not to exceed the allowable values given in Table 5.5.1 Allowable stresses in windlass and chain stopper supporting structure. The capability of the supporting structure to withstand buckling is also to be assessed.

Table 5.5.1 Allowable stresses in windlass and chain stopper supporting structure

	Permissible stress				
	N/mm ²				
(a) For strength assessment by means of beam theory or grillage analysis (see Note 1):					
Normal stress	1,00σ ₀				
Shear stress	0,60σ ₀				
Von Mises stress	1,00 σ ₀				
(b) For strength assessment by means of finite element analysis (see Note 2):					
Von Mises stress	1,00 σ ₀				
Sym	Symbols				

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Section 6

 σ_0 = specified minimum yield stress, N/mm²

Note 1. Normal stress is defined as the sum of bending and axial stresses. The shear stress to be considered corresponds to the shear stress acting perpendicular to the normal stress. No stress concentration factors are to be taken into account.

Note 2. For strength assessment by means of finite element analysis, the mesh is to be fine enough to represent the geometry as realistically as possible. The aspect ratios of elements are not to exceed 3. Girders are to be modelled using shell or plane stress elements. Symmetric girder flanges may be modelled by beam or truss elements. The element height of girder webs must not exceed one-third of the web height. In way of small openings in girder webs, the web thickness is to be reduced to an appropriate mean thickness over the web height. Large openings are to be modelled. Stiffeners may be modelled using shell or plane stress elements. The mesh size of stiffeners is to be fine enough to obtain proper bending stress. If flat bars are modelled using shell or plane stress elements, then dummy rod elements are to be modelled at the free edge of the flat bars and the stresses of the dummy elements are to be evaluated. Stresses are to be read from the centre of the individual element. For shell elements the stresses are to be evaluated at the mid plane of the element.

5.6 Cable locker

- 5.6.1 Adequate storage is to be provided to accommodate the full length of anchor cable.
- 5.6.2 The chain locker is to be of a capacity and depth adequate to provide an easy direct lead for the cable into the chain pipes, when the cable is fully stowed. Chain or spurling pipes are to be of suitable size and provided with chafing lips. The port and starboard cables are to be separated by a division in the locker.
- 5.6.3 Chain lockers fitted abaft the collision bulkhead are to be weathertight and the space to be efficiently drained.

■ Section 6

Mooring arrangements

6.1 Mooring lines

- 6.1.1 Ships of Rule length L_R less than 90 m are recommended to have mooring lines as specified in *Vol 1*, *Pt 3*, *Ch 5*, 6.2 Mooring lines (Equipment Number \leq 2000) or *Vol 1*, *Pt 3*, *Ch 5*, 6.3 Mooring lines (Equipment Number > 2000) as appropriate.
- 6.1.2 Ships of Rule length L_R 90 m or more are recommended to have mooring lines as specified in *Vol 1, Pt 3, Ch 5, 6.2 Mooring lines (Equipment Number \leq 2000) or <i>Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000)* as appropriate.
- 6.1.3 It is recommended that not less than four mooring lines be carried on ships exceeding 90 m in length, and not less than six mooring lines on ships exceeding 180 m in length. The length of mooring lines should be not less than 200 m, or the length of the ship, whichever is the lesser.
- 6.1.4 For ease of handling, fibre ropes should be not less than 20 mm diameter. All ropes having breaking strengths in excess of 736,0 kN and used in normal mooring operations are to be handled by, and stored on, suitably designed winches. Alternative methods of storing should give due consideration to the difficulties experienced in manually handling ropes having breaking strengths in excess of 490,0 kN
- 6.1.5 It is permitted to reduce the specified length of an individual mooring line by up to 7 per cent, provided the total length of mooring lines is not less than the total length if all the required lines were of equal given lengths. Proposals to fit individual mooring lines of reduced length to suit the particular service will be specially considered.
- 6.1.6 Ship Design Minimum Breaking Load (MBL_{SD}) is the minimum breaking load of new, dry mooring lines for which shipboard fittings and supporting hull structures are designed in order to meet mooring restraint requirements.
- 6.1.7 Line Design Break Force (*LDBF*) is the minimum force at which a new, dry, spliced, mooring line will break at. This is applicable to all synthetic cordage materials.

6.2 Mooring lines (Equipment Number ≤ 2000)

6.2.1 It is recommended that the ship design minimum breaking load, length and number of mooring lines provided on board ships with equipment number of less than or equal to 2000 be not less than those specified in *Table 5.6.1 Equipment - Kedge anchors and wires, towlines and mooring lines*. The equipment number is to be calculated in accordance with *Vol 1, Pt 3, Ch 5,*

Volume 1, Part 3, Chapter 5 Section 6

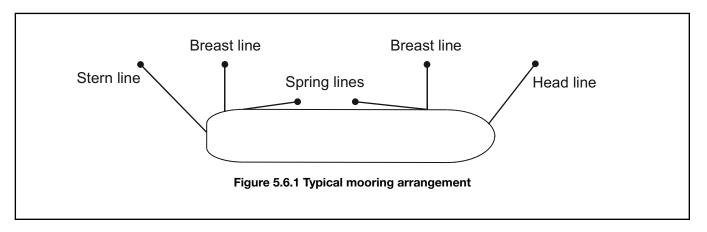

- 2.1 Equipment Number calculation. It is the Owner and designer's responsibility to ensure the adequacy of the mooring equipment. The adequacy of minimum recommended mooring lines in this sub-s ection needs to be verified based on assessments carried out for the individual mooring arrangement, expected shore-side mooring facilities and design environmental conditions for the berth.
- 6.2.2 For ships having the ratio of side projected area *A* and equipment number as defined in *Vol 1, Pt 3, Ch 5, 2.1 Equipment Number calculation* greater than 0,9, the following number of lines is to be added to the number of mooring lines as given by *Table 5.6.1 Equipment Kedge anchors and wires, towlines and mooring lines*:
- (a) One line where $0.9 < \frac{A}{\text{Equipment Number}} \le 1.1$,
- (b) Two lines where $1,1 < \frac{A}{\text{Equipment Number}} \le 1,2,$
- (c) Three lines where 1,2 $< \frac{A}{\text{Equipment Number}}$.
- 6.2.3 As an alternative to the minimum recommendations for mooring lines prescribed in this sub-section, the minimum recommendations for mooring lines may be determined by direct mooring analysis in accordance with the procedure given in Appendix A of IACS Recommendation 10 *Chain Anchoring, Mooring and Towing Equipment*.

6.3 Mooring lines (Equipment Number > 2000)

- 6.3.1 It is recommended that the ship design minimum breaking load, length and number of mooring lines for ships with an equipment number greater than 2000 are as defined in this sub-Section. The equipment number is to be calculated in accordance with Vol 1, Pt 3, Ch 5, 2.1 Equipment Number calculation. It is the Owner and designer's responsibility to ensure the adequacy of the mooring equipment. The adequacy of minimum recommended mooring lines in this sub-section needs to be verified based on assessments carried out for the individual mooring arrangement, expected shore-side mooring facilities and design environmental conditions for the berth. A typical mooring arrangement is indicated in Figure 5.6.1 Typical mooring arrangement and the following is defined with respect to mooring lines.
- (a) Breast line: A mooring line that is deployed perpendicular to the ship, restraining the ship in the off-berth direction.
- (b) Spring line: A mooring line that is deployed almost parallel to the ship, restraining the ship in the fore or aft direction.
- (c) Head/stern line: A mooring line that is oriented between longitudinal and transverse direction, restraining the ship in the off-berth and in the fore or aft direction. The amount of restraint in fore or aft and off-berth direction depends on the line angle relative to these directions.
- 6.3.2 The strength of mooring lines and the number of head, stern, and breast lines for ships with an Equipment Number > 2000 is based on the side-projected area A_1 . Side projected area A_1 is to be calculated similar to the side-projected area A_1 according to *Vol 1*, *Pt 3*, *Ch 5*, *2.1 Equipment Number calculation* but considering the following conditions:
- (a) For ships with substantial variation in draught such as fleet tankers, the ballast draught is to be considered for the calculation of the side-projected area A_1 . For ship types having small variation in the draught, the side projected area A_1 may be calculated using the summer load waterline.
- (b) Wind shielding of the pier can be considered for the calculation of the side-projected area A_1 unless the ship is intended to be regularly moored to jetty type piers. The lower part of the side projected area above the waterline for the considered loading condition can be disregarded up to the pier height in the calculation of the side-projected area A_1 . Where known, the actual height of the pier above the waterline may be used in the calculation. If the pier height cannot be pre-determined, an assumed height may be used. However, in both cases, the pier height shall not exceed 3 m.
- 6.3.3 The mooring lines specified are based on a maximum current speed of 1,0 m/s and the following maximum wind speed V_w :
 - $V_{\rm w} = 25.0 0.002 \, (A_1 2000) \, \text{m/s}$ for ships with large side projected area, i.e. $2000 \, {\rm m}^2 < A_1 \le 4000 \, {\rm m}^2$
 - = 21,0 m/s for ships with large side projected area $A_1 > 4000 \text{ m}^2$
 - = 25,0 m/s for other ships
- 6.3.4 The maximum wind speed V_w is representative of the mean wind speed over a 30 second period from any direction and at a height of 10 m above the ground. The current speed considered is a representative of the maximum current speed acting on bow or stern ($\pm 10^\circ$) at a depth of one-half of the mean draught. Furthermore, it is considered that the ships are moored to solid piers that provide shielding against cross currents.

Volume 1, Part 3, Chapter 5

6.3.5 Additional loads caused by higher wind or current speeds, cross currents, additional wave loads, or reduced shielding from non-solid piers, for example are to be specially considered. Consideration is also to be given to the fact that unfavourable mooring layouts can significantly increase the loads on individual mooring lines.

6.3.6 The ship design minimum breaking load (MBL_{SD}), in kN, of the mooring lines is to be taken as:

$$MBL_{SD} = 0.1 \times A_1 + 350$$

A₁ = Side projected area as defined by Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.2

The ship design minimum breaking load may be limited to 1275 kN (130 tonnes). However in these cases, the moorings 6.3.7 are to be considered as not sufficient for the environmental conditions given by Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.3. For these ships, the acceptable wind speed $V_{\rm w}^*$, in m/s, to be calculated as follows:

$$V_{\rm w}^* = V_{\rm w} \times \sqrt{\frac{MBL_{\rm SD}^*}{MBL_{\rm SD}}}$$

 $V_{\rm w}={
m wind\ speed\ as\ per\ Vol\ 1,\ Pt\ 3,\ Ch\ 5,\ 6.3\ Mooring\ lines\ (Equipment\ Number>2000)\ 6.3.3}$

 MBL_{SD}^{*} = the intended ship design minimum breaking load

MBL_{SD} = ship design minimum breaking load provided by Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.6

However, the intended ship design minimum breaking load MBL_{SD}^{*} is not to be taken less than that corresponding to an acceptable wind speed of 21 m/s:

$$MBL_{\text{SD}}^* \ge \left(\frac{21}{V_{\text{vir}}}\right)^2 \times MBL_{\text{SD}}$$

If the mooring lines are intended to be supplied for an acceptable wind speed $V_{\rm w}^*$, higher than $V_{\rm w}$ as per Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.3, the ship design minimum breaking load MBL_{SD}^{*} is to be taken as:

$$MBL_{\text{SD}}^* = \left(\frac{V_{\text{w}}^*}{V_{\text{w}}}\right)^2 \times MBL_{\text{SD}}$$

where

MBL_{SD} = required ship design minimum breaking load provided by Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.6

6.3.9 The total number of head, stern and breast lines is specified as:

Volume 1, Part 3, Chapter 5 Section 6

 $n = 8.3 \times 10^{-4} \times A_1 + 6$

where

 A_1 = side projected area as defined by Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.2

The total number of head, stern and breast lines is to be rounded to the nearest whole number. The number may be increased or decreased in conjunction with an adjustment to the ship design minimum breaking load. The adjusted ship design minimum breaking load MBL_{SD}^{**} , is to be taken as:

$$MBL_{SD}^{**} = 1.2 \times MBL_{SD} \times \frac{n}{n^{**}} \leq MBL_{SD}$$
, for increased number of lines

$$MBL_{\text{SD}}^{**} = MBL_{\text{SD}} \times \frac{n}{n^{**}}$$
, for reduced number of lines

where

 $MBL_{\mathrm{SD}} = MBL_{\mathrm{SD}}$ or MBL_{SD}^* , if intended ship design minimum breaking load is different as provided by Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.7 or Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.8

n = number of lines for the considered ship type as calculated by the above formula without rounding

 n^{**} = increased or decreased total number of head, stern and breast lines

Vice versa, the ship design minimum breaking load of head, stern and breast lines may be increased or decreased in conjunction with an adjustment to the number of lines.

6.3.10 The total number of spring lines, n_s is to be taken not less than:

Two lines where EN < 5000,

Four lines where $EN \ge 5000$.

The ship design minimum breaking load of spring lines is to be the same as that of the head, stern and breast lines. If then the number of head, stern and breast lines is increased in conjunction with an adjustment to the ship design minimum breaking load of the lines, the number of spring lines is to be taken as follows, but rounded up to the nearest even number.

$$n_s^* = \frac{MBL_{SD}}{MBL_{SD}^{**}} \times n_s$$

where

 $MBL_{SD} = MBL_{SD}$ or MBL_{SD}^* , if the intended ship design minimum breaking load is different as provided by Vol~1, Pt~3, Ch~5, 6.3~Mooring~lines~(Equipment~Number > 2000)~6.3.7~or~Vol~1, Pt~3, Ch~5, 6.3~Mooring~lines~(Equipment~Number > 2000)~6.3.8

 MBL_{SD}^{**} = adjusted ship design minimum breaking load as provided by Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) 6.3.9

 n_s = the number of spring lines as given above

 $n_{\rm s}^*$ = the increased number of spring lines

6.3.11 As an alternative to the minimum recommendations for mooring lines prescribed in this sub-section, the minimum recommendations for mooring lines may be determined by direct mooring analysis in accordance with the procedure given in Appendix A of IACS Recommendation 10 'Chain Anchoring, Mooring and Towing Equipment'.

Volume 1, Part 3, Chapter 5 Section 6

Table 5.6.1 Equipment - Kedge anchors and wires, towlines and mooring lines

Equipment number		Equipment	Mass of stockless kedge anchor, in kg	Kedge anchor wire or chain (see Notes 1 and 2)		Mooring lines (see Notes 2 and 5)

Note 1. The rope used for kedge anchor wire is to be constructed of not less than 72 wires, made up into six strands.

Note 2. Steel wire and fibre ropes used for mooring lines and kedge anchors are to meet the requirements of *Ch 10, 6 Steel wire ropes* and *Ch 10, 7 Fibre ropes* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* respectively.

Note 3. Wire ropes for mooring lines used in association with mooring winches (on which the rope is stored on the winch drum) are to be of suitable construction.

Note 4. Irrespective of strength requirements, no fibre rope is to be less than 20 mm diameter.

Note 5. The mooring lines to be selected only for ships with equipment number less than or equal to 2000.

6.4 Materials

- 6.4.1 Mooring lines may be of steel wire rope, natural fibre or synthetic fibre. The diameter, construction and specification of wire or natural fibre mooring lines are to comply with the requirements of *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials. Where it is proposed to use synthetic fibre ropes, the size and construction will be specially considered.
- 6.4.2 The design loads applied to deck fittings by Vol 1, Pt 3, Ch 5, 6.9 Deck fittings and support structure relate to conventional fibre ropes (i.e. polypropylene, polyester and nylon). If other materials are used i.e. HMPE, consideration should be given to the elongation properties and therefore the design load applied to deck fittings.
- 6.4.3 Wire rope mooring lines used in association with winches (on which the rope is stored on the winch drum) are to be of suitable construction.

6.5 Testing and certification

6.5.1 Mooring ropes are to be tested and certified in accordance with *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials.

6.6 Bollards, fairleads and bull rings

6.6.1 Means are to be provided to enable mooring lines to be adequately secured on board ship.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and **Docking**

Volume 1, Part 3, Chapter 5

6.6.2 It is recommended that the total number of suitably placed bollards on either side of the ship and/or the total brake holding power of mooring winches should be capable of holding not less than 1,5 times the sum of the ship design minimum breaking load (MBL_{SD}) of the mooring lines recommended.

6.7 Mooring arrangement and winches

- 6.7.1 The recommendations with respect to the mooring arrangement and mooring winches are provided by this sub-Section.
- 6.7.2 Mooring lines in the same service (e.g. breast lines) are to be of the same characteristics in terms of strength and elasticity.
- 6.7.3 Mooring winches where provided are to be suitable for the intended purpose. As far as possible, a sufficient number of mooring winches is to be fitted so as to allow all mooring lines to be belayed on winches. This allows for an efficient distribution of the load to all mooring lines in the same service and for the mooring lines to shed the load before they break. If the mooring arrangement is designed such that mooring lines are partly to be belayed on bitts or bollards, it is to be understood that these lines may not be as effective as the mooring lines belayed on winches.
- 6.7.4 The mooring winch is to be fitted with brakes, the holding capacity of which is sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 per cent of the ship design minimum breaking load of the rope as fitted on the first layer. The winch is to be fitted with brakes that will allow for the reliable setting of the brake rendering load.
- For powered winches the maximum hauling tension which can be applied to the mooring line (the reeled first layer) is to be not less than 2/9, nor to be more than, 1/3, of the rope's ship design minimum breaking load. For automatic winches these figures apply when the winch is set to the maximum power with automatic control.
- For powered winches on automatic control, the rendering tension which the winch can exert on the mooring line (the reeled first layer) is not to exceed 1,5 times, nor be less than 1,05 times, the hauling tension for that particular power setting of the winch. The winch is to be marked with the range of rope strengths for which it is designed.
- 6.7.7 Mooring lines are to have a straight lead from the mooring drum to the fairlead as far as practicable.
- 6.7.8 When a mooring line changes direction, the contact surface on the fitting shall have a large radius so as to minimise the wear experienced by the mooring lines. Recommendations from the rope manufacturer for the intended rope type are also to be complied with.

6.8 Mooring line construction

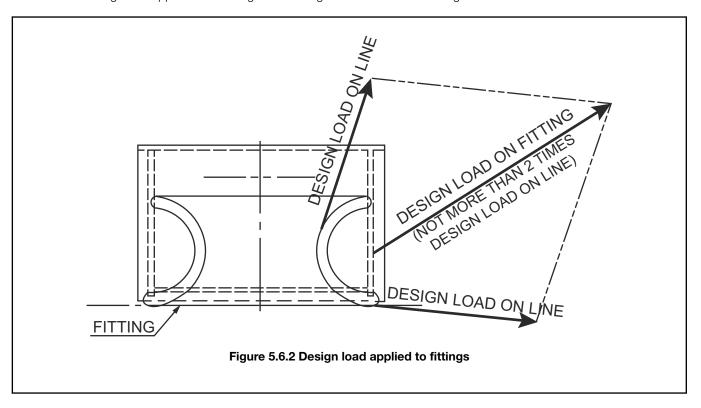

- 6.8.1 Mooring lines are to be of wire, natural fibre or synthetic fibre construction or of a mixture of wire and fibre. For synthetic fibre ropes it is recommended that lines with reduced risk of recoil (snap-back) be used to mitigate the risk of injuries or fatalities in the case mooring line failure.
- 6.8.2 Notwithstanding the strength recommendations, no fibre rope shall be less than 20 mm in diameter. For polyamide ropes the line design break force is to be increased by 20 per cent and for other synthetic ropes by 10 per cent to account for strength loss due to, among other causes, aging and wear.
- 6.8.3 Wire ropes used for mooring lines are generally to be of a flexible construction with not less than 144 wires in six strands with seven fibre cores for strengths up to 490 kN, and 222 wires in six strands with one fibre core for strengths exceeding 490 kN. The wires laid round the fibre centre of each strand are to be made up in not less than two layers.
- Wire ropes for mooring lines used in association with mooring winches (on which the rope is stored on the winch drum) 6.8.4 are to be of suitable construction.
- The mooring lines are to be tested in accordance with Ch 10, 6 Steel wire ropes and Ch 10, 7 Fibre ropes of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2 for wire ropes and fibre ropes, respectively.

6.9 Deck fittings and support structure

- 6.9.1 The strength of shipboard fittings used for mooring operations and their supporting hull structures as well as the strength of supporting hull structures of winches and capstans are to comply with the requirements specified in this sub-Section.
- Shipboard fittings, winches and capstans for mooring are to be located on stiffeners and/or girders which are part of the deck construction so as to facilitate efficient distribution of the mooring load. Other arrangements are acceptable (for chocks in bulwarks, etc.) provided that the strength is confirmed adequate for the service.

Volume 1, Part 3, Chapter 5

- 6.9.3 The design load applied to shipboard fittings and supporting hull structure is not to be less than that given in Table 5.6.2 Minimum design load for deck fittings and supporting structure - Mooring.
- The design load is to be applied to fittings in all directions that may occur by taking into account the arrangement shown on the towing and mooring arrangements plan. Where the mooring line takes a turn at a fitting the total design load applied to the fitting is equal to the resultant of the design loads acting on the line, see Figure 5.6.2 Design load applied to fittings. However, in no case does the design load applied to the fitting need to be greater than twice the design load on the line.

- Shipboard fittings are to be selected from an acceptable National or International standard and to be based on the ship design minimum breaking load as given in Vol 1, Pt 3, Ch 5, 6.1 Mooring lines 6.1.1 or Vol 1, Pt 3, Ch 5, 6.1 Mooring lines 6.1.2 as appropriate (see Note 2 of Table 5.6.2 Minimum design load for deck fittings and supporting structure - Mooring).
- Mooring bitts (double bollards) are to be chosen for the mooring line attached in figure-of-eight fashion if the industry standard distinguishes between different methods to attach the line, i.e. figure-of-eight or eye-splice attachment. With the line attached to a mooring bitt in the usual way (figure-of-eight fashion), either of the two posts of the mooring bitt can be subjected to a force twice as large as that acting on the mooring line. Disregarding this effect, depending on the applied industry standard and fitting size, overload may occur.
- When the shipboard fitting is not selected from an accepted industry standard, the strength of the fitting based on net scantlings and its attachment to the ship is to be adequate for the loads specified in Table 5.6.2 Minimum design load for deck fittings and supporting structure - Mooring based on the acceptance criteria given Vol 1, Pt 3, Ch 5, 6.9 Deck fittings and support structure 6.9.10 or Vol 1, Pt 3, Ch 5, 6.9 Deck fittings and support structure 6.9.11 as appropriate. Mooring bitts (double bollards) are required to resist the loads caused by the mooring line attached in figure-of-eight fashion. For strength assessment, beam theory or finite element analysis using net scantlings is to be applied, as appropriate. Wear down allowance for shipboard fittings not selected from an accepted industry standard is not to be less than 1,0 mm, added to surfaces which are intended to regularly contact the line.

Table 5.6.2 Minimum design load for deck fittings and supporting structure - Mooring

Use/Item	Minimum design load (see Notes 1 to 2)
Mooring (Fittings and its supporting hull structure)	1,15 times the ship design minimum breaking load given in Vol 1, Pt 3, Ch 5, 6.1 Mooring lines 6.1.1 or Vol 1, Pt 3, Ch 5, 6.1 Mooring lines 6.1.2 as appropriate

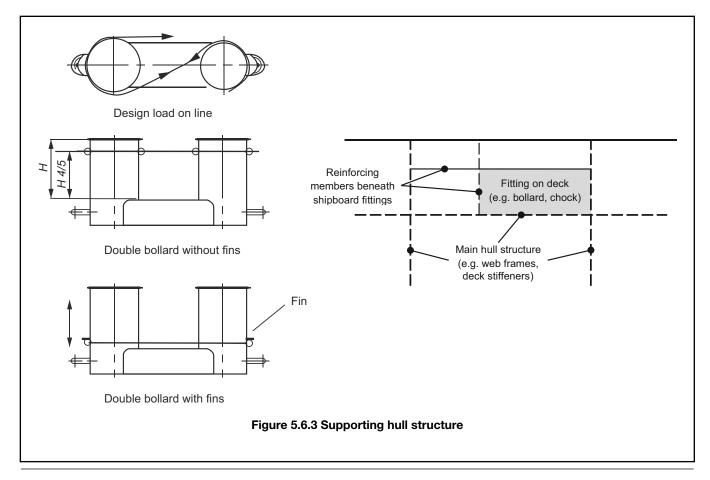

Volume 1, Part 3, Chapter 5

Winches (Supporting hull structure only)	1,25 times the intended maximum brake holding load, where the maximum brake holding load is to be assumed not less than 80% of the ship design minimum breaking load given in Vol 1, Pt 3, Ch 5, 6.1 Mooring lines 6.1.1 or Vol 1, Pt 3, Ch 5, 6.1 Mooring lines 6.1.2 as appropriate
Capstans (Supporting hull structure only)	1,25 times the maximum hauling in force, where hauling in force is defined as the maximum pull of the capstan or 1,25 times the intended maximum brake holding load if that be greater

Note 1. When a safe working load SWL greater than that determined according to the Rules is requested, the design load is to be increased in accordance with the appropriate SWL/design load relationship given in *Vol 1, Pt 3, Ch 5, 6.9 Deck fittings and support structure 6.9.12*

Note 2. The increase of the line design break force for synthetic ropes need not to be taken into account for the loads applied to shipboard fittings and supporting hull structure.

- 6.9.8 The net scantlings of the supporting hull structure for the fittings are to be adequate for the loads given in *Table 5.6.2 Minimum design load for deck fittings and supporting structure Mooring* based on the acceptance criteria given in *Vol 1, Pt 3, Ch 5, 6.9 Deck fittings and support structure 6.9.10* or *Vol 1, Pt 3, Ch 5, 6.9 Deck fittings and support structure 6.9.11* as appropriate. The arrangement of reinforced members beneath shipboard fittings, winches and capstans is to consider any variation of direction (horizontally and vertically) of the mooring forces acting upon the shipboard fittings, see Figure 5.6.3 Supporting hull structure for a sample arrangement. Proper alignment of fitting and supporting hull structure is to be ensured. The acting point of the mooring force on a shipboard fitting is to be taken at the attachment point of a mooring line or at a change in its direction.
- 6.9.9 For bollards and bitts the attachment point of the mooring line is to be taken not less than 4/5 of the tube height above the base, see *Figure 5.6.3 Supporting hull structure*. However, if fins are fitted to the bollard tubes to keep the mooring line as low as possible, then the attachment point of the mooring line is to be taken at the location of the fins, see *Figure 5.6.3 Supporting hull structure*.

Volume 1, Part 3, Chapter 5

- 6.9.10 In the case of strength assessment using beam theory or grillage analysis, the stress within the supporting structure of fittings, with net scantlings, is not to exceed that given in Table 5.6.3 Allowable stress within the supporting structure of shipboard fittings.
- 6.9.11 For strength assessment by means of finite element analysis the mesh is to be fine enough to represent the geometry as realistically as possible. The aspect ratios of elements are not to exceed three. Girders are to be modelled using shell or plane stress elements. Symmetric girder flanges may be modelled by beam or truss elements. The element height of girder webs must not exceed one-third of the web height. In way of small openings in girder webs the web thickness is to be reduced to an appropriate mean thickness over the web height. Large openings are to be modelled. Stiffeners may be modelled using shell or plane stress elements. The mesh size of stiffeners is to be fine enough to obtain proper bending stress. If flat bars are modelled using shell or plane stress elements, then dummy rod elements are to be modelled at the free edge of the flat bars and the stresses of the dummy elements are to be evaluated. Stresses are to be read from the centre of the individual element. For shell elements the stresses are to be evaluated at the mid plane of the element. The Von Mises stress within the supporting structure of fittings, calculated with net scantlings, is not to exceed the specified minimum yield strength of the material.
- The Safe Working Load (SWL) is the safe load limit of shipboard fittings used for mooring purposes. Unless a greater SWL is requested, the SWL assigned shall be the ship design minimum breaking load given in Vol 1, Pt 3, Ch 5, 6.1 Mooring lines 6.1.1 or Vol 1, Pt 3, Ch 5, 6.1 Mooring lines 6.1.2, (see Note 2 of Table 5.6.2 Minimum design load for deck fittings and supporting structure - Mooring).
- 6.9.13 The SWL, in tonnes, of each shipboard fitting is to be marked (by weld bead or equivalent) on the deck fittings used for mooring.
- 6.9.14 The above requirements on SWL apply for the use with no more than one mooring line.
- 6.9.15 The mooring arrangements plan as mentioned in Vol 1, Pt 3, Ch 5, 6.10 Mooring arrangements plan is to define the method of use of mooring lines.

Table 5.6.3 Allowable stress within the supporting structure of shipboard fittings

	Normal stress, in N/mm ²	Shear stress, in N/mm ²
Allowable stress	$\frac{235}{k}$	$\frac{141}{k}$
whore		

235

 σ_0 = specified minimum yield strength of the material in N/mm²

Note Normal stress is defined as the sum of bending and axial stresses. No stress concentration factors accounted for and as such may need to be considered separately.

6.10 Mooring arrangements plan

- 6.10.1 The SWL for the intended use for each shipboard fitting is to be noted in the mooring arrangements plan available on board for the guidance of the Master.
- 6.10.2 Information provided on the plan is to include in respect of each shipboard fitting:
- (a) location on the ship;
- (b) fitting type;
- SWL;
- (d) purpose, i.e. mooring; and
- manner of applying towing or mooring line load, including limiting fleet angles, i.e. angle of change in direction of a line at the

Note Item (c) with respect to items (d) and (e), is subject to approval.

Furthermore, information provided on the plan is to include:

- the arrangement of mooring lines showing number of lines (M);
- the ship design minimum breaking load (MBL_{SD}, MBL_{SD}* or MBL_{SD}** as appropriate); and

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and **Docking**

Volume 1, Part 3, Chapter 5

- the acceptable environmental conditions, the minimum environmental conditions are as given in Vol 1, Pt 3, Ch 5, 6.3 Mooring lines (Equipment Number > 2000) for the recommended ship design minimum breaking load for ships with EN > 2000:
- 30 second mean wind speed from any direction ($V_{\rm w}$ or $V_{\rm w}^*$)
- Maximum current speed acting on bow or stern (±10°).
- The above information as given in Vol 1, Pt 3, Ch 5, 6.10 Mooring arrangements plan 6.10.2 is to be incorporated into the pilot card in order to provide the pilot proper information on harbour and other towing operations.

Section 7

Towing arrangements

7.1 **Definition**

7.1.1 Towing can be defined as either receiving motive assistance from, or rendering it to, another vessel.

7.2 **Application**

- The towing arrangements specified in this section are applicable to NS1, NS2 and NS3 category ships carrying the corresponding optional towing arrangement notation.
- 7.2.2 The strength of strong points, fittings and machinery are to be proof tested unless type approved.
- 7.2.3 In general, ships complying with the requirements of this section will be eligible to be classed with the notation TA1, TA2 or TA3.
- 7.2.4 TA1 This notation will be assigned when an appraisal has been made of the towing arrangements and strength performance of the supporting structures in accordance with the Rules. This notation recognises the most severe weather conditions, see Table 5.7.2 Design weather factors and Table 5.7.3 Environmental conditions.
- 725 TA2 This notation will be assigned when an appraisal has been made of the towing arrangements and strength performance of the supporting structures in accordance with the Rules. This notation recognises weather conditions less severe than TA1, see Table 5.7.2 Design weather factors and Table 5.7.3 Environmental conditions.
- 7.2.6 TA3 This notation will be assigned when an appraisal has been made of the towing arrangements and strength performance of the supporting structures in accordance with the Rules. This notation recognises the least severe weather conditions, see Table 5.7.2 Design weather factors and Table 5.7.3 Environmental conditions.
- These three levels of towing arrangements in 7.2.4 to 7.2.6 recognise towing a ship of similar displacement at 6 knots in 7.2.7 defined environmental conditions (see Table 5.7.3 Environmental conditions) and are appropriate for the weather conditions found in the equivalent service areas, i.e. **TA1** corresponds to the weather conditions found with service area notation **SA1**.
- Where alternative requirements to the breaking load of the towing hawser required by Vol 1, Pt 3, Ch 5, 7.6 Strength requirements for towing arrangements 7.6.1 are specified, and have been complied with, the ship will be entitled to the notation TA(NS). These alternative requirements are to be clearly defined and referenced in the Certificate of Class. The load specified in the alternative is to replace the BL value given by the expression in Vol 1, Pt 3, Ch 5, 7.6 Strength requirements for towing arrangements 7.6.1.
- Where the towline complies with the strength requirements of Table 5.7.1 Equipment Minimum length and breaking strength of towlines as applicable to merchant ships for the related equipment number, the ship will be entitled to the assignment of the TA(S) notation. The breaking load specified in Table 5.7.1 Equipment - Minimum length and breaking strength of towlines is to replace the BL value given by the expression in Vol 1, Pt 3, Ch 5, 7.6 Strength requirements for towing arrangements 7.6.1 and the strength of shipboard fittings and their supporting structures are be in accordance with the Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5, Pt 3, Ch 13, 9.2 Towing as appropriate.
- 7.2.10 Towing operations are to be in accordance with the towing, mooring and arrangements plan or equivalent information which is required to be placed on board. See Vol 1, Pt 3, Ch 5, 7.4 Information required.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Section 7

7.3 Materials

- 7.3.1 Towing hawsers and towing pennants can be of steel wire rope, natural fibre or synthetic fibre. The diameter, construction and specification of steel wire or fibre towlines are to comply with *Ch 10 Equipment for Mooring and Anchoring* of the Rules for Materials. Where synthetic fibre ropes are used the size and construction will be specially considered.
- 7.3.2 Where a length of chafing chain is included in the arrangement it is to comply with *Ch 10 Equipment for Mooring and Anchoring* of the Rules for the Materials.
- 7.3.3 The design loads applied to deck fittings by this Section relate to conventional fibre ropes (i.e. polypropylene, polyester and nylon). Consideration should be given to the elongation properties of the actual line used.
- 7.3.4 Wire ropes used in association with winches (on which the rope is stored on the winch drum) are to be of suitable construction.

7.4 Information required

- 7.4.1 Plans are to be of sufficient detail for plan approval purposes. Plans covering the following items are to be submitted for approval:
- Strong points, bollards and fairleads, see Vol 1, Pt 3, Ch 5, 7.5 Towing arrangements 7.5.7.
- Support structure and foundations of towing equipment.
- 7.4.2 The towing arrangement plan is to be submitted for information. It is to include the following in respect of each shipboard fitting:
- Location on the ship.
- Fitting type.
- Safe working load (SWL).
- Manner of applying towing line load, including limiting fleet angles.

The towing arrangement plan is to be provided on board the ship for the guidance of the Master.

7.5 Towing arrangements

- 7.5.1 A towing arrangement is to be provided at both the fore and aft end of the ship.
- 7.5.2 The fixed towing equipment is to comprise a securing arrangement which is a strong point and may be in the form of a stopper bollard, bracket, deck clench or towing slip. A fairlead, rollers or other appropriate towline guides as necessary are to be included in the arrangement.
- 7.5.3 Loose towing equipment is to comprise a towing hawser and a towing pennant. The towing pennant may comprise a length of chafing chain. In the absence of a length of chafing chain suitable arrangements (e.g. a low friction sheath) are to be provided.
- 7.5.4 Fairleads and guides are to be designed so as to prevent excessive bending stress in the towing hawser, towing pennant or chafing chain, whichever is applicable. The bending ratio of the guides bearing surface to the diameter of the applicable towline element is not to be less than 7 to 1. For fibre rope towing hawsers and towing pennants the bending ratio is to comply with the rope manufacturer's specification.
- 7.5.5 The fairlead or guide is to have an opening large enough to allow the passage of the largest element of the loose towing equipment.
- 7.5.6 The fairlead or guide is to be fitted as close to the deck as practicable and in a position so that the tow will be approximately parallel to the deck when under tension between the strong point and the guide.
- 7.5.7 The selection of shipboard fittings is to be made by the shipyard in accordance with an acceptable National or International standard. If the shipboard fitting is not selected from an acceptable National or International standard then the design load used to assess its strength and its attachment to the ship is to be in accordance with the design load given in *Vol 1*, *Pt 3*, *Ch 5*, *7.6 Strength requirements for towing arrangements 7.6.3*. The design is to be submitted for approval. Any weld, bolt or equivalent device connecting the shipboard fitting to the supporting structure is part of the shipboard fitting and is subject to the National or International standard applicable to that shipboard fitting.
- 7.5.8 Deck fittings and strong points are to be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the towing load. Other equivalent arrangements will be considered, providing the strength is confirmed as adequate for the intended use.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and **Docking**

Volume 1, Part 3, Chapter 5

- 7.5.9 To avoid chafing, the arrangement is to be designed so that no element of the loose towing equipment, when under tension, is to contact with the ship's hull at any point other than those specified as a securing arrangement, fairlead or guide. The final point of contact of the towline with the ship is to be positioned as close as practicable to the centre line so as to reduce the adverse effect on manoeuvrability.
- 7.5.10 The chafing arrangement is to extend a minimum of 3 m outboard of the fairlead or guide when in the deployed position and 2 m inboard.
- The loose towing equipment is to be located as near as practicable to the strong point and is to be designed to be 7.5.11 capable of being rigged and deployed in the absence of power. It is recommended that extra loose gear meeting the requirements of this Section be carried on board to provide for redundancy.
- The minimum length of the towing hawser is to be as given in Table 5.7.1 Equipment Minimum length and breaking strength of towlines.
- Irrespective of strength requirements, no fibre rope is to be less than 20 mm in diameter. 7.5.13
- 7.5.14 The SWL of each shipboard fitting is to be clearly marked, by weld bead or equivalent, on each of the fittings used for towing, see Vol 1, Pt 3, Ch 5, 7.6 Strength requirements for towing arrangements 7.6.10.

7.6 Strength requirements for towing arrangements

7.6.1 The minimum Breaking Load (hereinafter referred to as BL), of the towing hawser carried on board the ship is assessed, in tonnes, is not to be less than that calculated below:

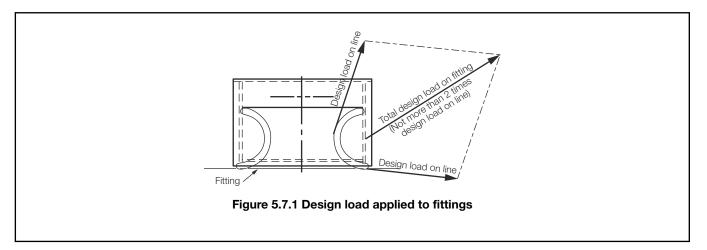

$$BL = (0.03\Delta^{2/3} + (C_{mw}A_t))K$$

where

- Δ = displacement, in tonnes, to the deep draught waterline
- C mw = wind speed coefficient, which is to be taken from Table 5.7.2 Design weather factors for the relevant notation
 - K = weather factor, which is to be taken from Table 5.7.2 Design weather factors for the relevant notation
 - A_{t} = transverse projected area, in m^{2} , of the hull and of all superstructures, houses, masts, etc. above the design draught
- The strength of other loose towing equipment e.g. links, shackles rings and chafing chain is to be determined on the basis of a design load equal to 1,25 times the BL of the towing hawser.
- The strength of shipboard fittings and their supporting structure is to be determined on the basis of a design load equal 7.6.3 to 1,25 times the BL of the towing hawser. The design load is to be applied through the towline according to the arrangement shown on the towing arrangement plan. The point of action of the force on the fitting is to be taken as the point of attachment of the mooring line or towline or at a change in its direction. The total design load applied to a fitting need not be more than twice the design load, see Figure 5.7.1 Design load applied to fittings.
- The stress in all loose and fixed towing equipment constructed of steel, and its supporting structure, is not to exceed the specified minimum yield stress of the material in bending and 60 per cent of the specified minimum yield stress of the material in shear. Special consideration will be given if the vessel and/or towing equipment is not constructed of steel.
- 7.6.5 The reinforced members (carling) beneath shipboard fittings are to be effectively arranged for any variation of direction (horizontally and vertically) of the towing forces (which is to be not less than the design load) acting through the arrangement of connection to the shipboard fittings. Other arrangements will be specially considered provided that the strength is confirmed as adequate for the service.
- For the assessment of fairleads and their supporting structure, due consideration is to be given to lateral loads. The strength of the fairlead is to be sufficient for all angles of towing load up to 90° horizontally from the ship's centreline and 30° vertically from the horizontal plane.
- 7.6.7 For the assessment of a strong point and its supporting structure, the applied load is to be in the direction that the towing pennant or towing hawser will take up during normal deployment. It is also to be applied at the maximum height possible above the deck for that specific type of strong point.

Volume 1, Part 3, Chapter 5

- 7.6.8 The structural arrangements of strong points, bollards and fairleads are to be such that continuity will be ensured. Abrupt changes in section; sharp corners and other points of stress concentration are to be avoided.
- Strong points are to be fitted in way of a transverse or longitudinal deck girder or beam to facilitate efficient distribution of the towing load.
- 7.6.10 The SWL of each towing arrangement component is to be no greater than 80 per cent of the design load applied.

Section 8

Anchor windlass design and testing

8.1 General

- A windlass, capstan or winch used for handling anchors, suitable for the size of chain cable required by Vol 1, Pt 3, Ch 5, 5 Anchor cable and complying with the following criteria is to be fitted. Where Owners require equipment significantly in excess of Rule requirements, it is their responsibility to specify increased windlass power.
- The design, construction and testing of windlasses are to conform with a relevant National or International Standard or code of practice acceptable to LR. To be considered acceptable, the standard, or code of practice, is to specify criteria for evaluation of stresses, performance and testing.
- 8.1.3 Operation and maintenance procedures for the anchor windlass are to be incorporated in the vessel operations manual.

8.2 Plans and particulars to be submitted

- 8.2.1 The following plans showing the design specifications, the standard of compliance, engineering analyses and details of construction, as applicable, are to be submitted for evaluation:
- Windlass design specifications, anchor and chain cable particulars, performance criteria, and standard of compliance.
- Windlass foundation drawings including the supporting structure below deck. The details shall include bolts, chocks, shear stoppers etc. along with the foot print loads for the specified windlass ratings.
- Chain stopper foundation drawings including the supporting structure below deck. The details shall include bolts, chocks, shear stoppers etc. along with the foot print loads for the specified rating.
- Windlass arrangement plans showing all the components of the anchoring/mooring system such as the prime mover, shafting, cable lifter, anchors and chain cables; mooring winches, wires and fairleads, if they form part of the windlass machinery; brakes; controls, etc.
- Dimensions, materials, welding details, as applicable, of all torque-transmitting components (shafts, gears, clutches, couplings, coupling bolts, etc.) and all load-bearing components (shaft bearings, cable lifter, sheaves, drums, bed-frames, etc.) of the windlass and of the winch, where applicable, including brakes, chain stopper (if fitted), and foundation.
- Hydraulic system, to include:
- piping diagram along with system design pressure; (i)
- safety valves arrangement and settings;

Volume 1, Part 3, Chapter 5

- (iii) material specifications for pipes and equipment;
- (iv) typical pipe joints, as applicable;
- (v) technical data and details for hydraulic motors;
- (vi) cooling systems arrangements for hydraulic system oil.
- Electrical one-line diagram along with cable specification and size, motor controller, protective device rating or setting, as applicable.
- Control, monitoring and instrumentation arrangements.
- Engineering analyses for torque-transmitting and load-bearing components demonstrating their compliance with recognised standards or codes of practice. Analyses for gears are to be in accordance with a recognised standard.
- Calculations proving satisfactory inertia loads for the intended windlass, see Vol 1, Pt 3, Ch 5, 8.4 Windlass design 8.4.1.(b).
- Plans and data for windlass electric motors including associated gears rated 100 kW and over.
- Calculations demonstrating that the windlass prime mover is capable of attaining the hoisting speed, the required continuous duty pull, and the overload capacity are to be submitted if the 'load testing' including 'overload' capacity of the entire windlass unit is not carried out at the shop (see Vol 1, Pt 3, Ch 5, 8.10 Shop inspection and testing 8.10.1.(b)).

8.3 Materials and fabrication

- 8.3.1 Materials used in the construction of torque-transmitting and load-bearing parts of windlasses are to comply with LR's Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2 or an appropriate National or International Standard acceptable to LR, provided that the Standard gives reasonable equivalence to the requirements of LR. The proposed materials are to be indicated in the construction plans and are to be approved in connection with the design. All such materials are to be certified by the material manufacturers and are to be traceable to the manufacturers' certificates.
- 8.3.2 Weld joint designs are to be shown in the submitted construction plans and are to be appraised in association with the approval of the windlass design in accordance with an appropriate National or International Standard acceptable to LR. .
- 8.3.3 Welding procedures, welding consumables and welders are to comply with the LR *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* or an appropriate National or International Standard acceptable to LR.
- 8.3.4 The degree of non-destructive examination of welds and post-weld heat treatment, if any, are to be specified and submitted for consideration.

8.4 Windlass design

- 8.4.1 In addition to the requirements of the National or International Standard or code of practice acceptable to LR (see *Vol 1*, *Pt 3*, *Ch 5*, 8.1 *General 8.1.2*) the following performance requirements are to be complied with:
- (a) Holding Loads: Calculations are to be made to show that, in the holding condition (single anchor, brake fully applied and chain cable lifter declutched) and under a load equal to 80 per cent of the specified minimum breaking strength of the chain cable, the maximum stress in each load bearing component will not exceed the maximum permissible yield. For installations fitted with a chain cable stopper, 45 per cent of the specified minimum breaking strength of the chain cable may instead be used for the calculation.
- (b) Inertia Loads: The design of the drive train, including prime mover, reduction gears, bearings, clutches, shafts, cable lifter and bolting is to consider the dynamic effects of sudden stopping and starting of the prime mover or chain cable, so as to limit inertial load.
- (c) Continuous Duty Pull: The windlass is to have sufficient power to exert a continuous duty pull, Z_{cont1} , over a period of 30 minutes corresponding to the grade and diameter, d_{c} , of the chain cables as follows:
 - (i) for specified design anchorage depths up to 82,5 m when using ordinary stockless anchors: :

Chain cable grade	Z_{cont1} (N)
U1	$37,5d$ c 2
U2	$42,5d$ c 2
U3	47,5d _c ²

(ii) for specified design anchorage depths greater than 82,5 m a continuous duty pull Z_{cont2} is:

$$Z_{\text{cont2}} = Z_{\text{cont1}} + (D_{\text{a}} - 82, 5) 0,27 d_{\text{c}}^2 \text{N}$$

Volume 1, Part 3, Chapter 5

where

 $d_{\rm C}$ = is the chain diameter, in mm

 D_a = is the specified design anchorage depth, in metres

The anchor masses are assumed to be the masses as given in Table 5.6.1 Equipment - Kedge anchors and wires, towlines and mooring lines. The value of Z_{cont} is based on the hoisting of one anchor at a time, and assumes that the effects of buoyancy and hawse pipe efficiency (assumed to be 70 per cent) have been accounted for. In general, stresses in each torque-transmitting component are not to exceed 40 per cent of yield strength (or 0,2 per cent proof stress) of the material under these loading conditions.

- (d) Overload Capability: The windlass prime mover is to be able to provide, for a period of at least two minutes, the necessary temporary overload capacity for breaking out the anchor. This temporary overload capacity is to be a pull equal to the greater of:
 - (i) short term pull:
 - 1,5 times the continuous duty pull as defined in Vol 1, Pt 3, Ch 5, 8.4 Windlass design 8.4.1.(c), or
 - (ii) anchor breakout pull:

$$12,18W_a + \frac{7,0L_c d_c^2}{100}$$
N

where:

 $L_{\rm C}=$ is the total length of chain cable on board, in metres, as given by *Table 5.4.1 Equipment - HHP Bower anchors and chain cables*

W =is the mass of bower anchor(kg) as given in *Table 5.4.1 Equipment - HHP Bower anchors and chain cables*.

Note The speed in this period may be lower than normal.

- (e) Hoisting Speed: The mean speed of the chain cable during hoisting of the anchor and cable is to be 0,15 m/s.
- (f) Brake Capacity: The capacity of the windlass brake is to be sufficient to stop the anchor and chain cable when paying out the chain cable in a controlled manner. Where a chain cable stopper is not fitted, the brake is to produce a torque capable of withstanding a pull equal to 80 per cent of the specified minimum breaking strength of the chain cable without any permanent deformation of strength members and without brake slip. Where a chain cable stopper is fitted, 45 per cent of the breaking strength may instead be applied. The following simplified formula is to be used to calculate the required brake capacity:

$$K_{\rm b}d_{\rm c}^{2}(44-0.08d_{\rm c})$$
 N

where K_b is given in Table 5.8.1 Values of K_b .

Table 5.8.1 Values of K_b

	$\kappa_{ ext{b}}$			
Cable grade	Windlass used in conjunction with chain stopper	Chain stopper not fitted		
U1	4,41	7,85		
U2	6,18	11,0		
U3	8,83	15,7		

- 8.4.2 As an alternative to conducting the engineering analyses required by *Vol 1, Pt 3, Ch 5, 8.4 Windlass design 8.4.1*, approval of the windlass mechanical design can be based on a type test, in which case the testing procedure is to be submitted for consideration.
- 8.4.3 Calculations for torque transmitting components are to be based on 1500 hours of operation with a nominal load spectrum factor of $K_{\rm m}$ = 1,0. Alternatively unlimited hours with a nominal load spectrum factor of $K_{\rm m}$ = 0,8 can be applied.
- 8.4.4 The following criteria are to be used for gearing design:
- (a) Torque is to be based on the performance criteria specified in Vol 1, Pt 3, Ch 5, 8.4 Windlass design 8.4.1.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and **Docking**

Volume 1, Part 3, Chapter 5

- The use of an equivalent torque, T_{eq} , for dynamic strength calculations is acceptable but the derivation is to be submitted to LR for consideration.
- The application factor for dynamic strength calculation, K_A , is to be 1,15.
- (d) Calculations are to be based on 1500 hours of operation.
- The static torque is to be 1,5 x T_n where T_n is the nominal torque.
- The minimum factors of safety for load capacity of spur and helical gears, as derived using ISO 6336 or a relevant National or International standard acceptable to LR, are to be 1,5 for bending stress and 0,6 for contact stress.

Gears intended to transmit power greater than 100 kW are to be certified by LR, and the gears are to meet the requirements of Vol 2, Pt 3, Ch 1 Gearing.

8.5 Additional requirements for windlass design for naval ships

- Hand-operated windlasses are only acceptable if the effort required at the handle does not exceed 150N for raising one anchor at a speed of not less than 2 m/min and making about thirty turns of the handle per minute.
- 8.5.2 Windlasses suitable for operation by hand as well as by external power are to be so constructed that the power drive cannot activate the hand drive.
- Where a chain stopper is fitted, the windlass braking system is only to ensure safe stopping when paying out the anchor and chain. It is the Master's responsibility to ensure that the chain stopper is in use when riding at anchor. At clearly visible locations on the bridge and adjacent to the windlass control position, the following notice is to be displayed:

"The brake is rated to permit controlled descent of the anchor and chain only. The chain stopper is to be used at all times whilst riding at anchor"

8.6 **Hydraulic systems**

8.6.1 Hydraulic systems, where employed for driving windlasses, are to comply with the requirements of Vol 2, Pt 7, Ch 5, 11 Hydraulic power actuating systems.

8.7 **Electrical systems**

- Electric motors are to meet the requirements of Vol 2, Pt 9, Ch 3, 6 Rotating machines general requirements and motors. Motors exposed to weather are to have enclosures suitable for their location, see also Vol 2, Pt 9, Ch 1, 2.2 Design, construction and location 2.2.10.
- Motor branch circuits are to be protected in accordance with the applicable Rules, and cable sizing is to be in accordance with the requirements of the Vol 2, Pt 9, Ch 3, 8 Electric cables, optical fibre cables and busbar trunking systems (busways).

8.8 **Control arrangements**

- All control devices are to be capable of being controlled from readily accessible positions and protected against 8.8.1 unintentional operation.
- 8.8.2 The maximum travel of the levers is not to exceed 600 mm if movable in one direction only, or 300 mm to either side from a central position if movable in both directions.
- Wherever practical, the lever is to move in the direction of the intended movement. If this cannot be achieved, it is to move towards the right when hauling and towards the left when paying out.
- For lever-operated brakes, the brake is to engage when the lever is pulled and disengage when the lever is pushed. The physical effort on the brake for the operator is not to exceed 160 N.
- 8.8.5 For pedal-operated brakes, the maximum travel is not to exceed 250 mm and the physical effort for the operator is not to exceed 320 N.
- 8.8.6 The handwheel or crankhandle is to actuate the brake when turned clockwise and release it when turned counterclockwise. The physical effort for the operator is not to exceed 250 N for speed regulation and 500 N at any moment.
- When not provided with automatic sequential control, separate push-buttons are to be provided for each direction of 8.8.7 operation.

Volume 1, Part 3, Chapter 5

- 8.8.8 The push-buttons are to actuate the machinery when depressed and stop and effectively brake the machinery when released.
- 8.8.9 The above mentioned individual push-buttons may be replaced by two 'start' and 'stop' push-buttons.
- 8.8.10 Control systems for windlasses are to comply with the requirements of Vol 2, Pt 9, Ch 8, 5 Programmable electronic systems (PES).
- 8.8.11 Windlass motors are to be protected against overload, overspeed and overpressure, using appropriate safety techniques suitable for the intended installation.

8.9 Protection arrangements

- 8.9.1 Where applicable, moving parts of windlass machinery are to be provided with suitable railings and/or guards to prevent injury to personnel.
- 8.9.2 Protection is to be provided for preventing persons from coming into contact with surfaces having temperatures over 50°C.
- 8.9.3 Steel surfaces not protected by lubricant are to be protected by a coating, in accordance with the requirements of a relevant National or International Standard acceptable to LR.
- 8.9.4 For arrangements of power transmission systems and relief requirements, see Vol 2, Pt 7, Ch 5, 11.1 General 11.1.2.
- 8.9.5 Electrical cables installed in exposed locations on open deck are to be provided with effective mechanical protection.
- 8.9.6 Means are to be provided to contain potential debris resulting from severe damage of the prime mover due to overspeed in the event of uncontrolled rendering of the cable, particularly when an axial piston type hydraulic motor forms the prime mover.
- 8.9.7 An arrangement to release the anchor and chain in the event of windlass power failure is to be provided. Windlasses are to be fitted with couplings which are capable of disengaging between the cable lifter and the drive shaft. Hydraulically or electrically operated couplings are to be capable of being disengaged manually.
- 8.9.8 The design of the windlass is to be such that the following requirements or equivalent arrangements will minimise the probability of the chain locker or forecastle being flooded in bad weather:
- (a) a weathertight connection can be made between the windlass bedplate, or its equivalent, and the upper end of the chain pipe by means of a cover or seal, and
- (b) access to the chain pipe is adequate to permit the fitting of a cover or seal, of sufficient strength and proper design, over the chain pipe while the ship is at sea.

8.10 Shop inspection and testing

- 8.10.1 Windlasses are to be inspected during fabrication at the manufacturers' facilities by a Surveyor for conformance with the approved plans. Acceptance tests, as specified in the specified Standard (see *Vol 1, Pt 3, Ch 5, 8.1 General 8.1.2*), are to be witnessed by the Surveyor and include the following tests, as a minimum:
- (a) No-load test. The windlass is to be run without load at nominal speed in each direction for a total of 30 minutes. If the windlass is provided with a gear change, an additional run in each direction for 5 minutes at each gear change is required.
- (b) Load test. The windlass is to be tested to verify that the continuous duty pull, overload capacity and hoisting speed as specified in *Vol 1, Pt 3, Ch 5, 8.4 Windlass design 8.4.1* can be achieved.
 - Where the manufacturer's works does not have adequate facilities, these tests, including the adjustment of the overload protection, can be carried out on board ship. In these cases, functional testing in the manufacturer's works is to be performed under no-load conditions.
- (c) Brake capacity test. The holding power of the brake is to be verified through testing if not verified by calculation.
- 8.10.2 Windlass performance characteristics specified in *Vol 1, Pt 3, Ch 5, 8.10 Shop inspection and testing 8.10.1* are based on the following assumptions:
- (a) one cable lifter only is connected to the drive shaft;
- (b) continuous duty and short term pulls are measured at the cable lifter;
- (c) hawse pipe efficiency assumed to be 70 per cent.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and **Docking**

Volume 1, Part 3, Chapter 5

8.11 **On-board testing**

- 8.11.1 Each windlass is to be tested under working conditions after installation on board to demonstrate satisfactory operation. Each unit is to be independently tested for braking, clutch functioning, lowering and hoisting of the chain cable and anchor, proper riding of the chain over the cable lifter, proper transit of the chain through the hawse pipe and the chain pipe, and effecting proper stowage of the chain and the anchor. It is to be confirmed that anchors properly seat in the stored position and that chain stoppers function as designed, if fitted. The braking capacity is to be tested by intermittently paying out and holding the chain cable by means of the application of the brake.
- The mean hoisting speed, as specified in Vol 1, Pt 3, Ch 5, 8.4 Windlass design 8.4.1.(e) is to be measured and verified. For testing purposes, the speed is to be measured over two shots of chain cable and initially with at least three shots of chain (82.5 m or 45 fathoms in length) and the anchor submerged and hanging free.
- Load testing is to be carried out if this was not previously completed as required by Vol 1, Pt 3, Ch 5, 8.10 Shop inspection and testing 8.10.1.(b).
- 8.11.4 Where the depth of water in the trial area is inadequate, suitable equivalent simulating conditions will be considered as an alternative.

8.12 Marking and identification

- 8.12.1 The windlass is to be permanently marked with the following information:
- The size designation of the windlass (e.g. 100/3/45, where 100 is the nominal diameter of the chain cable in mm, 3 is the numeral in the chain cable steel grade U3, and 45 refers to the holding load expressed as a percentage of the chain cable breaking load).
- (b) Maximum anchorage depth, in metres.

8.13 Seatings

The windlass is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass is to 8 13 1 be increased, and the supporting structure for the anchor windlass should be examined for the brake holding loads specified by Vol 1, Pt 3, Ch 5, 8.4 Windlass design. The allowable stresses specified in Table 5.5.1 Allowable stresses in windlass and chain stopper supporting structure are to be used to derive the net scantlings of the supporting structure. The capability of the supporting structure to withstand buckling is also to be assessed. The structural design integrity of the bedplate is the responsibility of the Builder and windlass manufacturer.

Structural requirements for windlasses on exposed fore decks 8.14

- Windlasses located on the exposed deck over the forward 0,25L_R of the Rule length, of naval ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0,1L_R or 22 m above the summer load waterline, whichever is the lesser, are to comply with the following requirements. Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.
- 8.14.2 The following pressures and associated areas are to be applied, see Figure 5.8.1 Windlass loading:
- 200 kN/m² normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction;
- 150 kN/m² parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of f times the projected area in this direction;

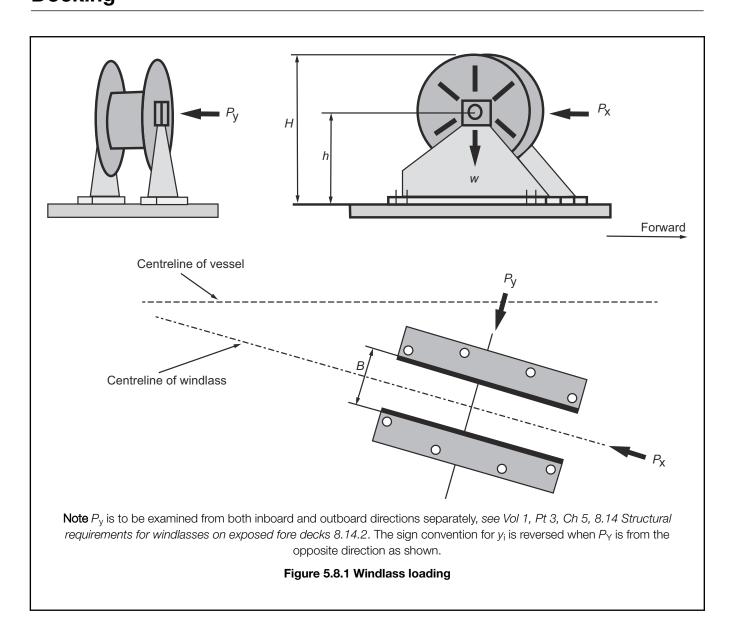

where

f = 1 + B/H, but not greater than 2,5

B =width of windlass measured parallel to the shaft axis, in metres

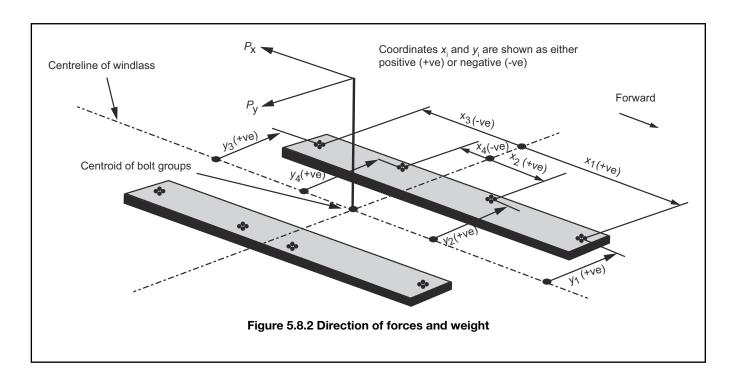

H = overall height of windlass, in metres.

Volume 1, Part 3, Chapter 5 Section 8

8.14.3 Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by N bolt groups, each containing one or more bolts, see *Figure 5.8.2 Direction of forces and weight*.

Volume 1, Part 3, Chapter 5 Section 8

8.14.4 The axial force R_i in bolt group (or bolt) i, positive in tension, may be calculated from:

 $R_{xi} = P_x h x_i A_i / I_x in kN$

 $R_{vi} = P_v h y_i A_i / I_v in kN, and$

 $R_i = R_{xi} + R_{vi} - R_{si}$ in kN

where

 P_{x} = force acting normal to the shaft axis, in kN

 P_y = force acting parallel to the shaft axis, either inboard or outboard whichever gives the greater force in bolt group

h =shaft height above the windlass mounting, in cm

 x_i , $y_i = x$ and y coordinates of bolt group i from the centroid of all N bolt groups, positive in the direction opposite to that of the applied force, in cm

 A_i = cross-sectional area of all bolts in group i, in cm²

 $I_x = \sum A_i x_i^2$ for N bolt groups, in cm⁴

 $I_y = \sum A_i y_i^2$ for N bolt groups, in cm⁴

 $R_{\rm Si} = {
m static}$ reaction at bolt group i, due to weight of windlass, in kN.

8.14.5 Shear forces F_{xi} , F_{yi} applied to the bolt group i, and the resultant combined force F_i may be calculated from:

$$F_{xi} = (P_x - \mu g M) / N \text{ in kN}$$

$$F_{vi} = (P_{v} - \mu g M) / N \text{ in kN}$$

and

$$F_{i} = \sqrt{(F_{xi}^{2} + F_{vi}^{2})} \text{ kN}$$

Volume 1, Part 3, Chapter 5

where

 μ = coefficient of friction (0,5)

M = mass of windlass, in tonnes

 $g = \text{gravity acceleration (9,81 m/sec}^2)$

N = number of bolt groups.

- 8.14.6 Tensile axial stresses in the individual bolts in each bolt group i are to be calculated. The horizontal forces Fxi and Fyi are normally to be reacted by shear chocks. Where 'fitted' bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses in the individual bolts are to be calculated, and compared to the stress under proof load. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations.
- 8.14.7 The safety factor against bolt proof strength is to be not less than 2,0.
- 8.14.8 Bolts are to be of ISO 898/1 material Grade 8.8, 10.9 or 12.9 or equivalent and are to be pretensioned by controlled means to 70 to 90 per cent of their yield stress. Pretensioning is to be in accordance with the manufacturer's instructions and, in general, pretensioning by bolt torqueing up to bolt size M30 may be used. Beyond this, pretensioning is to be carried out by an hydraulic tensioning device and the elongation of the bolts measured to determine pre-load. Where resin chocks are proposed, plans and calculations are to be submitted for consideration.
- The windlass is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass is to be increased. Adequate stiffening of the deck in way of the windlass is to be provided. The scantlings of the supporting structure and deck are to be determined by additional calculations applying the weight of the windlass combined with the resultant force on the seat due to the application of the following design loads:
- P_x (as defined in Vol 1, Pt 3, Ch 5, 8.14 Structural requirements for windlasses on exposed fore decks 8.14.4);
- $P_{\rm x}$ and $P_{\rm y}$ combined;

The allowable stresses specified in Pt 3, Ch 13, 8.12 Structural requirements associated with anchoring 8.12.2 are to be used to derive the net scantlings of the supporting structure. The capability of the supporting structure to withstand buckling is also to be assessed.

8.14.10 The axial tensile and compressive forces in Vol 1, Pt 3, Ch 5, 8.14 Structural requirements for windlasses on exposed fore decks 8.14.4 and the lateral forces in Vol 1, Pt 3, Ch 5, 8.14 Structural requirements for windlasses on exposed fore decks 8.14.5 are also to be considered in the design of the supporting structure.

Section 9

Structural details

9.1 Bulbous bow and wave piercing bow arrangements

The shell plating is to be increased in thickness at the fore end of the bulb and in other areas likely to be damaged by the anchors and chain cables. The increased plate thickness is to be the same as that required for plated stems by Vol 1, Pt 6 Hull Construction in Steel.

9.2 Hawse pipes and anchor recesses

- Hawse pipes, bow rollers and other deck gear, of adequate size and construction, are to be provided for handling and securing the anchors and are to be efficiently attached to the structure and arranged to give an easy lead to the cable.
- The hawse pipes are to be of sufficient size and thickness with a minimum diameter not less than 12 times the diameter of the chain cable. The arrangement is to give an easy lead for the cable to the windlass.
- Hawse pipes and anchor pockets are to be of ample thickness and of a suitable size and form to house the anchors efficiently, preventing, as much as practicable, slackening of the cable or movements of the anchor being caused by wave action. The shell plating and framing in way of the hawse pipes are to be reinforced as necessary, see Vol 1, Pt 3, Ch 5, 9.4 Local reinforcement 9.4.1. Substantial chafing lips are to be provided at shell and deck. These are to have sufficiently large, radiused

Volume 1, Part 3, Chapter 5

faces to minimise the probability of cable links being subjected to high bending stresses. Alternatively, roller fairleads of suitable design may be fitted. Where unpocketed rollers are used, it is recommended that the roller diameter be not less than eleven times the chain diameter. Where hawse pipes are not fitted, alternative arrangements will be specially considered.

924 The lines of the bow are to be taken into consideration when siting the anchor recesses for conventional bower anchors. Sufficient clearance of the flukes from the hull is to be maintained over the whole of the anchor run, above and below the water, considering the flukes in the most critical position. If a bow sonar dome is fitted, consideration is to be given to the positioning of the anchor recesses to reduce the possibility of the anchor chain rubbing on the dome when the anchor is in the deployed position.

9.3 **Spurling pipes**

Satisfactory means are to be provided to prevent inadvertent flooding of chain lockers. 9.3.1

9.4 Local reinforcement

The thickness of shell plating determined in accordance with the Rule requirements is to be increased locally by not less 9.4.1 than 50 per cent in way of hawse pipes.

Section 10

Anchoring equipment in deep and unsheltered water

10.1

- 10.1.1 It is recommended that the equipment requirements specified in this Section are complied with if the vessel intends to anchor in deep and unsheltered waters. Where a ship's anchoring equipment complies with the requirements of this Section, the ship will be eligible to be assigned the notation **DWA**.
- The equipment specified is for ships intended to anchor in water with depth up to 120 m, current with speed up to 1,54 m/s, wind with speed up to 14 m/s and waves with significant height of up to 3 m. The scope of chain cable, being the ratio between the length of chain paid out and water depth, is assumed to be not less than 3 to 4. These requirements are applicable only to ships with a Rule length $L_{\rm R}$ of not less than 135 m.
- 10.1.3 The requirements specified in other Sections of this Chapter need to be complied with unless alternative requirements are provided.

10.2 Anchor and chain cable

Anchors and chain cables to be in accordance with Table 5.10.1 Anchoring equipment for ships in unsheltered water with depth up to 120 m and based on the Equipment Number EN₁ obtained from the following equation.

$$EN_1 = 0.628 \left[a \left(\frac{EN}{0.628} \right)^{1/2}, 3 + b(1-a) \right]^{2.3}$$

$$a = 1.83 \times 10^{-9} \times L_{R}^{3} + 2.09 \times 10^{-6} \times L_{R}^{2} - 6.21 \times 10^{-4} L_{R} + 0.0866$$

$$b = 0.156 \times L_{\mathbf{R}} + 8.372$$

L_R = Rule length, in metres, see Vol 1, Pt 3, Ch 1, 5.2 Principal particulars 5.2.2

EN = Equipment Number calculated in accordance with Vol 1, Pt 3, Ch 5, 2.1 Equipment Number calculation

- 10.2.2 The bower anchors are to be connected to their chain cables and positioned on board ready for use.
- Anchors are to be of the stockless High Holding Power (HHP) type. The mass of the head of a stockless anchor, including pins and fittings, is to be not less than 60 per cent of the total mass of the anchor.

Volume 1, Part 3, Chapter 5

Section 10

- 10.2.4 The mass, per anchor, of bower anchors given in *Table 5.10.1 Anchoring equipment for ships in unsheltered water with depth up to 120 m* is for anchors of equal mass. The mass of individual anchors may vary to 7 per cent of the tabular mass, but the total mass of anchors is not be less than that specified for anchors of equal mass.
- 10.2.5 Bower anchors are to be associated with stud link chain cables of special (U2) or extra special (U3) quality. The total length of chain cable, as given in *Table 5.10.1 Anchoring equipment for ships in unsheltered water with depth up to 120 m* is to be approximately divided between the two bower anchors.

10.3 Anchor windlass and chain stopper

10.3.1 Notwithstanding the requirements according to *Vol 1, Pt 3, Ch 5, 8.4 Windlass design 8.4.1*, the windlass unit prime mover is to be able to supply for at least 30 minutes a continuous duty pull Z_{cont} , in N, given by:

$$Z_{\text{cont}} = 35 d^2 + 13.4 m_{\text{A}}$$

where

- d = chain diameter, in mm, as per Table 5.10.1 Anchoring equipment for ships in unsheltered water with depth up to 120 m
- m_A = HHP anchor mass, in kg, as per *Table 5.10.1 Anchoring equipment for ships in unsheltered water with depth* up to 120 m
- 10.3.2 The windlass is to have sufficient power to exert, over a period of at least two minutes, a pull equal to the greater of:
- (a) short term pull:
 - 1,5 times the continuous duty pull as defined in Vol 1, Pt 3, Ch 5, 10.3 Anchor windlass and chain stopper 10.3.1
- (b) anchor breakout pull:

12,18
$$m_{\rm A} + \frac{7.0L_{\rm c}d^2}{100}N$$

where

- L_c = is the total length of chain cable on board, in metres, as given by Table 5.10.1 Anchoring equipment for ships in unsheltered water with depth up to 120 m
- m_A = is the mass of HHP bower anchor (kg) as given in *Table 5.10.1 Anchoring equipment for ships in unsheltered* water with depth up to 120 m
 - d = chain diameter, in mm, as per Table 5.10.1 Anchoring equipment for ships in unsheltered water with depth up to 120 m
- 10.3.3 The capacity of the windlass brake is to be sufficient to stop the anchor and chain cable when paying out the chain cable. Where a chain cable stopper is not fitted, the brake is to produce a torque capable of withstanding a pull equal to 80 per cent of the specified minimum breaking strength of the chain cable without any permanent deformation of strength members and without brake slip. Where a chain cable stopper is fitted, 45 per cent of the breaking strength is to be applied instead.
- 10.3.4 In addition to the requirements of *Vol 1, Pt 3, Ch 5, 8.11 On-board testing 8.11.2*, as far as practicable, for testing purposes the speed of the chain cable during hoisting of the anchor and cable should be measured over 37,5 m of chain cable and initially with at least 120 m of chain with the anchor submerged and hanging free. The mean speed of the chain cable during hoisting of the anchor from the depth of 120 m to the depth of 82,5 m should be at least 4,5 /min.
- 10.3.5 The chain cable stopper, if fitted, along with its attachments is to be designed to withstand, without any permanent deformation, 80 per cent of the specified minimum breaking strength of the chain cable.

■ Section 11

Launch and recovery, berthing and dry-docking arrangements

11.1 Berthing loads

11.1.1 To resist loads imposed by tugs and berthing operations all structure within a 1,0 m strip centred 1,0 m above the deep waterline. It should be able to withstand the following pressure $P_{\rm h}$:

$$= P_b = \left(\frac{g\Delta}{800}\right) kN/m$$

where

 Δ = deep displacement, in tonnes.

- 11.1.2 If $L_R > 200$ m, or the ship is able to have significantly different loading conditions, the strip is to be taken from 1,5 m above the light waterline to 2,5 m above the deep waterline.
- 11.1.3 Ships with markings to indicate location of internal structure designed specifically for berthing purposes will be specially considered.

11.2 Dry-docking arrangements

11.2.1 Dry-docking arrangements are not explicitly covered in the Rules, see Vol 1, Pt 3, Ch 1, 4.1 Submission of plans and data. These requirements are intended to address the loads imposed on the vessel during dry-docking.

11.3 Dry-docking plan

- 11.3.1 In accordance with *Vol 1, Pt 6, Ch 1, 2.2 Plans to be submitted 2.2.6* a dry-docking plan is to be submitted as a supporting document. Consideration should be given throughout the design of a vessel to producing a dry-docking plan. The dry-docking plan should include, but not be limited to, the following information:
- The permissible locations of dock furniture;
- Maintenance and withdrawal envelopes;
- The arrangement of underwater fittings and openings.

The dry-docking plan should take into account multiple likely docking arrangements for maintenance and through-life support.

11.4 Dry-docking loads

- 11.4.1 Dry-docking a ship on blocks potentially imposes high vertical loads on the keel. For ships where the Rule length, $L_{\rm R}$, exceeds 50 m, the strength of the keel and bottom structure is to be assessed.
- 11.4.2 Methods, other than those described here, for demonstrating that the strength of the keel and bottom structure is sufficient to withstand the loads imposed by dry-docking may be considered. Such methods are to be agreed with LR prior to the analysis being conducted.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

11.4.3 For each dry-docking arrangement the stress and buckling behaviour of the bottom structure in way of the proposed dock blocks is to be assessed. The acceptance criteria given in Table 5.11.1 Acceptance criteria are not to be exceeded.

Table 5.11.1 Acceptance criteria

Structural Item	Allowable stres	Minimum Buckling factor		
	σ_{e}	τ	λ	
Double bottom girders	0,75 σ _L	0,35 σ _ο	1,2	
Double bottom floors	0,75 σ _L 0,35 σ _o		1,1	

Symbols

 σ_0 = specified minimum yield stress of material. σ_0 for steels having a yield stress above 355 N/mm² will be specially considered

$$\sigma_L = \frac{235}{k_I} \text{ N/mm}^2$$

 λ = factor against elastic buckling

$$\sigma_{\Theta}$$
 = von Mises equivalent stress = $\sqrt{\frac{\sigma_{x}^{2} + \sigma_{y}^{2} - \sigma_{y}^{\sigma}}{x^{2} + 3\tau_{xy}^{2}}}$

Note In areas where the openings have not been modelled, the resulting shear stress and Von Mises stress is to be corrected according to the ratio of the actual to the modelled shear area. If the resulting stress levels exceed 90% of the specified allowable values, further study by means of fine mesh follow up models may be required. Von Mises stresses are to be recalculated on the basis of the corrected shear stresses.

- Where it is anticipated that there will be more than one typical dry-docking loading condition, the bottom structure is to be assessed for a representative number of loading conditions.
- It is recommended that the block load distribution be derived by direct calculation using a full ship finite element model, constructed generally in accordance with the ShipRight SDA procedure for passenger ships. Where the dry-docking load distribution, F DI, as defined in Vol 1, Pt 3, Ch 5, 11.4 Dry-docking loads 11.4.6 becomes negative at any point, the block load distribution is to be derived by such direct calculations. The model is to be supported on grounded spring elements representing the proposed dry-docking arrangements. The spring element stiffness in the model should be representative of the combined block and capping stiffness. A sensitivity assessment should be carried out to ascertain the structural response to the spring constant used.
- 11.4.6 The following equation may be used to calculate the dry-docking load distribution, F DL, between main transverse bulkheads acting on a keel block:

$$F_{\rm DL} = \frac{W_{\rm c}f_{\rm bhd}}{(n-1)L_{\rm kb}} + W_{\rm oh} \text{ kN/m}$$

where

 F_{DL} = dry-docking load distribution acting on a keel block, in kN/m

 $W_{\rm c}$ = section weight between main transverse bulkheads, in kN

 $f_{bhd} = 0.5$, for the keel blocks located adjacent to a main transverse bulkhead

= 1, elsewhere

n = number of keel blocks between main transverse bulkheads

 $L_{\rm kb}$ = nominal keel block length, in metres

W oh = weight increase per unit length due to an overhang, if applicable, see Vol 1, Pt 3, Ch 5, 11.4 Drydocking loads 11.4.8.

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and **Docking**

Volume 1, Part 3, Chapter 5

11.4.7 For ships with an after end cut-up or significant rake of stem where there is considerable overhang, it may be assumed that the increase in load due to the overhang will extend a distance equal to twice the length of the overhang and will be distributed parabolically, see Figure 5.11.1 Calculation of dock block loads in way of the after cut-up.

The increase in weight per unit length to be added due to an overhang, see Vol 1, Pt 3, Ch 5, 11.4 Dry-docking loads 11.4.6, is to be determined from the following equation:

$$W_{\text{oh}} = \frac{W_{\text{o}} K_{\text{dl}}}{L_{\text{o}}} kN/m$$

217 LLOYD'S REGISTER

Anchoring, Mooring, Towing, Berthing, Launching, Recovery and Docking

Volume 1, Part 3, Chapter 5

Section 1:

= where

 W_{oh} = additional weight per unit length due to overhang, in kN/m

 W_0 = weight of overhang in kN

$$k_{\text{cll}} = \left(1, 5 + 2, 25 \frac{L_G}{L_o}\right) \left(\frac{X}{L_o}\right)^2 - \left(4, 5 + 6 \frac{L_G}{L_o}\right) \left(\frac{X}{L_o}\right) + 3 \frac{L_G}{L_o} + 3$$

x = distance from the overhang, measured in metres from the mid-point of the last keel block

 L_{o} = length of overhang, in metres

L_G = horizontal distance measured from the mid-point of the last keel block to the centre of gravity of the overhang, in metres.

11.4.9 When an overlap of the forward and aft overhang correction curves occurs, both curves are to be included. This will increase the possibility that blocks amidships will become unloaded, see Vol 1, Pt 3, Ch 5, 11.4 Dry-docking loads 11.4.5.

11.5 Launching loads

- 11.5.1 The launching loads are to be checked by the shipbuilder using conventional analytical methods appropriate to the method of launch. If via a slipway, the structure in way of the fore poppet should be suitable for the high loads that will be transmitted in this area. If adequate structure is not available, temporary stiffening is to be arranged.
- 11.5.2 The global strength of the hull girder is to be adequate under the loads imposed by launching, in particular for NS1 ships.

Structural Procedures for the Design, Volume 1, Part 3, Chapter 6 Construction and Lifetime Care of Ships

Section

- 1 General
- 2 Structural Design Assessment
- **Fatigue Design Assessment**
- 4 Construction Monitoring
- 5 Ship Event Analysis
- 6 Protective Coatings
- 7 Hull Condition Monitoring
- 8 Ship Emergency Response Service

■ Section 1

General

1.1 Application

1.1.1 This Chapter is applicable to all ship types and components and the requirements are to be applied in conjunction with the relevant Chapters of Vol 1, Pt 6 Hull Construction in Steel

1.2 Classification notations

1.2.1 In addition to the hull class notations defined in *Vol 1, Pt 1, Ch 2 Classification Regulations*, ships complying with the requirements of this Chapter will be eligible to be assigned the additional optional class notations defined in *Vol 1, Pt 1, Ch 2 Classification Regulations*.

1.3 Information and plans required to be submitted

1.3.1 The information and plans required to be submitted are as specified in *Vol 1, Pt 6, Ch 1, 2.2 Plans to be submitted*, applicable to the particular ship type and in this Chapter where related to particular items and notations.

■ Section 2

Structural Design Assessment

2.1 Structural Design Assessment notation – SDA

2.1.1 Where scantlings are primarily examined using finite element methods for both the overall and detailed structural capability of the ship using Lloyd's Register (hereinafter referred to as 'LR') approved procedures, the notation **SDA** (Structural Design Assessment) may be assigned and will be entered in the *Register Book*.

■ Section 3

Fatigue Design Assessment

3.1 Fatigue Design Assessment notation – FDA

3.1.1 Where the fatigue capability of the ship has been assessed using LR approved procedures, the notation **FDA** (Fatigue Design Assessment) may be assigned and will be entered in the *Register Book*.

Rules and Regulations for the Classification of Naval Ships, January 2022

Structural Procedures for the Design, Volume 1, Part 3, Chapter 6 Construction and Lifetime Care of Ships

■ Section 4

Construction Monitoring

4.1 Construction Monitoring notation – CM

- 4.1.1 The Construction Monitoring (**CM**) notation may be assigned if extended controls on structural alignment, fit-up and workmanship standards are applied to critical areas, as identified during the design of the ship. Construction Monitoring is applied primarily to verify the quality of workmanship required to improve the fatigue resistance of critical details, though other construction quality requirements can be specified in the CM plan.
- 4.1.2 The fatigue life of structural details can be adversely affected by a variety of factors, including workmanship defects. Criteria for workmanship defects can be considered in the CM plan. The most common factors that impact on fatigue are:
- (a) Misalignment of structural members; i.e. poor fit-up;
- (b) Welding defects;
- (c) Materials defects;
- (d) Stress concentrations resulting from incorrect geometry of structure, inadequate plate edge finish or generally poor manufacturing;
- (e) Erroneous cut-outs due to inappropriate routing of systems;
- (f) Discontinuity of structural members.

4.2 Identification of critical areas

- 4.2.1 A critical area is generally a structurally significant item or structural joint that has been subjected to an enhanced calculation or assessment. As a consequence, the performance of the item or joint will be influenced by the workmanship and fitup in the building yard. In some areas, where there are high cyclic stresses, an enhanced workmanship and alignment standard is required in order to achieve the specified design hull fatigue life.
- 4.2.2 Critical areas will be identified by LR from the following assessments:
- (a) Structural Design Assessment (SDA), specified in Vol 1, Pt 3, Ch 6, 2 Structural Design Assessment;
- (b) Fatique Design Assessment (FDA), specified in Vol 1, Pt 3, Ch 6, 3 Fatique Design Assessment.

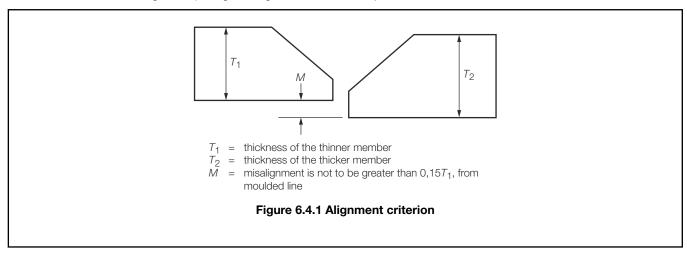

The **CM** notation is mandatory if the **SDA** or **FDA** notations are applied.

- 4.2.3 Critical areas may also be identified by LR from one of the following optional assessments. In general, these will be associated with reinforcement and alignment of specific critical joints; they will not be associated with general deformation criteria:
- (a) Extreme Strength Assessment (ESA), specified in Vol 1, Pt 6, Ch 4, 3 Extreme Strength Assessment, ESA;
- (b) Residual Strength Assessment (RSA), specified in Vol 1, Pt 6, Ch 4, 4 Residual Strength Assessment, RSA;
- (c) Whipping Assessment (WH), specified in Vol 1, Pt 4, Ch 2, 6 Whipping.
- 4.2.4 In addition, critical areas may be identified by the designer, Naval Administration or Owner from one of the following:
- (a) Known areas of high stress identified by structural engineers;
- (b) Areas that have experienced failure on similar ships in service;
- (c) Structures with specific alignment requirements; e.g. masts, shaft brackets.
- 4.2.5 The critical areas, locations and assessment criteria are to be detailed in the Construction Monitoring plan. The plan should also contain templates to be used to record specific alignment requirements. The CM plan may be supported by a high-stress key plan identifying critical regions on the ship.
- 4.2.6 Development of the CM plan is the responsibility of the designer; LR will identify the critical locations to be subjected to monitoring, following appraisal of the assessments identified in *Vol 1, Pt 3, Ch 6, 4.2 Identification of critical areas 4.2.2* and *Vol 1, Pt 3, Ch 6, 4.2 Identification of critical areas 4.2.3* above. In general, areas with stress ranges greater than σ_{ws} , see *Vol 1, Pt 6, Ch 4, 2.2 Bending strength 2.2.3*, and areas where general or detailed fatigue analysis has been undertaken will be listed in the appraisal documentation. LR may develop the CM plan on behalf of the designer, if so requested.
- 4.2.7 It is recommended that the areas for Construction Monitoring be identified and the criteria developed in a workshop with the Owner, Naval Administration, Builder and LR.

Structural Procedures for the Design, Volume 1, Part 3, Chapter 6 Construction and Lifetime Care of Ships

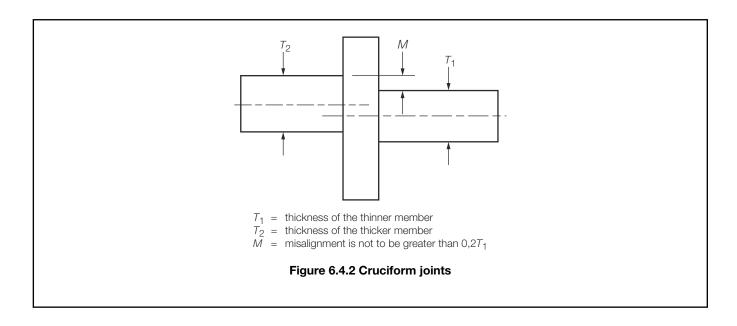

4.3 Construction monitoring criteria

- 4.3.1 Critical areas are to be assigned an alignment criterion, as given in *Vol 1, Pt 3, Ch 6, 4.3 Construction monitoring criteria 4.3.2*, based on the significance of the item and requirement from which it was derived. LR will review and agree the criterion assigned before construction commences.
- 4.3.2 **Normal alignment** is assigned to structure which requires an enhanced level of survey above the normal survey requirement but does not require enhanced levels of alignment above the agreed production standard, such as the Naval Survey Guidance for Steel Ships:
- (a) Structure will be inspected by the Builder, before welding, for compliance with the general shipbuilding tolerances laid down in the agreed production standard.
- (b) A representative sample of alignment measurements will be undertaken by LR during the survey to confirm compliance with the agreed production standard.
- (c) Where there are non-compliances, the relevant shipyard department will be requested by LR to undertake full measurements and to produce a report for review by LR which details the non-compliances.
- 4.3.3 **Enhanced alignment** is assigned where critical areas have enhanced alignment requirements to maintain structural performance:
- (a) The relevant shipyard department will be required to provide a report, based on templates in the CM plan, detailing the achieved alignment at each location.
- (b) LR will review the alignment report and request check measurements as necessary to confirm the results.
- (c) The maximum allowable misalignment between the interconnection of structural members is to be 15 per cent of the thinner of the members being connected. This alignment criterion is to be applied where longitudinally effective structure is butted; e.g. plating at ring butts, longitudinal butts, see Figure 6.4.1 Alignment criterion.
- (d) For all cruciform joints, the maximum allowable misalignment between the interconnection of structural members is to be 20 per cent of the thinner of the members being connected. This alignment criterion is to be applied where there is alignment through a thickness; e.g. intercostal longitudinal bulkheads through a transverse bulkhead, bilge keel plate alignment with internal structure through shell plating, see Figure 6.4.2 Cruciform joints.

Rules and Regulations for the Classification of Naval Ships, January $_{2022}$

Structural Procedures for the Design, Volume 1, Part 3, Chapter 6 Construction and Lifetime Care of Ships

- 4.3.4 **Specific alignment** is assigned where there are specific alignment criteria identified by the designer which need to be verified by LR:
- (a) the relevant shipyard department will be required to provide a report detailing the achieved alignment at each location;
- (b) LR will review the alignment report and request check measurements as necessary to confirm the results;
- (c) the alignment criteria and templates, where appropriate, are to be defined by the designer for each critical area defined.
- 4.3.5 **Close-up inspection** is assigned to structure which has no specific alignment requirement but requires an increased level of inspection; for example, to verify correct plate thickness or maximum permitted plate deformation. Close-up inspection may be required to verify a particular or unusual structural feature:
- (a) Structure will be subject to an enhanced close-up visual inspection by LR Surveyor(s).
- (b) Dry surveys should identify where units or compartments contain construction monitoring points. These are to be identified by the Builder as a specific witness point.
- 4.3.6 Non-destructive examination, in addition to the general levels of NDE required in *Vol 1, Pt 6, Ch 6 Material and Welding Requirements*, may be specified by the designer for critical areas, which LR will verify:
- (a) The relevant shipyard department will be required to undertake the additional NDE required at each location and record the results.
- (b) LR will review and audit the NDE measurements as necessary to confirm the results.

4.4 Construction Monitoring survey

- 4.4.1 Construction Monitoring is a process for monitoring workmanship standards and alignment in critical areas. It is the Builder's responsibility to carry out the necessary checks and document the results for relevant critical locations, irrespective of the Surveyor(s) attendance at hold points. Shipyard personnel are responsible for the inspection and recording of all CM requirements, in accordance with the approved CM plan.
- 4.4.2 LR will provide third party inspection to confirm that the critical areas to be covered by CM conform to the required/ agreed standards based on check inspections and audit activities. Where LR undertakes a CM inspection to verify the implementation of the CM plan, it will cover:
- (a) weld specification in terms of type, size and finish/treatment, including:
 - (i) fit-up and alignment before commencement of welding;
 - (ii) alignment after application of first root run;
 - (iii) back gouging;
 - (iv) final welding and alignment;
 - (v) stress relief grinding of weld profile (where required for enhanced fatigue performance);
- (b) the continuity of structural members, where required;

Rules and Regulations for the Classification of Naval Ships, January $_{2022}$

Structural Procedures for the Design, Volume 1, Part 3, Chapter 6 Construction and Lifetime Care of Ships

- (c) plate edge radius and roughness;
- (d) joints for radius and tapering;
- (e) openings and penetrations for radius corners.
- 4.4.3 LR will review all of the specific CM records, as defined in *Vol 1, Pt 3, Ch 6, 4.3 Construction monitoring criteria*, and in a few cases request that measurements be presented. It is not intended that the attending Surveyor(s) witness each stage of the fabrication process for every critical area, except during the early stages of construction whilst the process is being established.
- 4.4.4 CM activities will generally be undertaken in conjunction with routine dry surveys required for all construction units. A few specific CM items require measurement by the shipyard; these are described as Enhanced or Specific Alignment.
- 4.4.5 Non-compliances will not be permitted in the critical areas identified within the CM plan. Where defects are identified within defined critical sections, LR is to agree the remedial action to be taken with the Shipbuilder before rectification is commenced.
- 4.4.6 On satisfactory completion of all surveys and measurements, LR Surveyor(s) will recommend the assignment of the CM notation.

■ Section 5

Ship Event Analysis

5.1 Ship Event Analysis – Class notations SEA(HSS-n), SEA(VDR), SEA(VDR-n)

- 5.1.1 At the Owner's request, and in order to enhance safety and awareness on board during ship operation, provisions can be made for the following systems:
- (a) A hull surveillance system that monitors the hull girder stresses and motions of the ship and warns the ship's personnel that these levels or the frequency and magnitude of slamming motions are approaching a level where corrective action is advisable.
- (b) A voyage data recorder system that can record the ship's control, navigational, operational and hull response information. This information is recorded and stored in a protective containment unit to enable the analysis of any marine or other incidents.
- 5.1.2 Where a hull surveillance system is fitted the class notation **SEA(HSS-n)** will be assigned. Where a voyage data recorder system is fitted the class notation **SEA(VDR-n)** will be assigned. The extension **-n** signifies the number of fitted strain gauges connected to the system. The appropriate class notation(s) will be entered in column 6 of the *Register Book*, see also Vol 1, Pt 1, Ch 2, 3.9 Machinery and Engineering Systems notations 3.9.5 of the Rules for Ships.

■ Section 6

Protective Coatings

6.1 General

- 6.1.1 All salt-water spaces having boundaries formed by the hull envelope are to have a corrosion protection coating applied. See Vol 1, Pt 6, Ch 6, 3 Corrosion protection.
- 6.1.2 It is recommended that consideration also be given to the effective corrosion protection of other internal spaces by the use of a suitable protective coating system.

6.2 Protective Coating in Water Ballast Tanks – PCWBT notation

- 6.2.1 The 'Protective Coating in Water Ballast Tanks', notation, **PCWBT**, will be assigned to naval ships, at the Owner's request, when protective coating systems have been applied to water ballast tanks during construction, in accordance with the ShipRight Protective Coatings in Water Ballast Tanks (PCWBT) procedure.
- 6.2.2 The notation will continue to be assigned provided that the coatings remain efficient and are maintained in good condition; however, if the coatings have broken down, particularly at more critical areas, and no effort is being made to maintain

Rules and Regulations for the Classification of Naval Ships, January $_{2022}$

Structural Procedures for the Design, Volume 1, Part 3, Chapter 6 Construction and Lifetime Care of Ships

the coatings, then the notation will be placed in parentheses, i.e. (**PCWBT**), and the date of the last survey will be placed in parentheses after the notation.

6.3 Anti-Corrosion System ACS () notations

- 6.3.1 The Anti-Corrosion System notation, **ACS (B) and/or ACS(V)**, will be assigned to naval ships, at the Owner's request, when protective coating systems have been applied to water ballast tanks or void spaces during construction, in accordance with the *ShipRight Anti-Corrosion System Notations procedure*.
- 6.3.2 The notation will continue to be assigned provided that the coatings remain efficient and are maintained in good condition; however, if the coatings have broken down, particularly at more critical areas, and no effort is being made to maintain the coatings, then the notation will be placed in parentheses, i.e. (**ACS (B,V)**), and the date of the last survey will be placed in parentheses after the notation.
- 6.3.3 The **ACS (B)** notation also indicates that the protective coating systems for water ballast tanks has been applied in accordance with IMO regulations; however, it is only available to new-build ships. The **PCWBT** notation may be applied to existing ships when in compliance with the applicable ShipRight Procedure.

■ Section 7

Hull Condition Monitoring

7.1 Hull Condition Monitoring – HCM

- 7.1.1 Where an Owner adopts the LR Hull Condition Monitoring Scheme the notation **HCM**, 'Hull Condition Monitoring' will be entered in the *Register Book*.
- 7.1.2 This notation will indicate that a computer software system for on-board recording of ship surveys is available aboard ship.

Section 8

Ship Emergency Response Service

8.1 Ship Emergency Response Service - SERS

- 8.1.1 This service, offered by LR, provides a rapid computer assisted analysis of a damaged ship's stability and damaged longitudinal strength in the event of a casualty to the ship.
- 8.1.2 Where an Owner adopts this service, the notation **SERS**, 'Ship is registered with LR's Ship Emergency Response Service', will be entered in the *Register Book*.

Volume 1, Part 4, Chapter 1

Section 1

Section

- 1 General requirements
- 2 Survivability
- 3 Military distinction notations
- 4 Military design guidance
- 5 Military design requirements
- 6 Magazine design and construction requirements
- 7 Design guidance for nuclear, biological and chemical defence
- 8 Design guidance for the reduction of radiated noise underwater due to sea-inlets or other openings

■ Section 1

General requirements

1.1 General

- 1.1.1 This section is aimed primarily at assessing structure such that it can resist the military loads imposed upon it, however it is essential in naval ship design to consider the effects an item of equipment or structure can have on a variety of parameters. For example a winch support and mount may adequately resist the forces imposed upon it during normal operation and absorb shock loads but have an unacceptably high noise or radar signature.
- 1.1.2 Chapter 1 gives guidance on some of the additional issues that the designer must consider in the design of a naval ship. Whilst it does not always give the definitive answer on these topics, it will help identify the impact of structural design on the subject. An example is radar signature reduction. The guidance gives the geometric properties to avoid but it will not give detail on radar absorbent coatings.
- 1.1.3 Information is classified in two types. Firstly, design guidance for which further approval has to be sought once a suitable standard is specified, and secondly, design requirements which have to be met as part of the * 100A1 notation or a specific notation such as LA(N).

1.2 Plans

- 1.2.1 Plans are to be submitted showing the manner in which the requirements have been met and the location of the structure within the vessel for those features that have either a special notation or are required as part of the notation *** 100A1** or ship type.
- 1.2.2 Details on the loadings applied to individual items, and by these items to the support structure are to be included. In some cases stiffness requirements will also need to be included, e.g. mast mounted equipment.
- 1.2.3 Plans, and where requested, calculations are to be submitted for the following features and loadings as appropriate:
- Replenishment at sea arrangements.
- Aircraft and vehicle tie down arrangements.
- Movable decks, ramps and lifts.
- Masts and support arrangements.
- Towed array or towed body arrangement.
- Weapon recoil and thrust loadings.
- Blast and efflux loadings and pressure curves.
- Arcs of fire and blast or efflux impact zones for weapons.

1.2.4 Arrangements for the following features are to be included with the hull structural plans listed in *Vol 1, Pt 6, Ch 2, 2 Structural design*. In addition calculations are to be supplied where requested:

Volume 1, Part 4, Chapter 1

Section 1

- Vehicle decks.
- Helicopter decks.
- Berthing.
- Docking loads.
- Beach landing or grounding.
- Holding down arrangements.
- 1.2.5 Plans and supporting calculations should be submitted for the following notations:
- External blast (EB1, EB2, EB3, EB4).
- Internal blast (IB1, IB2).
- Fragmentation (FP1, FP2).
- Small arms protection (SP).
- Underwater explosion (Shock) (SH).
- Whipping (WH1, WH2, WH3).
- Residual strength (RSA1, RSA2, RSA3).

1.3 Signature

- 1.3.1 A naval vessel will generally require some form of signature control and the operational requirement will determine the extent to which this is necessary. Signature control can be achieved using a variety of methods both active and passive. This section deals with the passive methods that structure can influence.
- 1.3.2 With good structural design the signature of the vessel can be controlled to a certain degree with little cost. The methods listed in *Table 1.1.1 Ship signatures* can help achieve this.
- 1.3.3 It is beyond the scope of the Rules to provide further detail on signatures, however on request, Lloyd's Register (hereinafter referred to as 'LR') is able to provide information on suitable organisations who are able to give specialist advice as necessary.
- 1.3.4 Special features notations for signature control will not normally be assigned. Some of the above features will form part of the Naval Ship notation **8 100A1 NS** and are detailed in *Vol 1, Pt 4, Ch 1, 3 Military distinction notations*.

Table 1.1.1 Ship signatures

Signature	Simple methods of control using hull construction
Above water	
Visual	Camouflage paint
Infrared	Careful positioning of exhaust outlets
Radar cross-section	Structural shaping
Unintentional electro-magnetic emissions	Use of steel plating (Faraday cage)
Under water	
Self noise	Fairness of hull, low vibration
Radiated noise	Low vibration
Magnetic field	Non-ferrous materials Degaussing
Electric field	Attention to earth paths
Wake	Hull form, propeller design

Volume 1, Part 4, Chapter 1

Section 1

1.4 Materials and welding

- 1.4.1 In addition to the requirements of *Vol 1, Pt 6, Ch 2 Design Tools*, ships having the following military distinction notations are to comply with the requirements of this section for the designated areas unless specified otherwise. The requirements apply to plates, stiffeners, fillet welds, butt welds and welded attachments:
- EB1, EB2, EB3, EB4 Above water portion of the hull, superstructure and upper decks assessed against external blast requirements.
- **IB1, IB2** Blast bulkheads.
- SH Hull envelope plating.
- WH1, WH2, WH3 Shear strake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull
 inserts.
- RSA1, RSA2, RSA3 Shear strake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull
 inserts.
- 1.4.2 Crack arresting strakes of minimum Grade E are to be fitted in the following locations, from $0.2L_R$ to $0.8L_R$, according to the notation assigned:
- SH Shear strake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull inserts in these areas
- WH1, WH2, WH3 Shear strake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull inserts in these areas.
- RSA1, RSA2, RSA3 Shear strake, stringer plate (including margin angle), bilge strake, keel plate, garboard strake and hull
 inserts in these areas.

Where the hull envelope is made entirely from Grade D steel, crack arresting strakes of minimum Grade E need not be fitted in the specified locations.

- 1.4.3 Generally for joints between steels of different strength levels the welding consumable may be of a type suitable for the lesser strength.
- 1.4.4 For joints between steels of different toughness levels, the welding consumable is to be of a type suitable for the higher grade being connected.
- 1.4.5 The consumable used is to comply with the requirements of *Table 1.1.2 Welding consumable grade*. Other grades of steel will be specially considered, but in general, the toughness in the upward vertical direction is not to be significantly less than that of the parent plate, measured in the direction of rolling.

Table 1.1.2 Welding consumable grade

Steel grade	Normal electrode grade	Military requirement grade		
А	1	1		
AH32	1Y	2Y		
AH36	1Y	2Y		
AH40	2Y40	2Y40		
В	2	2		
D	2	3		
DH32	2Y	3Y		
DH36	2Y	3Y		
DH40	3Y40	3Y40		
E	3	4		
EH32	3Y	4Y		

Volume 1, Part 4, Chapter 1

Section 2

EH36	3Y	4Y
EH40	4Y40	4Y40

- 1.4.6 Where armour plating consisting of steels with a specified tensile strength of 1000 MPa or above is integrated into the ship's structure by welding, consideration should be given to the susceptibility of these materials to hydrogen cracking. The use of normal strength or higher strength steel of toughness grade D or higher in terms of Charpy V-notch fracture toughness should be considered as an intermediate transition material where the adjacent material is not already of this grade.
- 1.4.7 The proposed welding procedures are to be submitted for review, and are to be chosen to minimise the risk of hydrogen cracking. The following is recommended:
- (a) The use of welding consumables and electrodes with low hydrogen content (less than 5 ml/100 g of deposited weld metal).
- (b) The weld preparation and welding apparatus, consumables and electrodes are to be clean, dry and free from other sources of hydrogen such as lubricants and grease.
- (c) Controlled preheat, interpass temperatures, cooling rates and post-heat treatment chosen in accordance with manufacturers' guidance and recognised welding standards.
- (d) Weld sequence chosen to minimise the formation of residual stresses.
- (e) The use of welding consumables of a higher strength than necessary should be avoided.
- (f) Non-destructive examination should not be carried out before a period of 48 hours has elapsed from the time welding is completed.
- 1.4.8 The use of mechanical fasteners to secure armour plating should be considered as a means of removing the risk of hydrogen embrittlement as a result of the welding process. Where higher strength steel fasteners with Vickers hardness above 320 HV are used, consideration should also be given to the susceptibility of these materials to hydrogen cracking.

■ Section 2

Survivability

2.1 General

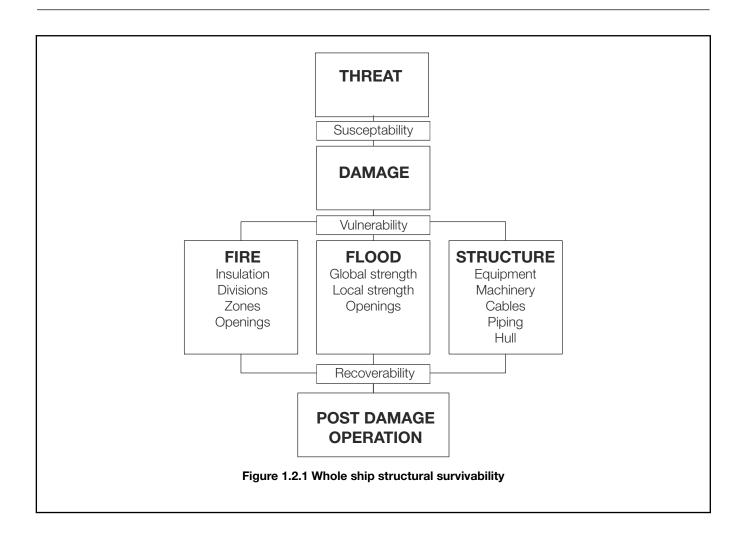

- 2.1.1 Survivability is defined as the probability that a ship can remain operational to some degree following an attack. The elements of whole ship survivability are shown in *Figure 1.2.1 Whole ship structural survivability*. Survivability is divided into two main aspects:
- Susceptibility, the probability of a threat acquiring, reaching and detonating on a ship.
- Vulnerability, the probability that a ship will be able to survive a successful attack and operate at a certain level.

Survivability is normally calculated as the product of susceptibility and vulnerability. Recoverability is an important aspect as it has a significant influence on the vulnerability of the overall ship as a system. It can be defined as a measure of the ability of the ship to reach a particular level of operation higher than that immediately following the hit. A variety of levels of operation required following damage can be defined, see *Vol 1*, *Pt 4*, *Ch 1*, *2.2 Vulnerability*

- 2.1.2 Generally there are four basic phases in the classification of naval ships with respect to survivability:
- Concept phase.
- Assessment phase.
- Build phase.
- Maintenance phase.
- 2.1.3 The **concept phase** is not normally part of classification and is a discussion between the Owner, Naval Administration, designer and those specialists able to perform the appropriate calculations. It is used to identify the potential threats, requirements for the ship structure, machinery and systems with respect to those threats.

Volume 1, Part 4, Chapter 1

Section 2

- 2.1.4 The **concept phase** will apply all of the elements shown in Figure 1.2.1 Whole ship structural survivability:
- (a) Identification of the threat is first and this is usually determined for current and future threats. Several threats will be identified which affect the ship in a variety of ways, they may be underwater or above water, far field, close in, or contact weapons. Typical threat groups are given in *Table 1.3.1 Relationship between notations*.
- (b) The susceptibility is the ability of the threat to reach the ship and detonate and is a function of the capability of the threat, the ship's signatures and the ship's defence systems. Various computer codes and simulations are available for determining the susceptibility of a hull and the capability of weapon systems. Consideration should be given to the degradation of a threat by a ships defence systems.
- (c) If a threat detonates, damage may result. The extent and amount of damage is a function of the vulnerability of the ship, see Vol 1, Pt 4, Ch 1, 2.2 Vulnerability. A vulnerability assessment may be used to determine the consequences of the threat detonation. The consequences are likely to be in the form of fire, flood and physical damage as shown in Figure 1.2.1 Whole ship structural survivability. The assessment tools used in the design stage for vulnerability analysis generally employ simple design formulae which are then verified during the assessment phase.
- (d) The consequences of damage can be limited through recoverability, the ability to repair damage to structure, equipment and systems. This is mainly an operational matter though it will have an impact on ship design. Damage control operational procedures will make certain demands on structure and equipment.
- 2.1.5 It is beyond the scope of the Rules to provide further detail on the concept phase. However on request, LR is able to provide details of suitable organisations who are able to give specialist advice as necessary.
- 2.1.6 The **assessment phase** looks in more detail at the vulnerability of the ship and uses explicit calculations to assess the capability of the ship based upon the relevant effects of threats such as blast pressure or fragment size. It is not necessary to define the actual weapon, just the consequences or effects of threats. A threat can produce a variety of effects, the manner in which the rules currently address these effects is detailed in *Vol 1, Pt 4, Ch 2 Military Load Specification*. In naval ship classification, notations are used to donate that a calculation for a particular threat has been reviewed. Currently, these are

Volume 1, Part 4, Chapter 1

Section 2

concerned with structural aspects only, though some aspects of machinery are indirectly addressed through other notations such as propulsion machinery redundancy, **PMR**, steering gear machinery redundancy, **SMR** and fire safety, **FIRE**.

- 2.1.7 The **build phase** ensures that the requirements of the assessment phase are put in place on board the ship. It is identical to the normal classification requirements for construction, installation and testing of structure and equipment under LR survey, verifying that the correct materials, welding fabrication and testing procedures are used.
- 2.1.8 The **maintenance phase** is applied by maintaining a ship in class through life. It verifies that the original standard to which the ship was built is maintained and that any new rule requirements are implemented. It also verifies that modifications to the ship do not compromise the integrity of the structure, equipment or systems.
- 2.1.9 It is the responsibility of the Naval Administration to ensure that each of the phases is implemented, to define the requirements that are to be met and advise the Owner on the manner in which particular threats can be dealt with.

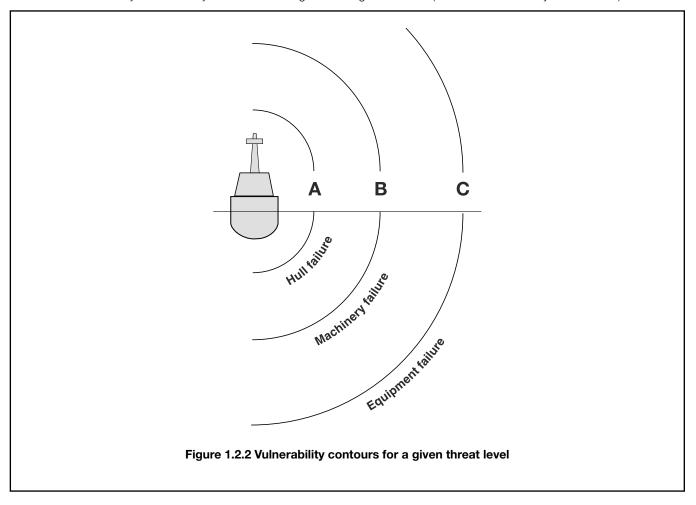

2.2 Vulnerability

- 2.2.1 The resistance of a vessel to loadings from military threats can be described by the term vulnerability which is the probability that once hit by a specified threat a vessel will lose capability.
- 2.2.2 This Chapter deals separately with the effects of a threat on the structure but when considering the total vulnerability of the ship it will be necessary to combine all the effects of a weapon detonation to determine the total damage to the ship as a system. This is normally done very early in the design stage at a low level of complexity, see *Vol 1*, *Pt 4*, *Ch 1*, *2.1 General 2.1.4* Several computer codes are available to determine the consequence of weapon threats on the ship system.
- 2.2.3 The damage to a ship is likely to occur by three mechanisms; fire, flood and physical damage, see *Figure 1.2.1 Whole* ship structural survivability. The direct effect of threats on the ship's crew is not included in this Section but some features such as shelter stations and CBRN protection will reduce the risk. Indirect damage caused by the threat should also be considered and a vulnerability analysis can be used to site magazines such that they are offered the maximum protection.
- 2.2.4 The methods used to control the spread of fire will have an effect on structural design, materials, fire insulation, fire divisions and openings, and must all be considered. One method used to control the spread of fire is zones and some guidance on the philosophy and structural requirements are provided in *Vol 1, Pt 4, Ch 1, 7 Design guidance for nuclear, biological and chemical defence*. However, the precise requirements for fire detection, protection and extinction are to be provided in the specified fire safety standard(s). Where this is examined by LR in accordance with *Vol 1, Pt 1, Ch 2, 3.10 Other notations 3.10.9* a **FIRE** notation may be assigned. Other methods include the use of smoke tight boundaries, insulation and fire-fighting systems.
- 2.2.5 The stability of a vessel and flooding following damage is not covered in this Chapter. The specified subdivision and stability standard, should define the extent of damage that the vessel is required to survive and remain stable. All structure and watertight closing appliances will need to be assessed to this level. Vol 1, Pt 3, Ch 1, 5 Definitions defines how the minimum extent of watertight subdivision is to be determined. Vol 1, Pt 3, Ch 4 Closing Arrangements and Outfit contains details on requirements for closing appliances. For such an extreme event as flooding, plastic type analysis is appropriate for watertight structure and this is recognised in the relevant rule requirements.
- 2.2.6 For the hull, the effect of the threat can be limited in two ways:
- Ensuring that there is adequate global strength following damage using a residual strength analysis. Where appropriate a whipping analysis may also be necessary.
- Ensuring that local structure can contain the threat or limit the damage. Individual items of structure can be hardened or strengthened in certain areas to achieve this.
- 2.2.7 Physical damage may occur to cables, piping, equipment and machinery, and other systems. The duplication or protection of these items is dealt with in *Vol 2*, *Pt 1*, *Ch 3*, *4.9 Military requirements*. Where protection is required, e.g. armour, the impact on the structural design of the hull is to be considered.
- 2.2.8 Different levels of vulnerability can be represented, as illustrated in *Figure 1.2.2 Vulnerability contours for a given threat level* Each will have different acceptance criteria for the hull structure. For an internally detonating threat, the increasing levels can be visualised as a threat of increasing magnitude rather than increasing distance.
- 2.2.9 Level A is that, closer than which, the hull structure will fail due to the detonation of a threat. The failure can occur in a number of ways as detailed in *Vol 1*, *Pt 4*, *Ch 2 Military Load Specification*. At this level the assessment will normally be performed using plastic criteria which will result in permanent deformation. The ship may no longer function effectively but it should remain afloat and not rupture or fail catastrophically.

Volume 1, Part 4, Chapter 1

Section 2

2.2.10 Level B is that, closer than which, the majority of the ship's machinery and equipment is damaged such that it will not operate effectively and the ship can no longer continue to navigate. The hull must therefore not deform permanently and elastic assessment criteria may be necessary to determine the global strength of the hull (local deformation may be sustained).

- 2.2.11 Level C is that, closer than which, the ship's weapon systems begin to fail and the vessel is no longer able to operate with full effectiveness. Normally the global and local criteria would be assessed against elastic criteria.
- 2.2.12 Levels B and C for underwater threats are primarily dealt with by adopting a suitable shock policy for the ship.
- 2.2.13 It is the responsibility of the Owner to specify the levels at which these should be set. In theory, they could be made to be coincident but this would provide little reserve within the vessel for recovery by damage control and repair. Conversely, they should not be set too far apart as this represents unnecessary armament and strengthening which is not effectively protecting the equipment and machinery from attack.
- 2.2.14 For an assessment of a threat which also produces effects on machinery, two structural calculations may have to be performed. One at the equipment level of failure using failure criteria that result in little or no deformation (plating only for example) and one approaching a structural failure level using ultimate strength or plastic collapse criteria. The requirements in *Vol 1*, *Pt 4*, *Ch 2 Military Load Specification* generally deal with ultimate strength or plastic criteria, the conventional rule calculations in *Vol 1*, *Pt 6*, *Ch 2 Design Tools* and *Vol 1*, *Pt 6*, *Ch 5 Structural Design Factors* set elastic failure criteria. For normal naval ship construction, the hull is usually able to withstand the threat level at which equipment and systems fail with little or no permanent deformation, though some check calculations may be necessary on critical areas.

Volume 1, Part 4, Chapter 1

Section 3

■ Section 3

Military distinction notations

3.1 General

- 3.1.1 By its very nature a naval ship will be required to face and resist a variety of threats and it will be necessary to incorporate particular features to address those threats.
- 3.1.2 Some of the features required are already incorporated in the notation ₱ **100A1 NS.** However, where the operational requirement demands, additional or specific levels of performance, special features notations such as those listed in *Vol 1*, *Pt 1*, *Ch 2*, *4 Surveys General* may be assigned showing protection against the effects of a particular threat.
- 3.1.3 Unless specifically requested these notations will be assigned at an appropriate level which will remain confidential to the Owner. It is the responsibility of the Owner to specify the threat levels suitable for their requirements. The agreed threat levels will not appear in the Register Book or be published in any other form. Only the notation ** MD will be used to show that some military features have been incorporated and constructed in accordance with LR's Rules and Regulations for the Classification of Naval Ships.
- 3.1.4 A distinction is made between:
- levels of threat, describing the magnitude of the missile, torpedo, mine or bomb; and
- method of analysis which may be performed at differing levels of complexity.
- 3.1.5 In an effort to establish links between the different military loads, default levels of threat have been assigned. A distinction is made between levels of above water and underwater threats, as certain ships may be at greater risk from one or the other depending upon their operational requirements. They are summarised in *Table 1.3.1 Relationship between notations*.
- 3.1.6 In addition to the hull class notations defined in Vol 1, Pt 1, Ch 2 Classification Regulations, ships complying with the requirements of this Chapter will be eligible to be assigned the additional class notations defined in Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.2 and Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.4 or descriptive notes as defined in Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.8.

3.2 Above water threats

3.2.1 As described in *Table 1.3.1 Relationship between notations* the external blast notation is normally independent of the internal blast and fragmentation notations as the threats that produce a survivable blast effect usually have a reasonable stand off. Typically, significant blast loading will arise from externally detonating threats such as far field nuclear at large stand offs and fuel air explosions at moderate stand offs. For an externally detonating conventional weapon, the blast will normally be insignificant but there will usually be a fragmentation threat. The external blast notation may also be independent of the residual strength notation unless the plastic deformation from an external blast renders certain structure ineffective with respective to global strength. For example a superstructure which contributes to longitudinal strength.

Table 1.3.1 Relationship between notations

				Underwater weapons								
	Small arms	Shell or projectile		Missile			Bomb		Mine or charge		Torpedo	
	Contact	Contact	Proximity	Contact	Proximity	Contact	Proximity	Far field (2)	Contact	Proximity	Contact	Proximity
SP	R	0										
FP		R	R	R	R	R	R					
IB		R		R		R						
ЕВ			R		R		R	R				
SH									R	0	R	0

Volume 1, Part 4, Chapter 1

Section 3

WH										R		R
RSA		0	0	R	0	R	R	R	R		R	
Symbols												

- R = Required threats to be considered in the absence of a specific requirement.
- O = Optional threats to be identified by the Owner and dependent on the characteristic of the threat.
- Note 1. It remains the responsibility of the Owner to determine the appropriate military notation and the appropriate levels of threat and analysis.
- Note 2. For nuclear threats, consideration should be given to CBRN requirements for structure, see Vol 1, Pt 4, Ch 1, 7 Design guidance for nuclear, biological and chemical defence, filtration and ventilation. The ability of the structure to screen an electromagnetic pulse should also be considered.
- 3.2.2 Usually, both internal blast and fragmentation will result from an internally detonating threat and are therefore linked, for example, a missile threat as shown in *Table 1.3.1 Relationship between notations*. For a particular threat it is recommended that both fragmentation and internal blast assessments will be made to the same level of threat for the structure adjacent to the point of detonation. Consideration should be given to the precise nature of the blast loading and fragmentation pattern of the threat.
- 3.2.3 If transverse bulkheads are used to limit the longitudinal spread of damage then the decks and side shell will probably be damaged such that a residual strength assessment is required to ensure that the global strength is not compromised. This should be to the same threat level as the internal blast threat. Longitudinal blast resistant bulkheads, box girders or service tunnels could be used to maintain the longitudinal effective material of the hull girder.
- 3.2.4 A residual strength assessment of the above water structure can be carried out for any threat level under any threat, independently of the other above water threat notations. This is because the ship may still retain function even though it has not been specifically armoured against the internal blast or fragmentation arising from such a threat. The residual strength notation is normally required for sea skimming missile threats that may remove significant areas of above water structure.

3.3 Underwater threats

- 3.3.1 Shock enhancement should be aimed at providing ruggedness and to verify at a low level, equipment and system operation is maintained and at a higher level, equipment is retained and the hull does not rupture. Notation is currently confined to structure and concentrates on local damage that can be addressed by close attention to quality of construction and by adopting good constructional detail. Shock effects give rise to equipment and system damage. Shock is a different mechanism from whipping, therefore a whipping assessment will not generally be required to the same level of a shock assessment, though it may be necessary to check that the shock threat assessed will not have a significant whipping load. Residual strength assessments may be appropriate for shock threats depending on the extent of local damage.
- 3.3.2 Whipping is caused by proximity detonation of a charge that excites the main hull girder at a low-order (two node) natural frequency which may cause significant structural damage at a relatively low charge weight. Shock effects therefore may be relatively low order and it will not always be necessary to undertake a shock analysis. In addition a whipping analysis may not be necessary for threats which detonate on contact or for steel ships under 70 m in length. Due to the nature of whipping effects (usually the plastic collapse at a section of the hull), a residual strength calculation is not normally appropriate for a whipping threat because the damage from the direct shock is usually limited.
- 3.3.3 Residual strength assessments of underwater threats are normally concerned with contact mines or torpedo impacts. These will remove a certain amount of hull structure the effect of which is to be assessed by the residual strength calculation. Shock or whipping threats will only require a residual strength notation where there are significant amounts of local deformation to the hull girder. Significant damage is defined as that which reduces the global strength below the design margins.

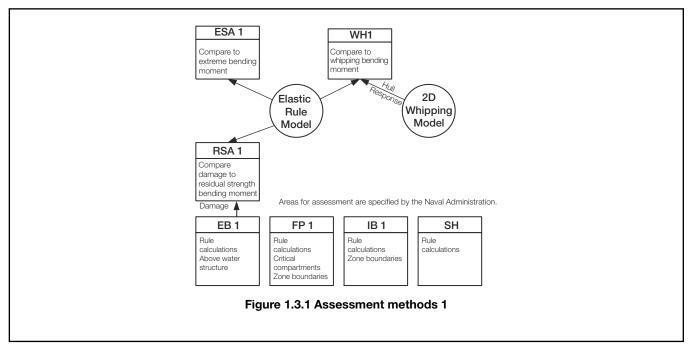

3.4 Analysis levels

- 3.4.1 In addition to levels of capability determined by the threat level specified, there are also different methods of assessment. The method of assessment will depend on three aspects:
- The level of the threat. At higher levels of threat, the requirements of the rules may become uneconomical or impractical and a more in depth analysis is required.
- Applicability of the rule formulations. If the threat level is outside the range of applicability of the rule formulations further analysis will have to be undertaken.

Volume 1, Part 4, Chapter 1

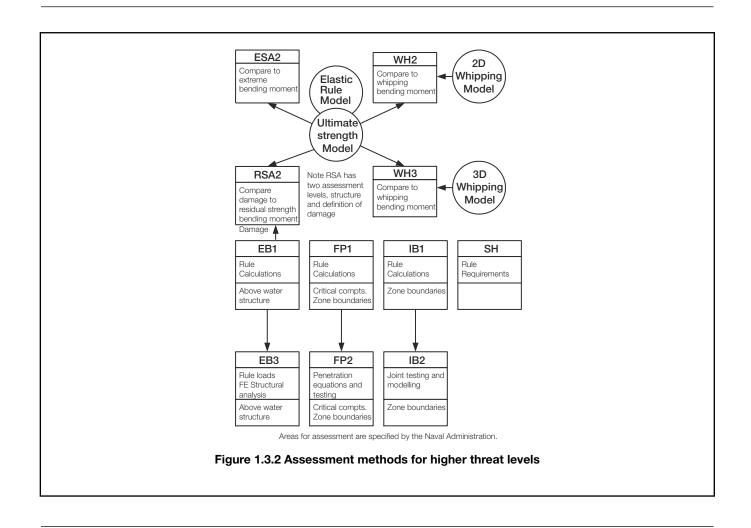

Section 3

- Acceptance criteria, dependent upon whether the threat is to be assessed against elastic or plastic collapse criteria.
- 3.4.2 Three methods of assessment are shown in *Figure 1.3.1 Assessment methods 1*. In general the same threat level can be specified in each case however, it is the responsibility of the Owner to specify the correct levels to meet their specific requirements.
- (a) The analysis of military loads can most simply be assessed using the elastic model created for rule analysis. This will result in an acceptable but conservative solution.
- (b) The next more complex method uses an elasto-plastic or ultimate strength model.
- (c) Finally more complicated processes such as 3D dynamic analysis can be used to determine the loading for the elasto-plastic model. Normally this will be carried out for local areas of interest.
- 3.4.3 Once an ultimate strength model has been created for the appropriate sections along the hull it may be utilised for a variety of military notation calculations, as shown in *Figure 1.3.2 Assessment methods for higher threat levels*.
- 3.4.4 The damage required for the residual strength calculation can be defined in a variety of ways for a variety of threats, collisions or groundings. Non-military damage is defined in *Vol 1, Pt 6, Ch 4, 4 Residual Strength Assessment, RSA* and military damage by the damage radii in *Vol 1, Pt 4, Ch 2, 7 Residual strength* or specifically from external blast and vulnerability calculations. The results from a vulnerability analysis can be used for input to a variety of military notations and, in general, formal vulnerability assessments will be required for higher threat levels, see *Vol 1, Pt 4, Ch 1, 2.1 General 2.1.4*

Volume 1, Part 4, Chapter 1

Section 4

■ Section 4

Military design guidance

4.1 Radar signature

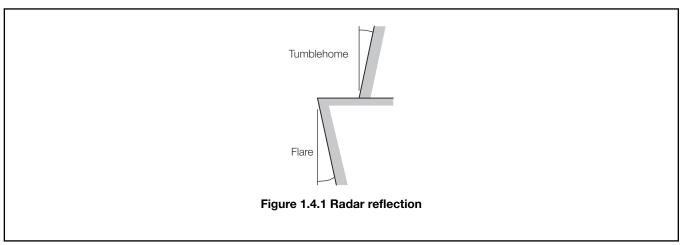

- 4.1.1 The Owner is responsible for determining the level of signature control required and agreeing any resultant design to achieve the required levels. There are however, instances where signature levels are not specified but good design practice may be applied. The following is offered as guidance.
- 4.1.2 All constructional details on the exposed surfaces of the hull, superstructures, masts and equipment above the design waterline should be considered for their radar reflection properties.
- 4.1.3 The Radar Cross Section (RCS) of the ship will primarily be controlled by shaping. This concentrates the returned energy into a small number of narrow beams, orientated in sacrificial directions or by directing the returned energy at an angle away from the incident energy. The extent of the orientation of the sacrificial directions should be agreed between the Owner and designer.
- 4.1.4 Appropriate modelling tools and expert judgement should be used for RCS calculation and assessment at various stages of the design iteration. Consideration should also be given to the RCS measurement of equipment.
- 4.1.5 Flare and tumblehome as defined in *Figure 1.4.1 Radar reflection* are to be used where possible on all otherwise vertical surfaces. The angle used should be greater than 6°. Consideration should be given to using a single or multiple elevation angles, see *Vol 1, Pt 4, Ch 1, 4.1 Radar signature 4.1.3*. This practice also eliminates the dihedral reflector potentially formed between a horizontal and a vertical surface.
- 4.1.6 Orthogonal corners give rise to high radar returns in the direction of the originating antenna. Creating dihedral or trihedral right angled reflectors should be avoided. This applies equally to disconnected orthogonal corners, where two (or three)

Volume 1, Part 4, Chapter 1

Section 4

surfaces do not meet but are orthogonal and a clear line of sight exists between them. This can include items such as: boat bays, reception areas, superstructure overhangs, sponsons and equipment mounts.

- 4.1.7 Corners which would otherwise be orthogonal should be made non-orthogonal by a minimum of 4° , i.e. avoiding an internal angle of between 86° and 94° . Any shaping which uses angles less than 4° could inadvertently be made ineffective by local plate deformation or build tolerances.
- 4.1.8 Where doors providing access to the deck penetrate sloped structure, it will be desirable for the door itself to be hung vertically on its hinges. To achieve this it is necessary to recess the door into the sloped plate. Where this approach is adopted, the structure of the door recess should be made non-orthogonal by rotating the vertical sides of the recess by a minimum of 4° .
- 4.1.9 Avoid single curved surfaces (such as cylinders or cones) with diameters greater than 30 mm. Consideration should be given to replace these items by combinations of flat plates (with appropriate orientations), shielding or choice of appropriate material property.
- 4.1.10 The use of lattice type masts and equipment supports should be avoided.
- 4.1.11 Consideration should be given to reducing the amount of clutter (microgeometry) by design, hiding it behind bulkheads or shielding (i.e. shutters for when equipment is not in use).
- 4.1.12 Where the use of homogenous reflective material is impractical for shielding, a mesh of electrical conductive fibres with an appropriate mesh spacing to simulate a reflective surface over the radar frequency range of interest can be used. This can also be applied to windows and non-structural bulkheads. Where a mesh is applied to windows which may be used for navigation purposes consideration should be given to the effects on visibility.
- 4.1.13 The number of external ladders should be kept to a minimum. Where they are unavoidable, ladder uprights should be rotated to avoid forming dihedral corners with the bulkheads on which they are mounted. As an alternative, external ladders could be constructed from a material translucent to radar.
- 4.1.14 Consideration should be given to the use of radar absorbent materials either as appliqués or more preferably as an inherent part of the structure i.e. Structural Radar Absorbent Material (SRAM).
- 4.1.15 Composites are generally semi-transparent to radar and therefore attention should be paid to equipment/ structures placed behind composite structures. Alternatively, consideration can be given to altering the composite properties, applying a metallic backing to the composite or by using SRAM.

4.2 Use of aluminium alloys

4.2.1 Due to the poor performance of aluminium alloys at high temperatures they are generally not to be used for items of main hull structure unless suitable insulation is arranged. Safety critical items such as life boat davits, ladders, fire main supports, emergency escape route bulkheads and floor plates, etc. are not to be constructed of aluminium alloys.

Volume 1, Part 4, Chapter 1

Section 5

Section 5

Military design requirements

5.1 RAS seating and support structure

- 5.1.1 The strength of seats and supporting structure is to be sufficient to withstand the forces imposed by the equipment for all possible operating conditions and loads from ship motions, see Vol 1, Pt 5, Ch 3, 5.3 Pressure on internal decks, Pin. Design calculations are to be submitted.
- 5.1.2 The seating and supporting structure is to be tested in accordance with a specified standard, see also Vol 3, Pt 1, Ch 5, 3.1 General 3.1.4. Care is to be taken to ensure that the test arrangements represent the actual magnitude and direction of loads, and that the loading is applied to all relevant parts of the supporting structure rather than local items only.
- 5.1.3 Guidance on the loads and requirements for replenishment at sea operations are given in Vol 1, Pt 4, Ch 2, 9.2 Replenishment at sea loads
- 5.1.4 A sufficient deck area clear of projections and equipment suitably strengthened for impact loading is to be provided for the landing of stores and equipment.
- 5.1.5 RAS equipment is to be designed in accordance with a specified standard, see also Vol 3, Pt 1, Ch 5, 3.1 General 3.1.4.

5.2 Vehicle and equipment holding down arrangements

5.2.1 The strength and stiffness of the holding down arrangements and the supporting structure under is to be sufficient to withstand the forces imposed by the vehicle(s) and or equipment for all possible operating conditions and loads from ship motions, see *Vol 1, Pt 5, Ch 3, 5.3 Pressure on internal decks, Pin* The design calculations are to be submitted.

5.3 Masts and externally mounted sensors or equipment

- 5.3.1 Masts are to be of adequate strength and stiffness for the equipment they support. The design calculations are to be submitted.
- 5.3.2 Plated mast structure is to be treated as superstructure and the structural requirements for superstructure as defined in Table 3.3.9 Superstructure plating and Table 3.3.10 Superstructure framing in Pt 6, Ch 3 for NS1 type vessels and Vol 1, Pt 6, Ch 3, 4.8 Superstructures, deckhouses and bulwarks 4.8.4 and Vol 1, Pt 6, Ch 3, 4.8 Superstructures, deckhouses and bulwarks 4.8.5 for NS2 and NS3 type vessels are to be applied. Minimum requirements are given in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements and Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections.
- 5.3.3 Pole mast structure is to be designed to be within the allowable stress limits defined in Vol 1, Pt 6, Ch 3, 16 Masts.
- 5.3.4 The excitation of the mast by ship motions, machinery, propellers and equipment is to be specially considered and the designers calculations are to be submitted. Where possible the designer should avoid mast natural frequencies within ±20 per cent of significant global mast excitation frequencies. Where this is not possible the vibration amplitudes should be calculated to confirm they are within acceptable limits for the mast structure and equipment. In general, ship motions can be estimated from *Vol* 1, *Pt* 5, *Ch* 3, 2 *Motion response*. See also *Vol* 1, *Pt* 6, *Ch* 2, 4 *Vibration control*. It is recommended that the frequency of the first mode of vibration of a pole mast be not less than 3,0 Hz to prevent potential excitation from the first vertical hull girder vibration mode in the range 1-2,5 Hz. The frequency of the first mode of vibration of a pole mast should be a minimum of 1 Hz above the first vertical hull girder mode.
- 5.3.5 Structure supporting radar or equipment critical to the operation of ship systems is to be of adequate stiffness to maintain the alignment of the equipment within the tolerance agreed with the manufacturer.
- 5.3.6 The mast should be designed and sited such that it produces minimum interference with the ships sensors and equipment.
- 5.3.7 Suitable permanent access arrangements are to be provided inside and on the exterior of the mast for maintenance of the structure and equipment. Provision is to be made for the drainage of water from all parts of the mast, both internal and external. Where applicable, protective coatings are to be applied in accordance with the requirements of *Vol 1*, *Pt 6*, *Ch 6*, *3.1 General*. For corrosion margins, see *Vol 1*, *Pt 6*, *Ch 6*, *3.8 Corrosion margin*.
- 5.3.8 Mast support arrangements are to be of suitable strength and stiffness and fully integrated into the hull or superstructure. The design calculations and arrangements are to be submitted.

Volume 1, Part 4, Chapter 1

Section 6

- 5.3.9 For equipment distributed along the length of the ship, consideration is to be given to the global stiffness of the ships' hull girder in relation to the alignment tolerances required for the equipment (increasing hull stiffness is not normally an efficient option).
- 5.3.10 High powered transmitting equipment where fitted is to be considered for the effects of electromagnetic influence on adjacent equipment and manned spaces.

5.4 Towed arrays, towed bodies and towing points

- 5.4.1 The support structure of towed systems is to be suitably integrated into the main hull structure. Any additional primary stiffening is to be extended for at least three frame spaces forward and aft of the equipment.
- 5.4.2 The towing point and associated equipment is to be located over a primary longitudinal girder and preferably supported by a transverse web frame. The designers calculations are to be submitted for the supporting structure using the 1,5 times the maximum breaking load of the cable.
- 5.4.3 Towed array handling equipment is to be designed in accordance with a specified standard. The seating of array handling equipment is to be adequately supported.

5.5 Crane support arrangements

- 5.5.1 Crane pedestals are to be efficiently supported and in general, are to be carried through the deck and satisfactorily scarfed into the surrounding structure. Alternatively, crane pedestals may comprise a foundation, in which case the foundation and its supporting structure are to be of substantial construction. Proposals for other support arrangements will be specially considered.
- 5.5.2 The scantlings of masts and derrick posts, intended to support derrick booms, conveyor arms and similar loads, and of crane pedestals are to be designed in accordance with a specified standard. When submitting plans for the proposed foundation, the design calculations are to be included.
- 5.5.3 Deck plating and underdeck structure are to be reinforced under masts, derrick posts or crane pedestals, and where the deck is penetrated the deck plating is to be suitably increased.
- 5.5.4 The pedestal or proposed arrangement is to be designed with respect to the worst possible combinations of loads resulting from the crane self weight, live load, wind and crane accelerations together with those resulting from the ship's heel and trim. The designers calculations are to be submitted.
- 5.5.5 Stowage arrangements are to be taken into account when calculating the loads applied to the pedestal.
- 5.5.6 Insert plates are to be incorporated in the deck plating in way of crane foundations. The thickness of the insert plates is to be as required by the designer's calculations but is in no case is to be taken as less than 1,5 times the thickness of the adjacent attached plating.
- 5.5.7 All inserts are to have well radiused corners and be suitably edge prepared prior to welding. All welding in way is to be double continuous and full penetration where necessary. Tapers are to be not less than three to one.
- 5.5.8 The support arrangements for life-saving appliance davits and cranes are, in general, to be in accordance with Pt 3, Ch 9, 6.5 Support structure for life-saving appliances of the Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5
- 5.5.9 Where life-saving appliance davits and cranes are used for additional military operations, the load cases are to be specially considered and the supporting deck structure assessed against these additional load cases. Consideration is to be given to the possibility of fatigue arising due to high cyclic loading.

Section 6

Magazine design and construction requirements

6.1 Genera

6.1.1 The design, construction and maintenance of magazines are to be in accordance with the specified magazine safety standard, see *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.15*. All Regulations, recommendations and requirements are to be confirmed to have been applied.

Volume 1, Part 4, Chapter 1

Section 6

- 6.1.2 Where standards have not been specified the following requirements apply. A Risk Assessment, in accordance with *Vol* 2, *Pt* 1, *Ch* 3, 18 *Risk* Assessment (*RA*), may be used to justify alternative arrangements. This is to be approved by the Owner and Naval Administration. All recommendations and requirements are to be demonstrated to have been applied.
- 6.1.3 A statement of magazine requirements is to be defined and is to include:
- (a) Armaments requirement; listing the expected munitions and materiel to be carried in magazines. Identifying the items which can or are to be co-located and those which must be stored separately or separated. Any special requirements for the storage of particular items are also to be listed including:
 - (i) environmental conditions; and
 - (ii) conductive deck coating requirements.
- (b) Construction materials requirement; describing the permissible materials or required alternatives for magazine structures and munition stowages.
- (c) Magazine Labelling requirement; describing the required labels and their locations.
- (d) Fluid Systems requirement; describing the operating fluids and operating pressures of all fluid systems within the magazine boundaries.
- (e) Munition handling requirement; describing the equipment and space requirements to enable the munitions to be safely handled, maintained and stowed.
- 6.1.4 Munition securing and handling equipment is to be in accordance with requirements of the Armaments Requirement or, with special consideration, LR's LAME Code. Explosive stores are to be classified and stowed in accordance with the armament requirement, see *Vol 1*, *Pt 4*, *Ch 1*, 6.1 General 6.1.3.
- 6.1.5 Ready use magazines are not to be used for the permanent stowage of munitions. They are to comply with the requirements of this Section for the appropriate magazine type.

6.2 Definitions

- 6.2.1 Munitions are a complete device (e.g. missile, shell, mine, demolitions store, etc. charged with explosives, propellant, pyrotechnics, or initiating composition), for use in conjunction with offensive, defensive, training, or non-operational purposes, including those parts of the weapon systems containing explosives.
- 6.2.2 Explosives are all weapons, missiles or stores containing substances especially designed to produce an explosive, propulsive, incendiary or pyrotechnic effect for use in conjunction with offensive, defensive, training, or non-operational purposes.
- 6.2.3 Integral magazines are those which are bounded by the elements of the main hull structure. They are specifically designed and constructed for the safe permanent stowage of the main outfit of designated munitions defined in the armaments requirement, see *Vol 1*, *Pt 4*, *Ch 1*, 6.1 General 6.1.3.
- 6.2.4 Independent magazines are those that are non integral, portable magazines greater than 3 m³ and the requirements for integral magazines are to be applied where applicable.
- 6.2.5 Small magazines are compartments opening off the upper deck which are of shape and size which does not permit walk-in and where the contents are handled from outside. Small magazines are to be specifically designed and constructed for the safe permanent or ready use stowage of munitions defined in the armaments requirement, see *Vol 1, Pt 4, Ch 1, 6.1 General 6.1.3*.
- 6.2.6 Magazine lockers are magazines less than or equal to 3 m³, designed and constructed for the safe stowage of explosive stores for which in built magazine facilities have not been provided. They are to be free standing and surrounded by an air gap such that they do not have an adjacent compartment.
- 6.2.7 Magazine boxes are non-integral, portable magazines with a capacity less than or equal to 3 m³ and capable of being iettisoned overboard.
- 6.2.8 Pyrotechnics lockers are to comply with the requirements for small magazines, magazine lockers or boxes as appropriate.
- 6.2.9 Class A fire divisions are those divisions formed by bulkheads and decks which comply with the requirements of IMO resolution MSC 61 (67) Fire test procedures code, Annex 1, Part 3 Test for "A", "B" and "F" Class Divisions.

6.3 Arrangement of magazines

6.3.1 Integral magazines and small magazines containing munitions or propellant are not to be sited adjacent to high fire risk and other compartments of high fire risk listed below:

Volume 1, Part 4, Chapter 1

Section 6

- (a) Machinery spaces of category A.
- (b) Galleys.
- (c) Switch boards or electrical control rooms.
- (d) Tanks containing liquids with a flashpoint lower than 60°C or with a temperature above 32°C.
- (e) Compartments containing liquid oxygen.
- (f) Fuel, petrol, oil or lubricant pump spaces.
- (g) Accommodation spaces.
- (h) Control Spaces.
- 6.3.2 Access is not permitted from any of the spaces defined in *Vol 1, Pt 4, Ch 1, 6.3 Arrangement of magazines 6.3.1*, to the magazine.
- 6.3.3 For ships where the above arrangement is completely impracticable the magazine is to be separated from the high risk space by a minimum 600 mm wide cofferdam and constructed of steel or an A-30 fire division. Cofferdams are to comply with the requirements of *Vol 1*, *Pt 3*, *Ch 2*, *4.9 Separation and protection of tanks*, are to be ventilated and are not to be designed or used for stowage purposes.
- 6.3.4 No gasoline or pressurised bottle stowage is to be within a 6 m radius of any magazine or locker.
- 6.3.5 Integral magazines and small magazines containing munitions may be sited adjacent to the following compartments of moderate fire risk provided that they are separated by an A-30 fire division:
- (a) Auxiliary machinery spaces including pump rooms air condition plant spaces, refrigeration compartment spaces and hydraulic compartments not containing flammable hydraulic fluids.
- (b) Service spaces, including laundries and workshops.
- (c) Uptakes and downtakes.
- (d) Hangars, docks and vehicle decks.
- (e) Paint, flammable, battery and acid stores.
- (f) Tanks or compartments containing independent tanks, of liquids other than sea or fresh water.
- 6.3.6 Magazine lockers are to be sited in a safe location on a weather deck, surrounded by an air gap of at least 300 mm on all sides and where applicable protected from direct sunlight by fitting solar cladding over top and sides with an air gap of at least 25 mm.
- 6.3.7 Within magazines arrangements are to be such to ensure that all munitions, including those in transit packaging, are safely stowed and suitably restrained in their stowage for predicted motions and environmental conditions as identified in the armaments requirement. Separate stowage is to be provided for each type of explosive except where specified by the armaments requirement, see *Vol 1*, *Pt 4*, *Ch 1*, *6.1 General 6.1.3*.
- 6.3.8 Magazines are to provide suitable electromagnetic screening and earthing arrangements for munitions as identified in the armaments requirement, see Vol 1, Pt 4, Ch 1, 6.1 General 6.1.3.
- 6.3.9 Magazine boxes are to be sited on a weather deck with an air gap of at least 300 mm between the box and the deck or surrounding deck houses. They are to be located in a position suitable for jettisoning of the contents and capable of remote release.
- 6.3.10 Detonators are to be stowed separately from other explosives in dedicated lockers or storerooms; such spaces are to be treated as designated danger areas. Co-location may be allowed as identified in the armaments requirement, see Vol 1, Pt 4, Ch 1, 6.1 General 6.1.3.

6.4 Structure

- 6.4.1 Integral magazines are to be of permanent watertight or gastight construction (see Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity and Vol 1, Pt 3, Ch 2, 7.7 Unusual designs) and formed by permanent A-15 class divisions. A-0 class divisions may be allowed if spaces adjacent to the magazine do not contain flammable products.
- 6.4.2 Independent magazines are to be of weathertight metal construction, see *Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity*. The interior is to be insulated with a non-combustible insulation providing an A-15 standard.
- 6.4.3 Magazine lockers and magazine boxes are to be constructed of steel. Other material may be accepted as identified in the construction materials requirement, see *Vol 1*, *Pt 4*, *Ch 1*, *6.1 General 6.1.3*.

Volume 1, Part 4, Chapter 1

Section 6

- 6.4.4 The scantlings of integral magazine boundaries are to be determined from *Table 3.3.15 Magazine bulkhead and deck* scantlings in Pt 6, Ch 3 for NS1 ships and the general plating and stiffening equations in *Vol 1, Pt 5, Ch 3, 5.8 Design pressures* for watertight and deep tank bulkheads and boundaries for other ships. The design pressure, P mag, is to be derived as shown in *Vol 1, Pt 5, Ch 3, 5.11 Design pressure for magazine decks and bulkheads*.
- 6.4.5 If venting from the magazine space is via a vent trunk, the required scantlings for the vent trunk structure are to be calculated as for magazine boundary requirements.
- 6.4.6 Vent plate structure and fittings are to be designed to meet the appropriate deck or bulkhead pressure requirements according to location.

6.5 Environmental conditions and ventilation

- 6.5.1 The temperature of the magazine is to be maintained at the environmental conditions required by the armaments requirement, see *Vol 1, Pt 4, Ch 1, 6.1 General 6.1.3*. Generally munitions are to be stored at temperatures greater than 7°C and less than 35°C with a relative humidity between 30 and 70 per cent. Munitions with propellant are to be maintained below 32°C.
- 6.5.2 The air conditioning may be recirculatory if confined to the ventilation of magazines only. If the magazine is to be ventilated with other compartments then the magazine is to vent to atmosphere. High fire risk and high value compartments should not share ventilation with magazines.
- 6.5.3 Where a magazine or magazine complex may require to be manned, fresh air make up, via the Air Filtration Unit is to be provided.
- 6.5.4 Emergency life support apparatus is to be sited in magazines where personnel are required to be permanently working.
- 6.5.5 Ventilation trunking is to be of an equivalent fire integrity standard as the magazine.
- 6.5.6 Air conditioning and ventilation systems are to be designed to maintain watertight integrity and flash.

6.6 Detail arrangements

- 6.6.1 Clear labelling of all magazine openings and equipment is to be maintained in accordance with the magazine labelling requirement, see *Vol 1, Pt 4, Ch 1, 6.1 General 6.1.3* The following requirements are to be applied as a minimum:
- (a) Integral, small and independent magazines:
 - (i) the space is a magazine.
 - (ii) open lights and flame are to be kept away.
 - (iii) the magazine door is to be kept shut.
 - (iv) sources of ignition such as matches, lighters and pocket torches are to be removed prior to entry.
 - (v) not to lift with contents (in the case of independent magazines).
 - (vi) magazine otherside markings in adjacent compartments.
- (b) Magazine lockers and boxes:
 - (i) the container is a magazine locker or box.
 - (ii) open lights and flame are to be kept away.
 - (iii) the box is to be kept shut.
 - (iv) not to lift with contents.
- 6.6.2 Magazines are to be insulated with non-combustible material as necessary to prevent the condensation of moisture.

6.7 Openings

- 6.7.1 Openings in the magazine and lockers such as doors, hatches and escape scuttles are to be of equivalent strength and fire integrity as the surrounding structure.
- 6.7.2 Accesses to magazines are to be fitted with suitable security arrangements to prevent unauthorised access. Openings are to be capable of being secured from the inside and fitted with external locks. Emergency escapes are to be opened from the inside only.
- 6.7.3 Locking arrangements on all magazines and lockers are to be designed to prevent the possibility of entry by removing the hinge pins.

Volume 1, Part 4, Chapter 1

Section 6

6.8 Piping, cabling and electrical systems

- 6.8.1 In order to eliminate potential sources of ignition in a magazine in which flammable mixtures are liable to collect, hazardous areas for magazines are to be identified and electrical equipment within the magazine is to be selected and installed in accordance with the requirements of Vol 2, Pt 9, Ch 5, 4 Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts.
- 6.8.2 Lighting is to be operated from outside the space. Indication is to be provided at the switch location when circuits are energised.
- 6.8.3 All apparatus fitted in magazines is to be capable of being isolated on all poles from any source of electrical energy. The preferred method of isolation is by means of a multipole switch. Services that operate on low power at low voltage and are required to operate continuously do not require local isolation. Fire and flood detection and internal communications systems are included amongst such services.
- 6.8.4 Only services which are required for equipment in the magazine are to penetrate boundaries of the magazine.
- 6.8.5 Air and hydraulic systems used within magazines are to be low pressure systems only. Non-flammable hydraulic fluid is to be used.
- 6.8.6 Electrically controlled handling machinery may be fitted in magazines provided that continuous earth monitoring is provided in the control circuits of the machinery.
- 6.8.7 Equipment and light fixtures installed in magazines which may be subjected to mechanical damage are to be equipped with suitable protection against such damage. All protective metal guards for apparatus and cabling as well as the apparatus itself must be effectively earthed. Where required, conduit is to be electrically continuous and bonded to earth to form an effective shield.

6.9 Fire protection

- 6.9.1 Integral and small magazines are to be fitted with a spray system capable of rapid reaction, with manual activation and a suitable permanent drainage system.
- 6.9.2 The spray system is to be capable of delivering 30 litres/m²/min. Large compartments may be fitted with independent spray systems covering separate areas.
- 6.9.3 Spray heads are to be arranged within magazines so that all stowages and boundaries are covered when sprayed.
- 6.9.4 Spray systems for integral magazines are to be fed from two separate sections of the ship's water supply.
- 6.9.5 Magazine lockers and boxes are to be fitted with flood and drainage systems. The flood system is to be operated by a manual control adjacent to the locker but at least 5 m away or 3 m if suitably screened and fed from a pressurised water supply.
- 6.9.6 Compartments other than tanks or void spaces adjacent to magazines are to be fitted with smoke or fire detectors.
- 6.9.7 Locking arrangements are to be fitted to all spray, flooding, drain valves and cocks with the exception of spray control valves when housed in a lockable cabinet.
- 6.9.8 Magazines are to be provided with fire extinguishers commensurate with risk classification, size and type of vessel. Generally one extinguisher should be fitted on the inside and one on the out side of the magazine.
- 6.9.9 Designated danger areas (DDA) where munitions are handled such as weapon lifts, transfer passages, weapon preparation areas, hangars, flight decks, docks and RAS points are to be fitted with similar fire protection systems to the magazine, commensurate with the risk classification and type of vessel. LR may allow system requirements to be reduced to the provision of sufficient hose points based on the risk classification.
- 6.9.10 Magazines are to be coated with fire resistant paint and the deck covering is to be non spark and non slip. Any requirements for a conductive deck area and personnel will be identified in the armaments requirement, see *Vol 1, Pt 4, Ch 1, 6.1 General 6.1.3*. Where there is a conducting deck requirement an anti static precaution notice is to be displayed.

6.10 Testing

6.10.1 Magazines are to be tested in accordance with the gas tight requirements of Vol 1, Pt 6, Ch 6, 7.6 Gastight testing.

Volume 1, Part 4, Chapter 1

Section 7

■ Section 7

Design guidance for nuclear, biological and chemical defence

7.1 General

- 7.1.1 The arrangements of hull structure for chemical, biological, radiological and nuclear defence (CBRN) are to generally be in accordance with the requirements of this section. The final design and arrangements are to be in accordance with a specified standard. Where specifically requested, LR can undertake the inspection and certification of CBRN arrangements or gastight integrity, see *Vol 1*, *Pt 6*, *Ch 6*, *7.6 Gastight testing*.
- 7.1.2 The subdivision of the ship for CBRN defence is achieved by the provision of zones which minimise the consequences of an attack. The zone boundaries provide protective barriers to resist the spread of primary and secondary weapon effects.
- 7.1.3 The number and location of zone boundaries and distribution of systems within those zones is best determined by carrying out a vulnerability analysis as detailed in *Vol 1*, *Pt 4*, *Ch 1*, *2 Survivability*.
- 7.1.4 The effect of zones on, and requirements for damage control should also be considered. This is best assessed by testing the zone arrangement with a series of 'what if' damage scenarios. A good zone arrangement will aid damage control.
- 7.1.5 An effective CBRN defence is to comprise of three distinct phases:
- Monitoring and detection by the provision of systems to detect the presence of and to identify the threat both outside the ship and within the zones.
- Protection of the ship and crew, using a pressurised citadel and zones with gas-tight boundaries and airlocks. Protection is
 also achieved with the filtration of air drawn into the ship and enclosing machinery intakes and exhausts.
- Decontamination of spaces within the ship is achieved using a suitable ventilation and filtration system. Decontamination of the ship itself is largely achieved using pre-wetting systems. For the crew and equipment, cleansing stations can be used.

7.2 Definitions

- 7.2.1 A citadel is the gastight envelope of the hull and superstructure. It consists of a group of interconnecting compartments enclosed by a gas-tight boundary with the independent systems necessary to provide a toxic free area free from any CBRN hazard. Large ships may have subcitadels or more than one citadel.
- 7.2.2 A zone is a smaller group of compartments within the citadel with some or all of the independent systems necessary to provide a toxic free area that is free from any CBRN hazard.
- 7.2.3 An airlock is a compartment with two doors between the toxic free area and the source of the CBRN hazard or cleansing station. Airlocks are normally purged with clean air to allow personnel to pass from one area to another without contaminants entering the toxic free area.
- 7.2.4 A cleansing station is a group of compartments suitably arranged and equipped whereby CBRN decontamination of personnel and materials can take place.
- 7.2.5 Individual protective equipment is the personal clothing and equipment required to protect an individual from CBRN hazard. It normally consists of a protective suit and respirator.

7.3 NS1 and NS2 ship requirements

- 7.3.1 The requirements of this Section deal only with the hull structure and mainly involve the arrangement of major divisions within the hull. Provision is to be made within the layout and design of the ship for the compartments required for CBRN defence. It is recommended that they are considered from a very early stage in the design.
- 7.3.2 Unless specified otherwise, the citadel's length is to be divided into zones. It is recommended that the zone boundaries coincide with main transverse watertight bulkheads and extend from the keel to the highest superstructure deck.
- 7.3.3 A suitable pressure above atmospheric is to be maintained inside the citadel and zones. Zones with a higher risk of contamination are to be maintained at a lower pressure than the adjacent zones but higher than atmospheric. For example those containing machinery spaces with ventilation to atmosphere open during CBRN conditions.
- 7.3.4 For NS1 ships at least three cleansing stations are to be provided in separate zones. For NS2 ships at least two cleansing stations are to be provided in separate zones. They are to be located so that safe and direct entry is possible from the weather deck. One cleansing station is to be located close to the medical complex with access for stretcher borne casualties.

Volume 1, Part 4, Chapter 1

Section 7

7.4 NS3 ship requirements

- 7.4.1 The requirements of this Section deal only with the hull structure and mainly involve the arrangement of major divisions within the hull. It is recommended that they are considered from a very early stage in the design.
- 7.4.2 For NS3 ships it may be impractical to provide zones and a citadel. In this case CBRN protection is to be provided by either individual protective equipment or sanctuaries.
- 7.4.3 Sanctuaries may be integral or temporary compartments on board the ship and are to be provided with an airlock, cleansing station and ventilation systems similar to that of a zone.
- 7.4.4 If individual protective equipment is provided arrangements are to be made to ensure that operation of the ship is possible such that it can reach a suitable place of refuge. For example, crew provisions, equipment and compartment accesses are to be suitable for persons wearing individual protective equipment.

7.5 Zones

- 7.5.1 The boundaries of zones are to be gastight and are to be tested in accordance with *Vol 1, Pt 6, Ch 6, 7.6 Gastight testing*. Ventilation and trunking is not to pass through zone boundaries.
- 7.5.2 Each zone is generally to be provided with a total air conditioning system. All air entering the citadel is to pass through CBRN filters. These filters may be bypassed when the ship is not in a threat situation.
- 7.5.3 Consideration is to be given to the provision of independent services in each zone for the following systems:
- (a) Electrical power generation and distribution.
- (b) Chilled water cooling.
- (c) Fire pumps, piping and hydrants (including pre-wetting).
- (d) Bilge pumps, piping and discharge.
- (e) Internal communications.
- (f) Machinery or damage control surveillance or control.
- (g) Compressed air.
- (h) Emergency crew support.
- (i) Smoke clearance arrangements.
- (j) Air start arrangements in the appropriate zones.
- 7.5.4 At least two airlocks to the weather decks are to be provided in each zone. Access between zones are to be fitted with airlocks. Consideration is to be given to providing gas-tight connections adjacent to this access for the provision of the services listed in *Vol 1*, *Pt 4*, *Ch 1*, *7.5 Zones 7.5.3*.
- 7.5.5 Consideration should be given to the use of materials that do not emit toxic fumes.

7.6 CBRN hardening

- 7.6.1 In determining the layout and design of the ship consideration should be given to the hardening of the ship to improve its capability in an CBRN environment.
- 7.6.2 All external compartments and equipment not included in the citadel should be sealed or designed such that residual contaminants cannot be trapped.
- 7.6.3 All access for operation and maintenance of equipment should be designed for personnel wearing individual protective equipment.
- 7.6.4 Shelters are to be provided deep within the ship for the temporary protection from radiation of the crew during nuclear attack.
- 7.6.5 Command and control centres should ideally be sited such that they are afforded the maximum protection against radiation from nuclear attack. All relevant Mobility and Ship Type equipment should be designed to resist incident nuclear radiation (INR) and nuclear electromagnetic pulse (NEMP).

7.7 Structural requirements

7.7.1 The scantlings of all gas-tight zone, citadel and airlock boundaries are to be capable of withstanding two times the maximum differential pressure that can occur in service and the scantlings are to be calculated in accordance with the relevant

Volume 1, Part 4, Chapter 1

Section 8

Sections of Vol 1, Pt 6, Ch 3 Scantling Determination. Gas-tight boundaries are to be tested in accordance with Vol 1, Pt 6, Ch 6, 7.6 Gastight testing.

- 7.7.2 All openings in gastight boundaries are to be fitted with gas-tight closing appliances and tested in accordance with *Vol* 1, *Pt* 6, *Ch* 6, 7.6 *Gastight testing* and are to be of equivalent strength to the structure in which they are placed.
- 7.7.3 Watertight and weathertight closing appliances may be considered gas-tight if a pressure greater than atmospheric is, and can be maintained inside the zone, citadel or airlock.

Section 8

Design guidance for the reduction of radiated noise underwater due to sea-inlets or other openings

8.1 General

- 8.1.1 The number of underwater openings should be kept to a minimum.
- 8.1.2 To aid in the reduction of underwater radiated noise, sea tubes and/or boxes are to be provided for each sea-water hull inlet or outlet. Where a number of openings are adjacent, consideration should be given to fitting a common plenum chamber with a single opening in the outer bottom. Care must be taken to avoid resonance of the chamber.
- 8.1.3 The outside of all underwater openings is to be flush with the surrounding hull plating. Particular care is to be taken to provide smooth surface on the inside of all sea tubes and discharges.
- 8.1.4 For sea openings required to be blanked, a smooth mating face surrounding the sea tube on to which the mating flange of the blank can sit is to be provided.
- 8.1.5 Adequate protective coating and cathodic protection should be considered at the interface of the valve and sea tube.
- 8.1.6 No underwater opening, at a level lower than the deep design draught, is to be fitted within 6 m of the aftermost part of the aft sonar dome.
- 8.1.7 Wherever possible, gratings or anti-sabotage bars fitted to underwater openings are to be arranged across and aligned with the flow of the water past the ship so as to minimise turbulence. They should be deep in section and have well radiused edges.

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 1

Section

- 1 General requirements
- 2 External blast
- 3 Internal blast
- 4 Fragmentation protection
- 5 Underwater explosion (shock)
- 6 Whipping
- 7 Residual strength
- 8 Strengthening requirements for beach landing operations
- 9 Military installation and operational loads
- 10 Aircraft operations

■ Section 1

General requirements

1.1 General

- 1.1.1 This Chapter contains design requirements that have to be complied with as part of \blacksquare **100A1** classification, ship type or a special notation such as **IB**.
- 1.1.2 Where significant regions of the hull structure are rendered ineffective by the threat under consideration, a residual strength calculation is to be carried out to verify the capability of the remaining structure.
- 1.1.3 For structure designed in accordance with the appropriate Sections of this chapter the following notations will be assigned. The level of threat and notation will remain confidential to the Owner and Lloyd's Register (hereinafter referred to as 'LR') unless requested otherwise.
- **EB** for external blast assessment.
- **IB** for internal blast assessment.
- FP for fragmentation protection.
- SP for small arms protection.
- SH for assessment against underwater explosion (shock).
- WH for whipping assessment.
- RSA for a residual strength assessment, see Vol 1, Pt 6, Ch 4, 4 Residual Strength Assessment, RSA.

■ Section 2

External blast

2.1 General

- 2.1.1 Structures and their response to air blast loadings, can be considered to fall into two categories:
- Diffraction-type structures.
- Drag-type structures.
- 2.1.2 In a nuclear type explosion, the diffraction-type structures would be affected mainly by diffraction loading and the drag-type structures by drag loading.

246

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 2

- 2.1.3 Large flat sided structures, with few openings, will respond mainly to diffraction loading because it will take an appreciable time for the blast wave to engulf the structure and the pressure differential between front and rear exists during the whole of this period. A diffraction-type structure is primarily sensitive to the peak over-pressure in the shock wave to which it is exposed.
- 2.1.4 If structures are small, or have numerous openings, the pressures on different areas of the structure are quickly equalised; the diffraction forces operate only for a very short time. The response of this type of structure is then mainly due to the dynamic pressure (or drag forces) of the blast wind. This is typical of masts and funnels. The drag loading on the structure is determined not only by the dynamic pressure but also by the shape of the structure. The drag coefficient is less for rounded or streamlined structures than for irregular or sharp edged structures.
- 2.1.5 The relative importance of each type of loading in causing damage will depend upon the type of structure as well as the characteristics of the blast wave.

2.2 Threat level determination

- 2.2.1 Ships complying with the requirements of this Section will be eligible for the notation **EB1, EB2, EB3** or **EB4** as defined in *Vol 1, Pt 4, Ch 2, 2.3 Notation assessment levels and methodology.*
- 2.2.2 External blast loading can come from a variety of threats the two main ones are far field from nuclear or fuel air type threats and near field from detonation by close in weapon systems. This part of the Rules is concerned only with the far field explosions.
- 2.2.3 The actual threat level used in the calculation of performance and the areas of the ship to be protected by this design method are to be specified by the Owner and will remain confidential to LR.

2.3 Notation assessment levels and methodology

- 2.3.1 Design to withstand increasing levels of blast pressure needs to employ increasing sophistication and complexity of analysis method if the structure is to be kept lightweight.
- 2.3.2 An **EB1** assessment method may utilise the simple design methodology suggested in *Vol 1, Pt 4, Ch 2, 2.8 Conventional explosive pressure loads* for structural assessment. The design criteria should ensure that the structure behaves in an elastic perfectly plastic manner with small displacements when subjected to the proposed blast level.
- 2.3.3 An **EB2** assessment method may utilise an extension of simple design methodology suggested in *Vol 1, Pt 4, Ch 2, 2.8* Conventional explosive pressure loads to look at the elasto-plastic behaviour for the structural assessment. The structure is to be designed such that maximum displacements experienced by all structure does not compromise the structural integrity, water or gas-tight integrity or functioning of critical items of equipment required for operation of the ship and systems that is attached or adjacent to the structure.
- 2.3.4 An **EB3** assessment method should employ a failure criterion based on an elasto-plastic methodology which considers the following structural responses:
- Local response of the plating, here the plating can be represented as a 2D plate strip and a large displacement, elasto-plastic dynamic response analysis carried out using a beam-column approach.
- Local bending response of stiffened panels, the preferred model will be to evaluate the non-linear dynamic response of a single stiffener with an attached strip of plating modelled as a beam-column with the appropriate boundary conditions under blast pressure.
- A lumped parameter model can be employed to look at 'overall sidesway' response of a ships superstructure.

The structure is to be designed such that maximum displacements experienced by all structure does not compromise the structural integrity, water or gas-tight integrity or functioning of critical items of equipment required for operation of the ship and systems that are attached or adjacent to the structure.

- 2.3.5 An **EB4** assessment method should employ a full non-linear analysis using finite element methods to predict the structural response. Using this methodology it is assumed that the ship must survive, this implies the need to retain primary hull structural integrity, water and gas-tight integrity or functioning of critical items of equipment required for operation of the ship and systems that is attached or adjacent to the structure.
- 2.3.6 For **EB3** and **EB4** notations, the assumptions made for initial deformations are to be submitted. Where these differ for normal ship building practice, the details are to be recorded on the approved plan.

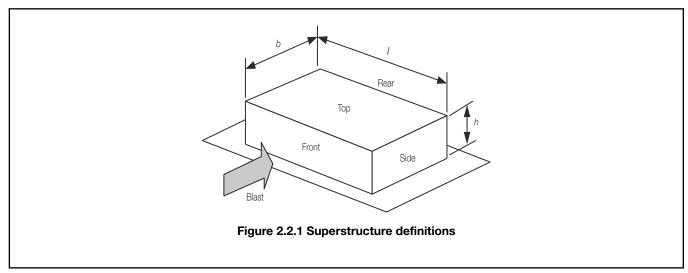

Military Load Specification

Volume 1, Part 4, Chapter 2

Section 2

2.4 Definitions

- 2.4.1 Atmospheric pressure P_0 is to be taken as 101,3 kN/m².
- 2.4.2 The dimensions of superstructure blocks are given in Figure 2.2.1 Superstructure definitions.

2.5 Blast pressure loads

2.5.1 For explosions of different magnitude, the range at which the peak blast incident and dynamic pressures occur can be scaled using the following equation.

$$D_{\rm i} = D_{\rm n} \left(\frac{1000}{W}\right)^{1/3} \text{ where}$$

 D_i = incident distance

 D_n = the distance at which the pressure occurs, in metres

W = the equivalent weight of TNT for the explosive, in kg.

2.5.2 Similarly for weapons of a different magnitude, the duration t_{p+} of a blast can be scaled using the scaling equation

$$t_{\rm i} = t_{\rm n} \left(\frac{1000}{W}\right)^{1/3}$$
 where

 t_i = incident duration

 t_n = duration the pressure occurs, in seconds

W = the equivalent weight of TNT for the explosive, in kg.

2.5.3 When a pressure shock front strikes a solid surface placed normal to the direction of shock travel there is an instantaneous rise in pressure above that of the shock front itself. The total pressure referred to as the reflected pressure is given by:

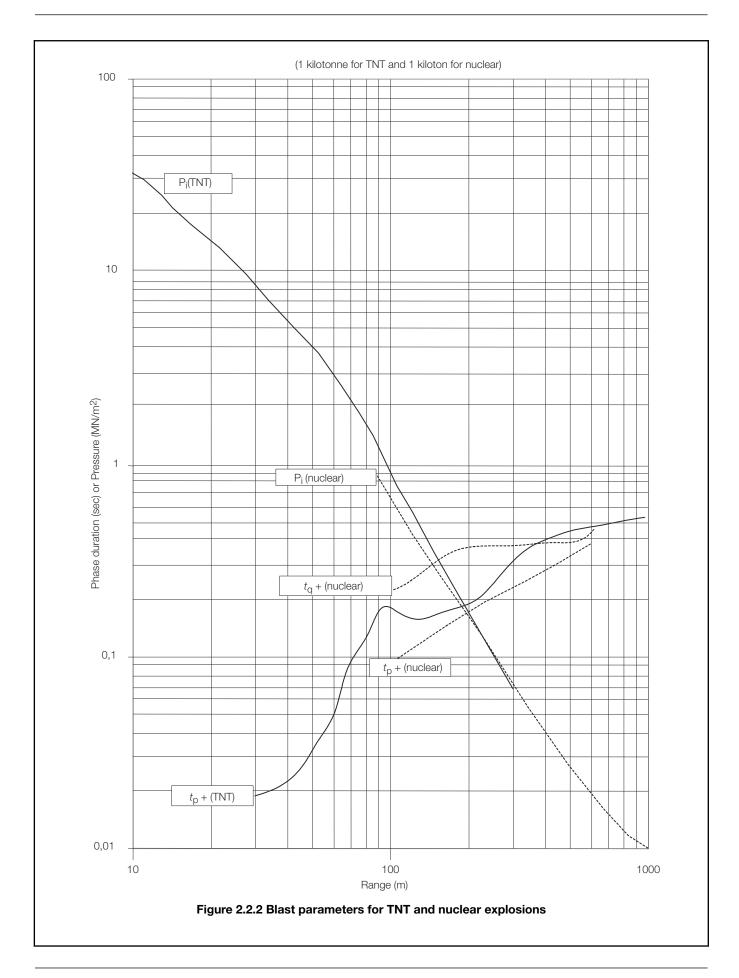

$$P_{\rm r} = 2P_{\rm i}(7P_{\rm o} + 4P_{\rm i})/(7P_{\rm o} + P_{\rm i}) \,\mathrm{kN/m}^2$$

when $P_i \ll P_o$ (small charge at large stand off) P_r may be taken as $2P_i$ similarly when $P_i >> P_o$ (large charge at short range) P_r may be taken as $8P_i$

where P_i = peak blast incident over-pressure in kN/m² from Figure 2.2.2 Blast parameters for TNT and nuclear explosions

248

Section 2

Section 2

2.5.4 The reflected pressure, $P_{\rm r}$ can be assumed to diminish linearly until it reaches the stagnation pressure $P_{\rm s}$ at time $t_{\rm s}$ where

 $t_{\rm s} = 3d/U \, seconds$

where

 $d = \text{is the lesser of } h \text{ or } \times /2 \text{ in metres, see } \textit{Figure 2.2.1 Superstructure definitions}$

U = shock front velocity in m/s

$$= U_0 \sqrt{1 + 6P_1/7P_0}$$

 U_0 = speed of sound in air in m/s

 $= 332+0.6T_{0}$

 T_{o} = ambient air temperature in °C.

2.5.5 The passage of the blast is immediately followed by a transient 'blast wind' that exerts a supplementary dynamic pressure which is given by:

$$q_i = 2,5(P_i^2/(7P_o + P_i)) \text{ kN/m}^2$$

where

P_i = peak blast incident over-pressure in kN/m² from Figure 2.2.2 Blast parameters for TNT and nuclear explosions

The duration of the dynamic pressure, t _{q+}, can be determined from Figure 2.2.2 Blast parameters for TNT and nuclear explosions.

2.5.6 The stagnation pressure, P_s , is determined for the front of the superstructure block by

$$P_s = P_i + C_D q_i \, \text{kN/m}^2$$

and for the top, sides and rear by

$$P_{\rm s} = P_{\rm i} - C_{\rm D} q_{\rm i} \, \rm kN/m^2$$

where

P_i = peak incident pressure from Figure 2.2.2 Blast parameters for TNT and nuclear explosions

q_i = the dynamic pressure from Vol 1, Pt 4, Ch 2, 2.5 Blast pressure loads 2.5.5

 C_D = the drag coefficient of the structure from *Table 2.2.1 Drag coefficients*.

Table 2.2.1 Drag coefficients

Structure	Drag coefficient, C_{D}
Ship sides	+1,0
Front face	+1,0
Top and sides	
0–170 kN/m ²	+0,4
170–340 kN/m ²	+0,3
340–930 kN/m ²	+0,2
Masts and funnels	+0,75

2.5.7 For the top and sides of the superstructure the peak pressure will occur at time t_{t} which is given by:

 $t_t = b/U$ seconds

where

b = superstructure breadth in m, see Figure 2.2.1 Superstructure definitions

U = shock front velocity in m/s, see Vol 1, Pt 4, Ch 2, 2.5 Blast pressure loads 2.5.4.

2.5.8 For the rear of the superstructure the peak pressure will occur at time t_r which is given by:

 $t_t = b/U + 4d/U$ seconds

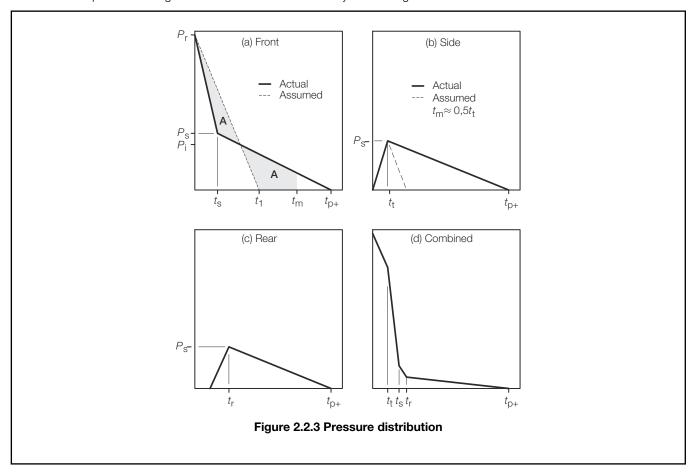

where

 $d = \text{is the lesser of } h \text{ or } \times /2, \text{ in metres, see } \textit{Figure 2.2.1 Superstructure definitions}$

b = superstructure breadth, in metres, see Figure 2.2.1 Superstructure definitions

U = shock front velocity, in m/s.

2.5.9 Pressure distributions for the faces of the superstructure block are given in *Figure 2.2.3 Pressure distribution*, together with the overall pressure acting on the block which is obtained by subtracting the forces on the rear face from those on the front.

2.6 Nuclear threats

2.6.1 An atmospheric nuclear explosion is most likely to occur at some height above ground level at a location known as ground zero, which may be optimised to produce maximum damage effects. The blast wave is reflected from the surface and at a certain distance from ground zero, primary reflected waves combine to form a vertical 'mach' front or stem that propagates outwards from ground zero with diminishing intensity. The peak blast incident over pressure P_i can be determined from Vol 1, Pt 4, Ch 2, 2.3 Notation assessment levels and methodology.

2.7 Fuel air pressure loads

- 2.7.1 In general a structure designed to resist a moderate degree of nuclear blast will also have a reasonable resistance to fuel air threats and calculations is not normally required.
- 2.7.2 Where there is a risk of fuel air explosions, and for ships for which there is no nuclear threat position required, consideration needs to be given to the blast wave characteristics of such explosions, see also Vol 1, Pt 4, Ch 2, 3.1 General.
- 2.7.3 The effects of temperature on the material of the structure due to fuel air threats are to be considered using the structure surface temperature.

2.8 Conventional explosive pressure loads

- 2.8.1 Blast waves caused by free field explosions in air are dependent upon the mass shape and type of explosive, the distance from the target and the height of the burst. As blast waves travel through air, rapid variations occur in pressure, density, temperature and particle velocity.
- 2.8.2 For a given high explosive of an equivalent TNT mass at a direct distance from the target Section *Vol 1, Pt 4, Ch 2, 2.3 Notation assessment levels and methodology* can be used to determine the blast parameters.

2.9 Structural assessment

- 2.9.1 The rules for the **EB1** and **EB2** structural assessment are based on the assumption that the structure can be idealised as a single degree of freedom system. They assume that there is no significant loading on the superstructure or ship's sides at the time of the blast. In cases where there are significant lateral loadings or concentrated point loads or fluids, the natural frequency and strength of the structure will be specially considered.
- 2.9.2 The acceptance criteria based contained in this section assume that the structure is loaded beyond its elastic limit but not such that significant deformations result.
- 2.9.3 For plating the thickness is not to be less than:

$$t = \sqrt{\frac{f_{\text{DLF}}P_{\text{p}}ls^{2}}{6f_{\sigma}\sigma_{o}(s + f_{\text{p}}l)}} \,\text{mm}$$

where

I = the length of the plate panel, in metres

s = width of the panel, in mm (short span length)

 σ_0 = yield stress of the material, N/mm²

 f_{p} = plate aspect ratio factor, see Table 2.2.2 Plate factors

 $f_{\sigma} = stress factor$

= 1,3 for $\sigma_0 \le 300 \text{ N/mm}^2$

= 1,2 for $\sigma_0 > 300 \text{ N/mm}^2$

 $P_{\rm p}$ = the peak pressure, $P_{\rm r}$, for the front of the superstructure, or $P_{\rm s}$ for the top sides and rear, as defined in Vol 1, Pt 4, Ch 2, 2.5 Blast pressure loads, in KN/m

f DLF = dynamic load factor to be determined from Vol 1, Pt 6, Ch 2, 5 Dynamic loading:

= for superstructure front and ship sides using a linearly decreasing load with initially:

 $= t_1 = P_r t_s/P_s$ seconds

= if $t_{\rm m}$ determined from Vol 1, Pt 6, Ch 2, 5 Dynamic loading is greater than 1,1 $P_{\rm r} t_{\rm s}/P_{\rm s}$ then $f_{\rm DLF}$, is to be recalculated such that:

$$= t_1 = t_s + \frac{P_s}{P_r} \left(t_p - t_m \left(\frac{t_p + t_m}{t_p + t_s} \right) \right)$$
seconds

= For superstructure top, sides and rear using a triangular load with:

252

where

 $= t_1 = 2t_t$ seconds

= t_1 = $2t_r$ seconds as appropriate.

= where

P_r = peak reflected pressure as defined in Vol 1, Pt 4, Ch 2, 2.5 Blast pressure loads 2.5.3

P_s = stagnation pressure, as defined in Vol 1, Pt 4, Ch 2, 2.5 Blast pressure loads 2.5.6

 t_{m} = time at which maximum deflection occurs

 t_{p+} = positive blast pulse duration

 $t_{\rm s}$ = corresponding time at stagnation pressure, $P_{\rm s}$.

Table 2.2.2 Plate factors

Aspect ratio (A _R)	f _p
1,0	1000
0,9	916
0,8	858
0,7	817
0,6	775
<0,5	750

2.9.4 The minimum edge through thickness area of the plate is not to be less than:

$$A_{\tau} = \frac{1}{100s \tau_0} (6f_{pl}t^2 \sigma_0(s + f_p l) + f_{p2}P_{tm}l s^2) cm^2$$

where

= t, σ_0 , l, s are given in Vol 1, Pt 4, Ch 2, 2.9 Structural assessment 2.9.3

 τ_{o} = shear yield stress in N/mm²

 $P_{\rm tm}$ = Pressure at the time of maximum displacement, $t_{\rm m}$, in kN/m² based on assumed pressure distribution.

 f_{p1} , f_{p2} = shear load factors, given in Table 2.2.3 Plate shear factors.

Table 2.2.3 Plate shear factors

Aspect ratios/ I	short span sides		n sides long span side l	
	f _{p1}	f _{p2}	f _{p1}	f _{p2}
1,0	0,18	0,07	0,18	0,07
0,9	0,16	0,06	0,20	0,08
0,8	0,14	0,06	0,22	0,08
0,7	0,13	0,05	0,24	0,08
0,6	0,11	0,04	0,26	0,09
0,5	0,09	0,04	0,28	0,09

2.9.5 The stiffener and plate combination is considered to be satisfactory if the plastic modulus of the beam plate combination is greater than:

$$Z_{p} = \frac{f_{DLF}P_{p}lsl_{e}}{f_{bz}f_{\sigma}\sigma_{o}}cm^{3}$$

where

 $P_{\rm p}$, $f_{\rm DLF}$, $f_{\rm g}$ and $\sigma_{\rm o}$ are given in Vol 1, Pt 4, Ch 2, 2.9 Structural assessment 2.9.3

 $Z_{\rm p}$ = plastic section modulus of the stiffener and attached plate, in cm³

 $l_{\rm e}$ = effective length of the beam, in metres

l = the length of the beam, in metres

f_{bz} = beam support factor

= 12 for fully fixed

= 8 for simply supported

s = spacing of the beams, in mm.

2.9.6 The maximum elastic deflection given by:

$$\delta_{\chi} = 10^5 \frac{f_{\text{DLF}} P_{\text{p}} lsl_{\text{e}}^3}{f_{\text{hd}} EI} \text{mm}$$

is not to be greater than

$$\delta_{\text{max}} = \frac{1000l}{115} \text{mm}$$

where

 $P_{\rm p}$, $f_{\rm DLF}$, s, l and $l_{\rm e}$ are given in Vol 1, Pt 4, Ch 2, 2.9 Structural assessment 2.9.3

I =second moment of inertia cm 4

f_{bd} = beam support factor

= 384 for fully fixed

= 76,8 for simply supported.

2.9.7 The shear area of the stiffener web is not to be less than:

$$A_{\tau} = \frac{1}{100 \tau_{o}} \left(\frac{f_{sI} f_{bz} Z_{p} \sigma_{o}}{1000 l_{e}} + f_{s2} P_{tm} l_{s} \right) cm^{2}$$

where

= $Z_{\rm p}$, $\sigma_{\rm o}$, $I_{\rm e}$, $I_{\rm s}$ are given in Vol 1, Pt 4, Ch 2, 2.9 Structural assessment 2.9.3

= τ_{o} , P $_{tm}$ are given in Vol 1, Pt 4, Ch 2, 2.9 Structural assessment 2.9.4

= $f_{s,1}$, $f_{s,2}$ = shear load factors, given in Table 2.2.4 Beam shear factors.

= f_{bz} is given in Vol 1, Pt 4, Ch 2, 2.9 Structural assessment 2.9.5.

Table 2.2.4 Beam shear factors

Beam type	Location	f _{s1}	f _{s2}
Simply supported	Both ends	0,39	0,11
Fixed ends	Both ends	0,36	0,14

Volume 1, Part 4, Chapter 2

Section 3

Simple and fixed	Fixed end	0,43	0,12
	Simple support	0,26	0,19

- 2.9.8 Direct calculations or analyses based on the elastoplastic or plastic response of structure using a dynamic load factor or finite element approach will be specially considered. The designers' calculations are to be submitted for approval.
- 2.9.9 In addition to the assessment of plating and stiffeners, the global capability of superstructure and above water structure are to be assessed. The designers' calculations are to be submitted.

2.10 Design considerations

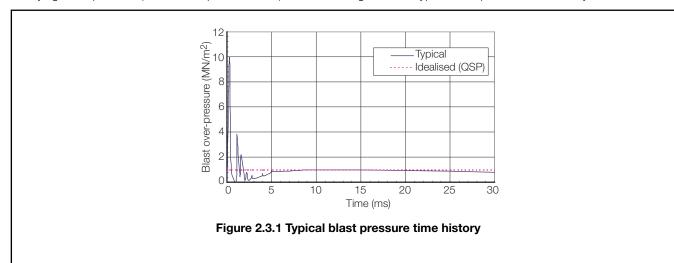

- 2.10.1 To minimise the effects of external blast, protrusions from the superstructure are to be kept to a minimum.
- 2.10.2 Re-entrant corners are to be avoided, where this is impractical they are to be covered by a blast deflecting plate, or be constructed such that the included angle between orthogonal faces is to be as large as possible.
- 2.10.3 Where the clear air gap between superstructure blocks is less than $0.1L_{\rm R}$, the interaction under external blast loading will be specially considered.

■ Section 3

Internal blast

3.1 General

3.1.1 Internal blast is defined as that which occurs from detonation of a high explosive from a hostile weapon or detonation of a ship's own ammunition inside the hull envelope. In an internal explosive loading situation the loading on a boundary can be characterised by a series of decaying reflected pressure waves (blast impulses) followed by the rapid formation of a slowly decaying static pressure (Quasi static pressure QSP) as shown in *Figure 2.3.1 Typical blast pressure time history*.

3.1.2 The magnitude of the initial blast impulse is related to the distance from structure under consideration to the explosion. The reflections are a function of the compartment geometry. The QSP is dependent on the compartment volume with the rate of decay related to the vent area.

3.2 Threat level determination

3.2.1 The threat protection levels for a given vessel should be determined through a vulnerability analysis against customer specified threat weapons. In the absence of such a study the following levels may be used as a guide:

Volume 1, Part 4, Chapter 2

Section 3

- Level I Watertight bulkheads at $R_{4N} \ge 1$ and zone bulkheads at $R_{4N} > 1$
- Level II Watertight bulkheads at $R_{4N} \ge 1,5$ and zone bulkheads at $R_{4N} > 2$
- Level III Watertight bulkheads at $R_{4N} > 3$ and zone bulkheads at $R_{4N} > 3$

R_{4N} is the normalised blast resistance 2,5 m high, 4 mm thick, mild steel, fillet welded bulkhead.

3.3 Notation assessment levels and methodology

- 3.3.1 The Rules are aimed at limiting the spread of blast damage to compartments adjacent to that directly affected by the explosion. For an explosion where the ratio of charge size to compartment volume is small, it may be possible to limit the damage to the affected compartment.
- 3.3.2 Ships complying with the requirements of this section will be eligible for the **IB1** notation. Where further analysis or testing is used to determine the blast resistance of the structure an **IB2** notation may be assigned.
- 3.3.3 For the **IB2** notation, the assumptions made for initial deformations are to be submitted. Where these differ from normal ship building practice, the details are to be recorded on the approved plan.
- 3.3.4 There are specific scenarios such as fuel air explosions within aircraft hangars where the internal blast wave characteristics will need to be specially considered on request.

3.4 Materials

- 3.4.1 For level **III** protection all plate bulkhead materials are to have a sulphur content less than 0,01 per cent. This may be achieved by the specification of through thickness properties in accordance with the requirements of *Ch 3*, 8 *Plates with specified through thickness properties* of Rules for Materials.
- 3.4.2 Consideration should be given to the use of austenitic electrodes for fillet welding of ferritic materials subject to high strain loading. In selecting the filler material, consideration is to be given to the material's proof strength and elongation; the 0,2 per cent proof stress of the filler material as welded is to match the strength of the ferritic parent steel plate, and the elongation to failure is to be as great as possible. Care should be taken to ensure that coatings are maintained as far as practicable. Where such materials are in wet or immersed areas, special attention is to be given to corrosion protection and the selection of a material that is not prone to chemical or electro-chemical attack. Details of the weld procedure are to be submitted for approval.

3.5 Quasi static pressure

- 3.5.1 Structural failure can be caused by either the impulsive loading or the dynamic loading imparted by the combined blast waves and QSP. Normally if the weapon is sufficiently large to cause failure by impulse it will also fail under a dynamic loading assessment based on a step function to the QSP level. For the purposes of general design the step function to the QSP level assessment can be used as the loading criteria to determine failure. Safety or mission critical areas should be specially considered.
- 3.5.2 The actual threat level used in the calculation and areas of the ship to be protected are to be specified by the Owner and will remain confidential to LR.
- 3.5.3 The QSP can be determined from the following:

$$P_{\rm qs} = 2,25 \, (W_{\rm e} / V)^{0,72} \, \text{x} 10^3 \, \text{kN/m}^2$$

where

 $P_{\rm qs}$ = quasi static pressure, in kN/m²

 $W_{\rm e}$ = weapon equivalent weight of TNT, in kg

V =free compartment volume, in m^3 .

3.6 Structural resistance

3.6.1 The blast resistance for a given bulkhead material, thickness and joint style can be determined as a proportion of 2,5 m high, 4 mm thick, mild steel, fillet welded bulkhead using the following formula based on a combination of explosive tests and analytical techniques:

$$R_{4N} = (K_j + K_m) t/l$$

Volume 1, Part 4, Chapter 2

Section 3

where

- $=R_{4N}$ is the normalised blast resistance 2,5 m high, 4 mm thick, mild steel, fillet welded bulkhead
- = $K_{\rm m}$ is the material type factor, see Table 2.3.1 Material type factor, $K_{\rm m}$
- = K_j is the joint type factor, see Table 2.3.2 Joint type factor, K_j
- = t is the thickness of steel, in metres
- = l is the short span length, in metres.

Table 2.3.1 Material type factor, $K_{\rm m}$

Steel grade	K _m
A, D, E, AH32, AH36	0
DH32, EH32	86
DH36, EH36	196

Table 2.3.2 Joint type factor, K_i

Joint style	Kj	Note
Normal fillet weld	625	Valid up for $t_{bh} \le 8 \text{ mm}$
Full penetration weld	665	Valid for t _{bh} ≤ 12 mm
Austenitic fillet weld	701	Valid for $t_{bh} \le 6 \text{ mm}$

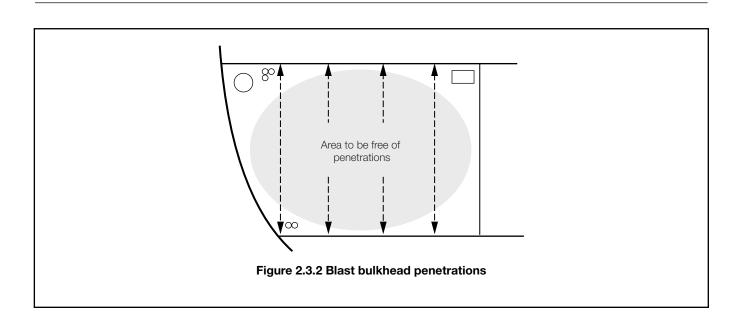

Note

Values of K_j up to 1200 can be achieved using blast resistant bulkhead designs.

- 3.6.2 The primary mode of failure for bulkhead structures is through the edge connection. Alternatives to the basic fillet weld have been assessed and incorporated in the joint type factor presented in *Table 2.3.2 Joint type factor, K*_i.
- 3.6.3 Alternative joint types may be used but are to be categorised using a dynamic joint test and blast assessment. For novel designs a further large scale controlled blast test of the proposed arrangement is to be tested. LR can provide details of the test and analysis requirements on request.

3.7 Bulkhead arrangements

3.7.1 Piping that passes through the bulkhead is to be fitted with expansion pieces either side of the bulkhead. In addition, piping and other penetrations are to be arranged at the edges of the bulkhead where the relative movement is less as shown in Figure 2.3.2 Blast bulkhead penetrations.

- 3.7.2 Bulkhead attachments are to be kept to a minimum and designed for good dynamic performance.
- 3.7.3 The strength of doors if fitted will be specially considered. Steps are to be taken to prevent their detachment from or pushing through the surrounding structure.
- 3.7.4 Consideration should be given to the use of flexible collars around deep girder penetrations through the blast bulkhead to allow relative movement but retain watertight or gas-tight integrity.
- 3.7.5 Under blast loading, large displacements of the bulkhead may occur. Any nearby structure or equipment is to be located so as to provide a minimum clearance of 350 mm from the bulkhead. This distance is generally appropriate for deck heights of between 2 m and 3 m. The minimum clearance for other deck heights will be specifically considered.

■ Section 4

Fragmentation protection

4.1 General

- 4.1.1 This section does not deal with the loss of structural strength due to material perforation. It is only concerned with fragmentation protection of equipment and personnel within critical compartments and potentially critical pipe and cable runs.
- 4.1.2 Fragment and small arms penetrators can be stopped by the use of structure designed to prevent penetration, either through the use of increased thickness of normal structural materials, suitable siting of compartments, addition of armour (non-structural) materials, or even the use of armour material that can take structural loads.
- 4.1.3 The Rules give design data based on fragment penetration equations for three representative threats. The selection and use of fragment penetration equations or computer modelling for other threats will be considered provided they are carried out by a competent body which has relevant experience and employs recognised procedures.
- 4.1.4 For fragmentation protection to be effective, materials within the ship forming part of the ship's equipment and outfit shall be of a type that is not prone to the generation of secondary fragments or 'splinters'. Materials such as wood, brittle plastics and brittle cast materials are not to be used in protected compartments. Where the use of such materials is essential, consideration may be given to the use of bonded splinter-retaining membranes.
- 4.1.5 RATTAM is defined as the response to attack on ammunition and describes protection fitted externally to the ship to prevent the penetration of particular threats which may cause damage, principally to magazines. Similar protection may also be fitted to protect other critical compartments, both are covered by the **SP** notation.

Volume 1, Part 4, Chapter 2

Section 4

4.2 Threat level determination

- 4.2.1 The threat may be classified as either small arms fire or fragments from the casing of shells or warheads ('shrapnel' or 'splinters') capable of perforating the ship's structure and thus causing damage to equipment or casualties amongst personnel.
- 4.2.2 Three levels of protection are shown in *Table 2.4.1 Fragment threat types*. They are from a combination of internally and externally detonating threats. Alternative levels will be considered in accordance with *Vol 1, Pt 4, Ch 2, 4.5 Structural requirements 4.5.2*.
- 4.2.3 The actual threat level and type used in the calculation and the areas of the ship to be protected are to be specified by the Owner and will remain confidential to LR.

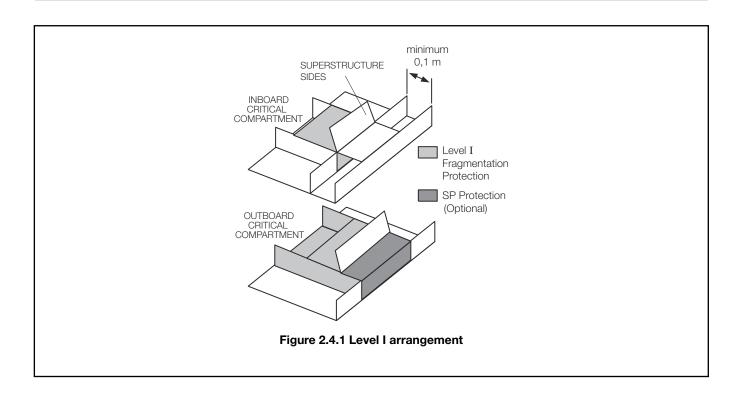

Table 2.4.1 Fragment threat types

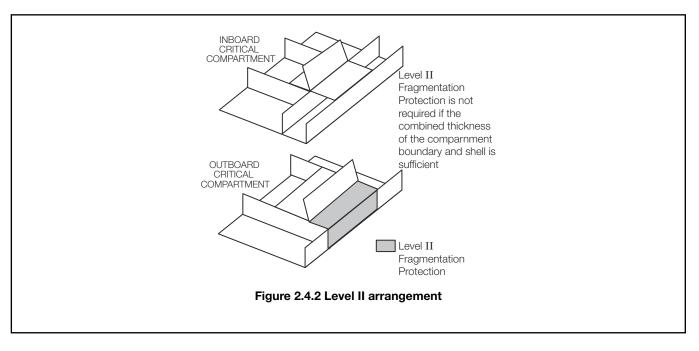

Level	Typical threat origin	Fragment weight (g)	Initial fragment velocity (m/s)
ı	Aircraft fired 30 mm high explosive (HE) cannon shell	up to 1 g	less than 1250
II	Proximity detonating 105 mm Artillery round	up to 15 g	less than 1250
III	Sea Skimming (SAP) missile	up to 55 g	less than 1400

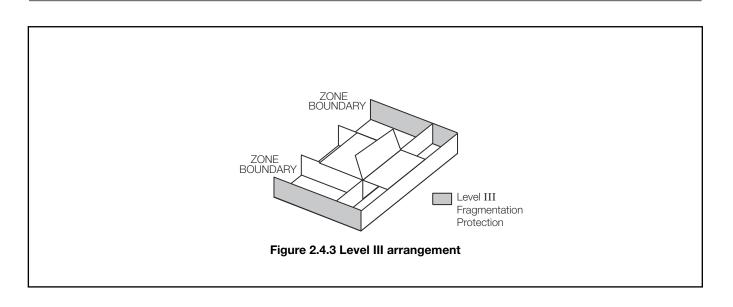

- 4.2.4 The Level I threat is assumed to detonate on impact with the ship's structure in the act of which it will penetrate the outer skin of the vessel. Fragmentation protection will reduce the risk of fragments penetrating additional compartments. The ends, internal sides and decks of critical compartments are in general to be fitted with protection, an example of which is shown in Figure 2.4.1 Level I arrangement, see also Vol 1, Pt 4, Ch 2, 4.3 Notation assessment levels and methodology 4.3.2. The outer skin of the ship may be strengthened to resist the shell in accordance with the requirements for the **SP** notation, however it will usually require a significant amount of armour.
- 4.2.5 Level II considers a threat posed by an externally detonating shell. Strengthening is, in general, to be fitted to the external skin of the ship to protect the critical internal spaces, an example of which is shown in *Figure 2.4.2 Level II arrangement*, see also *Vol 1*, *Pt 4*, *Ch 2*, *4.3 Notation assessment levels and methodology 4.3.2*. For this level of protection a stand off distance for the weapon is to be specified by the Owner.
- 4.2.6 The Level III threat is a generic weapon based on a sea skimming anti-ship weapon with a semi armour piercing, (SAP) warhead that detonates within the hull. Fragmentation protection is intended to reduce the risk of fragments penetrating additional compartments. The considerable amount of protection required will normally mean that protection is only fitted at zone boundaries to limit the longitudinal spread of fragments. See example in *Figure 2.4.3 Level III arrangement* and also *Vol 1, Pt 4, Ch 2, 4.3 Notation assessment levels and methodology 4.3.2.*
- 4.2.7 The examples given in *Figure 2.4.1 Level I arrangement* show a compartment immediately under the main deck with deckhouse over subject to a side-on attack. Where the critical compartment is fitted directly below an external deck, in a deckhouse or the threat is directly above the compartment, protection is to be arranged using the principles given in examples in *Figure 2.4.1 Level I arrangement*.

Volume 1, Part 4, Chapter 2

Section 4

4.3 Notation assessment levels and methodology

- 4.3.1 The fragmentation protection **FP1** and **FP2** notations are assigned for ships which have protection fitted to resist fragments from the casing of a shell or warhead. The small arms protection, **SP** notation is assigned for ships fitted with protection to resist the penetration of small arms fire into the hull. For ships where the fragmentation resistance is carried out using the Tables and graphs of this section an **FP1** notation is assigned. Where fragmentation testing or analysis is used to determine the fragmentation resistance required a **FP2** notation is assigned.
- 4.3.2 The pressure produced by a Level II threat is such that an IB notation is not required. The Level II threat is external and of a level such that an EB notation will not be required. A Level III threat will require the effect of the internal blast pressure on the structure to be considered and IB and RSA notations will generally be required.

4.4 Information required

- 4.4.1 For each threat level it will be necessary to identify the critical compartments requiring protection, plus the critical pipe and cable runs where appropriate. Plans are to be provided showing the location and manner of all fragmentation and terrorist attack protection.
- 4.4.2 Where alternative tests or calculations have been carried out full details are to be submitted. They are to include details of the organisation involved, their experience, test or calculation procedures and the program or equations used.

4.5 Structural requirements

- 4.5.1 Where different threats, materials or multiple plate arrays are fitted alternative methods may be used to determine the fragmentation resistance, for example:
- Penetration equations.
- Finite element and fluid-codes.
- Experimental methods.

Ascending the levels of calculation complexity is not simply a matter of increased cost in design, the increased complexity potentially offers the reward of reduced protection requirement for the given threats.

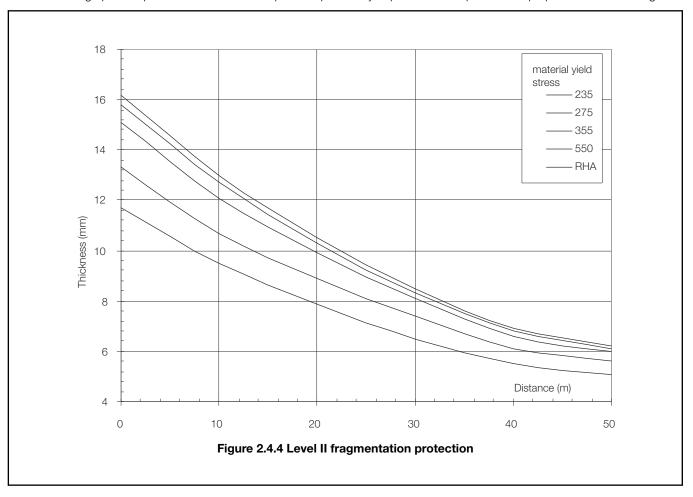

- 4.5.2 Armour spaced normal to the threat can reduce the total thickness by up to 30 per cent. It may also be effective for bullets provided the gap between plates is greater than 1,0 m.
- 4.5.3 For Level I fragmentation protection, the equivalent thickness of steel is to be in accordance with *Table 2.4.2 Level I fragmentation protection*.
- 4.5.4 For Level **II** fragmentation protection, the equivalent thickness of steel is to be determined from *Figure 2.4.4 Level II* fragmentation protection.

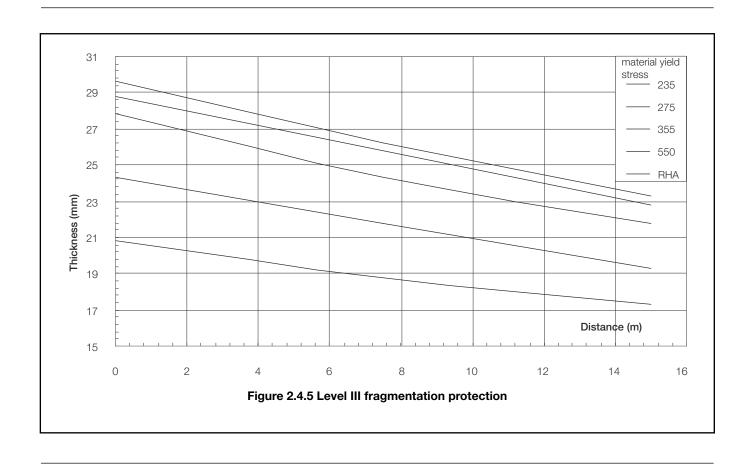

Table 2.4.2 Level I fragmentation protection

Material yield strength N/mm ²	Transverse bulkhead or deck thickness mm	Longitudinal bulkhead thickness mm	
235	6,5	6,0	
355	6,0	5,5	
550	5,5	5,0	
RHA	5,0	4,5	
Note RHA is defined as rolled homogenous armour.			

4.5.5 For Level **III** fragmentation protection, the equivalent thickness of steel is to be determined from *Figure 2.4.5 Level III* fragmentation protection. Protection will normally be required to be provided by several bulkheads or specific armour and the graph can serve only as a guide. The structural protection for this type of threat will generally be specially considered based on the particular weapon characteristics and protection arrangements. It should also be noted that many modern missiles generate controlled fragments which will need special consideration.

4.5.6 The graphs are produced based on a 50 per cent probability of perforation for penetrators perpendicular to the target.

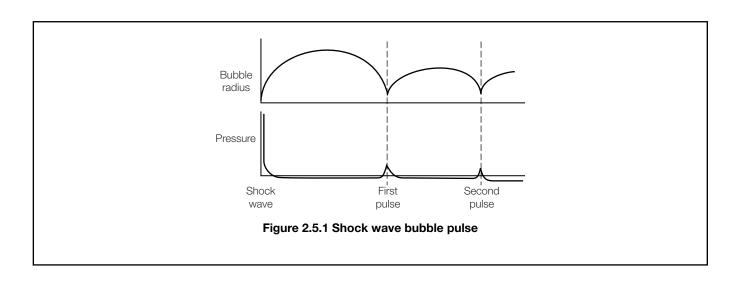

Section 5

Underwater explosion (shock)

5.1 General

- 5.1.1 There are two principal loading mechanisms associated with the underwater detonation of a conventional high explosive ordnance:
- shock wave loading;
- bubble flow loading.
- 5.1.2 The energy released is in general, equally divided between shock wave energy and the energy contained within the superheated high pressure bubble of gaseous explosion products.
- 5.1.3 The shock wave generated as the detonation wave passes into the water is a highly non-linear pressure pulse which propagates at a speed well in excess of the speed of sound in water (approximately 1500 m/s). However, within a few charge radii of the detonation point, it can be mathematically defined as an acoustic pressure pulse travelling at the speed of sound. Its amplitude falls off inversely with distance and its profile can be characterised by a pulse which has an infinite rise to a peak pressure followed by an exponential decay. The peak value and decay rate at a given field point are given by the similitude equations/coefficients for the explosive material.
- 5.1.4 In the meantime, the gas bubble begins to expand against the ambient hydrostatic pressure displacing water radially outward as incompressible flow. As it expands, it loses pressure and temperature but the inertia of the outwardly flowing water leads to an overshoot of the equilibrium state so that at maximum bubble radius, the gas pressure is well below the ambient. This initiates the collapse sequence, the gas bubble is recompressed, slowly at first but then rapidly, to a minimum volume by the hydrostatic forces. Because of the generation of a large pressure in the bubble during this stage the bubble begins to expand again and several other cycles may follow. The gas bubble and water interaction can be thought of as a gas spring mass system. It has a periodicity associated with it but because of energy losses during the process, the spring constant and mass changes over each cycle leading to a change in the periodicity. At each minimum, that is, each recompression, additional pressure pulses are emitted which become weaker with each oscillation as shown in *Figure 2.5.1 Shock wave bubble pulse*.

- 5.1.5 The bubble is pulsating in a gravitational field and will have a tendency to migrate to the water/air boundary (the free surface). However, this bodily motion of the bubble centre may be influenced by the proximity of other boundaries such as the seabed or a nearby ship structure. The rate at which a bubble will migrate to the free surface is a function of the buoyancy forces generated when it is at its maxima and of the drag forces it experiences as it moves through the water. Because these drag forces are small when the bubble is at its minima, it tends to migrate vertically upwards more rapidly when at its smallest volume.
- 5.1.6 The fluid flow generated by the bubble dynamics is an important loading mechanism for a structure, within its sphere of influence. Normally bubble loading can be ignored if the bubble never approaches within a distance of around ten times the maximum bubble radius. The important feature of the bubble loading is its low frequency which is ideally suited to induce ship hull girder flexural motion. This flexural motion is commonly referred to as hull girder whipping. This loading mechanism is dealt with in Vol 1, Pt 4, Ch 2, 6 Whipping. If the bubble is within one bubble radius of the ship structure, it is likely to form a jet which will impact on the structure. This bubble collapse mechanism will cause extensive local damage. It is generally not possible to efficiently design against this loading event for a **NS2** or **NS3** ship. For a **NS1** ship there may be sufficient residual strength to withstand such damage, but the extent of the damage will need to be determined by a specialist calculation and the capability of the hull using a residual strength assessment, see Vol 1, Pt 4, Ch 2, 7 Residual strength.
- 5.1.7 The shock wave loading is greatest at a point on the structure nearest to the detonation event and because of the fall-off with distance and the narrowness of the pulse width, it can be thought of as a local loading event. (In contrast, the bubble induced whipping of the hull girder is considered a global loading event.) The remainder of this section will focus on the shock loading event only.
- 5.1.8 There are no simple analytical or numerical techniques for reliably determining the shock resistance of a structure. A measure of the resistance to shock loading can be achieved by good design of the details of the structure to avoid stress concentrations which may lead to rupture. It is also possible to ensure that the plating thickness is matched to the assumed performance of the joints using a simple damage law. The inertial loads on the ship's structure caused by the equipment and its seatings can be determined by time domain analysis.
- 5.1.9 The shock performance of a ship's hull structure can be assessed solely by conducting shock tests (usually at scale). However, cost usually precludes this approach and a better strategy is to combine tests to determine failure criteria with numerical modelling using Finite Element methods. This complementary experiment /numerical simulation approach reduces the amount of testing required and also provides a method for extrapolating to full scale from scaled experiments.
- 5.1.10 Generally, for a normal ship structure, the explosion required to cause uncontrollable flooding or total loss of propulsive power or loss of mission system effectiveness (radars, electronics, etc.) is much less than that required to cause failure of a hull designed for normal sea loads.
- 5.1.11 Due to operational requirements, some vessel types, such as minesweepers, will be required to resist repeated shock loading at a specified level without degradation of the system or structural performance. Such vessels will also be expected to survive a single attack at a considerably higher shock loading level.

5.2 Threat level determination

5.2.1 The actual threat level used in the calculation of performance and the areas of the ship to be protected by this design method are to be specified by the Owner and will remain confidential to LR.

Volume 1, Part 4, Chapter 2

Section 5

- 5.2.2 Loading levels may be specified with varying degrees of structural and system degradation to define the shock performance of the vessel. An important consideration is the balance that has to be achieved between system functionality and structural performance.
- 5.2.3 Two performance bounds can be considered for the shock response of structure:
- The first performance bound (lower bound) relates to the onset of material yield (assuming that careful design has ensured
 that no buckling will occur before this state is reached). This level is useful to know as it may have consequences for system
 functionality. For example, there may be problems associated with equipment mis-alignment because of the permanent set of
 the supporting structure.
- The second performance bound (upper bound) relates to removal or rupture of material; this being the loading level at which there is no longer sufficient residual hull girder strength to resist normal environmental loading. This is addressed in a separate assessment which is defined by the residual strength notations **RSA1**, **RSA2** or **RSA3** in *Vol 1*, *Pt 4*, *Ch 2*, *7 Residual strength*. In conventional naval ships, this upper bound will be significantly higher; but there will be little, if any, system functionality.

5.3 Notation assessment methodology

- 5.3.1 The shock performance required is to be specified by the Owner and is to include requirements for:
- Local strength assessment;
- Detailed design;
- Seat design, shock mounts and system hangers;
- Hull valve design and integration;
- Global strength assessment;
- Shock qualification/testing of equipment;
- 1st of class shock trial.

It is recommended that seats, valves, piping and equipment are categorised into:

- equipment required to be capable of operation after the specified shock event;
- equipment that is required to be captive, with reduced or no operational capability after the specified shock event;
- equipment which has no requirements after the specified shock event.

See also Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.1.

- 5.3.2 Ships that comply with the minimum or enhanced requirements of this Section will be eligible for the shock notation SH.
- 5.3.3 For ships where the machinery is in class (**LMC** notation), and shock requirements for machinery and equipment are specified, the requirements of *Vol 2*, *Pt 1*, *Ch 3*, *4.11 Machinery shock arrangements* are to be complied with.
- 5.3.4 For the minimum shock capability, the design emphasis should focus on maintaining a high level of system functionality and reducing the risk of flooding.
- 5.3.5 For the assignment of the **SH** notation, the minimum requirement is for the structure to be designed to resist normal environmental loads in accordance with the Rules. For **NS1** ships, the inherent ruggedness in the Rules is sufficient for the structure to resist a low level threat. For **NS2** and **NS3** ships, the integrity of the hull plate and stiffeners is to be verified, using the simple formulae for pressure in *Vol 1*, *Pt 4*, *Ch 2*, *5.4 Local strength assessment 5.4.1*, and comparing the response to a specified standard. In addition, the hull valves below the waterline are to comply with the requirements of *Vol 1*, *Pt 4*, *Ch 2*, *5.8 Design guidance for hull valves, piping and seals*.
- 5.3.6 The minimum local assessment required by Vol 1, Pt 4, Ch 2, 5.3 Notation assessment methodology 5.3.5 can be enhanced by undertaking a more complex assessment as defined in Vol 1, Pt 4, Ch 2, 5.4 Local strength assessment, which accurately models the physics of the rapid, dynamic, fluid structure interaction problem.
- 5.3.7 In addition to the analysis, the **SH** notation can be enhanced by selecting detail design requirements to reduce the risk of fracture initiation and structural collapse, based on historical work on shock. Details are provided in *Vol 1*, *Pt 4*, *Ch 2*, *5.5 Detail design guidance*.
- 5.3.8 The **SH** notation may be further enhanced by undertaking shock trials in accordance with established procedures, on the first ship in the class. The magnitude of the test is normally less than the design value for the hull and at a level that is appropriate for the equipment and systems.

Volume 1, Part 4, Chapter 2

Section 5

5.3.9 Global assessment may be undertaken for the **SH** notation, using the residual strength procedures outlined in *Vol 1*, *Pt 4*, *Ch 2*, *7 Residual strength* with the extent of damage being defined from the results of the local strength assessment rather than the damage radii. For the **RSA1** procedure, the damaged structure is to be removed from the analysis. For the **RSA2** or **RSA3** procedure, if the damage is limited, the geometry of the damaged structure can be modelled and if the damage is severe, the structure is to be removed from the analysis. The structure is considered acceptable when the hull girder is able to withstand the design loads as specified in *Vol 1*, *Pt 5 Environmental Loads*.

5.4 Local strength assessment

5.4.1 For the notation **SH**, a simple analysis can be performed which allows the motion response at any point in the ship to be determined. This can be derived from experimental results or the Taylor plate equations given below. Once the motion response is known, the damage potential can be determined by comparing the response to a specified standard.

Maximum velocity

$$V_{\text{max}} = \frac{2P_{\text{m}}}{\rho \text{ c}} z^u \text{ m/s}$$

Time to maximum velocity

$$t_{\text{max}} = \frac{m}{\rho c} \left(\frac{1}{1-z}\right) \log_e \left(\frac{1}{z}\right)$$
 seconds

where

$$Z = \frac{m}{\rho c \theta}$$

$$U = \frac{z}{1-z}$$

 θ = decay constant of explosive charge in seconds

 $P_{\rm m}$ = peak pressure in N/mm²

 ρ = density of water in kg/m³

c = speed of sound in water in m/s

 $m = \text{structural mass per unit area in kg/m}^3$.

- 5.4.2 A more complex assessment method can be used to enhance the **SH** notation. Methods can be used which accurately model the physics of the shock event. At the simplest level, a finite element model of the structure coupled with a suitable boundary element from proprietary software may be used.
- 5.4.3 For complex ships such as multi-hull designs a boundary element approach may not be suitable and a volume element approach should be used. Also, if non-linear fluid behaviour is important (i.e. hull cavitation or bulk cavitation), then a volume element approach should be used, unless the finite element or boundary element code used has a suitable cavitation model.
- 5.4.4 The assessment method or analysis used should be validated against shock trial results and the evidence made available. As an alternative to analysis, full or large-scale shock trials of a section of the ship can be used to validate the proposed design. For novel design arrangements or ship types, a combination of trials and analysis may be necessary, the requirements of which will depend on the threat level and type of structure or ship design.
- 5.4.5 Any finite element analysis performed for local strength assessment is to be in accordance with the requirement of this Section for assignment of the **SH** notation.
- 5.4.6 The extent of the analysis model is to be from about $0.35L_{\rm R}$ to $0.55L_{\rm R}$ and encompass at least two major compartments and three watertight bulkheads. It is to be sufficiently large to avoid reflections within the structure from the boundaries, for the threats considered. For the assessment of structural strength, the structure need only be modelled to 1.0 m above the design water line. If the model is to be used to determine equipment response, all structure within that section should be modelled.
- 5.4.7 The model, or versions of the model, should encompass representative integral tank arrangements and hull penetrations, stabiliser inserts, hull valves, the failure of which could lead to uncontrollable flooding. Penetrations, the failure of

266

Volume 1, Part 4, Chapter 2

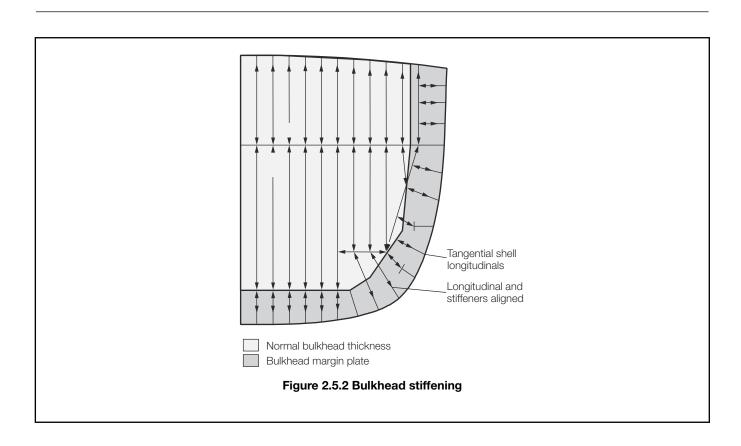

Section 5

which will not lead to significant flooding or damage, need not be considered. The tanks and penetrations need not actually be in the section under consideration but should be sufficiently similar to represent structure outside the region modelled.

- 5.4.8 All masses above 100 kg should be included in the model together with an approximation of the mounting system if applicable.
- 5.4.9 The model should include at least one major machinery item or raft.
- 5.4.10 The response of hull panels depends upon a large number of variables which are both design and attack geometry dependent. To simplify the task, the following assumptions can be made:
- The charge detonates in the worst location, perpendicular to the structure under consideration.
- All welding is continuous and there are no manufacturing or material defects in the panels.
- 5.4.11 During the analysis, appropriate elements are to be used to couple the fluid medium and the structural model.
- 5.4.12 The shock wave can be represented by an exponentially decaying, infinite rise time pressure pulse which sweeps across the structure at the speed of sound.
- 5.4.13 Non-linear structural modelling can be used in finite element analyses. If used, stiffeners should be modelled explicitly using shell elements of the appropriate thickness. Stiffener flanges should be modelled with at least two elements per half width or flange. Initial imperfections in the hull plating are to be taken into account prior to the dynamic loading analysis.
- 5.4.14 The structure is considered acceptable when:
- Elastic deflections are less than the temporary limits of machinery and systems.
- Permanent deflections are less than the limits of machinery and systems.
- Deflections and strain are less than the limits of the structure or applicability of the analysis method.

5.5 Detail design guidance

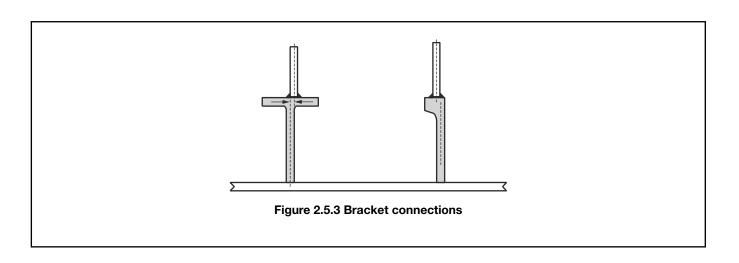

- 5.5.1 For enhanced shock performance, any of the following design details can be included in the design, which is based on historical shock testing and experience.
- 5.5.2 Tank boundaries are to be of equivalent scantlings to the hull boundaries.
- 5.5.3 Intermittent welding is not to be used on hull girder structure or tank boundaries below the water line or for 1 metre in way of the deck and shell connections.
- 5.5.4 Structural discontinuities are to be avoided and in general a minimum taper of 1:4 is to be applied to changes of structural section.
- 5.5.5 Bar keels are not to be fitted.
- 5.5.6 Tanks are to be integral with the ship's structure. For free standing tanks greater than 100 litres, calculations demonstrating the capability of the tank and supporting structure are to be submitted.
- 5.5.7 Main machinery mounts or raft mounts are to be supported on transverse web frames or floors forming part of the transverse ring structure. See Vol 1, Pt 3, Ch 2, 3.2 Primary members 3.2.2
- 5.5.8 The size of longitudinal members passing through, or ending on, bulkheads are to be as small as possible, though still complying with the appropriate scantling requirements of *Vol 1, Pt 6, Ch 3 Scantling Determination*. Bulkhead stiffeners are to be fitted perpendicular to the shell plating.
- 5.5.9 Where deep longitudinal members are unavoidable, their connection to the bulkhead will be specially considered.
- 5.5.10 Bottom longitudinals are to be of a uniform size. Alternate large and small longitudinals are to be avoided as they may lead to high shear forces in the bulkhead.
- 5.5.11 Access holes in all primary framing members are to be avoided in areas of high shear stress. Where they are essential to the operation of the ship they are to be circular and fitted with appropriate stiffening or compensation.
- 5.5.12 Frames on the bilge are to be provided with adequate lateral support, consideration should be given to the fitting of a shock stringer.
- 5.5.13 Lapped connections are not to be used to connect frames to floors.
- 5.5.14 All bulkhead stiffeners are to end on longitudinals, see Figure 2.5.2 Bulkhead stiffening.

- 5.5.15 In transversely framed ships, bulkhead stiffeners are to be terminated on a shock stiffener welded to the bulkhead, parallel to, and spaced 500 mm from the shell. The bulkhead plating thickness is to be suitably increased in way. The shock stringer and bulkhead plate may be replaced by a web frame of suitable scantlings.
- 5.5.16 Bulkhead penetrations are to be grouped, away from the side shell and kept above the water line as far as is practicable.
- 5.5.17 Shell frames and deck beams are to be fitted in such a way as to minimise misalignment. Brackets where fitted are to be radiused and fitted with soft toes.
- 5.5.18 Where the vessel is to be subjected to very high levels of shock, the following details can be included in the design.
- 5.5.19 Pillar bulkheads are to be used below the waterline in place of pillars.
- 5.5.20 It is recommended that symmetric stiffeners should be fitted to the to the underwater portion of the shell envelope.
- 5.5.21 Where a transverse framing system is used, the shock capability of the structure will be specially considered. Calculations supporting the use of particular design details are to be submitted.
- 5.5.22 All bulkhead stiffeners are to end on longitudinals, see *Figure 2.5.2 Bulkhead stiffening*. An increased thickness margin strake on bulkheads of thickness not less than 80 per cent of the adjacent shell plate thickness, the thickness of the adjacent shell stiffener or 6,5 mm. The margin plate is to have a width not less than 1,5 times the adjacent stiffener spacing or four times the depth of adjacent shell stiffeners.
- 5.5.23 Shell frames and deck beams are to be fitted in such a way as to minimise misalignment. The frames are to be fitted within a tolerance of 0,3 t_{fl} median line up to a maximum of 3,0 mm where t_{fl} is the greater thickness of the frames being connected. Where this is not possible, the frame is to be released over 20 t_{fl} and realigned.
- 5.5.24 Where brackets are fitted, similar tolerances to *Vol 1*, *Pt 4*, *Ch 2*, 5.6 Seat design 5.6.5 are to be applied subject to a suitable area being provided for weld fillet, see *Figure 2.5.3 Bracket connections*. Tripping brackets or intercostal stiffeners should be used to stabilise the frame at the bracket toes. Brackets are to be radiused and fitted with soft toes.

Volume 1, Part 4, Chapter 2

Section 5

5.5.25 The cross-sectional area of the bulkhead stiffeners at their outer ends in way of the margin plate should not be less than 60 per cent of the area of the web of the hull longitudinals to which they are attached. To achieve this requirement, the bulkhead stiffeners may be tapered between the outer end and the point at which the size is the minimum required to withstand lateral pressure. The slope of the taper is to be such that:

 $A_x > 0.6A_1 - 2t_x/3$

where

 A_{x} = cross-sectional area of the bulkhead stiffener at a distance x from its outer end

 A_{\perp} = web area of the longitudinal, and t is the bulkhead plating thickness at x.

5.5.26 The short stiffeners above the turn of bilge should be on the same side of the bulkhead as the main bulkhead stiffeners and should end on such a stiffener, see *Figure 2.5.2 Bulkhead stiffening*. Where necessary, an additional diagonal stiffener may be worked to facilitate the arrangement.

5.6 Seat design

- 5.6.1 The shock notation may be enhanced by specifying that some or all of the equipment seating is to be designed to resist shock loading. Seat design should take account of the acceleration and deceleration from the shock wave; the magnitude of the shock acceleration will depend on the equipment mass, position in the ship and mounting arrangements. The seat design methodology is to be in accordance with a specified standard. The selection of seats to be assessed will depend on the equipment supported and the compartment in which it is situated.
- 5.6.2 Minor seats should be assessed to ensure that equipment remains captive. Detail design requirements such as minimum thickness, alignment, and free edge support can be specified to improve shock performance. In the absence of information, minor seats can be considered as those with equipment mass below 100 kg.
- 5.6.3 Seats which are not classed as minor are to be assessed for shock loads using acceleration values appropriate to the region of the ship in which the equipment is installed. Large items of equipment where the seat is integrated into the ship's structure will normally require a finite element analysis to assess the strength of the seat. Where these seats are adjacent to the hull or an integrated tank, the fluid structure interaction may need to be modelled. See Vol 1, Pt 4, Ch 2, 5.4 Local strength assessment.
- 5.6.4 The shock accelerations are to be specified by the Owner. In general, accelerations will be specified for the following regions of the ship:
- (a) within 2,0 m of the wetted hull;
- (b) main transverse bulkheads and decks below the strength deck;
- (c) above strength deck and superstructures.

Shock accelerations can be scaled using a factor for different equipment based on its category of use.

- 5.6.5 For each equipment seat to be assessed, a report is to be provided containing the following information:
- (a) equipment mass and centre of gravity;

Volume 1, Part 4, Chapter 2

Section 5

- (b) location in vessel;
- (c) mounting system;
- (d) spatial clearances around the mounted equipment;
- (e) captivity requirements:
- (f) relevant excitation frequencies from mounted equipment in the case of reciprocating or rotational machinery;
- (g) calculations demonstrating maximum stress and displacement, under vertical acceleration, vertical deceleration and athwartships accelerations. For non-linear analyses, strain rates are to be provided;
- (h) equipment alignment requirements, as appropriate.
- 5.6.6 As a minimum, the following seat load cases are to be assessed:
- (a) bolts; pull through, tensile, shear and bearing strength;
- (b) seat flange; flange bending and top plate weld area;
- (c) seat web; buckling and overturning;
- (d) deck; seat weld area if less than flange.
- 5.6.7 Stress and strain are to be assessed against criteria appropriate for the seat material and loading rate. The first fundamental mode of vibration of the seat including equipment is to be greater than 10 times the shock mount rated natural frequency to provide a sufficiently rigid base for the shock mount. In the absence of specific information, for steel, the following data may be used:

	Tension	Bending	Shear
Plastic deformation of seats	1,3 σ _{ps}	1,3 σ _{ps}	1,0 σ _{ps}
Long loading times ≥0,5 ms (elastic deformation only)	1,0 σ _{ps}	1,0 σ_{ps}	0,8 σ _{ps}
Short loading times <0,5 ms (elastic deformation only)	1,2 σ _{ps}	$1,5 \sigma_{ps}$	0,9 σ _{ps}

where

 σ_{ps} = static 0,1% proof stress

The values in this Table are applicable to mild and high tensile steel grades up to a yield strength of 400MPa.

5.7 Shock mounts

- 5.7.1 All shock mounts are to be of an approved type. Approval is to be undertaken by organisations approved by the Naval Administration. Approval documentation should contain the following information in accordance with NATO document ANEP63:
- (a) nature and application of the mount, including generic type, application, load range, shock displacement, environmental constraints and frequency range;
- (b) description of the mount assembly, including the complete assembly, the mount and the associated components;
- (c) details of the mount standard assembly and installation;
- (d) physical size, mass and dimensions;
- (e) performance data as listed in *Table 2.5.1 Shock mount characterisation*;
- (f) details of the mount testing process, including method of force generation, number of mounts used/shots used, mount supplier, validation, mount permanent deflection, details of test facility and date of testing;
- (g) mount specific protection, installation, inspection and maintenance requirements;
- (h) any applicable historic data, i.e. changes to the mount details over time. For example, changes of material, etc.

5.8 Design guidance for hull valves, piping and seals

5.8.1 Hull valves below the waterline are to be of an approved type. Approval is to be undertaken by organisations approved by the Naval Administration. Approval documentation should contain the following:

Volume 1, Part 4, Chapter 2

Section 5

- (a) details of the valve body, main components and securing arrangement to the hull, including bolt material grade and tightening torque;
- (b) details of the valve testing process, including method of force generation, number of tests, validation, details of test facility and date of testing.
- 5.8.2 Only materials with sufficient ductility to avoid fracture under shock conditions are to be used. Materials should be able to withstand high stresses for very short periods without exhibiting brittleness. Valve bodies are not to be made from materials with an elongation of less than 10 per cent. There should be adequate material in way of the valve seat to prevent distortion.
- 5.8.3 In general, the valve body should be as symmetrical as possible with no rapid changes in section; web stiffeners should not be incorporated. Spindles should be as short as possible. Square threads or sharp thread run-outs are to be avoided. Handwheels should be as light and small as possible.
- 5.8.4 The weight of the actuator is to be considered in the design of the valve and its connection to the hull. The actuator can form a considerable proportion of the overall weight of the valve.
- 5.8.5 Consideration should be given to the attached piping and its capacity to withstand shock:
- (a) Detachable pipe connections should be kept to the minimum necessary for installation and maintenance requirements;
- (b) Flanged and welded connections are to be used adjacent to the hull valve. Adjacent piping is to be designed to allow the valve and hull to flex under shock with limited restraint;
- (c) Where necessary, piping shall be supported with shock resistant mounts at a sufficient number of locations commensurate with the design shock level. The selection of shock mounts should consider displacement capability, see Vol 1, Pt 4, Ch 2, 5.7 Shock mounts. The response of the piping relative to equipment should be considered. Sufficient space between equipment and piping should be provided to ensure they do not contact each other in a shock scenario;
- (d) The routing of piping should be developed to minimise the number and size of penetrations through bulkheads, see *Vol 1, Pt 4, Ch 2, 5.8 Design guidance for hull valves, piping and seals 5.8.11*;
- (e) The consequences of leakage from piping and fittings should be investigated;
- (f) Brackets should not be welded direct to steel piping;
- (g) Adequate division of vital piping systems to isolate damage should be considered;
- (h) The shock resistance of flanged connections should consider bolt preload, anti-rotational locking devices where appropriate and performance of gaskets.
- 5.8.6 The sealing arrangement between the valve and the hull insert is to be suitable for shock loading and able to accommodate elongation of the securing studs.
- 5.8.7 Hull valve designs can be approved by the following methods:
- (a) physical testing;
- (b) semi-empirical methods;
- (c) direct calculation.
- 5.8.8 Physical shock testing may be used to assess the valve. Physical testing is to take account of the attachment to the hull and possible combinations of hull scantlings, stiffener spacing, materials, etc.
- 5.8.9 Recognised semi-empirical methods may be used to assess the valve.
- 5.8.10 Validated numerical methods may be used to assess the valve. Where used, they are to take account of the following criteria:
- (a) asymmetry in the valve and piping assembly;
- (b) dimensions of the hull insert/pad;
- (c) use of sea tube between the valve and hull insert;
- (d) hull scantlings and stiffener/frame spacing;
- (e) plasticity in the hull and valve assembly;
- (f) the effective mass of the valve, actuator and piping;
- (g) the valve to hull securing arrangement, taking into account fit and pre-stress effects;
- (h) dynamic properties of materials;
- (i) the effect of any surrounding equipment or masses.

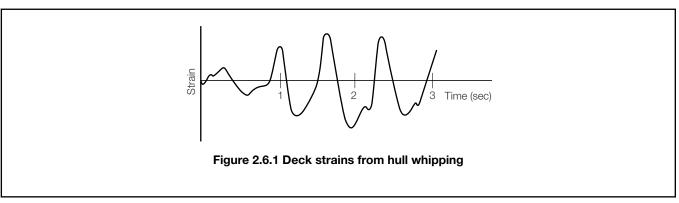

Sea tubes of unusual material, GRE for example, or unusual configuration are to be assessed by physical shock testing and not assessed by numerical simulation.

5.8.11 The potential for leakage from seals/glands under shock loading, and the consequences of leakage, are to be considered. The shock resistance of vital seals/glands, including stern-tube seals, is to be validated by shock qualification testing. The sealing efficiency of stern-tube seals should not be compromised by the anticipated axial, radial and angular shaft movements commensurate with the design shock level.

Section 6Whipping

6.1 General

6.1.1 The effects of a non-contact underwater explosion are described in *Vol 1, Pt 4, Ch 2, 5 Underwater explosion (shock)*. Whilst the initial shock wave described in that section initiates whipping to some degree it is the pulsation of the bubble which leads to the majority of damage to the hull. The initial shock wave causes local hull damage and shock damage to the vessels equipment. In the strain history shown in *Figure 2.6.1 Deck strains from hull whipping* the initial shock wave can be seen to be not just the free response of an elastic system to an impulse as the amplitude continues to increase. There is a typical second kick to the system which stems from the first bubble pulse and which increases the response for several more cycles.

- 6.1.2 The nature and behaviour of the gas bubble are dependent upon the warhead charge size, the explosive composition, the detonation depth and the influence of boundaries such as the sea bed.
- 6.1.3 The maximum radius of the bubble at the end of the first expansion phase is given by:

$$R_{\text{bub}} = 3,417 \left(\frac{W}{H+10}\right)^{\frac{1}{3}} m$$

where

W =bare charge equivalent weight of TNT, in kg

H = depth of the charge at the time of detonation, in metres.

6.1.4 The period of duration of the first bubble pulse is given by:

$$t_{\text{bub}} = 2,108 \frac{W^{1/3}}{(H+10)^{5/6}} \sec$$

where

W and H are defined in Vol 1, Pt 4, Ch 2, 6.1 General 6.1.3.

- 6.1.5 Even a relatively modest warhead charge size can produce a bubble which displaces a large mass of water in a very short time frame. The momentum associated with this rapid incompressible flow of a sizeable volume of water constitutes a major loading mechanism for any structure within its sphere of influence.
- 6.1.6 The effect on the hull is a large amplitude vertical bending and vibration. This first introduces high shear forces at the quarter points which may cause shear wrinkling, this damage will probably not be catastrophic and the hull will go on to develop

273

Volume 1, Part 4, Chapter 2

Section 6

high compressive forces in the keel. These may cause buckling especially as the bottom structure may already be damaged from the initial shock wave. For extreme cases whipping may lead to the 'back breaking' and total loss of the ship.

6.1.7 An estimate of the hull natural frequency for steel ships is given by:

$$f_{sl} = \frac{215}{L_{OA}}HZ$$

where

 L_{OA} = the overall length of the ship, in metres.

- 6.1.8 The risk of a whipping response from a particular threat can be determined using the approximation for the natural frequency and the bubble characteristics of *Vol 1*, *Pt 4*, *Ch 2*, *6.1 General 6.1.4*.
- 6.1.9 If the threat is closer to the hull than 2R _{bub} then the bubble loading is to be specially considered.

6.2 Threat level determination

- 6.2.1 The level to which a ship will be expected to survive an attack scenario that excites hull whipping is to be specified by the Owner and will remain confidential to LR.
- 6.2.2 The whipping threat level may be defined for a range of warheads detonating at a given stand off distance and longitudinal (axial) location. The probability of weapon hit locations can be determined from threat analyses which can be used to select the appropriate charge locations for the assessment.
- 6.2.3 It is also possible to undertake a parametric study to establish the detonation location which will lead to the worst case loading scenario. In this case, all possible hit locations that will induce whipping are assessed and the worst case induced bending moments are compared with an appropriate acceptance criteria. Contours from the keel of maximum threat size to induce failure can also be determined.
- 6.2.4 Where a shock threat is also being assessed for whipping effects, the warhead stand off distance from the keel is set to be the same as that which induces the prescribed severity of shock. A series of axial locations are assessed to establish the worst case excitation which is compared to the appropriate acceptance criteria.
- 6.2.5 The non-dimensional measure of whipping severity, commonly referred to as Whipping Factor, is simply the ratio of maximum induced hull girder bending moment at a section to the critical bending moment for that section. Each threat location assessed will generate a whipping factor which can be assigned to that particular location. In this way a series of iso-Whipping Factor contours can be mapped in the fluid beneath the keel for a particular threat weapon. These contours define hit volume boundaries within which that particular weapon will induce a known level of whipping response.

6.3 Notation assessment levels and methodology

- 6.3.1 Ships for which a whipping assessment is performed will be eligible for a **WH1, WH2** or **WH3** notation as defined in *Vol* 1, *Pt* 4, *Ch* 2, 6.3 Notation assessment levels and methodology 6.3.4
- 6.3.2 There are two types of assessment to determine the whipping response of the hull girder.
- Simple 2D beam model.
- Advanced 3D beam model.
- 6.3.3 For most ships a simple analysis will be sufficient to determine the whipping capability of the hull girder. An advanced analysis will be required when:
- more detailed information is required on areas of a ship which have been shown by simple analysis to be deficient under whipping loads, for example where there are large structural discontinuities variations;
- the ship design cannot be idealised as a 2D beam, for example when it has an unusual structural configuration or has low frequency modes of vibration in additional to its vertical flexural modes;
- there is a requirement to predict the extent of plastic deformation in a section;
- the whipping threats are assessed in a shallow water environment.
- 6.3.4 A **WH1** analysis method uses a 2D beam representation and a failure level criterion based on the bending moment to induce material yield.

Volume 1, Part 4, Chapter 2

Section 6

- 6.3.5 A **WH2** method of analysis uses a 2D beam representation and a failure level criterion based on the section ultimate bending moments. This will require assessment using ultimate strength calculations at each of the discrete sections of the hull girder beam model.
- 6.3.6 A **WH3** method of analysis uses a 3D definition of a section of the hull girder and geometric and material failure criteria implicit in the chosen finite element code.
- 6.3.7 In each case, it is to be demonstrated that the hull section remains below the defined failure limits for all threat scenarios.
- 6.3.8 For certain ship types such as minesweepers, it will be necessary to carry out several levels of analysis. An elastic analysis is required for threat levels which are expected to be survived on a regular basis. An elasto-plastic analysis at a higher threat level for which the ship is expected to survive.

6.4 Simple 2D beam model

- 6.4.1 The modelling of ship interaction with explosion bubbles conveniently breaks down into a set of distinct sub-models.
- 6.4.2 The hull girder model is usually subdivided into at least twenty equal sections, each of which is assumed to form a 'Timoshenko' beam element. Since the stiffness and mass distributions may vary considerably along the length of a ship, a lumped mass/weightless beam representation is appropriate rather than a consistent mass model. The effect of shear deflection is to be included in the model.
- 6.4.3 The hull hydrodynamics may be modelled using standard strip theory to represent the effect of the inertia of surrounding water. At any lumped mass representing the hull girder, the added mass of water may be assumed using 'Lewis' forms coefficients. The added mass correction can be assumed to be constant for each mode of vibration.
- 6.4.4 For the bubble hydrodynamics it is assumed that the flow around the explosion bubble is inviscid and incompressible, that gaseous products obey ideal gas law, and that the bubble itself remains spherical. As a first approximation it may also be assumed that the bubble remains stationary but in general the migration is significant and should be considered. It is also assumed that the bubble motion is not modified by the presence of either the ship or the water surface. The loading model is to account for the dissipation of shock wave energy at the outset of detonation, generally achieved by using a modified initial radius for the bubble calculation.
- 6.4.5 The interaction hydrodynamics may also be assumed to be incompressible and inviscid consistent with the bubble hydrodynamics. The bubble radial flow may be resolved at the ship axis (the intersection line of the waterplane and the vertical centreline plane) at each lumped mass, into three components. Normally only the vertical *z* and athwartships *y* components need be considered as the bubble is assumed to be some distance from the ship. It may also be assumed that at each lumped mass, the transverse velocity around the whole section will be uniform in magnitude and direction.
- 6.4.6 The force acting on a strip is to account for this motion, plus the uniform pressure gradient assumed in the fluid which induces a buoyancy force proportional to the displaced volume of water. Wave generation and Bernoulli pressure effects may be neglected but the accelerations should account for the free surface reflection of the bubble.
- 6.4.7 Several assessment codes are available and calculation should be performed by a competent and experienced body with relevant experience and using recognised codes.

6.5 Advanced assessment

- 6.5.1 Advanced whipping assessments will normally be performed using a hybrid 3D/2D structural model for computational efficiency. However, care is to be exercised in the coupling of the 2D beam elements to the 3D section to ensure that this artificial boundary condition does not adversely influence the analysis. As an alternative, the ship may be defined as a full 3D shell model. In which case, it may be possible to invoke symmetry to reduce the problem size and reduce the computational burden.
- 6.5.2 More than one option exists for modelling the fluid domain. It may be modelled using a boundary element approach and coupled to the structural domain using a Doubly Asymptotic Approximation. Alternatively, a computationally intensive volume fluid element approach employing an Eulerian code may be used. This fluid domain model would have to be coupled to the Lagrangian structural domain through a general or arbitrary coupling scheme. The detonation process and the bubble development would be physically modelled in this approach. A combined approach would entail modelling an island of fluid around the ship, truncated by a boundary element surface on which a bubble loading model would be applied.
- 6.5.3 For surface ship problems, whichever solution strategy is adopted, the fluid solver must be able to cope with the proximity of the bubble to the free surface and where appropriate reflections from the sea bed. Analysis is to be undertaken by a

Volume 1, Part 4, Chapter 2

Section 7

competent and experienced body using recognised techniques and with the relevant expertise necessary to establish the correct interface strategy between structural and fluid element meshes.

Section 7

Residual strength

7.1 General

7.1.1 This Section details the determination of the threat levels and methodology to be adopted in the attainment of an **RSA1**, **RSA2** or **RSA3** notation.

7.2 Threat level determination

- 7.2.1 The level to which a ship will be expected to structurally survive an attack scenario that results in weapon damage is to be specified by the Owner and will remain confidential to LR.
- 7.2.2 The threat level may be defined for a range of warheads detonating at given internal positions or UNDEX stand off distances with defined longitudinal locations. The probability of weapon hit locations can be determined from threat analyses which can be used to select the appropriate charge locations for the assessment.
- 7.2.3 Generally, fragmentation scenarios are not included in residual strength assessments since the damage is usually localised. However, any significant structural damage resulting from fragmentation (as determined in *Vol 1*, *Pt 4*, *Ch 2*, *4 Fragmentation protection*) must be considered. Similarly, any damage from an external blast threat weapon must also bep included (*Vol 1*, *Pt 4*, *Ch 2*, *2 External blast*). In addition, residual strength calculations must be used in conjunction with level 2 whipping analysis (*Vol 1*, *Pt 4*, *Ch 2*, *6 Whipping*).
- 7.2.4 Where the **STAB** notation is assigned, the damage scenarios included in the residual strength assessment are to include grounding/raking and collision damages which are consistent with the compartment damage criteria specified by the subdivision and stability standard, see *Vol 3*, *Pt 2*, *Ch 6*, *1 General*.

7.3 Notation assessment levels and methodology

- 7.3.1 Ships for which a residual strength assessment is carried out will be eligible for a **RSA1**, **RSA2** or **RSA3** notation as defined in *Vol 1*, *Pt 4*, *Ch 2*, *7.3 Notation assessment levels and methodology 7.3.6*.
- 7.3.2 The assessment of the residual strength capability of a ship is to be performed as defined in Vol 1, Pt 6, Ch 4, 4 Residual Strength Assessment, RSA.
- 7.3.3 There are three methods of assessment that may be used to determine the damaged residual strength of the hull girder.
- Simple 2D cross-section elastic model.
- 2D ultimate strength model.
- Advanced 3D Finite Element Methods.
- 7.3.4 In the case of a mine warfare ship or NS3 ships, a 2D elastic analysis will normally be sufficient. For most other naval ships, a 2D ultimate strength analysis would normally be required to determine the damaged residual strength at a particular frame location along the hull girder.
- 7.3.5 An advanced 3D analysis incorporating initial deformations and residual stresses will be required when:
- More detailed information is required throughout one or more compartments along the length of the ship which have been shown by the more simplified 2D ultimate strength analysis to be inadequate. This may be necessary, for example, where there are large structural discontinuities in hull girder strength.
- The ship design cannot be reduced to a 2D beam or ultimate strength description, for example, when it has an unusual structural configuration.
- 7.3.6 A **RSA1** analysis method uses a 2D elastic cross-section representation and a failure level criterion based on the calculated bending moment being greater than both the design hogging and sagging bending moments at the sections considered to be most critical.

Volume 1, Part 4, Chapter 2

Section 7

- 7.3.7 A **RSA2** method of analysis uses a 2D ultimate strength beam representation and a failure level criterion based on the section ultimate bending moments being satisfactory compared to the design bending moments in both hogging and sagging. This will require assessment using ultimate strength calculations at no less than three damaged positions along the length of the hull.
- 7.3.8 A **RSA3** method of analysis uses a 3D definition of a section of the hull girder and relies on geometric and material failure criteria implicit in the chosen finite element code. It could also include coupled Euler-Lagrange formulations to specifically account for internal and external blast effects, UNDEX shock and whipping.
- 7.3.9 In each case, it is to be demonstrated that the hull girder remains below the defined design hogging and sagging design bending moment failure limits for all prescribed threat scenarios.
- 7.3.10 For certain ship types, such as minesweepers, it will be necessary to carry out several levels of analysis. An elastic analysis should be carried out for threat levels which are expected to be survived on a regular basis and geometric and material nonlinear analysis at higher threat levels for which the ship is expected to survive.

7.4 Definition of damage

- 7.4.1 The damage radius is a measure of the extent of the damage caused by specific above water attack scenarios. This is shown diagrammatically in *Figure 2.7.1 Determination of damaged structure*, where the assumption of a detonation mid-compartment is shown and the extent of damage is indicated by the extent of the damage radii. Assumptions about position and extent of damage radii are dependent on warhead characteristics. In general, the radii is to be vertically positioned such that it removes the maximum amount of material or has the greatest effect on the sectional inertia.
- 7.4.2 The damage radii can be determined from:

$$r = f_z W^{1/3} m$$

where

 f_{7} = scaled distance dependent on ship type

W = equivalent weight of TNT, in kg.

- 7.4.3 Once a damage radius has been determined, the simplest method of accommodating damage is to remove all structure within and touching the damage radii from the residual strength calculation.
- 7.4.4 For underwater shock (UNDEX), hull plating failure can be derived from angle hull shock factor, as defined in *Figure 2.7.2 Angle shock factor*, exceeding appropriate hull lethality levels. The angled shock factor may be determined from:

$$SF = \frac{W^{0,5}}{R} f(\theta)$$

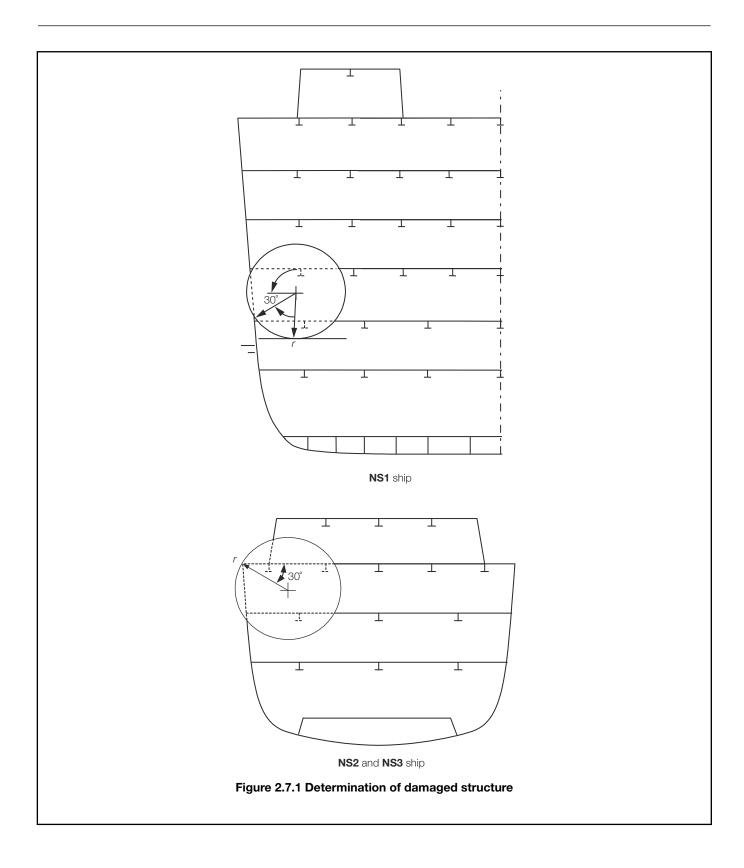

where

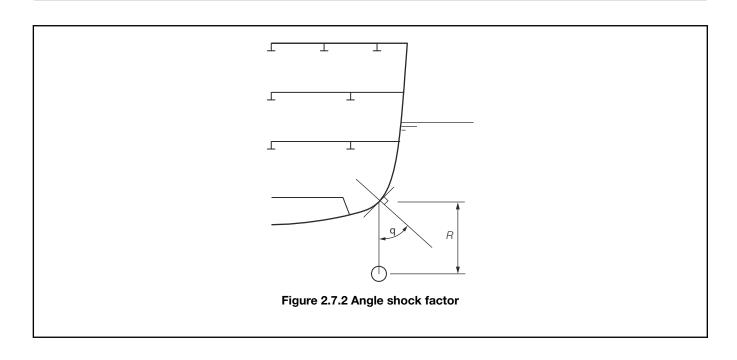

W = equivalent charge weight of TNT, in kg

R = distance from charge, in metres

 $f(\theta)$ = threat angle function, see Figure 2.7.2 Angle shock factor.

Volume 1, Part 4, Chapter 2 Section 7

- 7.4.5 Special consideration will be given to the effects of damage to box type strengthening structure, armour plating, high yield strength materials, double skin hulls and blast strengthened bulkheads.
- 7.4.6 Generic damage can be generated using pseudo-random hit probability algorithms and repeated application of such algorithms can be used to represent successive weapon hits. Specific damage is difficult to quantify but can be estimated by using damage radii techniques for above water structure and by assuming critical shock factor levels for below water structure.

Section 8

Strengthening requirements for beach landing operations

8.1 General

- 8.1.1 These requirements are in addition to those of *Vol 1*, *Pt 6*, *Ch 3 Scantling Determination* for bottom shell structure. They need only be applied to those areas of the hull at risk from grounding during beach landing operations. These areas are to be agreed with LR at an early stage in the plan approval process. A distinction is made between those areas likely to see impact loads on beaching and those where contact due to grounding will occur after the initial beaching.
- 8.1.2 The Rules assume that the ships will be brought into shallow water and up to the beach in a controlled manner and that procedures are in place and on board for the operation of these ships. The beach is assumed to be free of rocks of substantially greater projection than the depth of the rubbing strake.
- 8.1.3 Depending on the operational profile of the ship the minimum bow height given in *Vol 1, Pt 3, Ch 2, 5.3 Minimum bow height and extent of forecastle* will be specially considered.
- 8.1.4 Loading ramps are to be in accordance with the requirements of Vol 1, Pt 4, Ch 3, 5 Movable decks, lifts, internal and external ramps.
- 8.1.5 Due regard is to be given to forces imposed on the ship and loading ramps by ship motions in shallow water both by impact from surf, the beach, and vehicles used to manoeuvre ships on the beach.

8.2 Minimum plate thickness

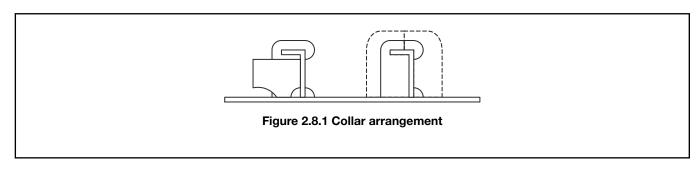

- 8.2.1 For areas subject to impact and grounding the thickness determined from *Vol 1, Pt 6, Ch 3 Scantling Determination* is to be increased by 20 per cent and is in no case to be taken as less than 7 mm.
- 8.2.2 For operation in Arctic and Antarctic conditions the material grades are to be in accordance with the requirements of *Vol* 1. Pt 6. Ch 6. 2 Materials Material Class II.

Volume 1, Part 4, Chapter 2

Section 8

8.3 Bottom stiffening

- 8.3.1 Secondary stiffening is to be designed in accordance with the requirements of *Vol 1, Pt 6, Ch 3 Scantling Determination* with the modulus increased by 20 per cent. For impact areas the spacing of stiffeners is not to be greater than 500 mm.
- 8.3.2 Primary structure is to be designed in accordance with the requirements of *Vol 1*, *Pt 6*, *Ch 3 Scantling Determination*. An additional load case with the forces imposed from global bending and grounding forces uniformly distributed over the bottom in contact with the beach is to be considered. In the absence of specific information, not more than 50 per cent of the bottom structure is to be assumed to be in contact with the beach. The primary structure is also to be capable of supporting the concentrated loads imposed by loading or unloading vehicles.
- 8.3.3 Primary and secondary structure is to be continuously welded throughout areas subject to grounding.
- 8.3.4 Lugged connections or fully welded collars of the type shown in *Figure 2.8.1 Collar arrangement* are to be used. Alternative equivalent arrangements will be individually considered.

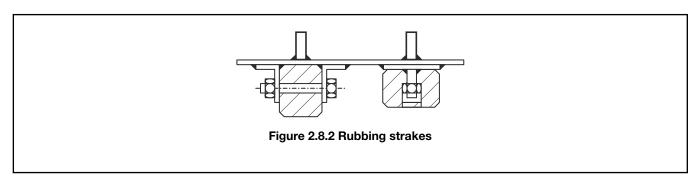

- 8.3.5 Transverse floors are not to be spaced more than 1,25 m for transversely framed structure or 1,85 m for longitudinal framed structure.
- 8.3.6 One side girder each side of the centreline is to be fitted in addition to the requirements of *Vol 1, Pt 3, Ch 2, 3.5 Single bottom structure* or *Vol 1, Pt 3, Ch 2, 3.6 Double bottom structure*.
- 8.3.7 Transverse floors and girders are to be suitably stiffened with web stiffeners spaced not more than 1,25 m apart.

8.4 Global strength

- 8.4.1 For ships with $L_R > 50$ m grounding conditions in addition to the loading conditions of *Vol 1, Pt 6, Ch 4 Hull Girder Strength* are to be assessed. The number and type of loading conditions will be determined by the operational requirements of the ship. In some cases residual strength calculations will be required.
- 8.4.2 If $L_{\rm R}$ > 50 m and areas of the bottom shell within 0,3 to 0,5 $L_{\rm R}$ are at risk from grounding the thickness of the bottom shell and longitudinal structure will be specially considered.

8.5 Rubbing strakes

8.5.1 Rubbing strakes or barwhales are to be fitted to the bottom shell. In longitudinally framed ships they are to be placed directly below longitudinals. Typical arrangements of rubbing strakes are shown in *Figure 2.8.2 Rubbing strakes*. Usually they consist of a steel frame welded to the hull supports with a bolted connection to softer material but rubbing strips can be constructed of solid steel sections. They are to be free of projections or other discontinuities which could lead to damage of the shell plating.

Volume 1, Part 4, Chapter 2

Section 9

- 8.5.2 It is recommended that rubbing strakes are not to be spread more than 1,5m apart. For rubbing strakes spaced greater than 1,5m the bottom structure is to be specially considered.
- 8.5.3 The rubbing strake housing both internally and externally is to be efficiently coated to prevent corrosion. Where different materials are used the materials are to be selected or insulated to ensure that there is no galvanic corrosion.
- 8.5.4 Rubbing strakes are to be continuously welded to the hull. Butts between sections of rubbing strake are to be butt welded together before being welded to the hull. Where this is not possible, ceramic rather than copper backing strips are to be used.
- 8.5.5 Rubbing strakes are to be of the same grade of steel as the shell plate to which they are attached.
- 8.5.6 The ends of rubbing strakes are to be tapered at an angle of not less than 1 in 3 with no discontinuities in the welding in this region. Where not supported by internal longitudinals, the ends of strakes are to be arranged to pass 30 to 50 mm over the end of transverse frames or floors.
- 8.5.7 Due consideration is to be given to the depth of the rubbing strakes with regard to the nature of the beach. In no case are they to be less than 100 mm projection.

Section 9

Military installation and operational loads

9.1 Weapon recoil, blast and efflux loads

- 9.1.1 Loads resulting from weapon launch may include recoil effects, blast and missile efflux pressures, and in general will be impulsive. These three types of load are estimated in different ways and will be covered in turn.
- 9.1.2 Gun and mortar recoil loads will generally be obtained from the manufacturer's documentation. If the natural frequency of the supporting structure is more than four times the firing rate and at least 50 per cent higher than the frequency derived from the time to maximum force, then a dynamic load factor of 1,6 may be used for a first estimate. If the gun is mounted immediately above an effective bulkhead then the structural resonant frequencies will be much higher and a dynamic load factor of 1,2 may be assumed. The stiffness of the supporting structure should be adequate for the loads imposed and in accordance with the manufacturer's recommendations.
- 9.1.3 The assessment of structure is to be made at the azimuth and elevation of the gun that produces the maximum demands on each component of the support structure. These will usually be ahead and abeam and at 0° and maximum elevation, although additional calculations should be made at the 45° positions vertically and horizontally against the resolved in-plane and normal elements of the load which occur simultaneously.
- 9.1.4 The load on the structure due to gun blast is in the form of a short-lived transient over-pressure; values of this over-pressure should be available in the manufacturer's documentation for the weapon as curves of pressure against distance from the gun muzzle. The pressure will act only for a time of the order of 10ms so the structure, with a much higher natural response period, is unable to react to the full over-pressure and it is sufficient to design to an equivalent static pressure using the dynamic load factors specified in *Vol 1*, *Pt 6*, *Ch 2*, *5 Dynamic loading*. Guns with a high rate of fire, typically greater than 30 rounds per minute, may induce a forced vibration and will be specially considered.
- 9.1.5 Should blast pressure curves not be available then a spherical approximation to the equivalent static design pressure P_g can be found from the following equation for φ_m values in the range 80 mm to 120 mm

$$P_{\rm g} = \frac{2 (1+\cos\theta)^2 \left(\frac{\varphi_{\rm m}}{x}\right)^{1.5} \times 10^3 \,\rm kN/m^2}$$

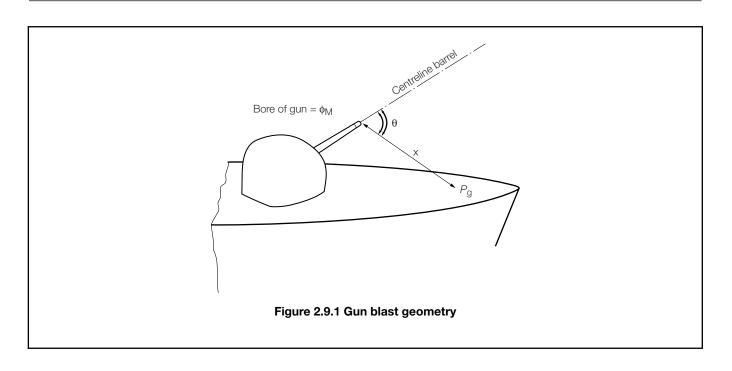

where

 $\varphi_{m} = \text{the bore of the gun, in mm}$

x = the distance from the muzzle of a point at which the pressure is required, in mm

 θ = the angle to the centre-line of the barrel.

As shown in Figure 2.9.1 Gun blast geometry

9.1.6 Missile efflux blast loading can be predicted by considering the rate of change of momentum of the efflux where it strikes the structure under consideration. However, when calculating the equivalent design load allowance must also be made for the dynamic response of the structure. For practical purposes therefore it is sufficient to design for the thrust averaged over a cone of semi-angle b and the resultant equivalent static pressure P_m may be found from

$$P_{\rm m} = f_{\rm DLF} \left(\frac{T_{\rm m}}{A} \right) \left(\frac{\sin \alpha}{\sin \alpha + \tan \beta \cos \alpha} \right) \text{kN/m}^2$$

where

 f_{DLF} = a dynamic load factor relating to variations in the efflux pressure and can be taken as 1,5

 $T_{\rm m}$ = thrust, in kN

 α = angle (25° < α < 90°) to the structure in degrees

 $A = \text{projected area of cone in m}^2$

 β = the efflux cone semi-angle in degrees and can be taken as 3°

As shown in Figure 2.9.2 Missile thrust geometry.

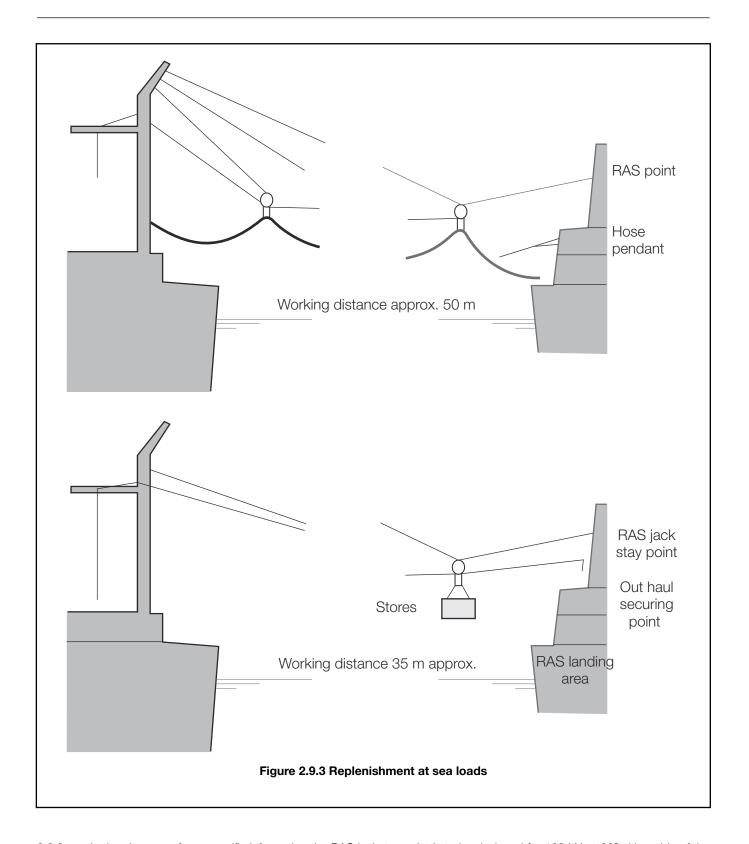

9.1.7 Missile efflux will generally be at high temperature and may contain particulates. Protection is to be provided for ship structure and equipment upon which the efflux may impinge during launch.

9.2 Replenishment at sea loads

- 9.2.1 The loads imposed on the ship's structure will depend on the operation of the vessel during RAS operation and what weight of stores is to be transferred.
- 9.2.2 Guidance on representative arrangements is presented in *Figure 2.9.3 Replenishment at sea loads*. It is the responsibility of the Owner to specify the design load values. The line of action of the forces is to be considered for all possible angles that might occur during replenishment operations.

Volume 1, Part 4, Chapter 2

Section 9

- 9.2.3 In the absence of any specific information the RAS jackstay point is to be designed for 160 kN at 20° either side of the vertical and 20° either side of the horizontal. The outhaul securing point and hose pendent securing point are to be designed for $40 \text{ kN } 20^{\circ}$ either side of the vertical and 0° to 45° below the horizontal.
- 9.2.4 The structure is to be designed such that the stress from RAS operations in no part of the structure exceeds 70 per cent of the yield stress of the material under test conditions and 35 per cent of the yield stress of the material under normal working conditions.

284

Volume 1, Part 4, Chapter 2

Section 10

- 9.2.5 For structure supporting RAS equipment, materials are to be in accordance with *Table 6.2.1 Material classes and grades*.
- 9.2.6 Where tripods, gantries or masts are used for RAS operations the buckling strength of members in compression is to be specially considered.
- 9.2.7 A clear area is to be provided for RAS operations and the landing area for RAS operation is to be suitably strengthened for impact loading and concentrated equipment loads.
- 9.2.8 The design load used in the determination of scantlings for tanks used in RAS operation are to take due account of the maximum loads experienced in service. See Vol 1, Pt 5, Ch 3, 5 Local design loads for decks and bulkheads.

■ Section 10

Aircraft operations

10.1 General

- 10.1.1 The landing area may be located on an appropriate area of the weather deck or on a platform specifically designed for this purpose and permanently connected to the ship structure. All ships operating aircraft are to comply with the requirements of this Section and will be assigned an **AIR** notation.
- 10.1.2 Attention is drawn to the requirements of National and other Authorities concerning the construction of helicopter landing platforms and the operation of helicopters as they affect the ship. Consideration should also be given to air flow over the landing area and the impingement of hot exhaust gases on equipment in the flight path.
- 10.1.3 Where the landing area forms part of a weather or erection deck, the scantlings are to be not less than those required for decks in the same position.
- 10.1.4 Equipment and vehicles using the landing area will also need to be assessed to identify the most onerous load in accordance with Vol 1, Pt 5, Ch 3 Local Design Loads.
- 10.1.5 Special consideration is to be given to the insulation standard if the space below the aircraft deck is a high fire-risk space.
- 10.1.6 These Rules assume that the aircraft are fitted with oil/gas dampers and pneumatic types, different under-carriage arrangements will be specially considered.
- 10.1.7 Suitable arrangements are to be made to minimise the risk of personnel sliding off the landing area. A non-slip surface is to be provided and is to cover the entire deck including any markings. Safety nets are to be provided in accordance with *Vol 1, Pt 3, Ch 4, 9.6 Safety nets*.
- 10.1.8 Structural fire protection, firefighting equipment and services are to be arranged on and around flight operations areas of the ship in accordance with the specified fire safety standard, see *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.110*.

10.2 Definitions

- 10.2.1 OLEO load is defined as the load which will cause the damper and tyre combination to reach the end of their travel. OLEO loads should not generally be used to determine loads from the undercarriage on the flight deck. OLEO loads do not always reflect the loads that can be imposed by an aircraft landing on a ship. Loads should be derived using the vertical velocities specified in *Table 2.10.3 Vertical velocity*. The ratios of OLEO loads may be used to determine the dynamic distribution of load from the undercarriage.
- 10.2.2 The all up weight (AUW) is the maximum that will be encountered for the specific application under consideration it includes the maximum weight of aircraft, personnel, fuel and payload:
- For helicopters the AUW is to be taken as the maximum weight of aircraft, personnel, fuel and payload at all times.
- For manoeuvring of fixed wing aircraft the AUW is to be taken as the maximum weight of aircraft, personnel, fuel and payload.
- For take off of fixed wing aircraft the fuel weight is to be the maximum less the fuel required to transit to the take off position.
- For landing of fixed wing aircraft the AUW is to be as above except that the fuel weight is to be the maximum less that consumed by the shortest possible flight.

Volume 1, Part 4, Chapter 2

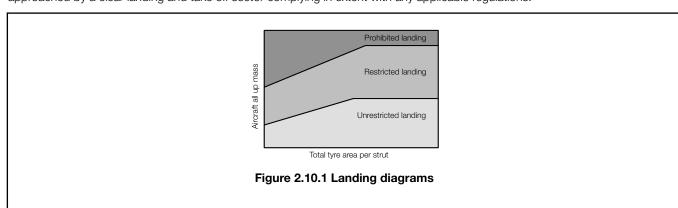

Section 10

10.3 Documentation

- 10.3.1 Plans are to be submitted showing the proposed scantlings and arrangements of the structure. The type, size and weight of aircraft to be used are also to be indicated.
- 10.3.2 Details of arrangements for securing the aircraft to the deck are to be submitted for approval.
- 10.3.3 A landing guide should be provided as part of the ship's documentation. This is to contain all the relevant design information on the aircraft for the ship, identification of landing parking and manoeuvring areas, tie down arrangements, weights and a summary of the design calculations. It is also to provide guidance on the suitability of the landing areas for other aircraft. The information is to be presented in a graphical form similar to that shown in *Figure 2.10.1 Landing diagrams*. Unrestricted landings are aircraft weights which can occur up to the design sea state. Restricted landing with weights higher than the design can occur but in a reduced sea state and are to be indicated on the diagram. Prohibited landings are aircraft weights that may not take place in any sea state. Different diagrams will be required for twin and single rotor helicopters and for aircraft as appropriate.

10.4 Flight deck arrangements

10.4.1 The landing area is to be sufficiently large to allow for the landing and manoeuvring of the aircraft, and is to be approached by a clear landing and take off sector complying in extent with any applicable regulations.

- 10.4.2 Normally, for maximum flexibility in helicopter operations, the landing area is to be taken as a square not less than 1,25 times the rotor diameter. Where the operation of helicopters is restricted to known helicopter types, the areas of deck structure to be assessed for the landing condition are to be taken as squares not less than two times the maximum wheel strut spacing. The squares are to be centred on all the normal landing points, at all specified landing orientations, for all helicopters. For fixed wing aircraft the area to be considered will be determined by the operational requirements of the vessel. The landing area is to be clearly identified.
- 10.4.3 The takeoff and landing area are generally to be free of projections above the level of the deck. Projections above 25 mm may only be permitted where allowed by the aircraft undercarriage design standard. Projections outside the landing and take off areas are to be kept to a minimum such that they do not hinder aircraft manoeuvring operations.
- 10.4.4 The structure is to be designed to accommodate the largest aircraft type which it is intended to use. It is advised that an allowance be made for future growth of the helicopter weight such that future operations are not restricted to lower sea states.
- 10.4.5 Engine uptake arrangements are to be sited such that exhaust gases cannot as far as practicable be drawn directly into aircraft engine intakes during aircraft take off or landing operations under anticipated operating conditions that include ship speed, ship motion and wind direction.
- 10.4.6 Arrangements are to be made for the drainage of the flight deck and other aircraft handling areas, including drainage of spilt fuel. The drainage arrangements are to be made of steel and are to lead away from enclosed spaces and directly overboard so as to avoid entrapment of burning fuel should an accident occur.
- 10.4.7 Flight decks are to be bounded by a coaming of approximately 50mm which is to be an integral part of the drainage system.
- 10.4.8 Flight decks are to have at least two means of escape located as far away as practicable from each other.

Volume 1, Part 4, Chapter 2

Section 10

10.5 Loading

10.5.1 The load cases to be applied to all parts of the structure are defined in *Table 2.10.6 Design load cases for primary and secondary deck stiffening and supporting structure* in which:

f = 1,15 for landing decks over magazines or permanently manned spaces, e.g deckhouses, bridges, control rooms, etc.

= 1,0 elsewhere

 λ = reaction factor for the aircraft considered .

 W_{auw} = the maximum all up weight of the aircraft, in kN

 $W_{\mathrm{ty}} = \mathrm{landing}$ or static load, on the tyre print, in kN; with the centre of gravity in a position that causes the highest load. In the absence of specific aircraft manufacturers' information on the dynamic distribution of load, W_{ty} is to be taken as W_{auw} distributed between all main undercarriages in accordance with the static load distribution. The contribution of small nose or tail wheels is to be ignored. The structure only needs to be assessed for the worst-case wheel loads and orientation.

10.5.2 The reaction factor, λ , may be determined from *Table 2.10.1 Landing reaction factor* where manufacturers' information is not available. Otherwise the information in *Vol 1*, *Pt 4*, *Ch 2*, 10.6 Determination of λ for fixed wing aircraft or *Vol 1*, *Pt 4*, *Ch 2*, 10.7 Determination of λ for helicopters as appropriate may be used to estimate λ .

Table 2.10.1 Landing reaction factor

Aircraft type	λ
Helicopters	2,5
VSTOL aircraft	3,5
Fixed wing aircraft	5

Note Reaction factors are derived from the average values for marinised versions of aircraft.

10.5.3 The reaction factor for helicopters using recovery systems will be specially considered.

10.6 Determination of λ for fixed wing aircraft

10.6.1 The reaction factor can be calculated by simulation, testing or estimated from the following formulae:

$$\lambda = \frac{V_{L}^{2}}{2g(\eta_{T} \delta_{T} + \eta_{S} \delta_{S})}$$

where

 λ = reaction factor

 δS , δT = deflection of the shock absorber or tyre, in metres

 V_{\perp} = vertical landing velocity including ship motions, in m/s

 ηT = efficiency of the tyre typically assumed to be 0,47

 ηS = efficiency of the shock absorber, see *Table 2.10.2 Shock absorber efficiency*.

Table 2.10.2 Shock absorber efficiency

	Steel spring	Rubber	Air	Liquid spring	OLEO
η	0,5	0,6	0,48	0,76	0,8

Volume 1, Part 4, Chapter 2

Section 10

10.6.2 The vertical velocity is the maximum landing velocity derived from trials or simulation and is to include the effects of ship motion. In no case is it to be taken less than 6 m/s. If landing operations are to be carried out in sea states greater than six then the minimum vertical velocity will be further considered.

10.7 Determination of λ for helicopters

10.7.1 The reaction factor can be calculated by simulation, testing or estimated from the following formulae:

$$\lambda = \frac{V_L^2}{2g(\eta_T \delta_T + \eta_S \delta_S)} + \frac{(1 - f_L)(\delta_T + \delta_S)}{\eta_T \delta_T + \eta_S \delta_S}$$

where

 λ , δ_S , δ_T , V_L , η_T , η_S are defined in Vol 1, Pt 4, Ch 2, 10.6 Determination of λ for fixed wing aircraft

 f_{\perp} = the percentage of lift carried by the rotors at the time of landing typically 66 per cent.

- 10.7.2 The vertical velocity is the maximum landing velocity derived from ship trials or simulation and is to include the effects of ship motion. In no case is it to be taken less than 3,72 m/s. If landing operations are to be carried out in sea states greater than six then the minimum vertical velocity will be further considered.
- 10.7.3 For ships where helicopter operations are restricted to sea states lower than six the vertical velocities defined in *Table 2.10.3 Vertical velocity* can be used.

Table 2.10.3 Vertical velocity

Sea state	Vertical velocity
6	3,72
5	3,35
4	2,97
3	2,60
2	2,23

- 10.7.4 Using a vertical velocity lower than the design given in this section, for example a land based helicopter, will result in higher probabilities of exceedence. The derivation of vertical velocity is such that it includes the effects of ship motions and pilot action and is independent of the design vertical velocity of the undercarriage.
- 10.7.5 Information on the probability of encountering a particular sea state for a sea area can be found in Vol 1, Pt 5, Ch 2, 2 Wave environment.
- 10.7.6 For helicopters with skids, determination of the reaction factor will be specially considered.

10.8 Deck plating design

10.8.1 The deck plate thickness, t_p , within the landing area is to be not less than:

$$t_{p} = \frac{\alpha \text{ s}}{1000\sqrt{\text{k}_{s}}} - t_{c} \text{ mm}$$

where

 α = thickness coefficient obtained from Figure 3.2.1 Tyre print chart using a value of β given by

 β = tyre print coefficient used in Figure 3.2.1 Tyre print chart

$$\beta = \log_{10} \left(\frac{0.6F_{\text{typ}} \varphi_{1} \varphi_{2} \varphi_{3} \gamma k^{2}}{9.81s^{2}} \times 10^{7} \right)$$

k_s = higher tensile steel factor defined in Vol 1, Pt 6, Ch 5 Structural Design Factors

288

Volume 1, Part 4, Chapter 2

Section 10

where

s = stiffener spacing, in mm

F _{typ} = tyre force, in kN from Table 2.10.6 Design load cases for primary and secondary deck stiffening and supporting structure

 λ = reaction factor for the aircraft considered, see Vol 1, Pt 4, Ch 2, 10.5 Loading

 γ = a location factor given in *Table 2.10.4 Location factor*, γ

 φ_1 , φ_2 , φ_3 = are patch load correction factors determined from Table 2.10.5 Patch load corrections φ_1 , φ_2 , φ_3

t c = permanent set correction in mm, see Vol 1, Pt 4, Ch 2, 10.8 Deck plating design 10.8.2

a, s = the panel dimensions in mm, see Figure 2.10.2 Tyre patch dimensions

u, v = the patch dimensions in mm, see Figure 2.10.2 Tyre patch dimensions.

Table 2.10.4 Location factor, γ

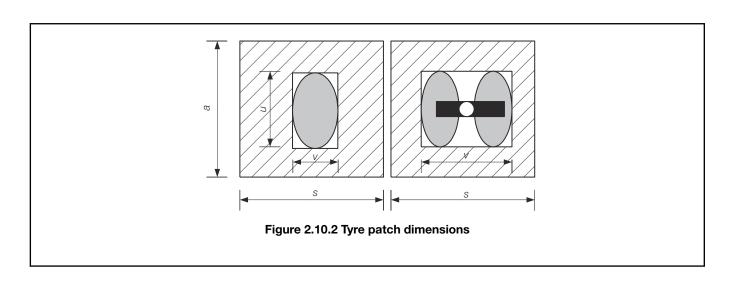

Location	Y
On decks forming part of the hull girder	
(a) within 0,4L _R amidships	1,18
(b) at the FP or AP	1,0
	Values for intermediate locations are to be determined by interpolation
Elsewhere	1,0

Table 2.10.5 Patch load corrections $\phi_1,\,\phi_2,\,\phi_3$

Factor	Condition
$\varphi_1 = \frac{2v_1 + 1, 1s}{u_1 + 1, 1s}$	$v_1 = v$, but $\le s$ $u_1 = u$, but $\le a$
$ \phi_2 = 1,0 = \frac{1}{1,3-0,3(a-u)/s} = 0,77a/u $	for $u \le (a - s)$ for $a \ge u > (a - s)$ for $u > a$
$\phi_3 = 1.0$ $= 0.6 (s/v) + 0.4$ $= 1.2 (s/v)$	for $v < s$ for $1,5 > (v/s) > 1,0$ for $(v/s) \ge 1,5$

Volume 1, Part 4, Chapter 2

Section 10

10.8.2 The permanent deflection correction, t_c , is a plating thickness reduction which can be applied if aircraft manoeuvring take off and deck equipment operations allow some permanent set to occur

$$t_{\rm c} = 0.001 \, C \, s^{\rm n} \, {\rm mm}$$

where

C = 0,00071 and n = 2,2 for moderate deformations

C = 0.0154 and n = 1.85 for large deformations.

- 10.8.3 Moderate deformations are defined as those that will restrict manual manoeuvring of the aircraft. They will typically be 1,5 times the deflection expected from normal ship construction.
- 10.8.4 Large deformations are defined as those that will restrict operations to aircraft landing only with no wheeled vehicle operations they will typically be 2,5 times the deflections expected from normal ship construction.
- 10.8.5 If permanent deformation of the landing area plating is to be allowed then the plating must also be assessed for normal operations with $t_c = 0.0$ mm.
- 10.8.6 The permanent deflection correction is not to be applied to landing areas within $0.3L_R$ to $0.7L_R$ and other areas where there are significant in-plane stresses in the plate. Also the correction is not to be applied to areas where deflections could cause operational restrictions, for example the use of forklift trucks or rolling take off.
- 10.8.7 The static tyre print dimensions at W_{auw} specified by the manufacturer are to be used for the calculation. Where these are unknown it may be assumed that the print area is 200 mm x 300 mm and this assumption is to be indicated on the submitted plan.
- 10.8.8 Twin wheels are to be combined to form a single patch as shown in Figure 2.10.2 Tyre patch dimensions
- 10.8.9 For helicopters fitted with landing gear consisting of skids, the print dimensions specified by the manufacturer are to be used. Where these are unknown it may be assumed that the print consists of a 300 mm line load at each end of each skid, when applying Figure 3.2.1 Tyre print chart
- 10.8.10 For decks fitted with sheathing greater than 25 mm a reduced plate thickness from that given in *Vol 1, Pt 4, Ch 2, 10.8 Deck plating design 10.8.1* may be specially considered.
- 10.8.11 For steel decks in frequent use and where no suitable protective sheathing or coating is used, it is recommended that the thickness of the plating is increased, see Vol 1, Pt 6, Ch 6, 3.8 Corrosion margin

10.9 Deck stiffening design

10.9.1 The aircraft deck stiffening is to be designed for the load cases given in *Table 2.10.6 Design load cases for primary and secondary deck stiffening and supporting structure* with the aircraft being positioned so as to produce the most severe loading condition for each structural member under consideration. All possible positions and orientations are to be considered that can occur during aircraft operations.

Volume 1, Part 4, Chapter 2

Section 10

10.9.2 The minimum requirements for section modulus, inertia and web area of secondary stiffeners are to be in accordance with the requirements of *Table 3.2.3 Secondary stiffener requirements*, using the load cases defined in *Table 2.10.6 Design load cases for primary and secondary deck stiffening and supporting structure*

Table 2.10.6 Design load cases for primary and secondary deck stiffening and supporting structure

Condition	Loading						
			Stiffening			Support structure	
	Plate F _{typ} kN	P _{tyw} kN/m ²	Point loads F _{tys} kN	Self weight F _{tym} kN	Vertical	Horizontal	
					kN	kN	
Emergency landing	λf W _{ty}	0,2	DLF λ f W _{ty}	(1 + a _z) W _s	Self weight $W_{\rm pl}$ plus landing	0,5 W _{auw} 0,5 W _{auw} + 0,5	
Normal landing	0,6 λ W _{ty}	0,5	0,6 <i>DLF</i> λ W _{ty}	$(1 + a_z) W_s$	loads from all	$W_{\rm pl}$	
Take off (fixed wing)	2,65 W _{ty}	0,5	2,65 W _{ty}	$(1 + a_z) W_s$			
Manoeuvring internal	1,6 W _{ty}	_	1,6 W _{ty}	$(1 + a_z) W_s$			
Manoeuvring external	1,75 W _{ty}	0,5	1,75W _{ty}	$(1 + a_z) W_s$			
Parking internal	$(1 + 0.6a_z) W_{ty}$	_	$(1 + 0.6a_z) W_{ty}$	$(1 + a_z) W_s$			
Parking external	$1,1(1+0,6a_z) W_{ty}$	2	1,1(1 + 0,6a _z) W _{ty}	$(1 + a_z) W_s$			

 $W_{\rm ty}$, $W_{\rm auw}$ and f as defined in Vol 1, Pt 4, Ch 2, 10.5 Loading λ is defined in Vol 1, Pt 4, Ch 2, 10.8 Deck plating design

 $W_{\rm pl}$ = structural weight of helicopter platform, in kN

 $W_{\rm s}$ = structural weight of stiffener and supported structure, in kN

 P_{tyw} = uniformly distributed vertical load over entire landing area, kN/m²

DLF = Dynamic load Fixed wing 1,35 for secondary stiffening, 1,5 for primary stiffening

Helicopters 1,2 for secondary stiffening, 1,5 for primary stiffening.

 a_z is defined in Vol 1, Pt 5, Ch 3, 2 Motion response

factor

Note 1. For the design of the supporting structure for helicopter platforms applicable self-weight and horizontal loads are to be added to the landing area loads.

Note 2. The helicopter is to be so positioned as to produce the most severe loading condition for each structural member under consideration.

Note 3. Stiffening members may have more than one point load acting at one time.

Note 4. The dynamic load factor may be determined from Vol 1, Pt 6, Ch 2, 5 Dynamic loading based on the structural natural frequency response.

10.9.3 For primary stiffening, and where a grillage arrangement is adopted, it is recommended that direct calculation procedures are used to determine the scantling requirements in association with the limiting permissible stress criteria given in *Table 5.3.2 Allowable stress factors f 1* in Pt 6, Ch 5. The calculation is to be submitted for consideration.

Volume 1, Part 4, Chapter 2

Section 10

10.9.4 Where continuous secondary stiffeners pass through the webs of primary members, they are to be fully collared or lugged in way. The shear stresses at the connections are to be in compliance with *Vol 1, Pt 6, Ch 5 Structural Design Factors*.

10.10 Parking and manoeuvring areas

- 10.10.1 For areas designed for parking and manoeuvring of aircraft the maximum take off weight of the aircraft is to be used with the maximum fuel and payload.
- 10.10.2 For areas where only manoeuvring occurs and parking is restricted to designated and clearly marked areas then the scantlings of structure are to be calculated in accordance with *Vol 1, Pt 4, Ch 2, 10.8 Deck plating design* and *Vol 1, Pt 4, Ch 2, 10.9 Deck stiffening design* using the manoeuvring and parking loads given in *Table 2.10.6 Design load cases for primary and secondary deck stiffening and supporting structure* as appropriate. If parking areas are not clearly marked then the parking loads in *Table 2.10.6 Design load cases for primary and secondary deck stiffening and supporting structure* are to be applied to all areas of aircraft operation outside the landing area. W_{tv} may be determined as stated in *Vol 1, Pt 4, Ch 2, 10.5 Loading 10.5.1*.
- 10.10.3 Parking areas may not be taken less than two frame spaces or the tyre width plus 500 mm whichever is the greater. Consideration should be given to the use of removable lagging around these areas and at the adjacent beam bulkhead connection.
- 10.10.4 Additional forces from tie down arrangements on the structure need only be considered if the tensioning force applied exceeds that imposed by the forces from ship motions as defined in *Vol 1, Pt 4, Ch 2, 10.14 Aircraft tie-downs*.
- 10.10.5 Decks subjected to a combination of parking and significant in-plane stresses will be specially considered.

10.11 Assisted take off

- 10.11.1 Where the aircraft jet is not parallel to the deck at the moment of launch or jet blast deflectors are used the structure is to be capable of withstanding the thermal loads imposed on the deck.
- 10.11.2 The structure of ramps used to assist take off are to be specially considered.
- 10.11.3 Structure surrounding catapults is to be effectively supported and designed for the maximum forces imposed by the launch system using the stress criteria given in *Table 5.3.2 Allowable stress factors f 1* in Pt 6, Ch 5.

10.12 Arrested landing

10.12.1 Structure surrounding arresting gear is to be effectively supported and designed for the maximum forces imposed by the arrested aircraft using the stress criteria given in *Table 5.3.2 Allowable stress factors f 1* in Pt 6, Ch 5.

10.13 Vertical recovery

10.13.1 The structure in way of the landing area and approach path is to be capable of withstanding the thermal loads imposed by hot exhaust gases.

10.14 Aircraft tie-downs

- 10.14.1 Aircraft tie-downs or general anchoring points are to be provided on the flight deck and in hangar spaces and are to be flush with the deck, when not in use.
- 10.14.2 The forces to be used in assessing the tie-down points are to preferably be determined with regards to specific aircraft but where the aircraft is unknown the designer may propose reasonable assumptions. Consideration is to be given to the range of angles of application of the force due to the relationship between the aircraft undercarriage arrangement and the spacing and arrangement of the tie-down points.
- 10.14.3 Tie-down points are to be tested in accordance with a suitable testing regime agreed with LR.

Volume 1, Part 4, Chapter 3

Section 1

Section

- 1 General
- 2 Vehicle decks and fixed ramps
- 3 Bow doors
- 4 Side, stern doors and other shell openings
- 5 Movable decks, lifts, internal and external ramps

■ Section 1

General

1.1 Application

1.1.1 The requirements of this Chapter are applicable to mono-hull and multi-hull ships of steel construction as defined in *Pt* 1, *Ch* 2, 2.2 *Definitions* 2.2.5.

1.2 Symbols and definitions

1.2.1 The symbols and definitions used in this Chapter are defined below and in the appropriate Section:

s = stiffener spacing, in mm

k_s = higher tensile steel factor, see Vol 1, Pt 6, Ch 5, 3.1 Design criteria 3.1.1.

■ Section 2

Vehicle decks and fixed ramps

2.1 General

- 2.1.1 These requirements are applicable to longitudinally or transversely framed ships intended for the carriage of tracked vehicles, wheeled vehicles, or where wheeled vehicles are to be used for cargo handling.
- 2.1.2 The deck and supporting structure are to be designed on the basis of the maximum loading to which they may be subjected in service. Where applicable, the hatch covers are to be similarly designed. In no case, however, are the scantlings to be less than would be required for a weather or cargo deck, or hatch cover, as applicable.
- 2.1.3 Details of the deck loading resulting from the proposed stowage or operation of vehicles are to be supplied by the Builder. These details are to include axle and wheel spacing, the wheel load, type of tyre and tyre print dimensions for the vehicles. The vehicle types and wheel loads for which the vehicle decks, including hatch covers where applicable, have been approved are to be included in the ship's documentation and contained in a notice displayed on each deck. For wheeled vehicles, the wheel loading is to be taken as not less than 3,0 kN.
- 2.1.4 The scantling requirements are based on structural strength and limitations on stress and deflection, guidance for wear and tear allowances is given in *Vol 1*, *Pt 4*, *Ch 3*, *2.3 Deck plating*. Local reinforcement is to be fitted as necessary, particularly in way of vehicle lanes and embarked personnel routes.
- 2.1.5 The webs of vehicle deck stiffening members are in no cases to be scalloped.
- 2.1.6 If wheeled vehicles are to be used on insulated decks or tanks tops, consideration will be given to the permissible loading in association with the insulation arrangements and the plating thickness.
- 2.1.7 Suitable fire fighting equipment and services should be provided in the vehicle space. Arrangements should be made for ventilation and drainage of spilt fuel.

Volume 1, Part 4, Chapter 3

Section 2

2.2 Definitions

2.2.1 **Load Area.** The load area is defined as the footprint area of an individual wheel or the area enclosing a group of wheels when the distance between footprints is less than the smaller dimension of the individual prints.

2.3 Deck plating

2.3.1 The thickness, t_p , of vehicle deck plating is to be taken as not less than:

$$t_{\rm p} = \frac{\alpha \, \rm s}{1000 \sqrt{k_{\rm s}}} \, \rm mm$$

where

 α = thickness coefficient obtained from Figure 3.2.1 Tyre print chart using a value of β given by

 β = tyre print coefficient used in Figure 3.2.1 Tyre print chart

$$= \log_{10} \left(\frac{F_{\text{typ}} k_s^2}{9,81s^2} \times 10^7 \right)$$

s = secondary stiffener spacing, in mm

 F_{typ} = corrected patch load for plating, in kN obtained from Table 3.2.1 Deck plate thickness calculation, see also Figure 3.2.1 Tyre print chart and Table 3.2.2 Tyre correction factor, n

s and k_s are as defined in Vol 1, Pt 4, Ch 3, 1.2 Symbols and definitions.

Volume 1, Part 4, Chapter 3 Section 2

Table 3.2.1 Deck plate thickness calculation

Symbols	Expression	
a, s, u and v as defined in Figure 3.2.1 Tyre print chart	$F_{typ} = \varphi_1 \varphi_2 \varphi_3 \lambda W_{ty}$	
n = tyre correction factor as detailed in <i>Table 3.2.2</i> Tyre correction factor, n	$2v_1 + 1, 1s$ $v_1 = v, \text{ but } \le s$	
F_{typ} = corrected patch load for plating, in kN	$\varphi_{1} = \frac{2v_{1} + 1, 1s}{u_{1} + 1, 1s}$ $v_{1} = v, \text{ but } \leq s$ $u_{1} = u, \text{ but } \leq a$	
$\lambda = ext{dynamic magnification factor}$	$\varphi_2 = 1,0$ for $u \le (a-s)$	
W ty = load, in kN, on the tyre print. For closely spaced wheels the area shown in Figure 2.10.2 Tyre patch dimensions may be taken as the combined print	$= \frac{1}{1, 3 - \frac{0, 3}{s}(a - u)} $ for $a \ge u > (a - s)$	
ϕ_1 = patch aspect ratio correction factor ϕ_2 = panel aspect ratio correction factor	$= 0.77 \frac{a}{u}$ for $u > a$	
ϕ_3 = wide patch load factor	$\varphi_3 = 1,0$ for $v < s$	
	= 0,6 (s/v) + 0,4 for 1,5 > (v/s) > 1,0	
	= 1,2 (s/v) for (v/s) \geq 1,5	
	$\lambda = 1,25$ for harbour conditions $= (1 + 0,7n) \text{ for sea gong conditions}$	

Section 2

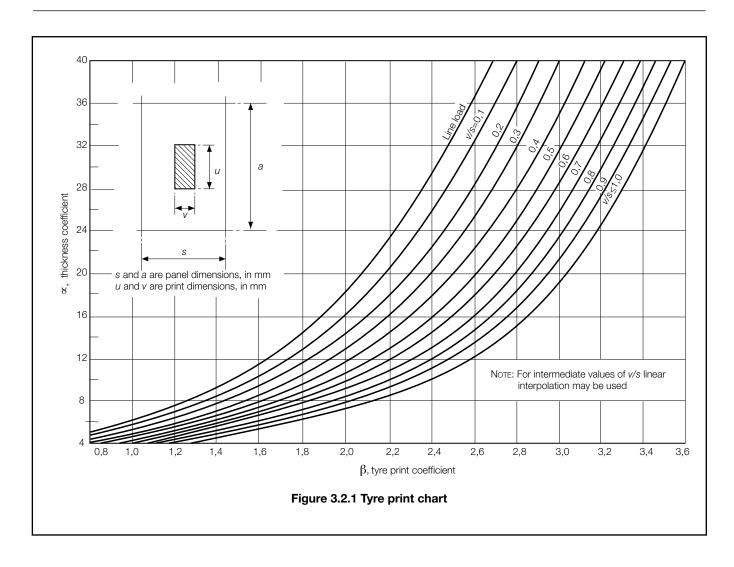

Table 3.2.2 Tyre correction factor, n

Number of wheels in idealised patch	Pneumatic tyres correction factor, n	Solid rubber tyres correction factor, <i>n</i>
1	0,6	0,8
2 or more	0,75	0,9

- 2.3.3 Where transversely framed decks contribute to the hull girder strength or where secondary stiffening is fitted perpendicular to the direction of vehicle lanes, the thickness, t_p , derived from *Vol 1, Pt 4, Ch 3, 2.3 Deck plating 2.3.1* is to be increased by 1,0 mm.
- 2.3.4 In the absence of a specific requirement the thickness t_p derived from *Vol 1, Pt 4, Ch 3, 2.3 Deck plating 2.3.1* is to be increased by a wear and wastage allowance of 1,5 mm for strength decks, weather decks, tank tops and inner bottom or 0,75 mm elsewhere.

2.4 Secondary stiffening

- 2.4.1 The scantlings of vehicle deck stiffeners are to satisfy the most severe arrangement of print wheel loads.
- 2.4.2 The minimum requirements for section modulus, inertia and web area of vehicle deck secondary stiffeners subject to wheel loading are to be calculated in accordance with *Table 3.2.3 Secondary stiffener requirements* using the loads defined in *Table 3.2.4 Design load cases for primary and secondary stiffening and supporting structure*.

Volume 1, Part 4, Chapter 3

Section 2

Table 3.2.3 Secondary stiffener requirements

Scantling	Load case		
requirement	$d \le l$	d > l	
Section modulus (Z) (cm³)	$Z = \left(\frac{k_{\rm w} F_{\rm tys} (3l^2 - d^2)}{24l} + \frac{P_{\rm tyw} sl^2}{10} + \frac{F_{\rm tym} l}{10}\right) \frac{10^3}{f \ \sigma \ \sigma_o}$	$Z = \left(\frac{k_{\text{w}} F_{\text{tys}} l^2}{10 \ d} + \frac{P_{\text{tyw}} s l^2}{10} + \frac{F_{\text{tym}} l}{10}\right) \frac{10^3}{f \ \sigma \ \sigma}$	
Inertia (I)(cm ⁴)	$I = \left(\frac{k_{\text{w}} F_{\text{tys}} (2l^3 - 2d^2l + d^3)}{384l} + \frac{P_{\text{tyw}} sl^3}{288} + \frac{F_{\text{tym}} l^2}{288}\right) \frac{10^5}{f \delta E}$	$I = \left(\frac{k_{\text{w}} F_{\text{tys}} t^3}{384d} + \frac{P_{\text{tyw}} s t^3}{288} + \frac{F_{\text{tym}} t^2}{288}\right) \frac{10^5}{f_{\delta} E}$	
Web area (A w) (cm²)	$A_{\mathbf{w}} = \left(\frac{k_{\mathbf{w}} F_{\mathbf{tys}} \left(m^3 - 2m^2 + 2\right)}{2} + \frac{P_{\mathbf{tyw}} sl}{2} + \frac{F_{\mathbf{tym}}}{2}\right) \frac{10}{f_{\tau} \tau_{o}}$	$A_{\mathbf{W}} = \left(\frac{k_{\mathbf{W}}^{F} \mathbf{tys}^{l}}{2d} + \frac{P_{\mathbf{tyw}}^{Sl}}{2} + \frac{F_{\mathbf{tym}}}{2}\right) \frac{10}{f_{\tau}^{T}} \frac{10}{o}$	
	where $m = d/l$		

Symbol

l = overall secondary stiffener length, in metres

s = stiffener spacing, in metres

d = dimension of load area parallel to stiffener axis, in metres

 $E = \text{Young's Modulus of elasticity of material, in N/mm}^2$

w = dimension of load area perpendicular to stiffener axis, in metres

 k_{w} = lateral loading factor

 $= 1 \text{ for } w \leq s$

= s/w for w > s

 F_{tys} = point load given in Table 3.2.4, in kN

 F_{tym} = self weight load given in Table 3.2.4, in kN

 P_{tyw} = weather deck load given in Table 3.2.4, in kN/m²

 $f_{\,\sigma}\!,\!f_{\,\delta}\!,\!f_{\,\tau}$ are the structural design factors given in Pt 6, Ch 5

 $\sigma_{_{\! O}} \; = \;$ specified minimum yield strength of the material, in N/mm²

 τ_{o} = shear strength of the material, in N/mm²

 $=\frac{\sigma_o}{\sqrt{3}}$

Volume 1, Part 4, Chapter 3

Section 2

Table 3.2.4 Design load cases for primary and secondary stiffening and supporting structure

Condition	Loading Stiffening			
Condition				
	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$			
Manoeuvring internal	-	1,6W _{ty}	$(1 + a_z)W_s$	
Manoeuvring external	0,5	1,75W _{ty}	$(1 + a_z)W_s$	
Parking internal	-	(1+ n a _z)W _{ty}	$(1 + a_z)W_s$	
Parking external	2	1,1 (1+ n a _z)W _{ty}	$(1 + a_z)W_s$	

Symbols

 W_{tv} = maximum effective load per wheel or group of wheels

 W_s = structural weight of stiffener and supported structure, in kN

UDL = uniformly distributed load over entire vehicle area, kN/m²

n = tyre correction factor in Table 3.2.3 Secondary stiffener requirements

a z is defined in Vol 1, Pt 5, Ch 3, 2 Motion response

Note 1. For the design of the supporting structure for vehicle decks, the applicable self weight and horizontal loads are to be added to the parking area loads.

Note 2. The vehicles are to be positioned so as to produce the most severe loading condition for each structural member under consideration.

Note 3. Stiffening members may have more than one point load acting at any time.

2.4.3 When two or more load areas are located simultaneously on the same stiffener span, the scantling requirements are to be specially considered on the basis of direct calculation.

2.5 Primary stiffening

2.5.1 Generally the scantlings of vehicle deck primary girders and transverse web frames are to be determined on the basis of direct calculation in association with the loads defined in *Table 3.2.4 Design load cases for primary and secondary stiffening and supporting structure* and the limiting permissible stresses and deflection criteria contained in *Vol 1, Pt 6, Ch 5 Structural Design Factors*

2.6 Securing arrangements

- 2.6.1 The strength and stiffness of the holding down arrangements and supporting structure are to be in accordance with *Vol* 1, *Pt 4*, *Ch 1*, *5.2 Vehicle and equipment holding down arrangements*.
- 2.6.2 Deck fittings in way of vehicle lanes are to be recessed.
- 2.6.3 The vehicle deck structure is to be of adequate strength for the upward forces imposed at fixed securing points. Local reinforcement is to be fitted as necessary.

2.7 Access

- 2.7.1 Bow doors are to comply with the requirements of Vol 1, Pt 4, Ch 3, 4 Side, stern doors and other shell openings.
- 2.7.2 Where access to the vehicle deck is provided by side and stern doors, the doors are to have scantlings equivalent to the structure in which they are fitted, see also Vol 1, Pt 3, Ch 4, 5 Side scuttles and windows.

Volume 1, Part 4, Chapter 3

Section 2

2.7.3 Doors providing access between vehicle decks and accommodation spaces are to be gastight, have scantlings equivalent to the surrounding structure and where applicable are to comply with the specified fire safety standard.

2.8 Hatch covers

- 2.8.1 The scantlings and arrangements of hatches and hatch covers located within vehicle decks are to be not less than that required by the Rules for the supporting structure in which such hatches are fitted. In general the end fixity of primary stiffening members is to be taken as simply supported. Local and secondary stiffening members may be either partially or fully fixed at their end connections dependent upon the proposed arrangement.
- 2.8.2 In no case, however, are the scantlings of plating and stiffeners to be less than would be required for a weather or cargo deck hatch cover, as applicable.
- 2.8.3 Where unusual arrangements of hatch cover stiffening are proposed, the scantlings of plating and stiffeners may be determined by direct calculations. The designers calculations are to be submitted.

2.9 Heavy and special loads

- 2.9.1 Where heavy or special loads are proposed to be carried, the scantlings and arrangements of the deck structure will be individually considered on the basis of submitted calculations.
- 2.9.2 Due account is to be taken of the acceleration levels due to ship motion as applicable to particular items of heavy mass such as vehicles, containers, pallets, etc.

2.10 Tracked and steel wheeled vehicles

- 2.10.1 Where it is proposed to carry tracked vehicles the patch dimensions may be taken as the track print dimensions and $F_{\rm w}$ is to be taken as half the total weight of the vehicle. Deck fittings in way of vehicle lanes are to be recessed.
- 2.10.2 Where it is proposed to carry tracked vehicles, the total weight of the vehicle is to be used when determining the section modulus of the transverse at the top of a ramp or at other changes of gradient.
- 2.10.3 A wear and tear allowance is to be added to the plating thickness and it is not to be less than that defined in *Vol 1, Pt 4, Ch 3, 2.3 Deck plating 2.3.4*

2.11 Openings in main vehicle deck

- 2.11.1 Items such as portable plates in main vehicle deck for the removal of machinery parts, etc. may be arranged flush with the deck, provided they are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.
- 2.11.2 Scuppers from vehicle or cargo spaces fitted with an approved fixed pressure water spray fire-extinguishing system are to be led inboard to tanks. Alternatively they may be led overboard providing they comply with *Vol 1, Pt 3, Ch 4, 8.1 General 8.1.3*.
- 2.11.3 Inboard draining scuppers do not require valves but are to be led to suitable drain tanks (not engine room or hold bilges) and the capacity of the tanks is to be sufficient to hold at least 20 minutes of drenching water. The arrangements for emptying these tanks are to be approved and suitable high level alarms provided.
- 2.11.4 Air pipes from cofferdams or void spaces may terminate in the enclosed 'tween deck space on the main vehicle deck provided the space is adequately ventilated and the air pipes are provided with weathertight closing appliances.
- 2.11.5 In addition, the requirements of Vol 1, Pt 4, Ch 3, 3.10 Securing and locking arrangements 3.10.8 are to be complied with.

2.12 Direct calculations

2.12.1 Lloyd's Register (hereinafter referred to as 'LR') will consider direct calculations for the derivation of scantlings as an alternative to and equivalent to those derived by Rule requirements. The assumptions made and the calculation procedures used are to be submitted for appraisal in accordance with Vol 1, Pt 3, Ch 1, 2 Direct calculations

Volume 1, Part 4, Chapter 3

Section 3

■ Section 3

Bow doors

3.1 Application

- 3.1.1 The requirements of this Section are applicable to the arrangement, strength and securing of bow doors, both the visor and the side opening type doors, and inner doors leading to a complete or long forward enclosed superstructure, or to a long non-enclosed superstructure which is fitted to attain minimum bow height equivalence.
- 3.1.2 Other types of bow door will be specially considered.
- 3.1.3 Where the operational requirements dictate that the doors and ramps be deployed at sea or in the surf zone, the strength and operation will be specially considered.

3.2 General

- 3.2.1 The attention of Owners and Builders is drawn to the additional statutory regulations for bow doors that may be required by the subdivision and stability standard.
- 3.2.2 Bow doors are to be located above the vertical limit of watertight integrity. A watertight recess is normally permitted below the vertical limit of watertight integrity located forward of the collision bulkhead and above the deepest waterline, for the arrangement of ramps or other related mechanical devices. For any ship where bow doors may be open at sea or located below the vertical limit of watertight integrity, the enclosed spaces protected by the door or ramp are to be considered open as well as closed in damage stability or flooding conditions.
- 3.2.3 An inner door is to be fitted which is to be gasketed and weathertight. The inner door is to be part of the collision bulkhead. The inner door need not be fitted directly above the bulkhead below, provided it is located within the limits specified for the position of the collision bulkhead, see *Vol 1*, *Pt 3*, *Ch 2*, *4 Bulkhead arrangements*. A vehicle ramp may be arranged for this purpose, provided its position complies with *Vol 1*, *Pt 3*, *Ch 2*, *4 Bulkhead arrangements* and the ramp is weathertight over its complete length. In this case the upper part of the ramp higher than 2,3 m above the vertical limit of watertight integrity may extend forward of the limit specified in *Vol 1*, *Pt 3*, *Ch 2*, *4 Bulkhead arrangements* If this is not possible a separate inner weathertight door is to be installed, as far as practicable within the limits specified for the position of the collision bulkhead.
- 3.2.4 Bow doors are to be fitted as to ensure tightness consistent with operational conditions and to give effective protection to inner doors. Inner doors forming part of the collision bulkhead are to be weathertight over the full height of the vehicle space and arranged with fixed sealing supports on the aft side of the doors.
- 3.2.5 Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a separate inner weathertight door is to be installed, as indicated in *Vol 1*, *Pt 4*, *Ch 3*, *3.2 General 3.2.3*.
- 3.2.6 The requirements for inner doors are based on the assumption that vehicles are effectively lashed and secured against movement in the stowed position.
- 3.2.7 The scantlings and arrangements of side shell and stern doors are to be in accordance with the requirements of *Vol 1*, *Pt 6, Ch 3 Scantling Determination*.

3.3 Symbols and definitions

3.3.1 The symbols used in this Section are defined as follows:

 A_s = area stiffener web, in cm²

A x = area, in m², of the transverse vertical projection of the bow door, between the bottom of the door and the top of the door or between the bottom of the door and the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Figure 3.3.2 Bow visor upward hinging. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded.

300

Volume 1, Part 4, Chapter 3

Section 3

- $A_y = \text{area}$, in m^2 , of the longitudinal vertical projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see *Figure 3.3.2 Bow visor upward hinging*. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser.
- $A_{\rm Z}={\rm area,\,in\,m^2,\,of}$ the horizontal projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see *Figure 3.3.2 Bow visor upward hinging*. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser.
- a _{bv} = vertical distance, in metres, from visor pivot to the centroid of the transverse vertical projected area of the visor door, as shown in *Figure 3.3.2 Bow visor upward hinging*
- b by = horizontal distance, in metres, from visor pivot to the centroid of the horizontal projected area of the visor door, as shown in *Figure 3.3.2 Bow visor upward hinging*
- c_{bv} = horizontal distance, in metres, from visor pivot to the centre of gravity of visor mass, as shown in *Figure* 3.3.2 Bow visor upward hinging
- d_{bv} = vertical distance, in metres, from bow door pivot to the centre of gravity of the bow door, see Figure 3.3.2 Bow visor upward hinging
 - h = height of the door between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, in metres, whichever is the lesser, as shown in *Figure 3.3.1* Definition of αf and βe
- k_s = higher tensile steel factor defined in Vol 1, Pt 6, Ch 5, 3.1 Design criteria 3.1.1
- Q_{bd} = shear force, in kN, in the stiffener calculated by using uniformly distributed external pressure P_{e} as given in Figure 3.3.1 Definition of αf and βe
- W_{bv} = mass of the visor door, in tonnes
 - W =breadth of the door at a height h/2 above the bottom of the door, in metres, as shown in *Figure 3.3.2* Bow visor upward hinging
 - $I_{\rm d}=1$ length of the door at a height h/2 above the bottom of the door, in metres, as shown in Figure 3.3.2 Bow visor upward hinging
 - τ = shear stress, in N/mm²
 - σ = bending stress, in N/mm²
 - σ_{o} = specified minimum yield strength of the material, in N/mm²
- σ_{eq} = equivalent stress, in N/mm²
 - $=\sqrt{\sigma^2+3\tau^2}$
- 3.3.2 **Locking device.** A device that locks a securing device in the closed position.
- 3.3.3 **Securing device.** A device used to keep the door closed by preventing it from rotating about its hinges.
- 3.3.4 **Side-opening doors.** Side-opening doors are opened either by rotating outwards about a vertical axis through two or more hinges located near the outboard edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the craft. It is anticipated that side-opening doors are arranged in pairs.

301

Volume 1, Part 4, Chapter 3

Section 3

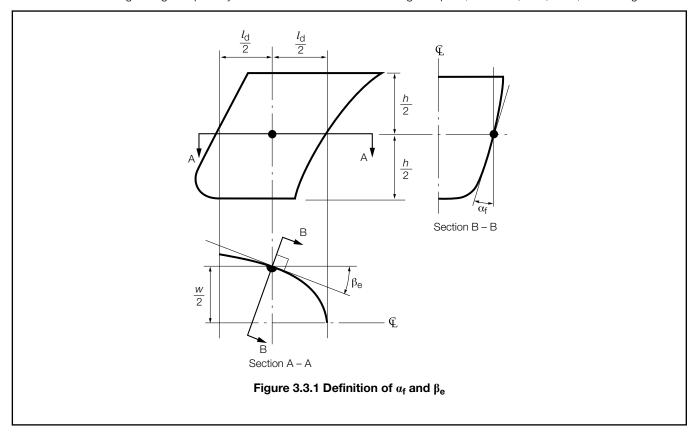

- 3.3.5 **Supporting device.** A device used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.
- 3.3.6 **Visor doors.** Visor doors are opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms.

3.4 Construction and testing

- 3.4.1 Plans are to be of sufficient detail for plan approval purposes. Plans showing the proposed scantlings and arrangement of the bow door are to be submitted. Bow doors are to be constructed under survey.
- 3.4.2 Bow doors fitted below the limit of watertight integrity are to be subject to a pressure test of a prototype to confirm the design pressure head.
- 3.4.3 As an alternative to prototype testing, the integrity of the door may be demonstrated by calculation and representative testing in accordance with MSC/Circular.1176 Unified Interpretations to SOLAS Chapters II-1 and XII and to the Technical Provisions for Means of Access for Inspections (25 May 2005). For doors fitted above the vertical limit of watertight integrity, the doors only require testing following installation, in accordance with Table 6.7.1 Testing requirements in Vol 1, Pt 6 Hull Construction in Steel.

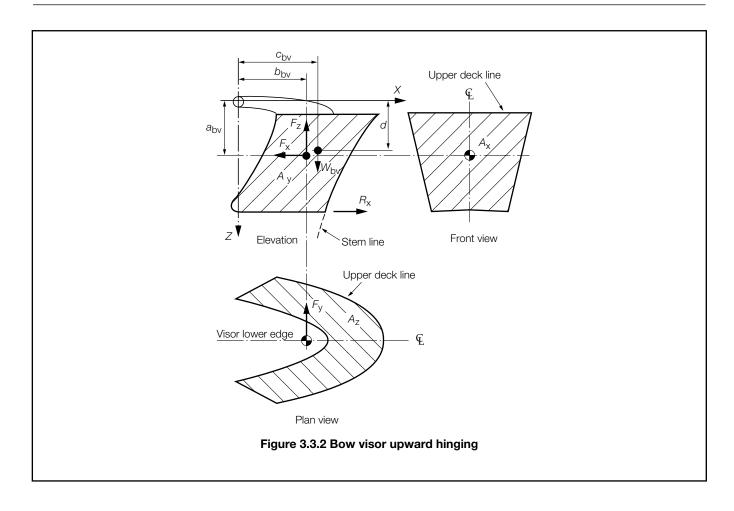

3.5 Strength criteria

- 3.5.1 Scantlings of the primary members, securing and supporting devices of bow doors and inner doors are to be able to withstand the design loads defined in *Vol 1*, *Pt 4*, *Ch 3*, *3.6 Design loads*. The shear, bending and equivalent stresses are not to exceed 80/k N/mm², 120/k N/mm² and 150/k _S N/mm² respectively.
- 3.5.2 The buckling strength of primary members is to be verified as being adequate, see Vol 1, Pt 6, Ch 2, 3 Buckling

Volume 1, Part 4, Chapter 3

Section 3

- 3.5.3 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed 80 per cent of the yield stress of the bearing material. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification.
- 3.5.4 The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tension in way of threads of steel bolts not carrying support forces is not to exceed 125/k N/mm².

3.6 Design loads

3.6.1 The design external pressure, $P_{\rm e}$, for the determination of scantlings for primary members, securing and supporting devices of bow doors is to be taken not less than the following:

$$P_{\rm e} = 2,75 \,\lambda_{\rm G} C_{\rm H} (0,22+0,15 \tan \alpha_{\rm f}) \,\mathrm{x} \left(0,4 V_{\rm max} \sin \beta_{\rm e} + 0,6 L_{\rm R} 0,5\right)^2 \,\mathrm{kN/m^2}$$

 V_{max} = maximum speed, in knots, as defined in Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.6.

L_R = Rule length of ship, in metres, as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars 5.2.2

λ_G = service area factor for mono-hull ships, see Vol 1, Pt 1, Ch 2, 3.6 Service area notations

= 1,0 for sea-going ships

= 0,8 for ships operated in coastal waters

= 0,5 for ships operated in sheltered waters

 $C_{\rm H} = 0.0125 L_{\rm R}$ for $L_{\rm R} < 80$ m

Volume 1, Part 4, Chapter 3

Section 5

- $= 1,0 \text{ for } L_{R} \ge 80 \text{ m}$
- $\alpha_{\rm f}$ = flare angle, in degrees, at the point to be considered, defined as the angle between a vertical line and the tangent to the side shell plating, measured in a vertical plane normal to the horizontal tangent to the shell plating, see *Figure 3.3.1 Definition of af and βe*
- $\beta_{\rm e}=$ entry angle, in degrees, at the point to be considered, defined as the angle between a longitudinal line parallel to the centreline and the tangent to the shell plating in a horizontal plane, see Figure 3.3.1 Definition of αf and βe .
- 3.6.3 For bow doors, including bulwark, of unusual form or proportions, the areas used for the determination of the design values of external forces will be specially considered.
- 3.6.4 For visor doors the closing moment, My, under external loads, is to be taken as:

$$M_{y} = F_{x} a_{by} + 10W_{by} c_{by} - F_{z} b_{by} \text{ kNm}$$

where

 $W_{\rm bv}$, $a_{\rm bv}$, $b_{\rm bv}$ and $c_{\rm bv}$ as defined in Vol 1, Pt 4, Ch 3, 3.3 Symbols and definitions 3.3.1, $F_{\rm x}$ and $F_{\rm z}$ as defined in Vol 1, Pt 4, Ch 3, 3.6 Design loads 3.6.2.

- 3.6.5 The lifting arms of a visor and its supports are to be dimensioned for the static and dynamic forces applied during the lifting and lowering operations, and a minimum wind pressure of 1,5 kN/m² is to be taken.
- 3.6.6 The design external pressure, in kN/m^2 , for the determination of scantlings for primary members, securing and supporting devices and surrounding structure of inner doors is to be taken as the greater of 0,45 L_R and 10 h^2 , where h^2 is the distance, in m, from the load point to the top of the space enclosed by the visor, L_R , as defined in *Vol 1*, *Pt 3*, *Ch 1*, 5.2 *Principal particulars 5.2.2*
- 3.6.7 The design internal pressure for the determination of scantlings for securing devices of inner doors is not to be taken less than 25 kN/m².
- 3.6.8 On ships with rounded nose bow and a large stem angle with the waterline, strengthening against horizontal impact loads is to be considered. Similarly, in ships with a flare angle of less than 60° with the waterline, strengthening against vertical impact loads to be considered.

3.7 Scantlings of bow doors

- 3.7.1 The strength of bow doors is to be equivalent to the surrounding structure.
- 3.7.2 Bow doors are to be adequately stiffened and means are to be provided to prevent lateral or vertical movement of the doors when closed. For visor doors adequate strength for the opening and closing operations is to be provided in the connections of the lifting arms to the door structure and to the craft structure.
- 3.7.3 The thickness of the bow plating is not to be less than that required for the side shell plating, using bow door stiffener spacing, but in no case less than the minimum required thickness of fore end shell plating.
- 3.7.4 The section modulus of horizontal or vertical stiffeners is not to be less than that required for end framing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and bow doors stiffeners.
- 3.7.5 The stiffener webs are to have a net sectional area, A s, not less than:

$$A_{\rm s} = \frac{23,5Q_{\rm bd}}{\sigma_{o}} \, \rm cm^2$$

where A $_{\rm S}$, Q $_{\rm bd}$ and σ $_{\rm O}$ as defined in Vol 1, Pt 4, Ch 3, 3.3 Symbols and definitions 3.3.1

3.7.6 The bow door secondary stiffeners are to be supported by primary members constituting the main stiffening of the door.

Volume 1, Part 4, Chapter 3

Section 3

- 3.7.7 The primary members of the bow door and the hull structure in way are to have sufficient stiffness to ensure integrity of the boundary support of the door.
- 3.7.8 Scantlings of the primary members are generally to be supported by direct calculations in association with the external pressure given in *Vol 1, Pt 4, Ch 3, 3.6 Design loads 3.6.1* and permissible stresses given in *Vol 1, Pt 4, Ch 3, 3.5 Strength criteria 3.5.1*. In general, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections.
- 3.7.9 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

3.8 Scantlings of inner doors

- 3.8.1 Scantlings of the primary members are generally to be supported by direct calculations in association with the external pressure given in *Vol 1, Pt 4, Ch 3, 3.6 Design loads 3.6.1* and permissible stresses given in *Vol 1, Pt 4, Ch 3, 3.5 Strength criteria 3.5.1* In general, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections.
- 3.8.2 Where inner doors also serve as vehicle ramps, the scantlings are not to be less than those required for vehicle decks.
- 3.8.3 The distribution of forces acting on the securing and supporting devices is, in general, to be supported by direct calculations taking into account the flexibility of the structure and actual position and stiffness of the supports.

3.9 Securing and supporting of bow doors

- 3.9.1 Bow doors are to be fitted with adequate means of securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the bow doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is, in general, not to exceed 3 mm. A means is to be provided for mechanically fixing the door in the open position.
- 3.9.2 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices. Small and/or flexible devices such as cleats intended to provide load compression of the packing material are, in general, not to be included in the calculations called for in *Vol 1, Pt 4, Ch 3, 3.9 Securing and supporting of bow doors 3.9.8.* The number of securing and supporting devices are, in general, to be the minimum practical whilst taking into account the requirements for redundant provision given in *Vol 1, Pt 4, Ch 3, 3.9 Securing and supporting of bow doors 3.9.9* and *Vol 1, Pt 4, Ch 3, 3.9 Securing and supporting of bow doors 3.9.10* and the available space for adequate support in the hull structure.
- 3.9.3 For opening outwards visor doors, the pivot arrangement is generally to be such that the visor is self closing under external loads, that is $M_y > 0$. Moreover, the closing moment, M_y , as given in *Vol 1, Pt 4, Ch 3, 3.6 Design loads 3.6.4*, is to be not less than:

$$M_y = 10W_{bv} c_{bv} + 0.1(a_{bv}^2 + b_{bv}^2)^{0.5} (F_{x^2} + F_{z^2})^{0.5}$$

where $W_{\rm bv}$, $a_{\rm bv}$, $b_{\rm bv}$ and $c_{\rm bv}$ as defined in Vol 1, Pt 4, Ch 3, 3.3 Symbols and definitions 3.3.1, $F_{\rm x}$ and $F_{\rm z}$ as defined in Vol 1, Pt 4, Ch 3, 3.6 Design loads 3.6.2

- 3.9.4 Securing and supporting devices are to be adequately designed so that they can withstand the reaction forces within the permissible stresses given in *Vol 1, Pt 4, Ch 3, 3.5 Strength criteria 3.5.1*
- 3.9.5 For visor doors the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body are determined for the following combination of external loads acting simultaneously together with the self weight of the door.

Case 1 F_x and F_z

Case 2 $0.7F_y$ acting on each side separately together with $0.7F_x$ and $0.7F_z$.

where F_x , F_y and F_z are to be determined as indicated in Vol 1, Pt 4, Ch 3, 3.6 Design loads 3.6.2 and applied at the centroid of projected areas.

Volume 1, Part 4, Chapter 3

Section 3

3.9.6 For side-opening doors the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body are determined for the following combination of external loads acting simultaneously together with the self weight of the door:

Case 1 F_x , F_y and F_z acting on both doors.

Case 2 $0.7F_x$ and $0.7F_z$ acting on both doors and $0.7F_y$ acting on each door separately.

where F_x , F_y and F_z are to be determined as indicated in *Vol 1*, *Pt 4*, *Ch 3*, *3.6 Design loads 3.6.2* and applied at the centroid of projected areas.

- 3.9.7 The support forces as determined according to *Vol 1*, *Pt 4*, *Ch 3*, 3.9 Securing and supporting of bow doors 3.9.5 and *Vol 1*, *Pt 4*, *Ch 3*, 3.9 Securing and supporting of bow doors 3.9.6 are generally to give rise to a zero moment about the transverse axis through the centroid of the area, Ax. For visor doors, longitudinal reaction forces of pin and/or wedge supports at the door base contributing to this moment are not to be of the forward direction.
- 3.9.8 The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports.
- 3.9.9 The arrangement of securing and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable to withstand the reaction forces without exceeding by more than 20 per cent the permissible stresses as given in *Vol 1*, *Pt 4*, *Ch 3*, 3.5 Strength criteria 3.5.1.
- 3.9.10 For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reaction force required to prevent opening of the door within the permissible stresses given in *Vol 1, Pt 4, Ch 3, 3.5 Strength criteria 3.5.1*. The opening moment, $M_{\rm O}$, to be balanced by this reaction force, is not to be taken less than:

$$M_0 = 10W_{bv} d_{bv} + 5A_x a_{bv} \text{ kNm}$$

where

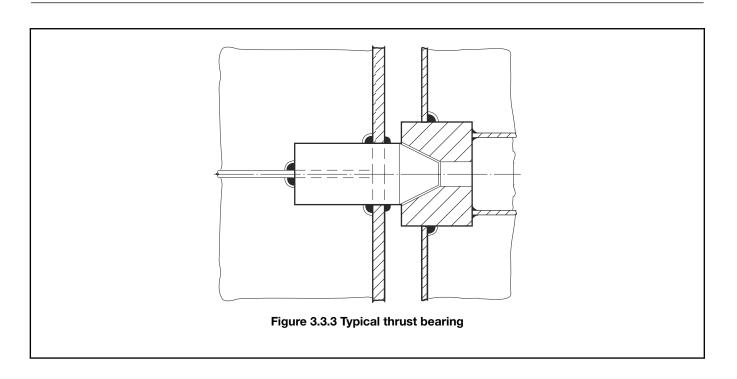

W_{by}, A_x, d_{by} and a_{by} as defined in Vol 1, Pt 4, Ch 3, 3.3 Symbols and definitions 3.3.1.

- 3.9.11 For visor doors, the securing and supporting devices excluding the hinges should be capable of resisting the vertical design force ($F_z 10W_{bv}$), in kN, within the permissible stresses given in *Vol 1, Pt 4, Ch 3, 3.5 Strength criteria 3.5.1*.
- 3.9.12 All load transmitting elements in the design load path, from door through securing and supporting devices into the ship structure, including welded connections, are to be the same strength. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.
- 3.9.13 For side-opening doors, thrust bearings have to be provided in way of girder ends at the closing of the two leaves to prevent one leaf to shift towards the other one under effect of unsymmetrical pressure, see *Figure 3.3.3 Typical thrust bearing*. Each part of the thrust bearing has to be kept secured on the other part by means of securing devices. Any other arrangement serving the same purpose is to be submitted for appraisal.

306

Volume 1, Part 4, Chapter 3

Section 3

3.9.14 The spacing for side and top cleats should not exceed 2,5 m and there should be cleats positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

3.10 Securing and locking arrangements

- 3.10.1 Securing devices are to be simple to operate and easily accessible. Securing devices are to be equipped with mechanical locking arrangement (self locking or separate arrangement), or be of the gravity type. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in the proper sequence.
- 3.10.2 Bow doors and inner doors giving access to vehicle decks are to be provided with an arrangement for remote control, from a position above the vertical limit of watertight integrity, of:
- (a) the closing and opening of the doors, and
- (b) associated securing and locking devices for every door.

Indication of the open/closed position of every door and every securing and locking device is to be provided at the remote control stations. The operating panels for operation of doors are to be inaccessible to unauthorised persons. A notice plate, giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour, is to be placed at each operating panel and is to be supplemented by warning indicator lights.

- 3.10.3 Where hydraulic securing devices are applied, the system is to be mechanically lockable in closed position so that in the event of loss of the hydraulic fluid, the securing devices remain locked. The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits when in closed position.
- 3.10.4 Separate indicator lights and audible alarms are to be provided on the navigation bridge and on the operating panel to show that the bow door and inner door are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. The indicator lights are to be provided with a permanent power supply, further, arrangements are to be such that it is not possible to turn off these lights in service.
- 3.10.5 The indicator system is to be designed on the failsafe principle and is to show by visual alarms if the door is not fully closed and not fully locked and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system is to be independent of the power supply for operating and closing the doors. The sensors of the indicator system are to be protected from water, ice formation and mechanical damages.
- 3.10.6 The indication panel on the navigation bridge is to be equipped with a mode selection function 'harbour/sea voyage', so arranged that audible alarm is given if the ship leaves harbour with the bow door or inner door not closed and with any of the securing devices not in the correct position.

Volume 1, Part 4, Chapter 3

Section 3

- 3.10.7 A water leakage detection system with audible alarm and television surveillance are to be arranged to provide an indication to the navigation bridge and to the engine control room of leakage through the inner door.
- 3.10.8 Between the bow door and the inner door a television surveillance system is to be fitted with a monitor on the navigation bridge and in the machinery control room. The system is to be able to monitor the position of doors and a sufficient number of their securing devices. Special consideration is to be given for lighting and contrasting colour of objects under surveillance.
- 3.10.9 A drainage system is to be arranged in the area between bow door and ramp, or where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible and visual alarm function to the navigation bridge being set off when the water levels in these areas exceed 0,5 m or the high water level alarm, whichever is the lesser. If not discharged by a bilge suction, scuppers are to be provided port and starboard having a diameter of not less than 50 mm. Valves are to be fitted
- 3.10.10 If the main vehicle deck is not totally enclosed, scuppers or freeing ports are to be provided consistent with the requirements of Vol 1, Pt 3, Ch 4, 9 Bulwarks, guard rails, raised walkways and other means for the protection of crew and embarked personnel.
- 3.10.11 Air pipes from cofferdams or void spaces may terminate in the enclosed 'tween deck space on the main vehicle deck provided the space is adequately ventilated and the air pipes are provided with weathertight closing appliances.

3.11 Operating and Maintenance Manual

- 3.11.1 An Operating and Maintenance Manual for the bow door and inner door is to be provided on board. The manual is to contain the following information:
- (a) main particulars and design drawings,
- special safety precautions;
- details of vessel, class and statutory certificates;
- equipment and design loading for ramps;
- key plan of equipment for doors and ramps;
- manufacturers' recommended testing for equipment; and
- a description of the following equipment: bow doors; inner bow doors; bow/ramp doors; central power pack; bridge panel; ramps leading down from the main deck; engine control room panel.
- (b) service conditions:
- limiting heel and trim of the ship for loading/unloading;
- limiting heel and trim for door operations;
- operating instructions for doors and ramps; and
- emergency operating instructions for doors and ramps.
- (c) maintenance:
- schedule and extent of maintenance;
- troubleshooting and acceptable clearances; and
- manufacturers' maintenance procedures.
- (d) register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

This Manual is to be submitted for approval and is to contain a note recommending that recorded inspections of the door supporting and securing devices carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.

3.11.2 Documented operating procedures for closing and securing the bow door and inner door are to be kept on board and posted at an appropriate place.

Volume 1, Part 4, Chapter 3

Section 4

■ Section 4

Side, stern doors and other shell openings

4.1 Symbols

4.1.1 The symbols used in this Section are defined as follows:

d = distance between closing devices, in metres

 k_s = material factor, see *Vol 1, Pt 6, Ch 5, 3.1 Design criteria 3.1.1* but is not to be taken less than 0,72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure

I = moment of inertia, in cm⁴, of the stiffener or girder, in association with an effective width of attached plating determined in accordance with Vol 1, Pt 6, Ch 2, 5 Dynamic loading

 σ = bending stress, in N/mm²

 σ_e = equivalent stress, in N/mm²

$$=\sqrt{\left(\sigma^2+3\tau^2\right)}$$

 σ_0 = minimum yield stress of the bearing material, in N/mm²

 τ = shear stress, in N/mm²

4.2 General

- 4.2.1 These requirements cover service doors in the ship side (abaft the collision bulkhead) and stern area, below the weather deck and in enclosed superstructures.
- 4.2.2 For the requirements of bow doors, see Vol 1, Pt 4, Ch 3, 3 Bow doors.
- 4.2.3 Side and stern doors are to be so fitted as to ensure tightness and structural integrity commensurate with their location and the surrounding structure, see also Vol 1, Pt 3, Ch 1, 5 Definitions
- 4.2.4 In general, the lower edge of door openings is not to be below a line drawn parallel to the design draught.
- 4.2.5 When the lower edge is below the design draught or doors below the vertical limit of watertight integrity are to be opened at sea, the arrangements will be specially considered. In general, the enclosed spaces protected by the door are to be considered open as well as closed in damage stability or flooding conditions.
- 4.2.6 Doors are generally to be arranged to open outwards, however inward opening doors will be considered provided strongbacks are fitted when the doors are situated in the first two lower decks above the waterline.
- 4.2.7 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined in *Vol 1, Pt 4, Ch 3, 3.3 Symbols and definitions*.

4.3 Construction and testing

- 4.3.1 Plans are to be of sufficient detail for plan approval purposes. Plans showing the proposed scantlings and arrangements of any side and stern doors or other shell openings are to be submitted. Side and stern doors or other shell openings are to be constructed under survey.
- 4.3.2 Side and stern doors fitted below the limit of watertight integrity are to be subject to a pressure test of a prototype to confirm the design pressure head.
- 4.3.3 As an alternative to prototype testing, the integrity of the door may be demonstrated by calculation and representative testing in accordance with MSC/Circular.1176 Unified Interpretations to SOLAS Chapters II-1 and XII and to the Technical Provisions for Means of Access for Inspections (25 May 2005). For doors fitted above the vertical limit of watertight integrity, the doors only require testing following installation, in accordance with Table 6.7.1 Testing requirements in Vol 1, Pt 6 Hull Construction in Steel.

Volume 1, Part 4, Chapter 3

Section 4

4.4 Scantlings

- 4.4.1 In general the strength of side and stern doors is to be equivalent to the strength of the surrounding structure.
- 4.4.2 Door openings in the side shell are to have well rounded corners and adequate compensation is to be arranged with web frames at sides and stringers or equivalent above and below, see *Vol 1, Pt 3, Ch 1, 5 Definitions*.
- 4.4.3 Doors are to be adequately stiffened, and means are to be provided to prevent movement of the doors when closed. Adequate strength is to be provided in the connections of the lifting/manoeuvring arms and hinges to the door structure and to the ship structure.
- 4.4.4 The thickness of the door plating is to be not less than the shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum adjacent shell thickness.
- 4.4.5 Where stern doors are protected against direct wave impact by a permanent external ramp, the thickness of the stern door plating may be reduced by 20 per cent relative to the requirements of *Vol 1, Pt 4, Ch 3, 4.4 Scantlings 4.4.4*. Those parts of the stern door which are not protected by the ramp are to have the thickness of plating in full compliance with *Vol 1, Pt 4, Ch 3, 4.4 Scantlings 4.4.4*.
- 4.4.6 Where higher tensile steel is proposed, the plating thickness required in Vol 1, Pt 4, Ch 3, 4.4 Scantlings 4.4.4 and Vol 1, Pt 4, Ch 3, 4.4 Scantlings 4.4.5 may be reduced by $\sqrt{k_{\rm s}}$.
- 4.4.7 The section modulus of horizontal or vertical stiffeners is to be not less than required for the adjacent shell framing using the actual stiffener spacing. Consideration is to be given, where necessary, to differences in fixity between ship's frames and door stiffeners.
- 4.4.8 Where necessary, door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.
- 4.4.9 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load is the uniformly distributed external sea pressure, $p_{\rm e}$, as defined in *Vol 1*, *Pt 4*, *Ch 3*, *4.9 Design loads 4.9.1*. For minimum scantlings, $p_{\rm e}$ is to be taken as 25 kN/m² and the permissible stresses are as follows:

$$\tau = \frac{80}{k_s} N/mm^2$$

$$\sigma = \frac{120}{k_a} \, \text{N/mm}^2$$

$$\sigma_{\varepsilon} = \frac{150}{k_{\rm s}} \,\text{N/mm}^2$$

- 4.4.10 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.
- 4.4.11 The stiffness of the edges of the doors and the hull structure in way are to be sufficient to ensure weathertight integrity. Edge stiffeners/girders are to be adequately stiffened against rotation and are to have a moment of inertia not less than:

$$l = 0.8 P_{\perp} d^4 \text{ cm}^4$$

where

 $P_{\rm L}$ = packing line pressure along edges, not to be taken less than 50 N/cm.

For edge girders supporting main door girders between securing devices, the moment of inertia is to be increased in relation to the additional force.

- 4.4.12 The buckling strength of primary members is to be specially considered.
- 4.4.13 All load transmitting elements in the design load path from door through securing and supporting devices into the ship structure, including welded connections, are to be to the same strength standard as required for the securing and supporting devices. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

Volume 1, Part 4, Chapter 3

Section 4

4.5 Doors serving as ramps

- 4.5.1 Where doors also serve as vehicle ramps, the plating and stiffeners are to be not less than required for vehicle decks, see Vol 1, Pt 4, Ch 3, 2 Vehicle decks and fixed ramps
- 4.5.2 The design of the hinges for these doors should take into account the ship angle of trim or heel which may result in uneven loading of the hinges.

4.6 Closing, securing and supporting of doors

- 4.6.1 Doors are to be fitted with adequate means of closing, securing and support so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is generally not to exceed 3 mm.
- 4.6.2 Devices are to be simple to operate and easily accessible. They are to be of an approved type.
- 4.6.3 Securing devices are to be equipped with mechanical locking arrangements (self locking or separate arrangements), or are to be of gravity type. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in a proper sequence.
- 4.6.4 Means are to be provided to enable the doors to be mechanically fixed in the open position taking into account the self weight of the door and a minimum wind pressure of 1,5 kN/m² acting on the maximum projected area in the open position.
- 4.6.5 The spacing for cleats or closing devices should not exceed 2,5 m and there should be cleats or closing devices positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

4.7 Systems for operation

- 4.7.1 Doors with a clear opening area of 12 m^2 or greater are to be provided with closing devices operable from a remote control position. Doors which are located partly or totally below the vertical limit of watertight integrity with a clear opening area greater than 6 m^2 are to be provided with an arrangement for remote control from a position above the vertical limit of watertight integrity. This remote control is provided for the:
- (a) Closing and opening of the doors.
- (b) Associated securing and locking devices.
- 4.7.2 The location of the remote control panel is to be such that the opening/closing operation can be easily observed by the operator or by other suitable means such as closed circuit television.
- 4.7.3 A notice is to be displayed at the operating panel stating that the door is to be fully closed and secured preferably before, or immediately the ship leaves the berth and that this operation is to be entered in the ship's log.
- 4.7.4 Means are to be provided to prevent unauthorised operation of the doors.
- 4.7.5 Where hydraulic securing devices are applied, the system is to be mechanically lockable in the closed position so that in the event of hydraulic system failure, the securing devices will remain locked. The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits when in the closed position.

4.8 Systems for indication and monitoring

- 4.8.1 The following requirements apply to doors in the boundaries of special category spaces or vehicle spaces, through which such spaces may be flooded. For ships, where no part of the door is below the design waterline, doors that are to be opened at sea are above the vertical limit of watertight integrity, and the area of the door opening is not greater than 6 m², then the requirements of this Section need not be applied.
- 4.8.2 Separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned. The indication panel is to be provided with a lamp test function. It is not to be possible to turn off the indicator light.
- 4.8.3 The indicator system is to be designed on the fail safe principle and is to indicate by visual alarms if the door is not fully closed and not fully locked, and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system is to be independent of the power supply for operating and closing the doors and is to be

Volume 1, Part 4, Chapter 3

Section 4

provided with a back-up power supply. The sensors of the indicator system are to be protected from water, ice formation and mechanical damages.

- 4.8.4 The indication panel on the navigation bridge is to be equipped with a mode selection function 'harbour/sea voyage', so arranged that audible alarm is given if the vessel leaves harbour with side shell or stern doors not closed or with any of the securing devices not in the correct position.
- 4.8.5 Where not already installed, a Closed circuit television surveillance and a water leakage detection system, of approved type and suitable for the intended location, shall be arranged to provide both a visible and an audible indication to the navigation bridge and to the main machinery control station of any leakage through the side or stern doors, or any other shell openings which could lead to major flooding.

4.9 Design loads

- 4.9.1 The design force considered for the scantlings of primary members, securing and supporting devices of side shell doors and stern doors are to be taken not less than:
- (a) Design forces for securing or supporting devices of doors opening inwards:

External force:

$$F_e = Ap_e + F_p kN$$

Internal force:

$$F_{i} = F_{0} + 10W \, \text{kN}$$

(b) Design forces for securing or supporting devices of doors opening outwards:

External force:

$$F_e = Ap_e kN$$

Internal force:

$$P_{i} = P_{o} + 10W + F_{p} kN$$

(c) Design forces for primary members:

External force:

$$F_e = Ap_e kN$$

Internal force:

$$F_i = P_o + 10W \text{ kN}$$

whichever is the greater.

The symbols used are defined as follows:

 $p_{\rm e}$ = external sea pressure, in kN/m², determined at the centre of gravity of the door opening and is not to be taken less than:

for
$$Z_G < T$$
 10 $(T - Z_G) + 25 \text{ kN/m}^2$

for
$$Z_G \ge T$$
 25 kN/m²

For stern doors, p_e is not to be taken less than:

$$\rho_{\text{ emin}} = 0.6 \lambda C_{\text{H}} (0.8 + 0.6 \sqrt{L_{\text{R}}})^2 \text{ kN/m}^2$$

T =summer draught, in metres

 Z_{G} = height of the centre of area of the door, in metres, above the baseline

 $L_{\rm R}$ = length of ship, but need not be taken greater than 200 m

 λ = coefficient depending on the area where the ship is intended to be operated:

= 1 for sea-going ships with service area notation SA1, SA2 and SA3

Volume 1, Part 4, Chapter 3

Section 4

= 0,5 for ships operated in sheltered waters with service area notation SA4

 $C_{\rm H} = 0.0125 L_{\rm B}$ for $L_{\rm B} < 80$ m

 $= 1 \text{ for } L_{\text{R}} \ge 80 \text{ m}$

 $A = \text{area, in } m^2$, of the door opening

W = weight of the door, in tonnes

 F_p = total packing force, kN. When packing is fitted, the packing line pressure is to be specified, normally not to be taken less than 5 kN/m^2

 F_{o} = the greater of F_{c} and 5,0A kN

 $F_{\rm C}=$ accidental force, in kN, due to loose cargo, etc. to be uniformly distributed over the area A and not to be taken less than 300 kN. For small doors such as bunker doors and pilot doors, the value of $P_{\rm C}$ may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental force due to loose items.

4.10 Design of securing and supporting devices

4.10.1 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

The terms 'securing device' and 'supporting device' are defined in Vol 1, Pt 4, Ch 3, 3 Bow doors

$$\tau = \frac{80}{k_s} \, \text{N/mm}^2$$

$$\sigma = \frac{120}{k_s} \, \text{N/mm}^2$$

$$\sigma_{\rm e} = \frac{150}{k_{\rm s}} \, \rm N/mm^2$$

4.10.2 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k}$$
 N/mm²

- 4.10.3 For steel to steel bearings in securing and supporting devices, the normal bearing pressure is not to exceed $0.8\sigma_0$, see *Vol 1, Pt 4, Ch 3, 4.1 Symbols 4.1.1* For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The normal bearing pressure is to be calculated by dividing the design force by the projected bearing area.
- 4.10.4 The distribution of the reaction forces acting on the securing and supporting devices may require to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not generally to be included in these calculations.
- 4.10.5 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be considered in the calculation of the reaction forces acting on the devices.
- 4.10.6 The number of securing and supporting devices is generally to be the minimum practicable whilst complying with *Vol 1*, *Pt 4*, *Ch 3*, *4.6 Closing*, securing and supporting of doors *4.6.3* and taking account of the available space in the hull for adequate support.
- 4.10.7 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, without exceeding, by more than 20 per cent, the permissible stresses as defined in *Vol 1*, *Pt 4*, *Ch 3*, *4.10 Design of securing and supporting devices 4.10.1*.

Volume 1, Part 4, Chapter 3

Section 5

4.11 Operating and Maintenance Manual

- 4.11.1 An Operating and Maintenance Manual for the doors is to be provided on board. The manual is to contain the following information:
- (a) main particulars and design drawings,
- special safety precautions;
- details of vessel, class and statutory certificates;
- equipment and design loading for ramps;
- key plan of equipment for doors and ramps;
- manufacturers' recommended testing for equipment; and
- a description of the following equipment: side doors; stern doors; central power pack; bridge panel; ramps leading down from the main deck; engine control room panel.
- (b) service conditions:
- limiting heel and trim of the ship for loading/unloading;
- limiting heel and trim for door operations;
- operating instructions for doors and ramps and
- emergency operating instructions for doors and ramps.
- (c) maintenance:
- schedule and extent of maintenance;
- troubleshooting and acceptable clearances; and
- manufacturers' maintenance procedures.
- (d) register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.
- 4.11.2 The Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.
- 4.11.3 Documented operating procedures for closing and securing the doors are to be kept on board and posted at an appropriate place.

■ Section 5

Movable decks, lifts, internal and external ramps

5.1 Classification

- 5.1.1 Where required by the **LA** or **LA** Notation, see *Vol 1*, *Pt 1*, *Ch 2*, *1.1 Framework of Classification 1.1.12*, or specified by the Owner, movable decks will be included as a classification item. In such cases, all movable decks on board the ship are to comply with the requirements of this Section.
- 5.1.2 Plans showing the proposed scantlings and arrangements of the system are to be submitted.
- 5.1.3 The operating and securing equipment or machinery is to be in accordance with all specified standards.

5.2 Arrangements and design

- 5.2.1 Positive means of control are to be provided to secure decks, ramps and lifts in the raised and lowered position.
- 5.2.2 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed 80 per cent of the yield stress of the bearing material. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specifications.
- 5.2.3 The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tension in way of threads of steel bolts not carrying support forces is not to exceed 125/k N/mm².

Volume 1, Part 4, Chapter 3

Section 5

5.3 Loading

- 5.3.1 Details of the deck, ramp or lift loading resulting from the proposed stowage arrangements of vehicles are to be supplied by the Shipbuilder. These details are to include the axle and wheel spacing, the wheel load, type of tyre and tyre print dimensions for the vehicles. For design purposes the wheel loading is to be taken as not less than 3,0 kN. see Vol 1, Pt 4, Ch 3, 2 Vehicle decks and fixed ramps.
- 5.3.2 Where it is proposed also to use the decks, ramps or lifts for general cargo, the design loadings are to be submitted for consideration.
- 5.3.3 The forces imposed on the decks, ramps or lifts are to take due account of the ship motion for all the conditions In which they will be operated, see Vol 1, Pt 5, Ch 3, 6.2 Loads for ramps and lifts, Pra
- 5.3.4 The scantlings and arrangements are to be not less than those required by the Rules for the supporting or surrounding structure in which the decks ramps or lifts are fitted. In general the end fixity of primary stiffening members is to be taken as simply supported. Local and secondary stiffening members may be either partially or fully fixed at their end connections dependent upon the proposed arrangement.
- 5.3.5 The buckling strength of primary members is to be verified as being adequate, see Vol 1, Pt 6, Ch 2, 3 Buckling
- 5.3.6 Decks, ramps or lifts and their supporting structure are to be designed for the maximum load that is to be carried; this may include loadings from emergency situations where they are specified by the Owner.

5.4 Movable decks

- 5.4.1 Movable decks are generally to be constructed as pontoons comprising a web structure with top decking. Other forms of construction will be individually considered.
- 5.4.2 The decks are to be efficiently supported, and hinges, pillars, chains or other means (or a combination of these) are to be designed on the basis of the imposed loads. Where supporting chains and fittings are required, they are to have a factor of safety of at least two on the proof load.
- 5.4.3 Where it is proposed to stow the pontoons on deck, when not in use, details of the proposals for racks, fittings, etc. are to be submitted for consideration.
- 5.4.4 Where wheeled vehicles are to be used, the supporting arrangements are to be such that the movement at the edge of one pontoon relative to the next does not exceed 50 mm during vehicle operations.

5.5 External deck ramps and lifts

5.5.1 In addition to the loading specified in *Vol 1, Pt 4, Ch 3, 5.3 Loading*, ramps and lifts are to be assessed using weather deck loading in the closed position, see *Vol 1, Pt 5, Ch 3, 5 Local design loads for decks and bulkheads*.

5.6 External shell ramps

- 5.6.1 In addition to the loading specified in *Vol 1, Pt 4, Ch 3, 5.3 Loading*, unprotected ramps are to be assessed using side shell loading in the closed position, see *Vol 1, Pt 5, Ch 3, 3 Loads on shell envelope*.
- 5.6.2 Scantlings of the primary members, securing and supporting devices of bow doors and inner doors are to be able to withstand the design loads defined in *Vol 1, Pt 4, Ch 3, 3.6 Design loads*. The shear, bending and equivalent stresses are not to exceed 80/k N/mm², 120/k N/mm² and 150/k N/mm² respectively.

5.7 Aircraft lifts

- 5.7.1 The aircraft lift platform deck alignment is to be provided by keeps at the flight deck and stops at the hangar deck.
- 5.7.2 If the ship has an underwater shock notation, latches are also to be provided at the flight and hangar deck levels to restrain the aircraft lift platform when stationary.
- 5.7.3 When transferring the aircraft or equipment to, or from, the lift platform with the keeps engaged the deflection of the platform edge is not to be greater than 25 mm.

General

Volume 1, Part 5, Chapter 1

Section 1

Section

- 1 Introduction
- 2 Direct calculations
- 3 Model experiments

■ Section 1

Introduction

1.1 General

- 1.1.1 The global and local design loads and criteria detailed in this Part are to be used in conjunction with the formulae given in *Vol 1*, *Pt 6 Hull Construction in Steel* to determine the scantlings of naval ships as defined in *Vol 1*, *Pt 1 Regulations*.
- 1.1.2 When appropriate, the load and design criteria detailed in this Part are to be supplemented by direct calculation methods incorporating model test results and numerical analysis for novel designs. Full scale measurements may be required where considered necessary by Lloyd's Register (hereinafter referred to as 'LR').
- 1.1.3 Alternative methods of establishing the load and design criteria will be specially considered, provided that they are based on model tests, full scale measurements or generally accepted theories. In such cases, full details of the methods used are to be provided when plans are submitted for approval.

■ Section 2

Direct calculations

2.1 General

2.1.1 Direct calculations using hydrodynamic computer programs may be specifically required by the Rules. Also, they may be required for craft having novel design features, or may be submitted in support of alternative load and design criteria. LR may, when requested, undertake calculations on behalf of designers and make recommendations in regard to suitability of any required model tests.

2.2 Submission of direct calculations

- 2.2.1 In cases where direct calculations have been carried out the following supporting information is to be submitted as applicable:
- (a) Reference to the direct calculation procedure and technical program used.
- (b) Input data.
- (c) A description of the direct calculation model.
- (d) A summary of analysis parameters including environmental conditions, speeds and headings.
- (e) Details of the weight distributions.
- (f) A comprehensive summary of calculation results. Sample calculations are to be submitted where appropriate.
- 2.2.2 In general, all input data and output results are required to be submitted. In such cases, electronic transferral of data with agreed format may be used for submission.
- 2.2.3 The responsibility for error free specification and input of program data and the subsequent correct interpretation of output rests with the designer/Builder.

316

Volume 1, Part 5, Chapter 1

Section 3

■ Section 3

Model experiments

3.1 General

- 3.1.1 LR may require model experiments and theoretical calculations to be carried out for novel or complex design concepts. It is advisable that details of all proposed model experiments and theoretical calculations are submitted to LR prior to commencement of the testing and analysis phases. The results of all such investigations are to be provided no later than when plans are submitted for approval, but preferably as early as possible.
- 3.1.2 Where model testing is undertaken, the following details are to be submitted:
- (a) a summary of the model construction and its instrumentation, including calibration of instruments;
- (b) a summary of the testing arrangements and procedures;
- (c) a summary of the tank facilities and test equipment;
- (d) details of the wave generation, response measurements, definitions and notations;
- (e) details of data recording, data reduction and data analysis procedures;
- (f) details of calibration procedures with theoretical computations; and
- (g) tabulated and plotted output.

3.2 Model test matrix

3.2.1 Where model testing is undertaken, the minimum test matrix shown in *Table 1.3.1 Minimum test matrix* is required to be carried out.

Table 1.3.1 Minimum test matrix

Item	Test matrix
Sea state	Regular and irregular seas, using the wave environment details in Vol 1, Pt 5, Ch 2 Environmental Conditions.
Heading	Beam, head, stern and bow and stern quartering seas
Speed	Three speeds including zero and maximum service speeds
Wave Frequency	Six frequencies for regular seas

- 3.2.2 In addition to those quantities which are normally measured in a model experiment, the following data is to be obtained where appropriate:
- (a) vertical accelerations at the LCG, bow and stern;
- (b) acceleration loads due to heave, pitch and roll;
- (c) vertical bending moment;
- (d) bow impact pressures at representative operational forward speeds;
- (e) oblique sea loads inducing horizontal bending moments and torsional moments.
- 3.2.3 The basis on which the parameters are chosen for investigation is to be submitted for approval at the earliest opportunity.
- 3.2.4 Results from open water model experiments and full scale measurements may be accepted, full details are to be submitted for appraisal.

- 4 Guidance for ice environment

■ Section 1

General

1.1 Introduction

- 1.1.1 This Chapter contains information regarding the environmental conditions to be applied in the derivation of loads that are to be used for the computation of the local and global design loads in *Vol 1, Pt 5, Ch 3 Local Design Loads* and *Vol 1, Pt 5, Ch 4 Global Design Loads*.
- 1.1.2 Environmental conditions include natural phenomena such as wind, wave and currents and also ice and thermal conditions.
- 1.1.3 The environmental conditions given here are derived from hindcast data, long term measurements and theoretical studies complemented with service experience.
- 1.1.4 Alternative methods of establishing the environmental conditions will be specially considered, provided that they are based on hindcast data, long term measurements, global and local environmental theoretical models, or similar techniques. In such cases, full details of the methods used are to be provided when plans are submitted for approval.
- 1.1.5 In order that an assessment of the design requirements can be made, the following information is to be submitted:
- (a) Service area notation required together with the required extent of the operational area.
- (b) The wave environmental parameters for the design.
- (c) Specification of the environmental conditions used for the design assessment.

1.2 Definitions and symbols

- 1.2.1 **Beaufort Number**. Beaufort Number is a measure of wind strength. The wind speed corresponding to each Beaufort number is shown in *Table 2.1.1 Wind data*.
- 1.2.2 **Sea state**. Sea state is an expression used to categorise wave conditions and is normally defined by a significant wave height and wave period, a suitable wave energy distribution may also be defined. A list of standard sea state definitions is shown in *Table 2.1.2 Sea state data*.
- 1.2.3 **Wave period**. References to wave period are to be taken as the zero crossing wave period, i.e. the average time interval between upward crossings of the mean value, unless otherwise stated.

Table 2.1.1 Wind data

Beaufort number	Wind speed range knots
0	0-1
1	1-3
2	4-6

 $\textbf{Note} \ \textbf{1.} \ \textbf{Ambient wind sustained at 19,5 m above surface to generate fully-developed seas.}$

Note 2. To convert to another altitude, H_2 , apply $V_2 = V_1 (H_2/19,5)^{(1/7)}$

Note 3. Minimum is 5 per cent and maximum is 95 per cent for periods given wave height range.

Note 4. The wave period shown here is the modal or peak period, T_p . The zero crossing period, T_z , may be derived by the expression $T_z = T_p/1,4$ for fully developed seas.

1.2.4 L _{WL} is defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

■ Section 2

Wave environment

2.1 General

- 2.1.1 Generally ships of Naval Ship Groups 1 and 2, **NS1** and **NS2**, see *Vol 1*, *Pt 1*, *Ch 2*, *2.1 Applicable ship types* will be designed for unrestricted world-wide operation. Ships in group 3, **NS3**, may also be designed for world-wide operation but typically will be designed for more specific roles within clearly defined areas of operation, e.g. coastal patrol craft, landing craft, harbour vessels, tugs, etc.
- 2.1.2 The procedure for deriving the design factors and the wave environment used for the assessment of local and global loads is illustrated in *Figure 2.2.1 Procedure for the specification of environmental conditions*.
- 2.1.3 The following definitions are applicable:

Service area

Volume 1, Part 5, Chapter 2

Section 2

(a) A service area refers to a collective group of sea areas. The service area specifies the limits of the ship's operational area.

Sea area

(a) A sea area is small area of the world's oceans for which statistical wave data has been collected, the sea areas are shown in *Figure 2.2.2 Sea areas*.

2.2 Service areas

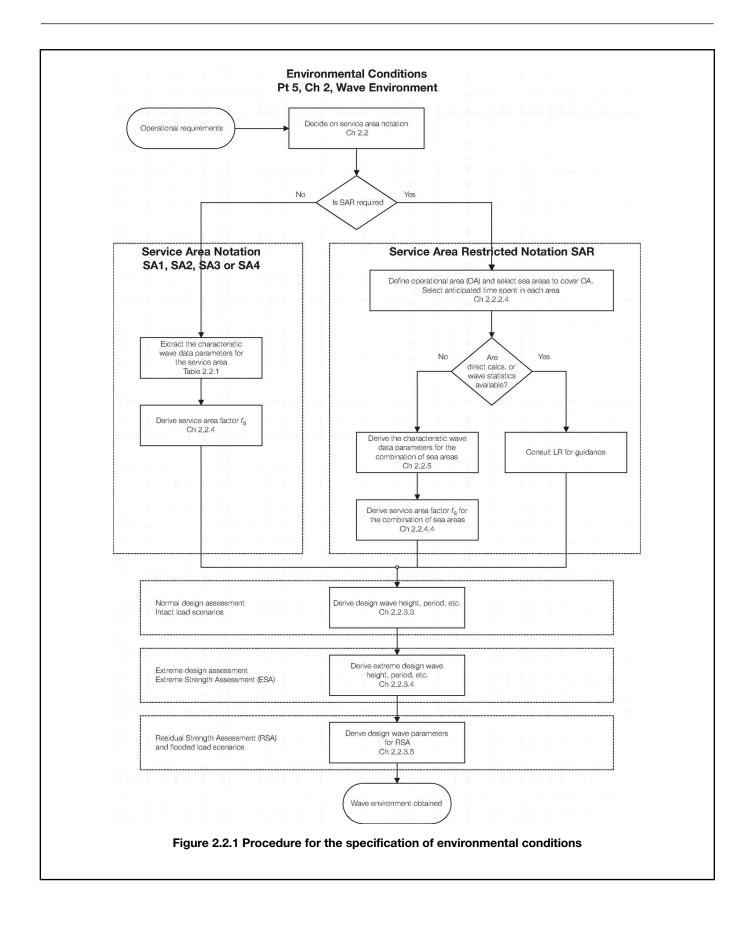

- 2.2.1 All ships classed under the Rules will be assigned a service area notation **SA** followed by a number or letter, e.g. **SA1**.
- 2.2.2 The service area notations listed below are available. The definitive extents of the service areas are shown in *Figure 2.2.2* Sea areas and *Table 2.2.3 Environmental wave data for individual sea area*. The chart shows the minimum service area requirement for operating in different areas of the world.
 - **SA1** = Service Area 1 covers ships having unrestricted world-wide operation. Service area 1 includes operation in all other service areas.
 - **SA2** = Service Area 2 is primarily intended to cover ships designed to operate in tropical and temperate regions, see *Vol 1*, *Pt 5*, *Ch 2*, *2.2 Service areas 2.2.3*. This service area excludes operating in sea areas for which a **SA1** notation is required.
 - **SA3** = Service Area 3 is primarily intended to cover ships designed to operate in tropical regions, see *Vol 1, Pt 5, Ch 2, 2.2 Service areas 2.2.3*. This service area excludes operating in sea areas for which a **SA1** or **SA2** notation is required.
 - **SA4** = Service Area 4 covers ships designed to operate in Sheltered water, as defined in *Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.14*. This service area excludes operating in sea areas for which a **SA1, SA2** or **SA3** notation is required.
 - **SAR** = Service Area Restricted covers ships that are designed to operate in a predetermined and contiguous area of operation, see *Vol 1, Pt 5, Ch 2, 2.2 Service areas 2.2.4*.
- 2.2.3 For all ships that are designed for specific areas of operation, the designer may take advantage of reduced wave loadings that are likely to be encountered. This covers all ships which are assigned a service area notation **SA2**, **SA3**, **SA4** or **SAR**.
- 2.2.4 For all cases where a **SAR** service area notation (Service Area Restricted) is required, the extents of the restricted area will be specified after the **SAR** service area notation. The service area factor, f_s , and the wave environment characteristics for the ship will be specially considered. Where the geographical limits of the intended service can be satisfied by a single or group of contiguous sea areas then the service area factor, f_s , and the wave environment characteristics may be derived using the methods given in *Vol 1*, *Pt 5*, *Ch 2*, *2.4 Service area factors* and *Vol 1*, *Pt 5*, *Ch 2*, *2.5 Derivation of wave statistics for a combination of sea areas*.
- 2.2.5 Under normal circumstances, a ship which is assigned a service area notation **SA2**, **SA3**, **SA4** or **SAR** is to operate in solely the designated area and is not transit to other areas of the world, see *Vol 1*, *Pt 1*, *Ch 2*, 3.5 *Ship type notations*. Due allowance is to be made for the ship's trials, work-up period and delivery voyages in the assignment of a service area notation. However special consideration may be appropriate to these periods in order to ensure that the ship is not subjected to dynamic loads which might impair the structural working life of the ship.
- 2.2.6 The wave environmental data for service areas **SA1, SA2, SA3** and **SA4** are specified in *Vol 1, Pt 5, Ch 2, 2.3 Wave environment.*
- 2.2.7 It is the responsibility of the Owner to determine that the chosen Service Area, the service area factor, f_s , and the wave environment characteristics as defined in *Vol 1*, *Pt 5*, *Ch 2*, *2.3 Wave environment* are appropriate for the intended areas of operation.
- 2.2.8 The allocation of a service area notation to a ship does not remove the responsibility of the Master or commanding officer to take suitable measures to avoid typhoon, hurricane and other extreme weather conditions, as appropriate.
- 2.2.9 The requirements for ships which are required to maintain station or operate in typhoon, hurricane and other extreme weather conditions will be specially considered.

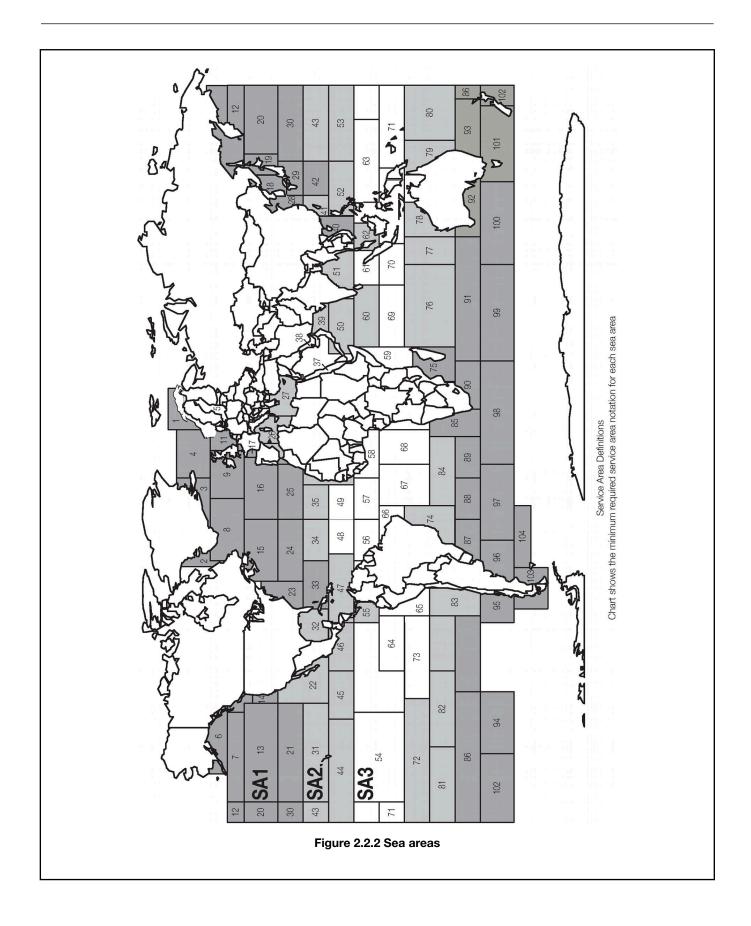

Volume 1, Part 5, Chapter 2

Section 2

2.3 Wave environment

- 2.3.1 The environmental wave data for each service area notation is given in *Table 2.2.1 Environmental wave data for each* service area *Table 2.2.4 Environmental wave data for each* sea area gives the environmental wave data for each individual sea area.
- 2.3.2 The definitions of wave height, wave period and wave period range given below are to be used in the determination of the environmental loads acting on the ship.

LLOYD'S REGISTER

Table 2.2.1 Environmental wave data for each service area

Service Area Notation	Wave height for the service area, m	Mean wave period, seconds	Standard deviation of wave period, seconds	Extreme design wave height, m	
	H _s	Tz	T_{sd}	H _×	
SA1	5,5	8,0	1,7	18,5	
SA2	4,0	7,0	1,7	13,5	
SA3	3,6	6,8	1,7	9,5	
SA4	2,5	6,0	1,5	6,0	
SAR	To be specially considered				

Note See text and notes in *Table 2.2.4 Environmental wave data for each sea area* for definitions of all values.

2.3.3 Wave environmental design criteria for normal design assessment. These design parameters have been used to derive the standard local and global environmental loadings in *Vol 1, Pt 5, Ch 3 Local Design Loads* and *Vol 1, Pt 5, Ch 4 Global Design Loads*. All direct calculations and model tests required to supplement these loads are to use these environmental loadings.

Design wave height, H_{dw}

(a) Average of the one hundredth highest observed wave heights for the service area. To be taken as:

$$H_{dw} = 1,67 H_{s} \text{ m}$$

Design wave period, $T_{\rm dw}$

(a) Average zero crossing period of all sea states in the service area

$$T_{dw} = T_{7}$$
 seconds

Standard deviation of wave period, T_{dsd}

(a) Standard deviation of the zero crossing periods for the service area

$$T_{dsd} = T_{sd}$$
 seconds

Design wave period range, T drange

(a) To be taken as the design wave period plus and minus 2 standard deviations of the zero crossing period, i.e.

$$T_{\text{drange}}$$
 is $T_{\text{dw}} - 2T_{\text{dsd}}$ to $T_{\text{dw}} + 2T_{\text{dsd}}$ seconds

H_s, T_z and T_{sd} are given in Vol 1, Pt 5, Ch 2, 2.3 Wave environment 2.3.6.

2.3.4 Wave environmental design criteria for extreme design analysis, **ESA** notations. These design parameters have been used to derive the global environmental loadings in *Vol 1*, *Pt 5*, *Ch 4 Global Design Loads* which are used for the extreme strength assessment notation. All direct calculations and model tests required to supplement these loads are to use these environmental loadings.

Extreme wave height, H_{xw}

(a) To be taken as the significant wave height that has a probability of 5×10^{-5} of being exceeded.

$$H_{xw} = H_x m$$

Extreme wave period, T_{xw}

(a) To be taken as the design wave period plus one standard deviation

$$T_{xw} = T_{dw} + T_{dsd}$$
 seconds

Extreme wave period range, T_{xrange}

Volume 1, Part 5, Chapter 2

Section 2

(a) To be taken as the extreme design wave period plus and minus 1,5 standard deviations

$$T_{\text{xrange}}$$
 is $T_{\text{xw}} - 1.5T_{\text{dsd}}$ to $T_{\text{xw}} + 1.5T_{\text{dsd}}$ seconds

Duration of extreme storm

(a) It is to be assumed that extreme storm events are to persist for three hours.

 $T_{\rm sd}$ and $H_{\rm x}$ are given in Vol 1, Pt 5, Ch 2, 2.3 Wave environment 2.3.6

 $T_{\rm dw}$ and $T_{\rm dsd}$ is given in Vol 1, Pt 5, Ch 2, 2.3 Wave environment 2.3.3.

2.3.5 Wave environmental design criteria for residual strength analysis, **RSA** notations. These design parameters have been used to derive the global and local environmental loadings in *Vol 1, Pt 5, Ch 3 Local Design Loads* and *Vol 1, Pt 5, Ch 4 Global Design Loads* which are used for the residual strength assessment notation. All direct calculations and model tests required to supplement these loads are to use these environmental loadings.

Residual wave height, Hrw

(a) To be taken as the significant wave height that has a 20 per cent probability of being exceeded for the service area

$$H_{rw} = 0.90 H_{s} \text{ m}$$

Residual wave period, T_{rw}

(a) To be taken as the standard design wave period

$$T_{dw} = T_z$$
 seconds

Residual wave period range, T_{rrange}

(a) To be taken as the standard design wave period range

$$T_{\text{rrange}} = T_{\text{drange}}$$
 seconds

Duration of sea state

(a) It is to be assumed that the duration of sea states of this magnitude is 12 hours.

 $H_{\rm s}$ and $T_{\rm z}$ are given in Vol 1, Pt 5, Ch 2, 2.3 Wave environment 2.3.6

T drange is given in Vol 1, Pt 5, Ch 2, 2.3 Wave environment 2.3.3.

2.3.6 The parameters used in above equations are given in *Table 2.2.1 Environmental wave data for each service area* for service area notations **SA1**, **SA2**, **SA3** and **SA4**. For the restricted service area notation **SAR**, the values of H_s , T_z , T_{sd} and H_x will need to be derived, see *Vol 1*, *Pt 5*, *Ch 2*, *2.5 Derivation of wave statistics for a combination of sea areas*.

2.4 Service area factors

2.4.1 The service area factor, f_s , is used to derive the global hull girder loads in *Vol 1, Pt 5, Ch 4 Global Design Loads*. The service area factor applicable for Service Area notations **SA1, SA2, SA3** and **SA4** is given by:

$$f_s = (f_1 + f_2 (L_{WI} - 100) / 1000) f_{sI}$$

where

(a) f_s is to have a minimum value of 0,5 and normally a maximum value of 1,0 and is to be rounded up to the nearest 0,05

f sl is the service life factor as defined in Vol 1, Pt 5, Ch 2, 2.4 Service area factors 2.4.2

f₁ and f₂ are given in Table 2.2.2 Environmental wave data for service area

L_{WL} is defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars.

2.4.2 The service life factor, f_{sl} , is based on a ship's operational life. This factor may need to be increased for service lives which are predicted to require significantly more wave encounters. The service life factor is to be taken as follows:

 $f_{\rm sl} = 1.0$ for 1 x 10⁸ wave encounters (20 years)

= 1,010 for $1,25 \times 10^8$ wave encounters (25 years)

= 1,019 for $1,5 \times 10^{8}$ wave encounters (30 years)

Table 2.2.2 Environmental wave data for service area

Service Area Notation	Intercept factor	Slope factor f 2	
SA1	1,00	0,00	
SA2	0,93	-1,15	
SA3	0,70	-1,00	
SA4	0,50	0,00	
SAR	To be specially considered		

- 2.4.3 For unrestricted sea-going service, i.e. service area notation **SA1**, the service area factor is to be taken as 1,0**fsl**.
- 2.4.4 Alternatively the service area factor may be derived by direct calculation of the long term hull girder loads, see Vol 1, Pt 5, Ch 4, 1.3 Direct calculation procedures 1.3.1
- 2.4.5 For restricted Service Area Notation **SAR** the service area factor is to be derived by combining the service areas factors for each sea area using the following formula:

$$f_s = In \left(\sum_{i=1}^{n} P_i e^{f_{si}} \right)$$

where

$$f_{si} = f_{1i} + f_{2i} (L_{WL} - 100) / 1000$$

f 1i and f 2i are the individual sea area factors given in Table 2.2.3 Environmental wave data for individual sea area

$$e = 2.7183$$

In () is the natural log

P_i is defined in Vol 1, Pt 5, Ch 2, 2.5 Derivation of wave statistics for a combination of sea areas 2.5.3

2.5 Derivation of wave statistics for a combination of sea areas

- 2.5.1 For the **SAR** restricted service area notation, it is necessary to derive the environmental wave data for the required area of operation. This data may be determined using statistical methods as specified in *Vol 1, Pt 5, Ch 2, 2.6 Direct calculations* or using the information given in this Section.
- 2.5.2 The following formulae may be used to derive the design wave statistics for a ship designed to operate with a particular service area restriction. These formulae enable the environmental wave data from a set of individual sea areas to be combined to give the appropriate design wave statistics for the **SAR** restricted service area notation, see also Vol 1, Pt 5, Ch 2, 2.2 Service areas.
- 2.5.3 The environmental wave data for each sea area is given in *Table 2.2.4 Environmental wave data for each sea area* The extents of each sea area are shown in *Figure 2.2.2 Sea areas*

Wave height, H s

 $H_{\rm S}$ = weighted average of the wave height for all sea areas plus one standard deviation

$$= H_{sm} + \sqrt{\sum_{i=1}^{n} P_{i} (H_{si} - H_{sm})^{2}} m$$

where

$$H_{sm} = \sum_{i=1}^{n} P_i H_{si} m$$

Volume 1, Part 5, Chapter 2

Section 2

Design wave period, T dw

 T_{dw} = weighted average of the wave period for all sea areas

$$= \sum_{i=1}^{n} P_i T_{zi} seconds$$

Standard deviation of wave period, T_{sd}

 $T_{\rm sd}$ = weighted average of the standard deviation for all sea areas about the combined design wave period, $T_{\rm sd}$

 $= \sqrt{\sum_{i=1}^{n} P_{i} \left(T_{sdi}^{2} + \left(T_{dw} - T_{zi}\right)^{2}\right)} seconds$

Extreme wave height, H_x

 $H_{\rm x}$ = weighted average of the extreme wave height for all sea areas plus one standard deviation

$$= H_{xm} + \sqrt{\sum_{i=1}^{n} P_{i} (H_{xi} - H_{xm})^{2}} m$$

where

$$H_{xm} = \sum_{i=1}^{n} P_i H_{xi} m$$

N =is the number of sea areas

i = is the sea area index reference

 P_i = is the probability of the ship operating in sea area i, i.e. the percentage of time, expressed as a probability value

 H_{si} = is the appropriate sea area wave height value for sea area i

 H_{xi} = is the appropriate extreme wave height value for sea area i

 T_{zi} = is the appropriate zero crossing period for sea area i

 T_{sdi} = is the appropriate standard deviation for sea area i

2.5.4 The designer/Builder is to supply full details of the **SAR** notation required together with full supporting calculations. All transit voyages and ship work-up/trial periods should be included in the list of sea areas if their inclusion results in a more severe wave environment, see also Vol 1, Pt 5, Ch 2, 2.2 Service areas 2.2.5

2.6 Direct calculations

2.6.1 The wave environmental parameters may be derived by direct calculation using long term statistical wave data for the selected area(s) of operation based on hindcast data or similar analysis. This data is to represent accurately the sea environment in the intended area of operation over a long period and enable sound long term and extreme short term statistics to be derived. Depending on the area of operation, due account is to be taken of typhoon, hurricane and other seasonal extremes, see also Vol 1, Pt 5, Ch 2, 2.2 Service areas 2.2.8

52	3,2	6,5	1,3	12,2	104	4,7	8,2	1,5	16,6

Note 1. The sea area wave height H_{si} and wave zero crossing period, T_{zi} , are based on the annual, all directions wave data scatter diagram.

Note 4. The extreme design wave height, H_{xi} , is based on a Gumbel projection using the following data set definition:

A wave data scatter diagram based on integer parts per ten thousand. (Note using a higher precision scatter diagram will result in a higher estimate of extreme wave height). Probability of exceedence of 5 x10⁻⁵, roughly equivalent to 6,5 years continuously at sea in each sea area.

Note 5. The values of H_{si} , T_{zi} , and T_{sdi} were derived from the data set used for the extreme wave height.

■ Section 3

Air environment

3.1 Wind speed

3.1.1 For design purposes a wind speed of 40 m/s is to be assumed.

3.2 Design air temperature

3.2.1 The design air temperature is to be taken as 2°C lower than the lowest mean daily average air temperature in the area of operation:

where

Mean = statistical mean over a minimum of 20 years (MDHT)

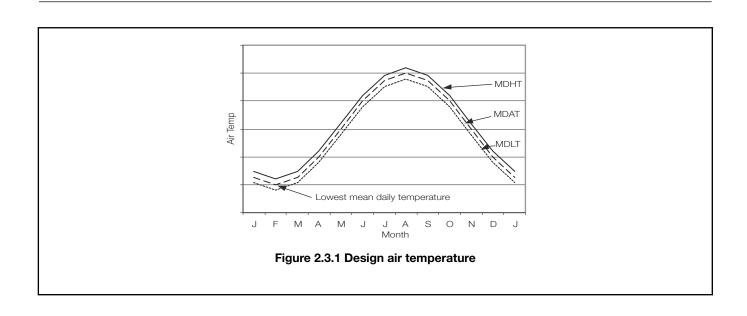

Average = average during one day and one night (MDAT)

Lowest = lowest during the year (MDLT).

Figure 2.3.1 Design air temperature shows the definition graphically.

Note 2. The sea area wave height H si is the average of the one third highest observed (or significant) wave heights in the wave scatter diagram.

Note 3. The T_{zi} and standard deviation of T_{sdi} are derived using all wave heights in the wave data scatter diagram.

Section 4

Guidance for ice environment

4.1 General

- 4.1.1 This section is intended to give guidance on the selection of a suitable ice class notation for the operation of naval ships in Arctic and Antarctic regions.
- 4.1.2 It is the responsibility of the Owner to determine which notation is most suitable for their requirements. Ultimately the responsibility rests with the commanding officer and their assessment of the ice and temperature conditions at the time.
- 4.1.3 The documentation supplied to the ship is to contain the ice class notation adopted, any operation limits for the ship and guidance on the type of ice that can be navigated for the nominated ice class.

4.2 Definitions

4.2.1 The World Meteorological Organisation's, WMO, definitions for sea ice thickness are given in *Table 2.4.1 WMO definition* of ice conditions.

Table 2.4.1 WMO definition of ice conditions

Ice conditions	Ice thickness
Medium first year	1,2 m
Thin first year, second stage	0,7 m
Thin first year, first stage	0,5 m
Grey-white	0,3 m
Grey	0,15 m

4.2.2 Table 2.4.2 Comparison ice standards defines the ice classes in relation to the Rules and the equivalent Internationally recognised Standards.

Table 2.4.2 Comparison ice standards

Lloyd's Register class notation	Finnish-Swedish Ice- Due class	Canadian type
1AS	IA Super	А
1A	IA	В
1B	IB	С
1C	IC	D
1D	ID	_
none	none	E

4.2.3 Extended periods are defined as those that involve the vessel remaining in air temperatures below 0°C for more than one week.

4.3 Application

- 4.3.1 For naval ships intended for extended periods of operation in Arctic and Antarctic areas the suggested ice class is **1C**. For these operational limits, the materials used for hull construction are to be in accordance with *Vol 1*, *Pt 6*, *Ch 6*, *2 Materials*. If a higher ice class is proposed, material requirements are to be specially considered using a specified design air temperature as defined in *Vol 1*, *Pt 5*, *Ch 2*, *3.2 Design air temperature*.
- 4.3.2 For naval ships required to operate in multi year ice as defined by the lce breaker region in *Figure 2.4.1 Ice limits Arctic Winter* without an ice breaker escort, the requirements for ice class will be specially considered. Material requirements are to be in accordance with *Vol 1*, *Pt 6*, *Ch 6*, *2 Materials* using a specified design air temperature as defined in *Vol 1*, *Pt 5*, *Ch 2*, *3.2 Design air temperature*.
- 4.3.3 The variable nature of ice conditions is such that the average limits of the conditions are not easily defined. However, it is possible to plot the probable limits of the ice flows and the ice edge for each season. Operation with Ice Class **1C** may be possible up to 150 nm inside the 7/10 region shown depending on the severity of the winter. Operation with Ice Class **1A** may be possible up to 150 nm inside the medium first year ice shown depending on the severity of the winter. Operation up to the multi year ice is possible most years with Ice Class **1AS**.
- 4.3.4 Operation in the region between 7/10 and 1/10 in the arctic is possible with due care for ships with no ice class. For ships operating for extended periods in these areas it will be necessary to specify and design for a minimum temperature for the hull materials. To cover all situations for a non-ice class ship, the material requirements of *Vol 1, Pt 6, Ch 6, 2 Materials* are recommended.

4.4 Ice Class notations

4.4.1 Where the requirements of *Vol 3, Pt 1, Ch 1 Ice Navigation - First-Year Ice Conditions* are complied with, the ship will be eligible for a special features notation as defined in *Vol 1, Pt 1, Ch 2, 3.9 Machinery and Engineering Systems notations*

4.5 National Authority requirements

- 4.5.1 Certain areas of operation may require compliance or demonstration of equivalence with National Authority requirements. *Table 2.4.2 Comparison ice standards* gives the equivalence of National Authority requirements.
- 4.5.2 The standards of ice strengthening required by the Rules have been accepted by the Finnish and Swedish Boards of Navigation as being such as to warrant assignment of the Ice-Due Classes given in *Table 2.4.2 Comparison ice standards*. For definition of Ice-Due Classes, see *Finnish-Swedish Ice Class Rules*, 1985.
- 4.5.3 Ships intending to navigate in the Canadian Arctic must comply with the Canadian Arctic Shipping Pollution Prevention Regulations established by the Consolidated Regulations of Canada, 1978, Chapter 353, in respect of which LR is authorised to issue Arctic Pollution Prevention Certificates.
- 4.5.4 The Canadian Arctic areas have been divided into zones relative to the severity of the ice conditions experienced and, in addition to geographic boundaries, each zone has seasonal limits affecting the necessary ice class notation required to permit

Volume 1, Part 5, Chapter 2

Section 4

operations at a particular time of year. It is the responsibility of the Owner to determine which notation is most suitable for their requirements.

4.6 Ice accretion

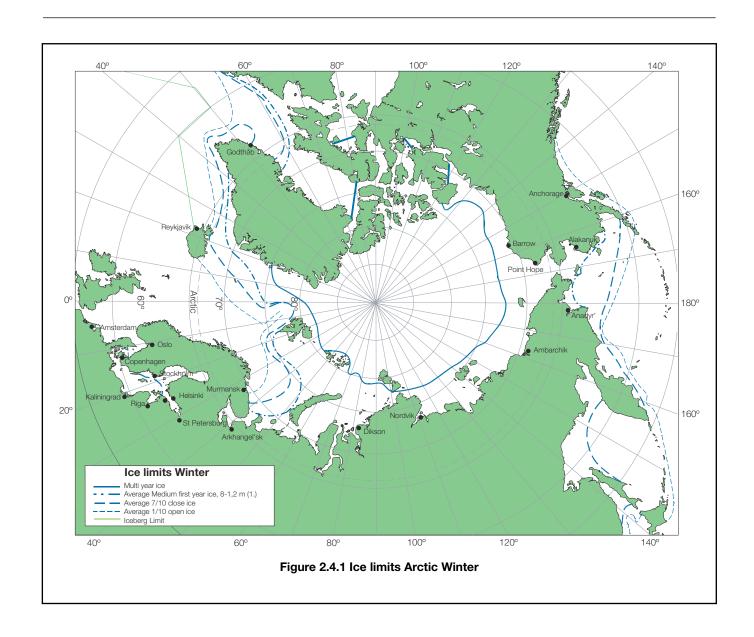

- 4.6.1 For ships intended to operate for extended periods in Arctic or Antarctic the build up of ice on exposed surfaces is to be considered. See Vol 1, Pt 5, Ch 3, 7 Ice loads and Vol 1, Pt 5, Ch 4, 2 Still water global loads.
- 4.6.2 As a minimum a full icing allowance is to be applied to vessels operating in the following areas, see Figure 2.4.5 Ice accretion limits Arctic:
- The area north of latitude 65°30'N, between longitude 28°W and the West coast of Iceland; north of the north coast of Iceland; north of the rhumb line running from latitude 66°N, longitude 15°W to latitude 73°30'N, longitude 15°E, north of latitude 73°30'N between longitude 15°E and 35°E, and east of longitude 35°E, as well as north of latitude 56°N in the Baltic Sea.
- The area north of latitude 43°N bounded in the west by the North American coast and the east by the rhumb line running from latitude 43°N, longitude 48°W to latitude 63°N, longitude 28°W and thence along longitude 28°W.
- All sea areas north of the North American continent west of the areas defined in subparagraphs above.
- The Bering and Okhotsk Seas and the Tartary Strait during the icing season.
- South of latitude 60°S.
- 4.6.3 A full icing allowance is defined as an additional pressure of 1 kN/m² (100 mm of ice) applied to all exposed horizontal or near horizontal surfaces and 0,25 kN/m² (25 mm of ice) applied to all exposed vertical surfaces. The volumetric centre of the ice is to be taken as that of an equivalent head of water. The density of the ice is assumed to be 1000 kg/m³.
- 4.6.4 As a minimum a half icing allowance is to be applied to vessels operating in the winter seasonal areas as defined in the international Load Line Convention.
- 4.6.5 A half icing allowance is defined as an additional pressure of 0,5 kN/m² (50 mm of ice) applied to all exposed horizontal or near horizontal surfaces and 0,18 kN/m² (18 mm of ice) applied to all exposed vertical surfaces. The volumetric centre of the ice is to be taken as that of an equivalent head of water. The density of the ice is assumed to be 1000 kg/m³.
- 4.6.6 The effects on stability of ice accretion are to be assessed in accordance with the specified subdivision and stability standard.
- 4.6.7 Where alternative icing allowances are specified and these allowances exceed that defined in *Vol 1, Pt 5, Ch 2, 4.6 Ice* accretion 4.6.3 and *Vol 1, Pt 5, Ch 2, 4.6 Ice* accretion 4.6.5 for the appropriate operational areas, these allowances shall be used in the assessment of the local and global structure.

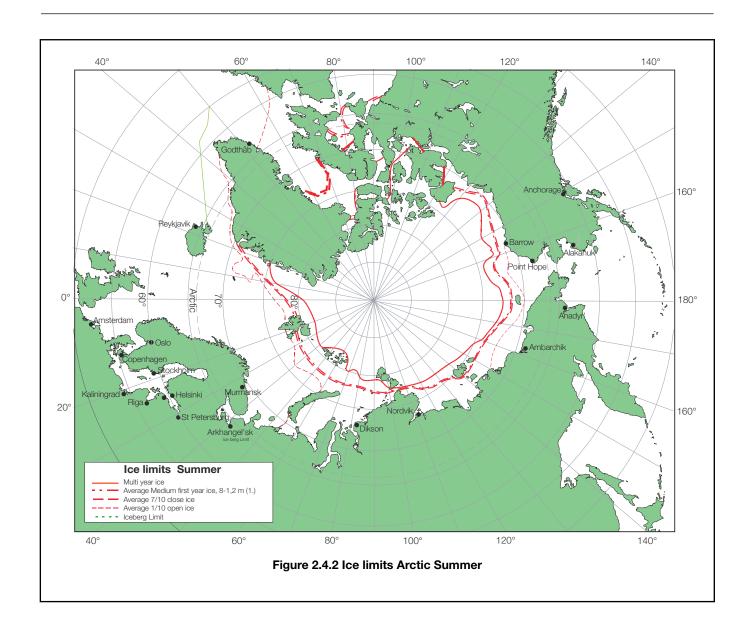

4.7 Ice conditions

- 4.7.1 Charts and images for the current and recent ice conditions in all areas of the world plus information on icebergs can be found from the National Ice Centre on the world wide web at
- (a) http://www.natice.noaa.gov/.

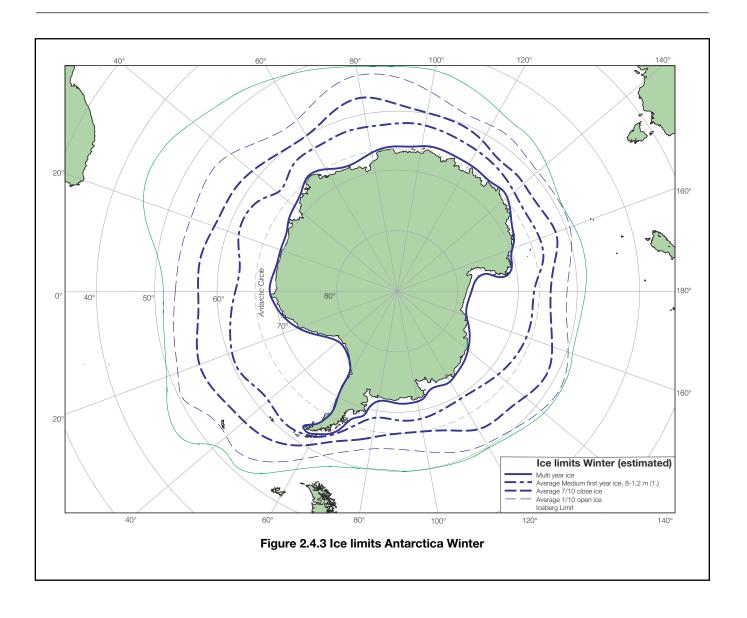

Information is supplied by regular assessment and survey by the naval ice centres patrols.

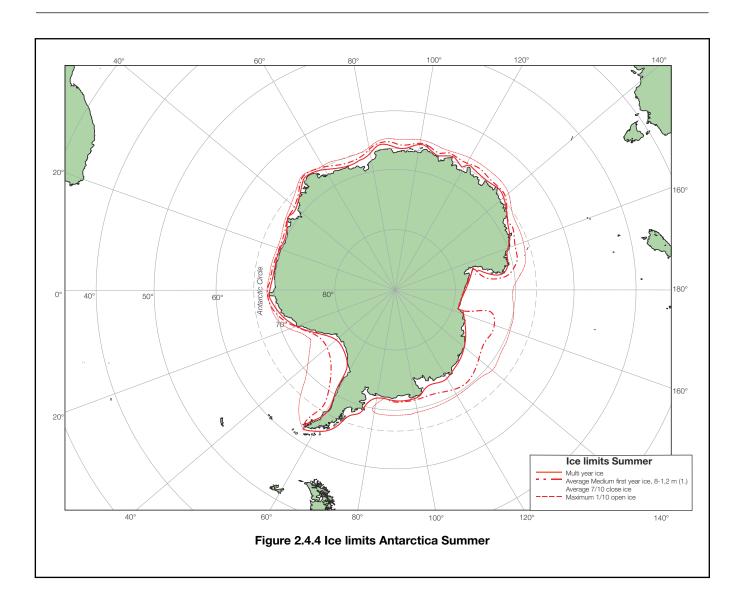

- 4.7.2 Daily ice information and consultation is available from the Canadian ice service which is part of the Canadian department of the environment. Their web site can be found at
- (a) http://www.ice-glaces.ec.gc.ca.

Section

- 1 Introduction
- 2 Motion response
- 3 Loads on shell envelope
- 4 Impact loads on external plating
- 5 Local design loads for decks and bulkheads
- 6 Other local loads
- 7 Ice loads

■ Section 1

Introduction

1.1 General

- 1.1.1 This Chapter contains information regarding the derivation of local design loads that are to be used for the assessment of scantlings to local loads as specified in *Vol 1*, *Pt 6*, *Ch 2 Design Tools*
- 1.1.2 The formulae for ship motion loads given in this Chapter are suitable for all ships that operate in the displacement mode. Ship motion loads for ships that operate in the fully planing mode will need to be specially considered.
- 1.1.3 Figure 3.1.1 Overview of derivation of local design loads gives an overview of the contents of this Chapter, the local load components and the route through the Chapter.

1.2 Environmental conditions

- 1.2.1 The environmental conditions for the determination of the local loads are to be based on the normal environmental design criteria specified in *Vol 1, Pt 5, Ch 2, 2.3 Wave environment* unless otherwise stated.
- 1.2.2 The wave height factor for local loads, f_{Hs} , is dependent on the service area notation and is to be taken as follows:

f Hs = 1,0 for SA1 service area notation, i.e. unrestricted sea-going service

otherwise

$$f_{HS} = \frac{design \ wave \ height \ for \ the \ restricted \ service}{design \ wave \ height \ for \ unrestricted \ service}$$

$$= \frac{H_{dw}}{H_{dw} \ for \ SA1}$$

 $f_{\rm Hs}$ is not to be taken as less than 0,5

H dw is given in Vol 1, Pt 5, Ch 2, 2.3 Wave environment 2.3.3.

- 1.2.3 All other environmental parameters are defined in Vol 1, Pt 5, Ch 2 Environmental Conditions.
- 1.2.4 The local design loads for assessment of the residual strength notation, **RSA**, or for special loading conditions where the ship will not experience severe weather or severe sea states may be adjusted for the appropriate environmental conditions. A reduced wave height factor, f_{Hs} , may be applied, see *Vol 1*, *Pt 5*, *Ch 3*, 5.10 Design loads for RSA notation assessment and *Vol 1*, *Pt 5*, *Ch 3*, 5.10 Design loads for RSA notation assessment 5.10.3.

1.3 Symbols and definitions

1.3.1 The symbols and definitions applicable to this Chapter are defined below or in the appropriate sub-Section. L_{WL} , B, B_{WL} , D, T and C_{b} are defined in *Vol* 1, *Pt* 3, *Ch* 1, 5.2 *Principal particulars*

Volume 1, Part 5, Chapter 3

Section 1

f Hs = wave height factor for service area, see Vol 1, Pt 5, Ch 3, 1.2 Environmental conditions 1.2.2

 $V_{\rm cr}$ = two thirds the cruising speed, in knots

 $V_{\rm sp}=$ is to be taken as the greater of the cruising speed or two thirds the sprint speed, in knots. For ships where it is not required to maintain high speeds in severe weather then the value of $V_{\rm sp}$ may be specially considered

 $T = \text{mean draught at midships to the design waterline, based on } L_{\text{WI}}$, measured from the baseline

 $T_{\rm x}$ = local draught measured from the underside of the keel to the design waterline at the longitudinal position under consideration see *Figure 3.1.2 Definition of symbols*

 x_{wl} = longitudinal distance, in metres, measured forwards from the aft end of the L_{WL} to the position or centre of gravity of the item being considered

y = transverse distance, in metres, from the centreline to the centre of gravity of the item being considered.
 y is positive to port and negative to starboard

z = vertical distance, in metres, from the base line to the position or centre of gravity of the item being considered. z is positive above the baseline

Normally the following definitions are to be applied:

For a longitudinally framed plate panel, z is to be taken at the panel centre

For a transversely framed plate panel, z is to be taken at two thirds of the panel height

For short stiffener members: z is to be taken at the stiffener mid position

For long stiffener members: *z* is generally to be taken at the stiffener mid position, but may need to be specially considered, especially when there is a significant pressure variation along its length

 z_k = vertical distance of the underside of the keel above the baseline, in metres, see Figure 3.1.2 Definition of symbols

 Δ = moulded displacement of the ship, in tonnes

1.3.2 **Froude Number** F_{n} . The Froude number is a nondimensional parameter which is the primary constituent part of the wave making resistance and which dictates the maximum displacement speed. It is defined as:

$$F_{\rm n} = \frac{V_{\rm m}}{\sqrt{g\,L_{\rm WL}}}$$

where

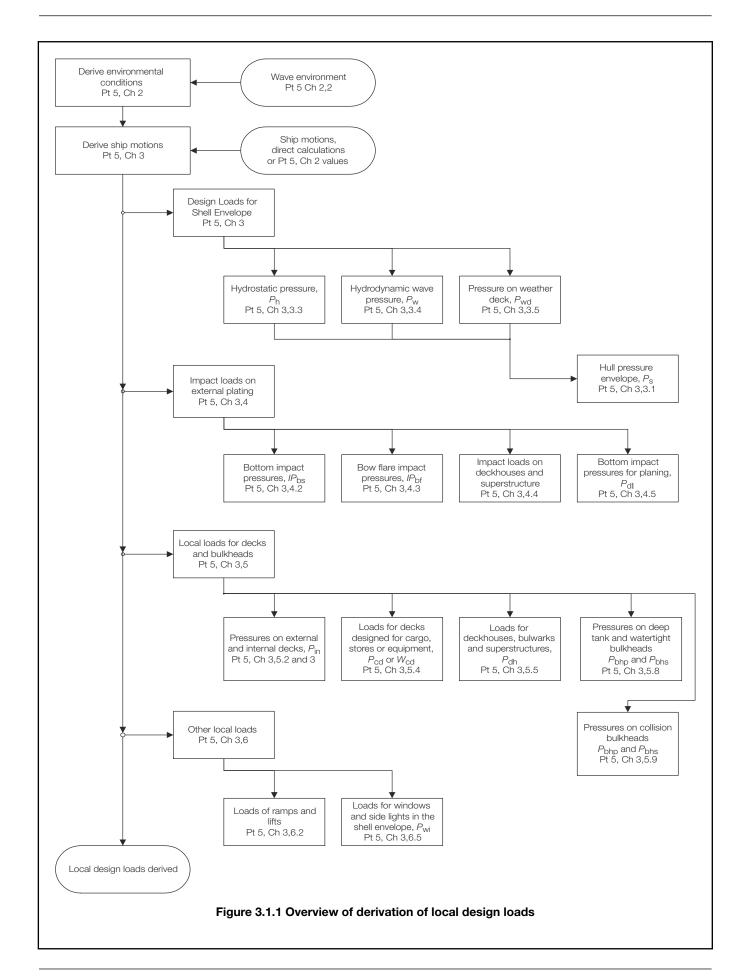

g = is the acceleration due to gravity and is taken to be 9,81 m/s²

L WL = is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1

 $V_{\rm m}$ = is the appropriate ship speed in m/s.

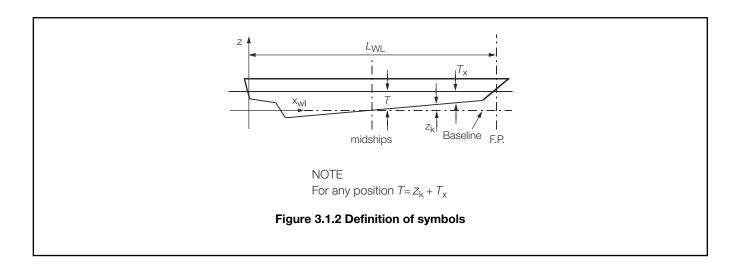

Volume 1, Part 5, Chapter 3

Section 1

Volume 1, Part 5, Chapter 3

Section 1

- 1.3.3 **Design loading condition.** The design loading condition is to be taken as the normal operating deep draft condition with tanks and consumables, etc in the departure state. Where there is a significant variation in loading conditions or operating modes, then it may be necessary to consider additional loading conditions which represent the extremes of service requirements. For example:
- a ship which can operate in displacement and non-displacement modes;
- a ship which is required to operate at a much deeper draft than the normal sea going draft for off-loading payload.
- a ship which is required to be involved in humanitarian emergency evacuation incidents or similar situations where short term overloading may be necessary.
- 1.3.4 **LCG.** The LCG is the longitudinal centre of gravity of the ship measured in metres from the aft end of the $L_{\rm WL}$ for the design loading condition.
- 1.3.5 **Displacement mode.** Displacement mode means the regime, whether at rest or in motion, where the weight of the ship is fully or predominantly supported by hydrostatic forces. Typically this applies to craft with a Taylor Quotient, Γ , less than 3. However, some craft are designed to plane with Γ less than 3 and these should be considered as operating in the non-displacement mode.
- 1.3.6 **Fully planing mode or Non-displacement mode.** Non-displacement mode means the normal operational regime of a ship when non-hydrostatic forces substantially or predominantly support the weight of the ship. Typically this applies to craft with a Taylor Quotient, Γ , greater than 3. However, some craft are designed not to plane with Γ greater than 3 and these should be considered as operating in the displacement mode unless they are classified as a high speed craft.
- 1.3.7 Taylor Quotient Γ . The Taylor Quotient is defined as:

$$\Gamma = \frac{V_{\rm m}}{\sqrt{L_{\rm WL}}}$$

where

 $V_{\rm m}$ = is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.2

L_{WL} = is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1.

- 1.3.8 **Support girth** G_S . The support girth is the girth distance at the LCG, in metres, and is to be calculated as follows:
- For craft with chines, it is to be taken as the distance around the shell plate between the girth chine locations, see Figure 3.1.3 Definition of girth chine location, B_C, B_{WL} and G_S when chine is below deepest load waterline. Girth chine location is to be taken as the lowest chine above which the shell plate has an angle to the horizontal greater than 50°.
- For craft where the design waterline intercepts the shell plate below the bilge tangential point or the girth chine location, the support girth is to be taken as the distance around the shell plate up to the design waterline, see Fig. Figure 3.1.4 Definition of girth chine location, B_C, B_{WL} and G_S when chine is above deepest load waterline.

Volume 1, Part 5, Chapter 3

Section 1

- For craft with round bilges, it is to be taken as the distance around the shell plate between the bilge tangential points of the hull. The bilge tangential point is defined as the tangential point of the bilge with an oblique line sloped at 50° to the horizontal at the LCG, see Figure 3.1.5 Definition of bilge tangential point, B C, B WL and G S.
- For multi-hull craft, it is to be taken as the summation of girths for each individual hull between the inner and outer bilge tangential points or chines, as appropriate.

The definition aims to define the canoe body. Narrow keels and skegs can be ignored.

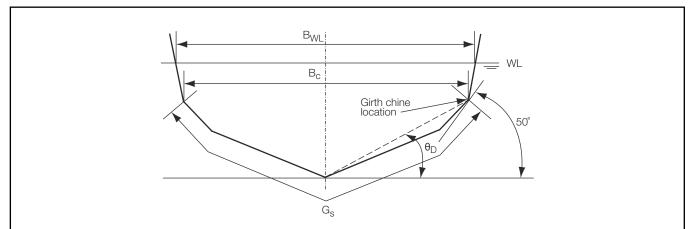

Figure 3.1.3 Definition of girth chine location, B_C, B_{WL} and G_S when chine is below deepest load waterline

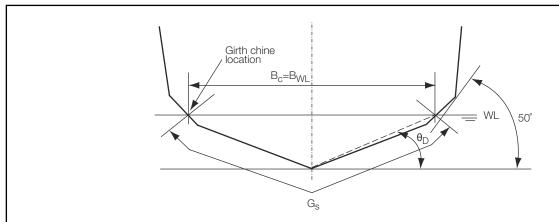

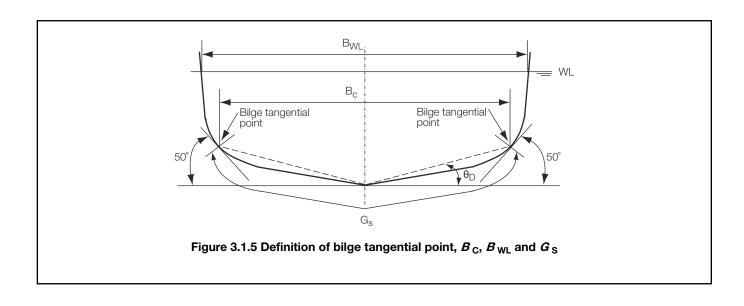

Figure 3.1.4 Definition of girth chine location, B_{C} , B_{WL} and G_{S} when chine is above deepest load waterline

Section 2

■ Section 2

Motion response

2.1 General

2.1.1 The motions of the ship are to be considered in deriving the loads acting on the ship. The formulae given in this section may be utilised or ship motion design values may be derived by direct calculation methods or model testing.

2.2 Ship motions

2.2.1 The ship motion response data given in *Table 3.2.1 Ship motions* are to be used in the design calculations. Alternatively, the ship motion responses may be derived by direct calculation or equivalent methods.

2.3 Design accelerations

- 2.3.1 The non-dimensional ship motion acceleration values given in this Section are to be used in the design calculations. The equations given here are applicable to ships with conventional hull forms operating in the displacement mode at their normal ship service speed or cruising speed. It is not normally necessary to consider the ship motion or acceleration values at sprint speeds unless there is a particular requirement to operate at sprint speeds in severe seastates.
- 2.3.2 The following formulae are given as guidance for the components of acceleration due to ship motions and apply for ships with a length exceeding 50 m and where the speed is such that the ship is operating within the displacement mode based on normal ship service speed. Typically this will apply to most ships with displacement hull forms that are not designed to operate in the planing regime.

Vertical acceleration due to heave, pitch and roll motions

$$a_z = \pm \sqrt{\left(a_{\text{heave}}^2 + a_{\text{pitch}}^2 + a_{\text{rollz}}^2\right)}$$

Transverse acceleration due to sway, yaw and roll motions

$$a_{y} = \pm \sqrt{\left(a_{\text{sway}}^{2} + a_{\text{yaw}}^{2} + a_{\text{rolly}}^{2}\right)}$$

Longitudinal acceleration due to surge motions

$$a_{x} = \pm a_{0} \sqrt{(0, 06 + A^{2} - 0, 25A)}$$

where

Volume 1, Part 5, Chapter 3

Section 2

$$A = f_{\text{HS}} f_{\text{st}} \left(0, 7 - \frac{L_{\text{WL}}}{I200} + \frac{5(z - T)}{L_{\text{WL}}} \right) \left(\frac{0, 6}{C_{\text{b}}} \right)$$

and

 a_x , a_y and a_z are the maximum dimensionless accelerations (i.e. relative to the acceleration of gravity) in the respective directions and are considered as acting separately for calculation purposes

 a_{x} = measured positive in the forward direction

 a_{v} = measured positive in the transverse direction to port.

 a_{7} = measured positive in the downwards direction, i.e. adds to g

Note

 a_{x} = includes the component due to static weight in the longitudinal direction due to pitching

Note

a_v = includes the component due to static weight in the transverse direction due to rolling

Note

 a_z = does not include the component due to static weight

Note a_{o} , a_{heave} , a_{pitch} , a_{rollz} , a_{sway} , a_{yaw} , a_{rolly} and A are defined in Table 3.2.1 Ship motions

Note

 f_{st} = is defined in *Table 3.2.1 Ship motions*

Note

f Hs = is defined in Vol 1, Pt 5, Ch 3, 1.2 Environmental conditions 1.2.2

Note T, L $_{\rm WL}$, C $_{\rm b}$ and z are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1

2.4 Design vertical acceleration for ships in the planing regime

2.4.1 The design vertical acceleration for the derivation of bottom impact pressures for ships operating in the planing regime may be derived using the following Sections.

Table 3.2.1 Ship motions

Motion			Acceleration
Heave		a _{heave}	= a _o
Pitch		a pitch	$= a_0 \left(5, 3 - \frac{45}{L_{WL}}\right) \left(\frac{x_{Wl} - L_{CG}}{L_{WL}}\right) \left(\frac{0, 6}{C_b}\right) 0, 75$
Sway		a _{sway}	$= a_{o}0.78$
Yaw		a _{yaw}	$= a_0 1.6 \left(\frac{x_{\text{wl}} - L_{\text{CG}}}{L_{\text{WL}}} \right)$
Roll	Acceleration due to Roll Vertical direction	a _{rollz}	$= a_0 \frac{0.6 y K^{1.5}}{B_{WL}}$
Roll	Acceleration due to Roll Transverse direction	a _{rolly}	$= a_{0}\sqrt{K} \left(1 + 0, 6K \left(\frac{z - T}{B_{WL}} \right) \right)$

Volume 1, Part 5, Chapter 3

Section 2

	a ₀	$= f_{\text{Hs}} f_{\text{st}} \left(\frac{0.2V}{\sqrt{L_{\text{WL}}}} + \frac{34 - \left(\frac{600}{L_{\text{WL}}}\right)}{L_{\text{WL}}} \right)$
Relative vertical motion	H _m	$= C_{w, \min} \left(1 + \frac{k_{r}}{(C_{b+0, 2})} \left(\frac{x_{wl}}{L_{WL}} - x_{m} \right)^{2} \right)$

Symbols

 $f_{\rm st} = {\rm correction\ factor\ for\ long\ term\ (10^{-8})\ acceleration}$ value to average of the highest 1/100 acceleration values

= 0,8

 $C_{\rm w}$ = a wave head, in metres

= f_{Hs} 0,0771 L_{WI} (C_b + 0,2)^{0,3} e^(-0,0044 L_{WL})

$$C_{\text{w,min}} = \frac{C_{\text{W}}}{k_{\text{m}}} \sqrt{\frac{2,25}{k_{\text{r}}}}$$

$$k_{\rm m} = \frac{k_{\rm r}(0, 5 - x_{\rm m})^2}{(C_{\rm b} + 0, 2)}$$

 $x_{\rm m} = 0.45 - 0.6F_{\rm n}$ but $x_{\rm m}$ is not to be less than 0.2

k_r = 2,25 for the determination of pressure loads in Vol 1, Pt 5, Ch 3, 3 Loads on shell envelope

 $k_r = 4,5$ for the determination of impact loads in *Vol 1*, Pt 5, Ch 3, 4 Impact loads on external plating $\ensuremath{\textit{V}}$ is appropriate design speed as follows:

- $V=V_{\rm cr}$ for determination of pressure in Vol 1, Pt 5, Ch 3, 3 Loads on shell envelope, local design loads in Vol 1, Pt 5, Ch 3, 5 Local design loads for decks and bulkheads and Vol 1, Pt 5, Ch 3, 6 Other local loads, and all other loads unless specifically noted
 - V_{sp} for determination of impact loads in Vol 1, Pt
 5, Ch 3, 4 Impact loads on external plating

$$F_{\text{n}} = \frac{0.515V}{\sqrt{gL_{\text{WL}}}}$$

 K = 1 in general. For particular loading conditions and hull forms, determination of K according to the formula below may be necessary

 $K = 13 \text{ GM} / B_{\text{WL}}, \text{ but } \ge 1,0$

GM = metacentric height, in metres

 $f_{\rm HS}$ and B $_{\rm WL}$ are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1

L CG is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.4

Note 1. Heave motion is measured positive upwards.

Note 2. Pitch motion is measured positive bow downwards.

Note 3. Sway motion is measured positive to port.

Note 4. Yaw motion is measured positive bow to port.

Note 5. Roll motion is measured positive port side upwards.

2.4.2 The non-dimensional vertical acceleration at the LCG, a_{op} , is defined as the average of the 1/100 highest accelerations and is to be taken as:

$$a_{OD} = 5,66g \theta_B L_1 (H_1 + 0,084) (5 - 0,1\theta_D) F_n^2 10^{-3}$$

where

 F_n = Froude number based on V_{sp} , where V_{sp} is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1, F_n is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.2

 $g = \text{acceleration due to gravity (9,81 m/sec}^2)$

$$L_{\rm 1} = \frac{L_{\rm WL}B_{\rm c^3}}{B_{\rm WL}A}$$
 , but $\frac{L_{WL}}{B_{\rm WL}}$ is not to be taken as less than 3

Volume 1, Part 5, Chapter 3

Section 3

where

 $H_1 = \frac{H_{\text{dw}}}{B_{\text{WL}}}$ but not less than 0,2

B_C = breadth of hull between the chines or bilge tangential points at the LCG, as appropriate, in metres

H_{dw} = design wave height in metres, see Vol 1, Pt 5, Ch 2, 2.3 Wave environment 2.3.3

 θ_D = deadrise angle at the LCG, in degrees, but is not to be taken as greater than 30°, see Notes 1 and 2 and Figure 3.1.5 Definition of bilge tangential point, B C, B WL and G S

 $\theta_{\rm B}$ = running trim angle in degrees, but is not to be taken as less than 3°.

 Δ is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1

LCG is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.4

B WL and L WL are defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

Note 1. For ships with no clearly defined deadrise angle at the LCG, the angle, in degrees, to the horizontal line at the LCG formed by joining the lowest point of the hull or underside of keel and the bilge tangential point is to be taken as the deadrise angle θ_D , see Figure 3.1.5 Definition of bilge tangential point, B C, B WL and G S

Note 2. For ships with hulls of asymmetric section, where the inner and outer deadrise angles differ, the smaller of the two angles is to be used.

- 2.4.3 Where the Froude number, F_n , is greater than 1,8, the motion response criteria are to be specially considered.
- 2.4.4 The vertical non dimensional acceleration, a_z , at any given distance x along the hull may be taken as:

$$a_z = a_{op} \left(1, 0 - 0, 32 \frac{(X_{wl} - L_{CG})}{L_{WL}} + 1, 76 \left(\frac{X_{wl} - L_{CG}^2}{L_{WL}^2} \right) \right)$$

where

 a_z = is the vertical acceleration in terms of g

 x_{wl} = distance from aft end of L_{WL} , in metres, to the point at which the vertical acceleration is calculated

LCG is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.4

■ Section 3

Loads on shell envelope

3.1 Pressures on the shell envelope

- 3.1.1 The design pressures for the shell envelope including exposed decks are to include the effects of combined static and dynamic load components. In addition the effects of impact or slamming loads are also to be considered, but these may be treated separately, see Vol 1, Pt 5, Ch 3, 4 Impact loads on external plating
- 3.1.2 The individual pressure components are given in Vol 1, Pt 5, Ch 3, 3.3 Hydrostatic pressure on the shell plating, Ph and the combined pressure to be applied to the shell envelope is given in Vol 1, Pt 5, Ch 3, 3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating, Ps. The pressure to be applied to exposed and weather decks is given in Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd.

3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating, P_s

3.2.1 The total pressure distribution, P_s , in kN/m² acting on the shell plating envelope due to hydrostatic and hydrodynamic pressures is illustrated in *Figure 3.3.1 Combined pressure distributution*, P_s and is to be taken as specified in *Table 3.3.1 Shell envelope pressure*, P_s

3.3 Hydrostatic pressure on the shell plating, P_h

3.3.1 The pressure, P_h, acting on the shell plating up to the design waterline due to hydrostatic pressure is to be taken as:

$$P_h = 10 (T_x - (z - z_k)) \text{ kN/m}^2$$

where

= T_x, z and z_k are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions

3.4 Hydrodynamic wave pressure, P_w

3.4.1 The hydrodynamic wave pressure distribution, P_w , around the shell envelope up to the design waterline, i.e. $z \le T_x + z_y$, is to be taken as the greater of the following:

P_m kN/m² (relative motion)

P_p kN/m² (pitching motion)

where

 $P_{\rm m}$ and $P_{\rm p}$ are defined in Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure, Pw 3.4.2 and Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure, Pw 3.4.3.

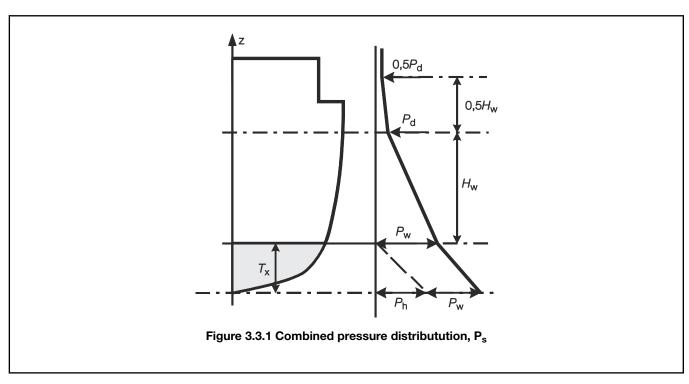

Table 3.3.1 Shell envelope pressure, P s

Vertical location	Shell envelope pressure, P s			
i.e. z value	kN/m ²			
for $z \le T_x + z_k$	$P_h + P_w$			
i.e. up to the design waterline				
$At z = T_x + z_k + H_w$	Pd			
At $z \ge T_x + z_k + 1,5H_w$	0,5P _d			
Symbols				

Volume 1, Part 5, Chapter 3

Section 3

 P_h is the hydrostatic pressure, see Vol 1, Pt 5, Ch 3, 3.3 Hydrostatic pressure on the shell plating. Ph

 $P_{\rm w}$ is the hydrodynamic wave pressure, see Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure. Pw

 $P_{\rm d}$ is the weather deck pressure, see Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd 3.5.2

 $H_{\rm w}$ is the nominal wave limit height, see Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure, Pw 3.4.4

 $P_{\rm h}$ and $P_{\rm w}$ are to be derived at the appropriate vertical position, z

T_x, z and z_k are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions

Note Pressure values at other *z* values are to be derived by interpolation.

3.4.2 The distribution of hydrodynamic pressure up to the design waterline, $P_{\rm m}$, due to relative motion is to be taken as:

$$P_{\rm m} = 10 f_{\rm z} H_{\rm rm} \, kN/m^2$$

where

 f_z = the vertical distribution factor

$$= K_z + (1 - K_z) \left(\frac{Z - Z_K}{T_X} \right)$$

$$k_7 = e^{-u}$$

$$u = \left(\frac{2\pi T_{x}}{L_{WL}}\right)$$

 $H_{\rm rm}$ is defined in Table 3.2.1 Ship motions z,z_k, $T_{\rm x}$ and $L_{\rm WL}$ are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions.

3.4.3 The distribution of hydrodynamic pressure up to the design waterline due to pitching motion, P_p , is to be taken as:

$$P_p = 10 H_{pm} \text{ kN/m}^2$$

where

$$H_{\text{pm}} = 1.1 f_{\text{HS}} \left(\frac{2X_{\text{Wl}}}{L_{\text{WL}}} - I \right) \sqrt{L_{\text{p}}} \text{ but not less than } 0.3 f_{\text{HS}} \sqrt{L_{\text{wL}}}$$

where

$$L_{P} = L_{WL}$$
 but ≤ 150 m

 $x_{\rm Wl}$, $L_{\rm WL}$ and $f_{\rm Hs}$ are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions.

3.4.4 The nominal wave limit height, $H_{\rm w}$, above the design draft, $T_{\rm x}$, is to be taken as:

$$H_{\rm w} = 2H_{\rm rm} \, \rm m$$

where

H_{rm} is given in Table 3.2.1 Ship motions

3.5 Pressure on exposed and weather decks, P_{wd}

3.5.1 The pressure acting on weather decks, exposed decks or decks designed for prolonged immersion, $P_{\rm wd}$, is illustrated in Figure 3.3.2 Weather deck pressure distribution, $P_{\rm wd}$ and is to be taken as specified in Table 3.3.2 Exposed/weather deck pressure, $P_{\rm wd}$

Section 3

3.5.2 The minimum design pressure for weather decks, $P_{\rm d}$, above the 0,5 $H_{\rm w}$ limit line and below the 1,0 $H_{\rm w}$ limit line is to be taken as:

$$P_{d} = 6 + 6f_{L}f_{Hs} \, kN/m^{2}$$

where

 f_{L} = a location factor

$$1 + 4 \left(\frac{X_{\text{wl}}}{L_{\text{WL}}} - 0,75 \right)$$

but not less than 1,0

 $L_{\rm WL}$ and $x_{\rm Wl}$ are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions $f_{\rm Hs}$ is defined in Vol 1, Pt 5, Ch 3, 1.2 Environmental conditions.

3.5.3 If a bulwark is fitted at the deck edge then consideration will be given to allowing the height of the top of the bulwark to be used for the pressure calculation.

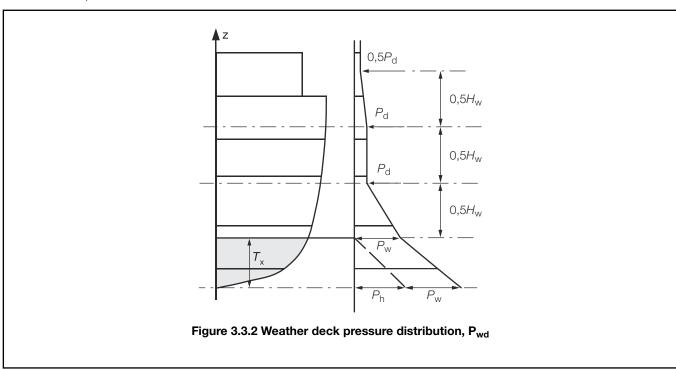

Table 3.3.2 Exposed/weather deck pressure, P_{wd}

Vertical location	Exposed/weather deck pressure, P _{wd} kN/m ²
i.e. z value	
for $z \le T_x + z_k$	P _h + P _w
i.e. up to the design waterline	
At $z = T_x + z_k + 0.5H_w$	P _d
At $z = T_x + z_k + 1.0H_w$	P _d
At $z \ge T_X + z_k + 1,5H_w$	0,5P d
Symbols	

Volume 1, Part 5, Chapter 3

Section 4

P_h is the hydrostatic pressure, see Vol 1, Pt 5, Ch 3, 3.3 Hydrostatic pressure on the shell plating, Ph

P $_{
m w}$ is the hydrodynamic wave pressure, see VoI 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure, Pw

 $P_{
m d}$ is the weather deck pressure, see Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd 3.5.2

 $H_{
m w}$ is the nominal wave limit height, see Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure, Pw 3.4.4

 $P_{\rm h}$ and $P_{\rm w}$ are all taken at the appropriate vertical position, z

T $_{
m x}$, z and z $_{
m k}$ are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions

NOTE

Pressure values at other z values are to be derived by interpolation.

■ Section 4

Impact loads on external plating

4.1 General

- 4.1.1 The effects of impact or slamming loads on the shell envelope are to be considered. This section gives formulations for equivalent design pressure loads. Alternatively the impact pressure loads may be derived using suitable direct calculation methods.
- 4.1.2 The methods below produce average instantaneous impact pressures which need to be converted to equivalent static pressures by application of a dynamic load factor, see Vol 1, Pt 6, Ch 2, 5 Dynamic loading and Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming and Vol 1, Pt 6, Ch 3, 15 Strengthening for wave impact loads above waterline.
- 4.1.3 These methods are based on the Ochi-Motter slamming approach and are equivalent to the standard direct calculation procedure. The values of m_0 , variance of the relative vertical motion, and m_1 , variance of the relative vertical velocity, may be derived using direct calculations. In this case the variances are to be based on sea states as defined by the normal design assessment environmental criteria, see *Vol 1*, *Pt 5*, *Ch 2*, *2.3 Wave environment*.

4.2 Bottom impact pressure, IP bi

4.2.1 The bottom impact pressure due to slamming, IP_{bi} , is to be derived using the method given below. This method will produce impact pressures over the whole of the underwater plating region:

$$IP_{bi} = 0.5k_{sl} V_{bs}^2 \text{ kN/m}^2$$

where

 $K_{\rm sl}$ = hull form shape coefficient

=
$$\frac{\pi}{\tan \beta_p}$$
 for $\beta_p \ge 10$

= 28 (1- $tan(2\beta_p)$) for $\beta_p < 10$

 β_p = deadrise angle,in degrees, see Figure 3.4.1 Bow flare and bottom slamming angles

 $V_{\rm bs} = {\rm slamming \ velocity, \ in \ m/s, \ and \ is \ given \ by}$

$$= \sqrt{V_{\text{th}}^2 + 2m_1 \ln(N_{\text{si}})} \text{ for } N_{\text{s1}} \ge 1$$

$$= 0 \text{ for } N_{s1} < 1$$

 V_{th} = threshold velocity for slamming, in m/s, to be taken as:

 $= \sqrt{10}$

 N_{s1} = No. of slams in a 3 hour period and is given by

where

$$= \frac{1720PR_{\rm sl}\sqrt{\frac{m_1}{m_0}}}$$

 PR_{s1} = probability of a slam and is given by

$$u = \left(\frac{Z_{wt}^2}{2m_0} + \frac{V_{th}^2}{2m_1} \right)$$

 $Z_{\rm wl}$ = distance of the centroid of the area of plating or stiffener to the local design waterline

$$= z - (T_x + Z_k)$$

 m_1 = variance of the relative vertical velocity

$$= 0.25 (\omega_e f_{s1} H_{rm})^2$$

 m_0 = variance of the relative vertical motion

$$= 0.25 (f_{s1} H_{rm})^2$$

 ω = effective wave frequency based on 80 per cent ship length

$$= \sqrt{\frac{2 \pi g}{0.8 L_{WI}}}$$

 ω_{e} = effective encounter wave frequency

$$= \omega \left(1 + \frac{0.2 \omega V_{\rm sp}}{g} \right)$$

 $H_{\rm rm} = {\rm relative} \ {\rm vertical} \ {\rm motion} \ {\rm based} \ {\rm on} \ {\rm V}_{\rm sp}, \ {\rm see} \ {\rm \it Table} \ {\rm \it 3.2.1} \ {\rm \it Ship} \ {\rm \it motions}$

 f_{sl} = probability level correction factor for relative vertical motion

 $V_{\rm sp},$ z, z $_{\rm k}$ and T $_{\rm x}$ are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions

See Figure 3.4.1 Bow flare and bottom slamming angles.

4.2.2 For the purposes of deriving the dynamic load factor, the rise time of the impact pressure may be taken as:

$$t_{\rm r} = \frac{1}{4\sqrt{IP_{\rm bi}}}$$
 seconds

It is assumed that the impact pressure may be represented by a triangular pulse load.

4.3 Bow flare and wave impact pressures, IP bf

- 4.3.1 This Section is applicable to:
- (a) Bow flare region.
- (b) Sides and undersides of sponsons.
- (c) Other parts of the side shell plating close to and above the design waterline that are expected to be subjected to wave impact pressures.

The bow flare wave impact pressure, wave impact pressure on sponsons and other parts of the side shell plating above the design waterline, IP_{bf} , in kN/m^2 , due to relative motion is to be taken as:

$$IP_{hf} = 0.5 (k_{bf} V_{bf}^2 + k_{rv} H_{rv} V_{rv}^2) kN/m^2$$

Volume 1, Part 5, Chapter 3

Section 4

where

 $k_{\rm bf}$ = hull form shape coefficient for wave impacts

$$=\frac{\pi}{\tan \psi}$$
 for $\psi \ge 10$

=
$$28 (1 - \tan(2 \psi))$$
 for $\psi < 10$

 $V_{\rm bf}$ = wave impact velocity, in m/s, and is given by

=
$$\sqrt{V_{\mathrm{thbf}}^2 + 2m_1 \ln(N_{\mathrm{bf}})}$$
 for $N_{\mathrm{bf}} > 1$ for $N_{\mathrm{bf}} \ge 1$

$$= 0 \text{ for } N_{\text{bf}} < 1$$

 V_{thbf} = threshold velocity for wave impact, in m/s, to be taken as:

$$= \frac{\sqrt{10}}{\cos \alpha_p}$$

 $N_{\rm bf}$ = No of wave impacts in a 3 hour period and is given by

$$= 1720 PR_{\rm bf} \sqrt{\frac{m_I}{m_0}}$$

PR _{bf} = probability of a wave impact and is given by e^{-u}

$$U = \left(\frac{Z_{WL}^2}{2m_0} + \frac{V_{thbf}^2}{2m_1}\right)$$

 k_{rv} = hull form shape coefficient for impact due to forward speed

$$= \frac{\pi}{\tan(90 - \alpha_p)} \text{ for } \alpha_p \le 80$$

= 28 (1 - tan(2 (90 -
$$\alpha$$
 _p))) for α _p > 80

 H_{rv} = relative wave heading coefficient

= 1,0 for
$$\gamma_{p} \ge 45$$

=
$$\cos(45-\gamma_p)$$
 for $\gamma_p < 45$ and ≥ 0

= 0 for
$$\gamma_D < 0$$

 V_{rv} = relative forward speed, in m/s

=
$$0.515 V_{sp} \sin(\gamma_p)$$

 α_p = buttock angle measured in the longitudinal plane, in degrees, see Figure 3.4.1 Bow flare and bottom slamming angles

 ψ = effective deadrise angle in degrees.

For C $_{b}$ > 0,6, ψ is to be taken as the maximum of α_{p} and β_{p} , see Figure 3.4.1 Bow flare and bottom slamming angles

For C $_{b}$ \leq 0,6, ψ is to be taken as the maximum of α_{p} and β

where

 $\beta=\beta_p-10^\circ,$ but is to be taken as not less than 0°

NOTE

The 10° deduction is to allow for the effects of roll motion on the impact pressures.

 γ_p = waterline angle, measured in the horizontal plane, in degrees, see Figure 3.4.1 Bow flare and bottom slamming angles

C_b = Block coefficient as defined in Vol 1, Pt 3, Ch 1, 5 Definitions

= z_{wl} , m_{1} , m_{0} , are defined in 4.2 but are to be calculated using:

 $f_{\rm sl}$ = probability level correction factor for relative vertical motion

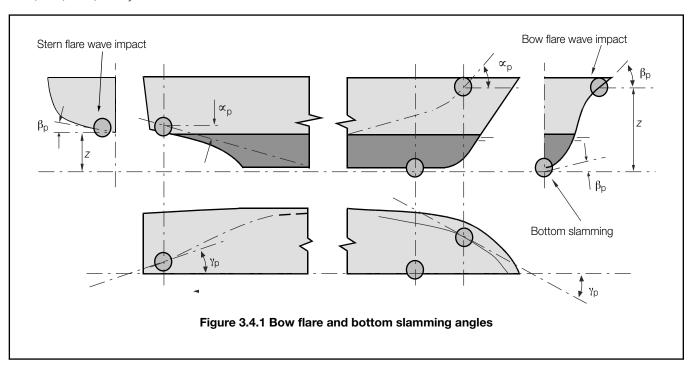

= 1,0 for ships $C_b \le 0,6$

= 1,2 for ships $C_b > 0,6$

Note Where only two angles are known and are measured in the orthogonal planes, then the third angle may be obtained by the following expression:

$$\alpha_{\rm p} = \tan^{-1} (\tan \beta_{\rm p} \tan_{\rm y})$$

If the area of plating under consideration has a waterline angle which is re-entrant or decreasing, e.g. in the stern region, then the relative wave heading coefficient, H_{rv} , and the speed V_{sp} , used in the derivation of H_{rm} , are to be taken as zero. V_{sp} is defined in *Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1*

4.3.2 For the purposes of deriving the dynamic load factor, the rise time of the wave impact pressure may be taken as:

$$t_{\rm r} = \frac{1}{4\sqrt{IP_{\rm hf}}}$$
 seconds

It is assumed that the wave impact pressure may be represented by a triangular pulse load.

- 4.3.3 The extents around the girth of the bow flare wave impact pressure are to be derived as follows:
- (a) the vertical slam extent, $g_{\rm bfv}$, is to be taken as:

$$g_{bfv} = \frac{4}{\sin \psi \sqrt{8K_{bf}}} m$$

(b) the horizontal slam extent, g_{bfh} , is to be taken as:

$$g_{bfh} = 4 \text{ m}$$

Volume 1, Part 5, Chapter 3

Section 5

where

k _{bf} and ψ are given in Vol 1, Pt 5, Ch 3, 4.3 Bow flare and wave impact pressures, IPbf 4.3.1.

4.4 Impact loads on deckhouses and superstructures

4.4.1 Normally, it may be assumed that the equivalent static pressure loads given in *Vol 1, Pt 5, Ch 3, 5.5 Loads for deckhouses, bulwarks and superstructures, Pdh* make due allowance for impact loads on deckhouse fronts and sides.

4.5 Bottom impact pressure for ships operating in the planing regime

4.5.1 The equivalent static bottom impact pressure due to slamming, $P_{\rm dl}$, at the LCG for planing hull forms is given by the following expression:

$$P_{\rm dl} = \frac{k_{\rm dl} \Delta f_{\rm dI} (I + a_{\rm op})}{L_{\rm WL} G_{\rm S}} \, \text{kN/m}^2$$

where

G_S = support girth in metres, as defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.8

L WL = waterline length, in metres, see Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1

a op = vertical acceleration as defined in Vol 1, Pt 5, Ch 3, 2.4 Design vertical acceleration for ships in the planing regime

 k_d = hull form pressure factor

= 54

= For craft in continuous contact with water:

 $f_{\rm dl} = 0.5 \text{ for } x = 0.0 L_{\rm WL}$

 $= 1.0 \text{ for } x = 0.5 L_{WI}$

 $= 1,0 \text{ for } x = 0,75 L_{WL}$

 $= 0.5 \text{ for } x = 1.0 L_{WI}$

Intermediate values to be determined by linear interpolation.

Otherwise $f_{dl} = 1.0$.

■ Section 5

Local design loads for decks and bulkheads

5.1 General

- 5.1.1 This section gives formulations for design pressure loads for decks, watertight and deep tank boundaries including decks and bulkheads.
- 5.1.2 The loads acting on the deck structures are to reflect the intended purpose for each deck. If it is envisaged that the role of the ship will be such that it may be used for emergency evacuation incidents or similar situations, then the appropriate design loads are to be considered in the assessment. The maximum permissible deck loading are to be recorded in the Operations Manual or Stability Information Book.
- 5.1.3 Bulkheads and decks forming the boundary of tanks are to be assessed in accordance with the requirements for deep tanks using the loads defined in *Vol 1*, *Pt 5*, *Ch 3*, 5.8 Design pressures for watertight and deep tank bulkheads and boundaries and *Vol 1*, *Pt 5*, *Ch 3*, 5.9 Design pressures for collision bulkheads or the maximum load experienced in service, e.g. from RAS operations, whichever is the greater. For an open system the pressure height may be taken from the keel to the filling point open to the atmosphere.

Volume 1, Part 5, Chapter 3

Section 5

5.2 Pressure on external decks

5.2.1 The standard pressure requirements for external decks are given in Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd. If the deck is also to be used for cargo, heavy equipment or similar, then the loads specified in Vol 1, Pt 5, Ch 3, 5.4 Loads for decks designed for cargo or heavy equipment loads, Pcd and Wcd are also to be applied. Consideration will be given to a reduction in the weather deck pressure loading if it can be shown that the cargo or equipment stowage makes the weather deck pressure requirements conservative.

5.3 Pressure on internal decks, P in

5.3.1 The pressure acting on internal decks, P in, not subject to cargo or heavy equipment loads is to be taken as:

 $P_{in} = 5 \text{ kN/m}^2 \text{ for accommodation spaces}$

 $P_{\text{in}} = 7.5 \text{ kN/m}^2 \text{ for main evacuation routes}$

 $P_{in} = 10 \text{ kN/m}^2 \text{ for workshop spaces}$

 $P_{in} = 20 \text{ kN/m}^2 \text{ for store spaces.}$

5.3.2 Alternatively the design pressure is to be based on the static loading on the deck with due allowance for inertial effects as follows:

$$P_{in} = W_{in} (1 + a_z) \text{ kN/m}^2$$

where the following values of static pressure are to be assumed

 $W_{\rm in} = 3 \, \rm kN/m^2$ for accommodation spaces

 $W_{\rm in} = 6 \, \rm kN/m^2$ for workshop spaces

 $W_{\rm in} = 12 \, \rm kN/m^2$ for store spaces

a ₇ is defined in Vol 1, Pt 5, Ch 3, 2.3 Design accelerations 2.3.2.

- 5.3.3 The hydrostatic design pressure for decks specified as watertight shall be taken as that determined by the damage stability analysis and limit of watertight integrity.
- 5.3.4 The static design pressure for internal decks not specified as watertight may be provided by the designer.

5.4 Loads for decks designed for cargo or heavy equipment loads, P_{cd} and W_{cd}

5.4.1 Where the load applied to the deck can be considered as uniformly distributed, the cargo deck design pressure, P_{cd} , is to be taken as:

$$P_{cd} = W_{cd} (1 + a_z) kN/m^2$$

where

a z = is the non dimensional vertical acceleration given in Vol 1, Pt 5, Ch 3, 2.3 Design accelerations 2.3.2

 $W_{\rm cd}$ = is the static pressure exerted by the cargo on the deck as specified by the designer in kN/m².

- 5.4.2 Where the load applied to the deck is not uniformly distributed, the likely actual forces and force distribution over the deck must be considered. The forces are to include the following if appropriate:
- gravity
- inertial forces due to ship motion.
- wind loads
- forces imposed by the securing arrangements
- wave impact loads
- icing loads

Volume 1, Part 5, Chapter 3

Section 5

$$F_{cd} = W_{ma} (1 + a_z) kN$$

where

 W_{ma} is the weight of each mass item on the deck as specified by the designer in kN

5.5 Loads for deckhouses, bulwarks and superstructures, P_{dh}

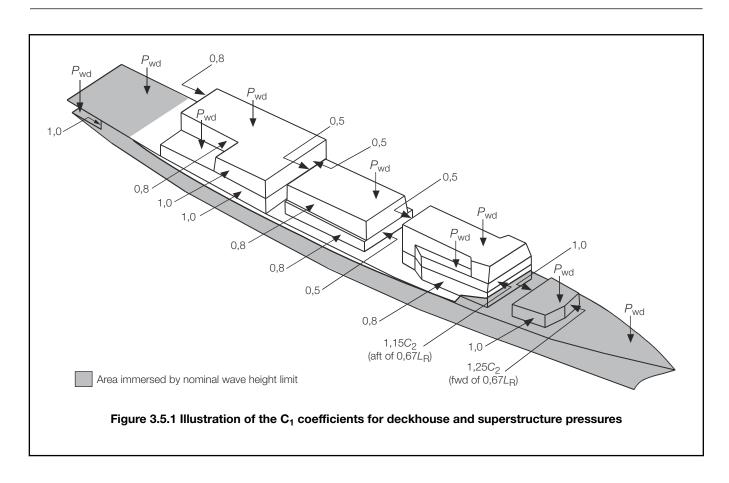

5.5.1 The design normal pressure, P_{dh} , for the side, front and back panels of plating and stiffeners for deckhouses, bulwarks and superstructures is given by:

$$P_{dh} = C_1 P_s kN/m^2$$

where

 $C_1 = 1,25C_2$ for exposed deckhouse fronts and superstructure fronts forward of 0,67L R

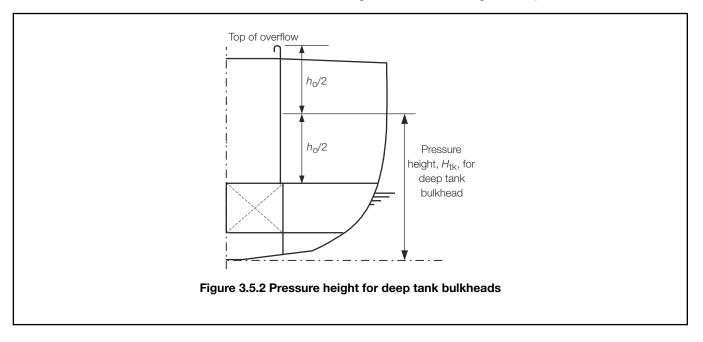

- = 1,15C₂ for exposed deckhouse fronts and superstructure fronts aft of 0,67L_R
- = 1,15 for exposed machinery casings
- = 0,8 for the side and back panels of deckhouses that are stepped in from the deck edge by 1,0 m or more which are also above the nominal wave limit height, H_w, see Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure, Pw 3.4.4
- = 0,5 for non-exposed deckhouse and super structure fronts, sides and backs which are also above the nominal wave limit height
- = 1,0 elsewhere
- P_s = is to be taken at the height of the deck supporting the deckhouse front, side or back panel under consideration, P_s is defined in *Vol 1*, *Pt 5*, *Ch 3*, *3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating*, P_s
- $C_2 = 1,2$ for panels below the nominal wave limit height
 - = 1,0 elsewhere
 - = Typical values of C₁ are shown in Figure 3.5.1 Illustration of the C₁ coefficients for deckhouse and superstructure pressures
 - Where there is more than one deckhouse, the front of the most forward deckhouse will normally be considered exposed, whereas the back of this deckhouse will be non-exposed. Normally, the front of the deckhouse aft of this one will also be considered non-exposed.

5.6 Pressure height for deep tank bulkheads and boundaries, H_{tk}

5.6.1 The design lateral pressure height for tank and deep tank bulkheads and boundaries, H_{tk} , is to be taken as

 $H_{\rm tk} = {\rm the \ distance}$, in m, from the baseline to half the distance from the top of the tank to the top of the overflow. For determination of the maximum head, the top of the overflow is to be taken as not less than 1,8 m above the crown of the tank, see *Figure 3.5.2 Pressure height for deep tank bulkheads*

Volume 1, Part 5, Chapter 3

Section 5

- 5.6.2 For tanks which are connected to a filling tank system, H_{tk} may be taken as the distance, in m, from the baseline to the highest point of the overflow pipe from the filling tank into the overflow tank. Consideration may need to be given to the pressure height for situations where any of the valves in the filling system may be closed. The transfer pump must feed only into the filling tank and must not be linked directly to the tanks.
- 5.6.3 In a filling tank system, suitable measures are to be provided such that the maximum design level in the system cannot be exceeded. Automatic shutdown measures are to ensure a fail safe arrangement to avoid overfilling tank or the overflow tank. The overflow pipe is to be of sufficient size to ensure that the filling trunk is not overfilled.

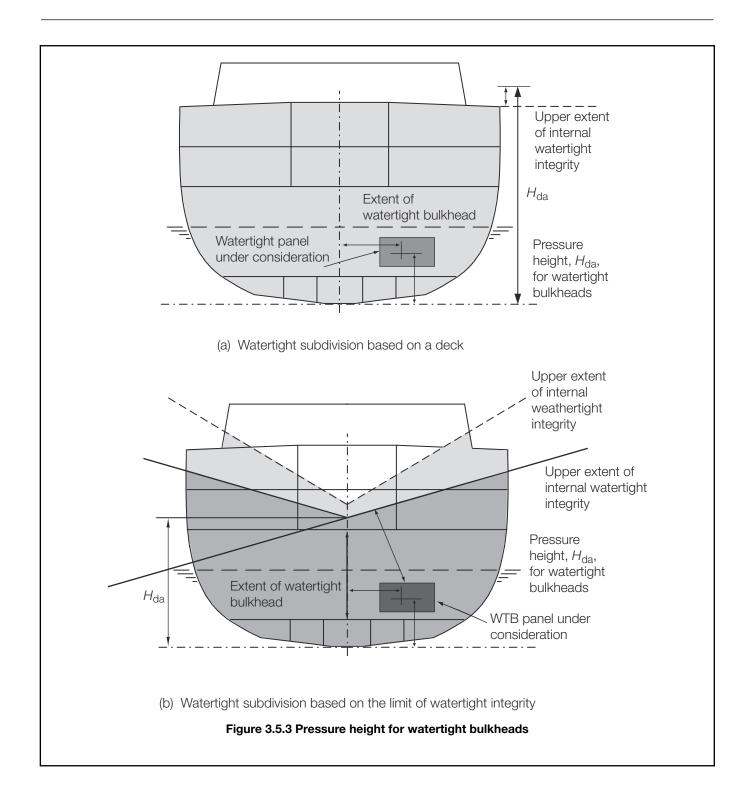

5.7 Pressure height for watertight bulkheads and boundaries, H_{da}

- 5.7.1 The design lateral pressure height for watertight bulkheads and boundaries, H_{da} , is to be taken as
- (a) for a watertight bulkhead design philosophy based on a SOLAS type approach, i.e. to the top of a watertight bulkhead deck or freeboard deck, see *Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity 1.3.8* and illustrated in *Figure 2.1.1*.
 - H_{da} = the vertical distance, in m, from baseline to a line 0,91 m above the top of the watertight bulkhead at side, see *Figure 3.5.3 Pressure height for watertight bulkheads*.
- (b) for a watertight bulkhead design philosophy based on a standard which requires a damaged stability draft and heel envelope approach, e.g. the red risk line approach, see Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity 1.3.9 and illustrated in Figure 2.1.2.

 H_{da} = the distance, in m, from baseline to the damaged stability draft envelope at the centreline, see *Figure 3.5.3 Pressure* height for watertight bulkheads.

Note: The effect of lesser angles of heel in the damage situation may lead to an increase in the effective pressure height, especially in way of the forward end of the ship where it may be necessary to consider H_{da} based on a zero heel angle.

Section 5

5.8 Design pressures for watertight and deep tank bulkheads and boundaries

5.8.1 The design normal pressure for bulkhead plating with stiffeners is to be considered separately for the plating and the stiffeners. The design normal pressure for the plating, $P_{\rm bhp}$, is to be taken as follows:

Deep Tank

 $\rho g (H_{tk} - z_p) kN/m^2$

WT sub-division based on the head normal to the line of watertight integrity

maximum of

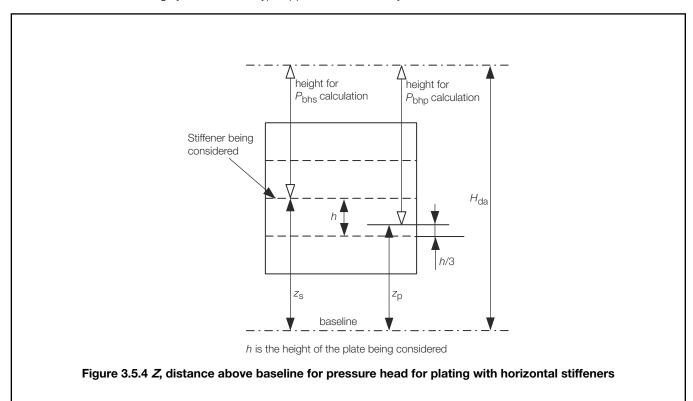

Volume 1, Part 5, Chapter 3

Section 5

 $10((H_{da} - z_p) \cos\theta + y_p \sin\theta) \text{ kN/m}^2$ $10(H_{da} - z_p) \text{ kN/m}^2$

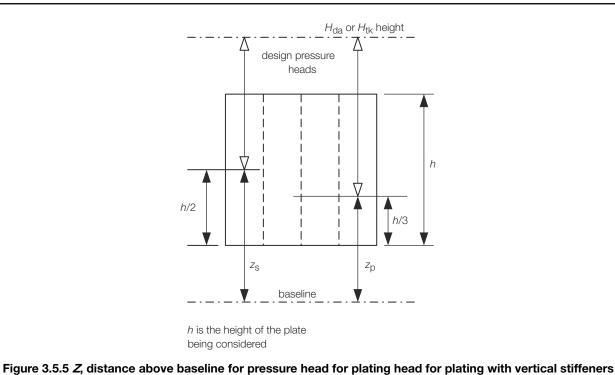

where

- $\rho = \text{density of fluid, in tonnes/m}^3$, and is not to be taken as less than 1,025
- $z_{\rm p}=$ distance above the baseline of a point one-third of the height, above the lower edge, of the plate strake under consideration, $z_{\rm p}$ is illustrated in *Figure 3.5.4 Z, distance above baseline for pressure head for plating with horizontal stiffeners* for horizontally stiffened plating and *Figure 3.5.5 Z, distance above baseline for pressure head for plating head for plating with vertical stiffeners* for vertically stiffened plating
- y_p = distance from the centreline of the mid-breadth of the plate strake under consideration, y_p , is always to be taken as positive
 - θ = the stipulated damaged stability heel angle, see also Vol 1, Pt 3, Ch 2, 1.3 Watertight and weathertight integrity For a SOLAS type approach, θ is normally to be taken as 0,0.

Volume 1, Part 5, Chapter 3

Section 5

rigure 3.3.3.2, distance above baseline for pressure near for planing flear for planing with vertical sufferiers

5.8.2 The design normal pressure for the stiffener, P_{bhs} , is to be taken as follows:

Deep Tank

 $\rho g (H_{tk} - z_s) kN/m^2 (Deep Tank)$

WT sub-division

maximum of:

 $10((H_{da} - z_s) \cos \theta + y_s \sin \theta) \text{ kN/m}^2$

 $10(H_{da} - z_s) \text{ kN/m}^2$

where

 z_s = distance above base of the mid span of the vertical stiffener under consideration, see Figure 3.5.5 Z, distance above baseline for pressure head for plating head for plating with vertical stiffeners

or

- z_s = distance above base of the mid span of the horizontal stiffener under consideration, see Figure 3.5.4 Z, distance above baseline for pressure head for plating with horizontal stiffeners
- y_s = distance from the centreline of the mid span of the stiffener under consideration, y_s is always to be taken as positive
- $\rho = \text{density of fluid, in tonnes/m}^3$, and is not to be taken as less than 1,025.
- 5.8.3 The appropriate design criteria are to be applied to the bulkhead plating and stiffeners, see *Vol 1, Pt 6, Ch 5 Structural Design Factors* It is not permissible to use watertight criteria for a deep tank design head.
- 5.8.4 The design impulse pressure, $IP_{\rm bh}$, for the bulkhead plating and stiffeners may be ignored, unless these members are likely to be subjected to significant sloshing loads or similar. In this case it will be necessary to determine the sloshing loads using a suitable direct calculation procedure.

Volume 1, Part 5, Chapter 3

Section 5

5.9 Design pressures for collision bulkheads

5.9.1 The design lateral pressure height for collision bulkheads, H_{cb}, is to be taken as:

H cb = the vertical distance, in m, from the baseline to 0,91 m above the uppermost point of the collision bulkhead.

5.9.2 The design normal pressure for the collision bulkhead plating, P bho, is to be taken as:

$$P_{bhp} = 10 (H_{cb} - z_p) kN/m^2$$

where

 z_p = distance above baseline of a point one third of the height, above the lower edge, of the plate strake under consideration.

5.9.3 The design normal pressure for bulkhead stiffeners, P_{bhs} , is to be taken as:

$$P_{\text{bhs}} = 10 (H_{\text{ch}} - z_{\text{s}}) \text{ kN/m}^2$$

where

 z_s = distance above base of the mid-span of the vertical stiffener under consideration, see Figure 3.5.5 Z, distance above baseline for pressure head for plating head for plating with vertical stiffeners

= 0

 z_s = distance above base of the mid-span of the horizontal stiffener under consideration, see Figure 3.5.4 Z, distance above baseline for pressure head for plating with horizontal stiffeners

- 5.9.4 The collision bulkheads are to be designed to the deep tank design criteria specified in Vol 1, Pt 6, Ch 5 Structural Design Factors
- 5.9.5 If there is a design requirement for the ship to be able to remain operational after an incident which results in the collision bulkhead becoming the primary watertight boundary to the sea, then it will be necessary to design the collision bulkhead using the pressures for the shell envelope, P_s , given in *Vol 1*, *Pt 5*, *Ch 3*, *3 Loads on shell envelope* and the shell envelope design criteria. It will also be necessary to consider the effects of wave impact pressures, see *Vol 1*, *Pt 5*, *Ch 3*, *4.3 Bow flare and wave impact pressures*, *IPbf*, using the design speed requirement after damage.

5.10 Design loads for RSA notation assessment

- 5.10.1 The capability of transverse bulkheads, longitudinal bulkheads, watertight decks and other structure to withstand any additional loads as a consequence of damage, e.g. sloshing loads on watertight bulkheads, may need to be specially considered. Pressure heads consistent with draughts and heel angles determined from the damage stability analyses are to be used for local scantling assessment.
- 5.10.2 Where watertight boundaries for damage control purposes are specified in the subdivision and stability standard, the nominated bounding decks are to be assigned as watertight see *Vol 1, Pt 6, Ch 3, 10 Deck structures*. The pressure heads used in the assessment of damage control decks are to be the greater of that determined from the Rules or that specified by the Owner.
- 5.10.3 The local design loads for structures subjected to additional loading as a consequence of structural damage are to be taken as specified in this Chapter except that the wave height factor, f_{Hs} , may be reduced, to account for the lesser environmental requirements, as follows:

 $f_{\rm Hs}$ = may be reduced by a factor of 1,85

where

f_{Hs} = is defined in Vol 1, Pt 5, Ch 3, 1.2 Environmental conditions.

- 5.10.4 Where local strength issues need to be considered, the following local loads are to be applied in the evaluation contained in *Vol 1, Pt 6, Ch 4, 4.1 Application*:
- Hydrostatic load due to flooding taking account of the increase in local draft.

Volume 1, Part 5, Chapter 3

Section 6

- Wave and inertial loads in the damaged condition, derived using the reduction factor given in Vol 1, Pt 5, Ch 3, 5.10 Design loads for RSA notation assessment 5.10.3.
- Local loads on watertight divisions as a consequence of flooding. For the evaluation of local loads on watertight divisions, the standard design pressure, H_{da} (see Vol 1, Pt 5, Ch 3, 5.7 Pressure height for watertight bulkheads and boundaries, Hda) may be applied. Alternatively the external hydrostatic and wave pressure load, P_s, may be applied using the reduction factor given in Vol 1, Pt 5, Ch 3, 5.10 Design loads for RSA notation assessment 5.10.3.
- Wave impact loads need not be considered unless a significant operational requirement is necessary following damage.

5.11 Design pressure for magazine decks and bulkheads

5.11.1 For magazine structure which is assessed in accordance with Pt 4, Ch 1,6.4 the quasi-static design pressure is to be taken as follows:

$$P_{\text{mag}} = 2,25 \left(\frac{W_e}{V}\right)^{0,72} \times 10^3 \text{ kN/m}^2$$

where

 $W_{\rm e}$ = weapon equivalent weight of TNT, in kg

V = free compartment volume, in m³.

5.11.2 For magazines below the limit of watertight integrity the design pressure, P_{mag} , is not to be taken as less than the design pressure for watertight bulkheads and boundaries, plating and stiffening, see Vol 1, Pt 5, Ch 3, 5.8 Design pressures for watertight and deep tank bulkheads and boundaries.

■ Section 6

Other local loads

6.1 General

6.1.1 This section gives formulations for design pressure loads for shell closing appliances and requirements for gravity and inertial loads due to equipment, payload, cargo, etc. acting on ramps and lifting appliances.

6.2 Loads for ramps and lifts, Pra

6.2.1 The loads acting on ramps and lifts intended to be used at sea, P_{ra} , is to be derived as follows:

$$P_{ra} = W_{cd} (1 + f_{d} (a_{z} + a_{ra})) kN/m^{2}$$

where

 $W_{\rm cd} = {\rm is}$ the equivalent static pressure exerted by the cargo on the ramp or lift as specified by the designer in ${\rm kN/m^2}$

 a_z = is the non dimensional vertical acceleration given in Vol 1, Pt 5, Ch 3, 2.3 Design accelerations 2.3.2

a ra = maximum acceleration of the lift, see Vol 1, Pt 5, Ch 3, 2.3 Design accelerations

 f_d = duty factor for the lift or ramp

= 2,0 for operation with personnel

= 1,5 otherwise.

6.2.2 If the hoisting speed of the ramp or lift is such that the acceleration of the lift will cause an increase in the forces acting on the lift, then this acceleration term should be included.

366

Volume 1, Part 5, Chapter 3

Section 6

6.2.3 Where the lift or ramp is designed to operate totally or partially under water, then due consideration is to be taken of the additional forces applied to the lift or ramp as a direct consequence of the water environment, e.g. added mass and velocity dependent damping forces.

6.3 Loads for windows and side scuttles in deckhouses and superstructures, P_{wi}

6.3.1 The design pressure, P wi, for windows and side scuttles in deckhouses and superstructures is to be taken as:

$$P_{wi} = W_1 P_s kN/m^2$$

In no case is the design pressure to be taken less than Pwi.min as given by:

$$P_{\text{wi,min}} = W_1 (10 + 0.04L_{\text{R}}) \text{ kN/m}^2$$

Where $P_{\text{wi,min}}$ need not be taken as greater than 15 kN/m² for the third tier of deckhouses or superstructures and above. where

$$W_1 = 1,33C_1$$

 $P_{\rm s}$ is to be taken at the height of the deck below the window or side scuttle, see 3.2

C₁ is defined in Vol 1, Pt 5, Ch 3, 5.5 Loads for deckhouses, bulwarks and superstructures, Pdh 5.5.1.

6.4 Loads for masts

- 6.4.1 The inertia forces resulting from the motions of the ship are to be calculated in accordance with *Vol 1, Pt 5, Ch 3, 2 Motion response* and combined with the wind force defined below acting in the most onerous direction for the case being considered.
- 6.4.2 Where applicable the additional inertia forces due to ice accretion are to be derived in accordance with *Vol 1, Pt 5, Ch 2, 4.6 Ice accretion* and included in the calculations.
- 6.4.3 The wind pressure, p, acting on the structure is given by:

$$p = \frac{V^2}{1630} \, \text{kN/m}^2$$

where

V = wind speed, in m/s. To be taken as 63 m/s unless otherwise specified.

6.4.4 The wind force, $F_{\rm w}$, on the mast structure is given by:

$$F_{w} = A p C_{f} kN$$

where

A =the effective area of the structure concerned, i.e. the solid area projected on to a plane perpendicular to the wind direction, in m^2

 $p = \text{wind pressure, in N/m}^2$

 $C_{\rm f} = {\rm force\ coefficient\ in\ the\ direction\ of\ the\ wind,\ as\ defined\ in\ \it Table\ 3.6.1\ \it Force\ coefficient\ (Cf)}$.

Volume 1, Part 5, Chapter 3

 V_s = wind speed, in m/s

b = breadth of box section, in metres

d = depth of box section, in metres

6.5 Hangar doors and other large doors in superstructures

6.5.1 The design pressure, P_{ds} , for large doors in superstructures is to be taken as:

$$P_{\rm ds} = C_1 P_{\rm s} \, \rm kN/m^2$$

where

 $P_{\rm s}$ is to be taken at the height of the deck on which the doors sits, see Vol 1, Pt 5, Ch 3, 3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating, Ps

 C_1 is defined in Vol 1, Pt 5, Ch 3, 5.5 Loads for deckhouses, bulwarks and superstructures, Pdh 5.5.1.

■ Section 1

General

1.1 Introduction

- 1.1.1 The global design loads detailed in this Chapter are to be used in conjunction with Vol 1, Pt 6 Hull Construction in Steel to determine the global hull strength requirements. The application of the global design loads is given in Vol 1, Pt 6, Ch 4 Hull Girder Strength.
- 1.1.2 Flowcharts showing the procedures for the specification of the global design loads are shown in *Figure 4.1.1 Procedure* for the specification of global design loads.
- 1.1.3 The global design loads are divided into the following categories:
- (a) Hull girder loads.

The types of hull girder loads which are to be considered for strength purposes in the initial design assessment are distinguished on the basis of their frequency of occurrence and are defined as follows:

- Still water shear forces and associated bending moments arising from static mass distribution and buoyancy forces, see Vol 1, Pt 5, Ch 4, 2 Still water global loads.
- (ii) Low frequency vertical wave shear forces and associated bending moments arising from hydrodynamic forces.
- (iii) High frequency dynamic shear forces and associated bending moments arising from slamming events.

The derivation of the hull girder loads is given in Vol 1, Pt 5, Ch 4, 3 Global hull girder loads.

(b) Extreme hull girder loads.

The loads to be considered for extreme hull girder strength purposes are used to assess the hull girder structural capability to withstand extreme sea states. The derivation of the extreme hull girder loads is given in *Vol 1, Pt 5, Ch 4, 4 Extreme hull girder loads*.

(c) Hull girder loads for residual strength assessment.

The loads to be considered for residual strength purposes are used to assess the structural capability of the ship after damage to withstand moderately severe sea states. The derivation of the residual strength hull girder loads is given in Vol 1, Pt 5, Ch 4, 5 Residual strength hull girder loads.

1.1.4 Alternative methods of establishing the global load and design criteria will be specially considered, provided that they are based on model tests, full scale measurements or other generally accepted theories. In such cases, full details of the methods used and the results are to be provided when plans are submitted for approval.

1.2 Definitions and symbols

1.2.1 $L_{\rm R}$, B, $B_{\rm WL}$, D and T are defined in Vol 1, Pt 3, Ch 1, 5 Definitions. $F_{\rm n}$ and Δ are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.2 and Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1 respectively. Displacement mode and non-displacement mode are defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions.

Volume 1, Part 5, Chapter 4

Section 1

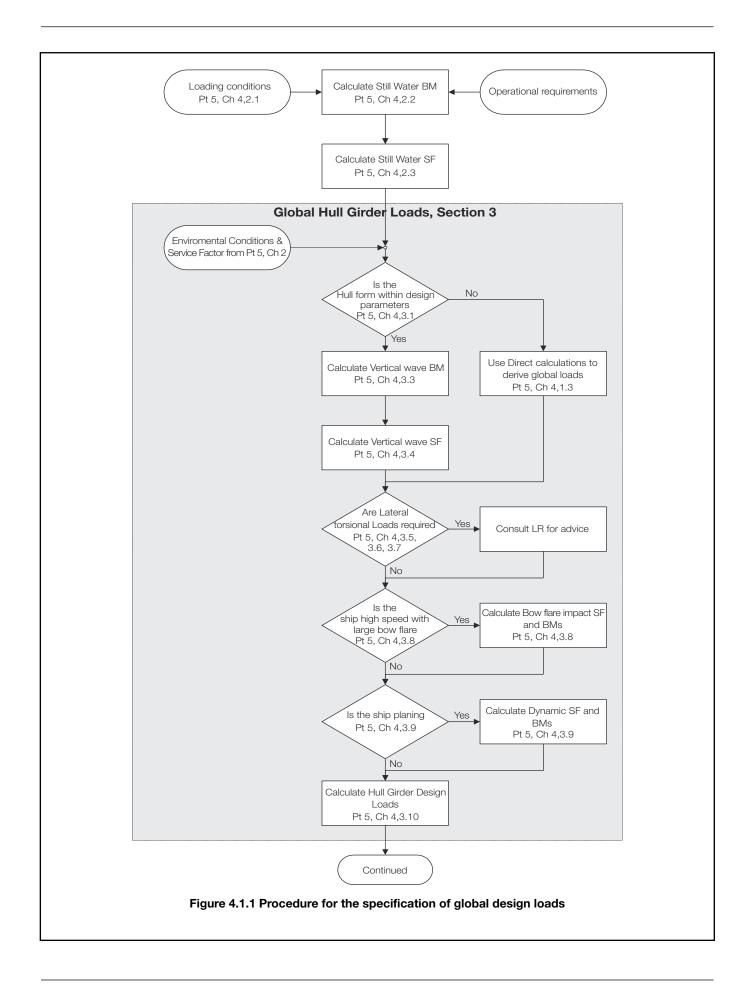

1.2.2 For longitudinal strength calculations of vertical shear force and bending moment, downward loads are to be taken as positive values and are to be integrated in the forward direction from the aft end of the ship. Shear force is positive when the algebraic sum of all vertical forces aft of the position is positive. Hogging bending moments are to be taken as positive values.

1.3 Direct calculation procedures

- 1.3.1 The still water longitudinal strength values are to be derived using a suitable longitudinal strength calculation system.
- 1.3.2 In direct calculation procedures capable of deriving the wave induced loads on the ship account is to be taken of the ship's actual form and weight distribution.
- 1.3.3 Lloyd's Register's (hereinafter referred to as 'LR') direct calculation method of the long term wave induced loads involves derivation of response to regular waves by strip theory, short-term response to irregular waves using the sea spectrum concept, and long-term response predictions using statistical distributions of sea states. Other direct calculation methods submitted for approval are normally to contain these three elements and produce similar and consistent results when compared with LR's methods.
- 1.3.4 The long term response predictions are to be based on probability of 10^{-8} . The LR long term prediction method produces values which have a low statistical probability of occurring taking into account many factors. These factors include:
- The operating life of the vessel, normally the operating life is taken as 20 years which is assumed to correspond to 10⁸ wave encounters.
- The mission profile of the vessel.
- Different loading conditions.
- The effect of different wave headings on ship motions.

Section 1

Volume 1, Part 5, Chapter 4

Section 2

1.4 Information required

- 1.4.1 In order that an assessment of the longitudinal strength requirements can be made, the following information is to be submitted, in LR's standard format where appropriate:
- (a) General arrangement and capacity plan or list showing details of the volume and position of centre of gravity of all tanks, spaces and compartments.
- (b) Bonjean data, in the form of tables or curves, for at least 21 equally spaced stations along the hull together with a lines plan and/or tables of offsets.
- (c) Details of the calculated lightweight and its distribution.
- (d) Details of the weights and centres of gravity of all deadweight items for each of the main loading conditions.
- (e) Calculated still water bending moments and shear forces and the proposed design envelopes. Calculated wave and dynamic bending moment and shear force values.
- 1.4.2 It is recommended that this information be submitted in the form of a preliminary Loading Manual or Stability Information Book including: specification of operational requirements, hydrostatic data, details of loading conditions, etc. It may also be necessary to submit a summary of the damage stability analysis.

■ Section 2

Still water global loads

2.1 General

- 2.1.1 The still water bending moments and shear force distributions are to be derived using a suitable direct calculation method for a range of loading conditions which cover the operational envelope of the ship.
- 2.1.2 In general, loading conditions based on amount of fuel, fresh water, stores and payload at departure, arrival and during special operations are to be considered. Loading conditions representing special operational requirements are also to be considered.
- 2.1.3 As a minimum the following conditions are to be considered in deriving the maximum hogging and sagging still water bending moment and shear force envelopes:
- Deep draught (departure) condition with no growth margin.
- Light draught (arrival) condition with no growth margin.
- Deep draught condition with full growth margin.
- Light draught condition with full growth margin.
- Maximum and minimum operating draught conditions, if different to the above.
- Ballast conditions, where appropriate.
- Any special mid-voyage conditions caused by changes in payload or ballast distribution.
- Other special loading conditions, e.g. Emergency evacuation or similar emergency scenario conditions, heavy payloads or cargo, deck cargo conditions, etc. where applicable.
- 2.1.4 For special loading conditions which may only be required in restricted operational areas, a reduced service area factor, *f* s, may be allowable, see *Vol 1*, *Pt 5*, *Ch 4*, *3.3 Vertical wave bending moments 3.3.1*.
- 2.1.5 If the still water bending moment and shear force envelope approach is not appropriate, (as a consequence of the envelope being too severe due to one or two special conditions distorting the envelope) then individual consideration of the bending moment and shear force will be necessary.
- 2.1.6 A full or half icing allowance in accordance with *Vol 1, Pt 5, Ch 2, 4 Guidance for ice environment* is to be included in the still water bending moment and shear force calculations.
- 2.1.7 To account for miscellaneous fittings such as stanchions and rails an additional 5 per cent should be added to the total ice weight calculated for both full and half icing allowances.

Volume 1, Part 5, Chapter 4

Section 3

2.2 Still water bending moments

- 2.2.1 The design still water hogging and sagging bending moment distribution envelope, $M_{\rm S}$, is to be taken as the maximum sagging (negative) and maximum hogging (positive) still water bending moments, in kN m, calculated at each position along the ship. The maximum moments from all loading conditions are to be used to define the still water bending moment distribution envelope.
- 2.2.2 It is normal for ships which have low deadweight requirements, e.g. frigates, to have a bending moment distribution envelope which is always hogging. In this case the maximum sagging bending moment envelope may be taken as the minimum hogging bending moment.

2.3 Still water shear forces

- 2.3.1 The design still water shear force distribution envelope, Q_S , is to be taken as the maximum positive and negative shear force values, in kN, calculated at each position along the ship. The maximum shear forces from all loading conditions, see *Vol 1*, *Pt 5*, *Ch 4*, *2.2 Still water bending moments*, are to be used to define the still water shear force distribution envelope.
- 2.3.2 It is recommended that the minimum shear force value over the midships region should not be less than 50 per cent of the maximum value.

■ Section 3

Global hull girder loads

3.1 General

- 3.1.1 The global hull girder loads specified here are applicable to all displacement mono-hull naval ships as defined in *Vol 1*, *Pt 1*, *Ch 2*, *2.2 Definitions 2.2.7*. These loads are to be used in the hull girder strength assessment given in *Vol 1*, *Pt 6*, *Ch 3 Scantling Determination*.
- 3.1.2 Individual consideration based on direct calculation procedures will generally be required for ships having one or more of the following characteristics:
- (a) Froude number > 0,8 (based on V sp, see Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1)

 $L_{\rm R}/B_{\rm WL} \le 5$, or $B_{\rm WL}/D \ge 2.5$

Unusual hull weight distribution

Unusual type or design.

3.2 Environmental conditions

3.2.1 The environmental conditions given in *Vol 1, Pt 5, Ch 2 Environmental Conditions* are to be used in the derivation of the global hull girder loads.

3.3 Vertical wave bending moments

3.3.1 The minimum value of vertical wave bending moment, $M_{\rm W}$ at any position along the ship may be taken as follows:

$$M_{\rm w} = F_{\rm f} D_{\rm f} M_{\rm o} \, \rm kNm$$

where

- (a) F_f is the hogging, F_{fH} , or sagging, F_{fS} , correction factor based on the amount of bow flare, stern flare, length and effective buoyancy of the aft end of the ship above the waterline.
- (b) F_{fS} is the sagging (negative) moment correction factor and is to be taken as

 $F_{\rm fS} = -1,10~R_{\rm A}^{0,3}$ for values of $R_{\rm A} \ge 1,0$

 $F_{fS} = -1,10$ for values of $R_A < 1,0$

An area ratio value of 1,0 results in a sagging correction factor of -1,10.

(a) F_{fH} is the hogging (positive) moment correction factor and is to be taken as

$$F_{\text{fH}} = \frac{1,9C_{\text{bl}}}{\left(C_{\text{bl}} + 0,7\right)}$$

R_A is an area ratio factor, see Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.2.

 $D_{\rm f}$ = the longitudinal distribution factor

= 0 at aft end of L_{R}

= 1,0 between 0,4 $L_{\rm R}$ and 0,65 $L_{\rm R}$

= 0 at forward end of $L_{\rm R}$

= Intermediate values of D_f are to be determined by linear interpolation

$$M_{\rm o} = 0.1 L_{\rm f} f_{\rm s} L_{\rm R}^{2} B_{\rm WL} (C_{\rm b1} + 0.7) \, {\rm kNm}$$

$$L_{\rm f} = 0.0412L_{\rm R} + 4.0 \qquad \qquad for L_{\rm R} \leq 90 \rm m$$

$$= 10,75 - \left(\frac{300 - L_{R}}{100}\right)^{1.5} for L_{R} > 90 \text{m}$$

$$= 10,75$$
 $for L_{R} > 300 m$

=
$$10,75 - \left(\frac{L_{R-350}}{150}\right)^{1,5}$$
 $for L_{R} > 350 \text{m}$

 f_s = Service area factor applicable to the Service Area Notation. To be specially considered depending upon the required areas of operation and in any event should be not less than 0,5.

For unrestricted sea-going service $f_s = 1,0$, for other Service Areas Notations, see Vol 1, Pt 5, Ch 2, 2.4 Service area factors

B_{WL} = maximum waterline breadth, see Vol 1, Pt 5, Ch 4, 1.2 Definitions and symbols 1.2.1

 $C_{\rm b1} = C_{\rm b}$ but is not to be taken less than 0,60

 $C_{\rm b}$ = the block coefficient as defined in Vol 1, Pt 3, Ch 1, 5 Definitions

3.3.2 The area ratio factor, R_A , for the combined stern and bow shape is to be derived as follows:

$$R_{A} = \frac{3\theta \left(A_{BF} + \theta, 5A_{SF}\right)}{L_{R}B_{WL}}$$

where

 $A_{\rm BF}=$ is the bow flare area, in m², see Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.3

 A_{SF} = is the stern flare area, in m², see Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.4

3.3.3 The bow flare area, A_{BF} , is illustrated in *Figure 4.3.1 Deviation of bow and stern flare areas* and may be derived as follows:

$$A_{BF} = A_{UB} - A_{IB} \text{ m}^2$$

where

 $A_{\text{UB}} = \text{half the water plane area at a waterline of } T_{\text{C,U}} \text{ of the bow region of the hull forward of 0,8 } L_{\text{R}} \text{ from the } \Delta P$

Volume 1, Part 5, Chapter 4

Section 3

where

 A_{LB} = half the water plane area at the design draught of the bow region of the hull forward of 0,8 L_R from the AP.

Note the AP is to be taken at the aft end of the Rule length, $L_{\rm R}$

The design draught is to be taken as T, see Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions 1.3.1

Alternatively the following formula may be used

$$A_{BF} = 0.05 L_{R} (b_{0} + 2 b_{1} + b_{2}) + b_{0} a/2 m^{2}$$

where

 b_0 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at the FP, in metres, see *Figure 4.3.1 Deviation of bow and stern flare areas*

 b_1 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at 0,9 L_R from the AP, in metres

 b_2 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at 0,8 L_R from the AP, in metres

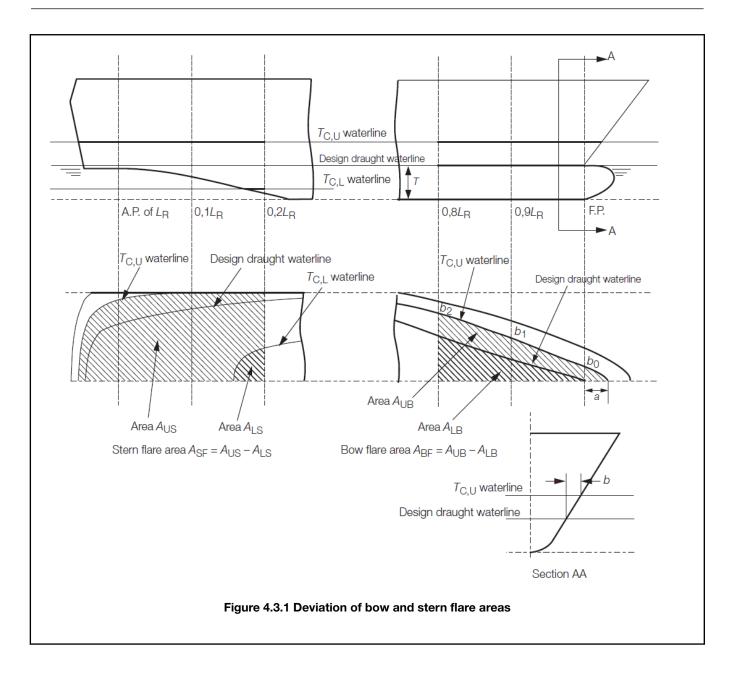

a = projection of $T_{C,U}$ waterline forward of the FP, in metres

 $T_{C.U}$ = a waterline taken $L_f/2$ m above the design draught

 $T_{C,U} = T + Lf/2 \text{ m}$

L_f is given in Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.1

For ships with large bow flare angles above the $T_{C,U}$ waterline the bow flare area may need to be specially considered.

3.3.4 The stern flare area, A_{SF} , is illustrated in *Figure 4.3.1 Deviation of bow and stern flare areas* and is to be derived as follows:

$$A_{SF} = A_{US} - A_{LS} m^2$$

where

 $A_{\rm US} = {\rm half}$ the water plane area at a waterline of $T_{\rm C,U}$ of the stern region of the hull from aft to 0,2 $L_{\rm R}$ forward of the AP

 A_{LS} = half the water plane area at a waterline of $T_{C,L}$ of the stern region of the hull from aft to 0,2 L_R forward of the AP

 $T_{C,L}$ = is a waterline taken $L_f/2$ m below the design draught

$$T_{\text{C.L}} = T - L_{\text{f}} 2 \text{ m}.$$

For ships with tumblehome in the stern region, the maximum breadth at any waterline less than $T_{\rm C.U}$ is

Volume 1, Part 5, Chapter 4

Section 3

to be used in the calculation of $A_{\rm US}$. The effects of appendages including bossings are to be ignored in the calculation of $A_{\rm LS}$.

- 3.3.5 Alternatively, for frigate and destroyer type ships the hogging and sagging vertical wave bending moments and shear forces may be derived from long term 'in-service' measurements of a series of ships with similar hull forms, mass distributions and areas of operation. Typically this will be based on a static wave balance approach. The longitudinal distribution of the vertical wave bending moment is to be taken in accordance with the longitudinal distribution factor, D_f .
- 3.3.6 The vertical wave bending moments and associated shear forces are not to be taken as less than that given by Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.1 and Vol 1, Pt 5, Ch 4, 3.4 Vertical wave shear forces 3.4.1.
- 3.3.7 Direct calculation methods may be used to derive the vertical wave bending moments, see Vol 1, Pt 5, Ch 4, 1.3 Direct calculation procedures
- 3.3.8 The sagging correction factor, $f_{\rm fS}$, in the vertical wave bending moment formulation in *Vol 1, Pt 5, Ch 4, 3.3 Vertical wave* bending moments 3.3.1 may be derived by direct calculation methods. Appropriate direct calculation methods may include a combination of long term ship motion analysis, non linear ship motion analysis and static balance on a wave crest or trough.

3.4 Vertical wave shear forces

3.4.1 The wave shear force, Q_W, at any position along the ship is given by:

$$Q_{W} = \frac{3K_{f}M_{o}}{L_{R}} \text{ kN}$$

where

= K_f is to be taken as follows; see also Fig. Figure 4.3.2 Shear force factor K_f

(a) Positive shear force:

 $K_f = 0$ at aft end of L_R

 $= +0.836F_{fH}$ between $0.2L_{B}$ and $0.3L_{B}$

= $+0.65F_{fH}$ between $0.4L_{R}$ and $0.5L_{R}$

= $-0.65F_{fS}$ between $0.5L_{R}$ and $0.6L_{R}$

 $= -0.91F_{fS}$ between $0.7L_{R}$ and $0.85L_{R}$

= 0 at forward end of $L_{\rm R}$

(a) Negative shear force:

 $K_f = 0$ at aft end of L_R

= $+0.836F_{fS}$ between $0.15L_{R}$ and $0.3L_{R}$

 $= +0.65F_{fS}$ between $0.4L_{B}$ and $0.5L_{B}$

= $-0.65F_{fH}$ between $0.5L_{R}$ and $0.6L_{R}$

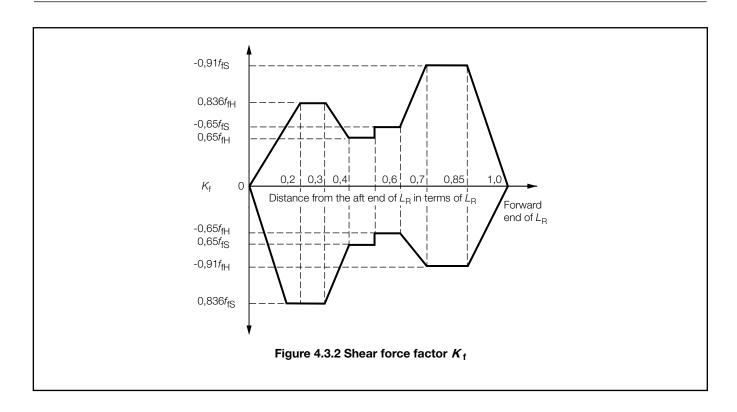

= $-0.91 F_{fH}$ between $0.7L_R$ and $0.85L_R$

= 0 at forward end of L_R

Intermediate values are to be determined by linear interpolation.

M $_{\rm o}$, F $_{\rm fH}$ and F $_{\rm fS}$ are defined in Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.1.

Section 3

3.4.2 The direct calculation method used to derive the vertical bending moments may also be used to derive the vertical shear forces, see *Vol 1, Pt 5, Ch 4, 1.3 Direct calculation procedures*.

3.5 Lateral wave bending moments

3.5.1 If considered necessary by LR, the effects of lateral bending moments may need to be considered. Normally this will only be required for ships with extreme hull forms, multihulls, unusual structural configurations or arrangements or particular loading conditions or operational modes which are likely to result in significant lateral stresses.

3.6 Lateral wave shear forces

3.6.1 If considered necessary by LR, the effects of lateral shear forces may need to be considered. Normally this will only be required for ships with extreme hull forms, multihulls, unusual structural configurations or arrangements or particular loading conditions or operational modes which are likely to result in significant lateral stresses.

3.7 Torsional moments

3.7.1 If considered necessary by LR, the effects of torsional moments may need to be considered. Normally this will only be required for ships with extreme hull forms, multihulls, unusual structural configurations or arrangements or particular loading conditions or operational modes which are likely to result in significant torsional stresses.

3.8 Bow flare impact global loads

- 3.8.1 The requirements of this section are applicable to fast ships operating in the displacement mode that satisfy the following requirements:
- (a) speed $V_{sp} > 17,5$ knots
- (b) bow shape factor $\psi > 0.15$

where

$$\Psi = \frac{100A_b K_{fr}}{L^{1.5}_{R} B_{WL}}$$

A_b = bow flare area, see Vol 1, Pt 5, Ch 4, 3.8 Bow flare impact global loads 3.8.3

Volume 1, Part 5, Chapter 4

Section 3

where

 k_{fr} = bow freeboard correction factor

 $k_{\rm fr} = \frac{6}{h_{\rm fr}}$ but is to be not less than 0,5 nor greater than 1,5

 $h_{\rm fr}$ = freeboard height to the upper deck measured at the FP, in metres

3.8.2 For ships with knuckles in the bow flare region above which the hull is nearly vertical or exhibits tumblehome, the values of $h_{\rm fr}$ and $A_{\rm b}$ are normally to be based on the bow flare region below the knuckle

L_R and B_{WL} are as defined in Vol 1, Pt 5, Ch 4, 1.2 Definitions and symbols 1.2.1

V sp is defined in Vol 1, Pt 5, Ch 3, 1.3 Symbols and definitions

3.8.3 The bow flare area is normally to be derived as follows:

$$A_{b} = 0.05L_{R} (a_{0} + 2a_{1} + a_{2}) + a_{0}b/2 \text{ m}^{2}$$

where

 a_0 = projection of deck at waterline at the FP, in metres

 a_1 = projection of deck at waterline at 0,9 L_B , in metres

 a_2 = projection of deck at waterline at 0,8 L_B , in metres

b = projection of upper deck at waterline from the FP to stem, in metres

see Figure 4.3.3 Derivation of bow shape.

L_R is given in Vol 1, Pt 5, Ch 4, 1.2 Definitions and symbols 1.2.1

3.8.4 The dynamic sagging bending moment due to bow flare impact loads, M BF, is given by the following:

$$M_{BF} = -33D_{bf}A_{b}k_{fr}L_{B}$$
 kNm

where

 D_{bf} = the longitudinal distribution factor, see Table 4.3.1 Longitudinal distribution factor D_{bf}

A b is given in Vol 1, Pt 5, Ch 4, 3.8 Bow flare impact global loads 3.8.3

k fr is given in Vol 1, Pt 5, Ch 4, 3.8 Bow flare impact global loads 3.8.1

L_R is given in Vol 1, Pt 5, Ch 4, 1.2 Definitions and symbols 1.2.1

It is not required to consider a hogging bow flare impact bending moment.

3.8.5 If the bow flare impact bending moment, $M_{\rm BF}$, is greater than the wave bending moment, $M_{\rm W}$, see Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.1, at any position along the length then $M_{\rm W}$ is to be replaced by $M_{\rm BF}$ at these positions.

Table 4.3.1 Longitudinal distribution factor $D_{\rm bf}$

Position	Longitudinal distribution factor D _{bf}
0,0L _R	0,00
0,4L _R	1,00
0,5 <i>L</i> _R	1,00
0,6 <i>L</i> _R	0,98

Volume 1, Part 5, Chapter 4

Section 3

0,7L _R	0,95
0,8 <i>L</i> _R	0,81
0,9 <i>L</i> _R	0,44
1,0 <i>L</i> _R	0,00

Note 1. Intermediate values to be obtained by interpolation.

Note 2. L_B as defined in Vol 1, Pt 5, Ch 4, 1.2 Definitions and symbols 1.2.1.

3.8.6 The bow flare impact shear force, Q_{BF} , associated with the bow flare bending moment is to be taken as follows over the forward half length of the ship:

$$Q_{BF} = 132K_{bf}A_{b}k_{fr}kN$$

where K bf is to be taken as follows:

Positive shear force

 $K_{bf} = 0.0$ aft of $0.5L_{R}$

= 0.7 between $0.5L_{\rm R}$ and $0.6L_{\rm R}$

= 1,0 between 0.7_{LR} and $0.85L_{R}$

= 0,0 at forward end of $L_{\rm R}$

Intermediate values are to be determined by linear interpolation.

Negative shear force

$$K_{bf} = 0.0$$
 for the length of the ship, L_{R}

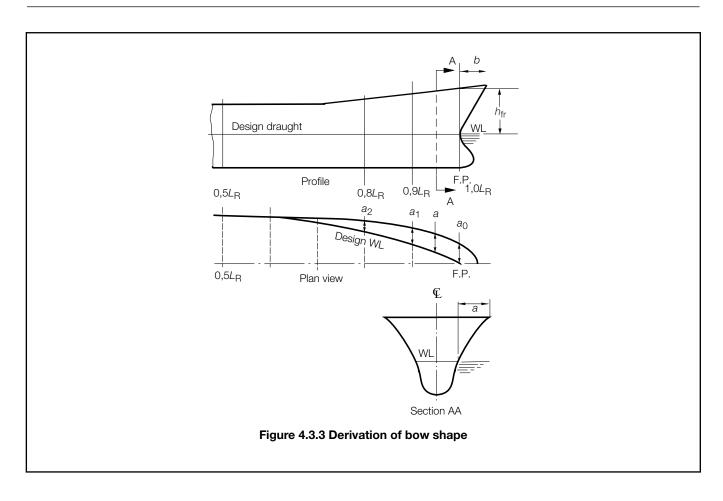

where

 $A_{\rm b}$ = is given in Vol 1, Pt 5, Ch 4, 3.8 Bow flare impact global loads 3.8.3

 $k_{\rm fr} = {\rm is\ given\ in}\ {\it Vol\ 1,\ Pt\ 5,\ Ch\ 4,\ 3.8\ Bow\ flare\ impact\ global\ loads\ 3.8.1}.$

3.8.7 If the bow flare impact shear force, Q_{BF} , is greater than the wave shear force, see Vol 1, Pt 5, Ch 4, 3.4 Vertical wave shear forces, at any position along the length then the wave shear force, Q_{W} , is to be taken as Q_{BF} at these positions.

Section 3

3.9 Dynamic bending moments and associated shear forces

- 3.9.1 The requirements of this section are applicable to mono-hull ships when operating in the planing regime.
- 3.9.2 This section gives formulae for the derivation of the high frequency dynamic bending moment, shear forces and associated pressures. The bending moment and shear force values are to be used for the global design loads if they are greater than the values derived in accordance with Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments and Vol 1, Pt 5, Ch 4, 3.4 Vertical wave shear forces
- 3.9.3 The dynamic bending moment, due to a high speed planning craft landing on a wave crest amidships, at any position along the ship, is to be calculated using the following expression:

$$M_{DW} = F_{df} D_{df} D_{df} |M_d| kN/m$$

where

$$|M_D| = 51\Delta L_R (16a_{op} - 4a_{bp} - 17a_{sp} - 5) \times 10^{-3} \text{ kN/m}$$

 $F_{df} = -1,0$ for sagging (negative) moment

= 1,0 for hogging (positive) moment

 $D_{df} = 0$ at aft end of LR

= 1,0 between 0,4 $L_{\rm R}$ and 0,65 $L_{\rm R}$

= 0 at forward end of $L_{\rm R}$

Intermediate values of $D_{\rm f}$ are to be determined by linear interpolation

 a_{op} = vertical acceleration at the LCG, in terms of g, as defined in Vol 1, Pt 5, Ch 3, 2.4 Design vertical acceleration for ships in the planing regime

383

Volume 1, Part 5, Chapter 4

Section 4

where

- $a_{\rm bp} = {\rm vertical}$ acceleration at forward end of $L_{\rm R}$, in terms of g, ${\rm Vol}~1$, ${\rm Pt}~5$, ${\rm Ch}~3$, ${\rm 2.4~Design~vertical}$ acceleration for ships in the planing regime
- a _{sp} = vertical acceleration at aft end of L _R, in terms of *g*, Vol 1, Pt 5, Ch 3, 2.4 Design vertical acceleration for ships in the planing regime
- 3.9.4 The non-dimensional vertical acceleration at the LCG, a_{op} , as defined in Vol 1, Pt 5, Ch 3, 2.4 Design vertical acceleration for ships in the planing regime, is not to be taken less than 1,0 for the purpose of determining the dynamic bending moment M_{DW} . If the values of a_{bp} and a_{sp} are unknown, the distributions given in Vol 1, Pt 5, Ch 3, 2.4 Design vertical acceleration for ships in the planing regime are to be applied.
- 3.9.5 Bottom longitudinals within 0,4 $L_{\rm R}$ of amidships are subjected to the following effective pressure, $P_{\rm ds}$:

$$P_{ds} = 0.14P_{dl} + 8T \text{ kN/m}^2$$

where

= P_{dl} is as defined in Vol 1, Pt 5, Ch 3, 4.5 Bottom impact pressure for ships operating in the planing regime

T is defined in 1.2.1.

3.9.6 Bottom plating within 0,4 L_R of amidships is subjected to the following effective pressure, P_{dp} :

$$P_{dp} = 0.175P_{dl} + 10T \text{ kN/m}^2$$

3.9.7 The dynamic shear force, Q_{DW}, at any position along the ship is given by:

$$Q_{DW} = 4K_f M_D/L_R kN$$

where

- = M_D is defined in Vol 1, Pt 5, Ch 4, 3.9 Dynamic bending moments and associated shear forces 3.9.3
- = K_f is defined in Vol 1, Pt 5, Ch 4, 3.4 Vertical wave shear forces 3.4.1

3.10 Hull girder design loads

- 3.10.1 The Rule bending moment envelope, $M_{\rm R}$, and associated shear force envelope, $Q_{\rm R}$, for use with the scantling determination procedures in Vol 1, Pt 6, Ch 3 Scantling Determination are to be determined as follows:
- (a) The Rule vertical bending moment envelope, $M_{\rm R}$, is to be taken as ($M_{\rm W}+M_{\rm S}$), as defined in *Vol 1, Pt 5, Ch 4, 3.3 Vertical* wave bending moments and *Vol 1, Pt 5, Ch 4, 2.2 Still water bending moments*, taking into account the hogging and sagging conditions.
- (b) The Rule vertical shear force envelope, Q_R , is to be taken as ($Q_W + Q_S$), as defined in *Vol 1*, *Pt 5*, *Ch 4*, *3.4 Vertical wave shear forces* and *Vol 1*, *Pt 5*, *Ch 4*, *2.3 Still water shear forces*, taking into account the hogging and sagging conditions.
- 3.10.2 The values $M_{\rm W}$ and $Q_{\rm W}$ are to be replaced by $M_{\rm BF}$ and $Q_{\rm BF}$ if these are larger, see Vol 1, Pt 5, Ch 4, 3.4 Vertical wave shear forces and Vol 1, Pt 5, Ch 4, 3.8 Bow flare impact global loads 3.8.7 Similarly, the Values $M_{\rm W}$ and $Q_{\rm W}$ are to be replaced by $M_{\rm DW}$ and $Q_{\rm DW}$ if these are larger.

■ Section 4

Extreme hull girder loads

4.1 Introduction

4.1.1 The extreme hull girder loads specified in this section are applicable to all mono-hull naval ships for which the optional **ESA1** or **ESA2**, Extreme Strength Assessment, notation is required. The design criteria detailed in this section are to be used in

Volume 1, Part 5, Chapter 4

Section 4

conjunction with the extreme hull girder strength assessment procedure given in Vol 1, Pt 6, Ch 4, 3 Extreme Strength Assessment, ESA

4.1.2 The extreme hull girder loads are typical lifetime maximum values that a ship is likely to encounter if it was to be present in an extreme sea state in sea areas associated with its service area notation.

4.2 Environmental conditions

- 4.2.1 The environmental design criteria for extreme design analysis given in Chapter 2 are to be used to determine the extreme hull girder loads.
- 4.2.2 The hull girder loads for the extreme hull girder strength assessment for unrestricted service operation, i.e. service area notation **SA1**, are typical maximum loads that are predicted for extreme winter North Atlantic conditions in head seas at low forward speed.
- 4.2.3 For other service area notations, the hull girder loads for the extreme hull girder strength assessment are typical maximum loads that are likely to be encountered within the restricted operational area.

4.3 Extreme vertical wave bending moments

4.3.1 For all mono-hull ships, the extreme vertical wave bending moment, $M_{
m WEX}$, at any position along the ship is given by:

$$M_{WFX} = K_{fFX} M_{W} kN m$$

where

= M_W is given in Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments

 K_{fFX} = extreme scaling factor

= 1,5.

- 4.3.2 Alternatively the extreme hull girder strength assessment wave loads may be derived using direct calculation methods, model tests or similar taking into account the likely range of wave periods and the environmental conditions specified in *Vol 1*, *Pt 5*, *Ch 2 Environmental Conditions*
- 4.3.3 In deriving the wave loads, the longitudinal distribution of the vertical wave bending moment is to taken in accordance with the longitudinal distribution factor, $D_{\rm f}$, see Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.1 Where appropriate, the hogging and sagging correction factor, $F_{\rm fH}$ and $F_{\rm fS}$ given in Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.1, may be used to derive the hogging and sagging bending moments from a direct calculation.
- 4.3.4 If specified by the Owner, the extreme hogging and sagging vertical wave bending moment or extreme scaling factor, *K* fex, may be derived from long-term 'in-service' measurements from a series of ships with similar hull forms, mass distributions and areas of operation.

4.4 Extreme vertical wave shear forces

4.4.1 The extreme vertical wave shear force, Q_{WEX} , at any position along the ship is given by:

$$Q_{WEX} = K_{fEX} Q_{W} kN$$

where

 Q_{W} = is given in Vol 1, Pt 5, Ch 4, 3.4 Vertical wave shear forces

 K_{fEX} = the extreme scaling factor, see Vol 1, Pt 5, Ch 4, 4.3 Extreme vertical wave bending moments.

4.4.2 Alternatively the method of derivation of the extreme wave shear force may be consistent with that used to derive the bending moments.

4.5 Direct calculation procedures

4.5.1 Direct calculation procedures may be used to derive the extreme hull girder loads. LR's calculation method of the extreme hull girder loads involves derivation of the short term maximum probable responses.

Volume 1, Part 5, Chapter 4

Section 5

4.5.2 The extreme hull girder loads, $M_{\rm WEX}$ and $Q_{\rm WEX}$, are to be based on the probable maximum values that are likely to be experienced during severe storms. The parameters of the severe sea state, i.e. significant wave height, wave period range and duration of storm, are given in *Vol 1*, *Pt 5*, *Ch 2 Environmental Conditions*.

4.6 Still water shear forces and bending moments

4.6.1 The still water hogging and sagging shear force and bending moment distributions for the extreme hull girder strength assessment are to be taken as the Q_S and M_S distributions defined in *Vol 1, Pt 5, Ch 4, 2.3 Still water shear forces* and *Vol 1, Pt 5, Ch 4, 2.2 Still water bending moments* respectively.

4.7 Extreme hull girder design loads

- 4.7.1 The extreme hull girder strength design bending moment, M_{REX} , and associated shear forces, Q_{REX} , for all naval ships are to be determined as follows:
- (a) The extreme hull girder strength design bending moment, M_{REX} , is to be taken as ($M_{WEX} + M_{S}$), as defined in Vol 1, Pt 5, Ch 4, 4.3 Extreme vertical wave bending moments and Vol 1, Pt 5, Ch 4, 4.6 Still water shear forces and bending moments, taking into account the appropriate hogging and sagging conditions.
- (b) The extreme hull girder strength design shear force, Q_{REX} , is to be taken as ($Q_{WEX} + Q_{S}$), as defined in *Vol 1*, *Pt 5*, *Ch 4*, *4.4 Extreme vertical wave shear forces* and *Vol 1*, *Pt 5*, *Ch 4*, *4.6 Still water shear forces and bending moments*, taking into account the appropriate hogging and sagging conditions.
- 4.7.2 It is unnecessary to consider the effects of operating at high speed on the extreme design values for extreme hull girder strength. The requirements for bow flare impact global loads may be ignored in the derivation of M_{WEX} and Q_{WEX} .

■ Section 5

Residual strength hull girder loads

5.1 Introduction

- 5.1.1 The residual strength hull girder loads specified in this section are applicable to all displacement mono-hull naval ships for which the optional **RSA1**, **RSA2** or **RSA3**, Residual Strength Assessment, notation is required. The design criteria detailed in this Section are to be used in conjunction with the residual strength assessment procedure given in *Vol 1*, *Pt 6*, *Ch 4*, *4 Residual Strength Assessment*, *RSA*.
- 5.1.2 The residual strength hull girder loads are used to assess the capability of the ship's global hull girder after suffering structural damage to meet specified global strength requirements. The effects of flooding, as a consequence of structural damage, on the static global bending moments and shear forces are also to be considered.

5.2 Environmental conditions

- 5.2.1 The environmental design criteria for residual strength analysis given in *Vol 1, Pt 5, Ch 2, 3 Air environment* are to be used to determine the residual strength hull girder loads.
- 5.2.2 The global loads for the residual strength hull girder strength assessment for unrestricted service operation, i.e. service area notation **SA1**, are typical maximum loads that are predicted in North Atlantic sea conditions that have a probability of exceedance of 20 per cent. The loads predicted for the ship in head seas at low forward speed are to be considered.
- 5.2.3 For other service area notations, the global loads for the hull girder residual strength assessment are typical maximum loads that are likely to be encountered within the restricted operational area in sea conditions that have a 20 per cent probability of being exceeded.
- 5.2.4 The designer/builder may stipulate the environmental conditions to be applied to the residual strength assessment. In which case the residual strength notation will be assessed against the required performance level.
- 5.2.5 The residual strength area reduction factor, $K_{\rm fRS}$, is given by the following:

$$K_{fRS} = 1.1 H_{rw} L_{R}^{-0.48}$$

Volume 1, Part 5, Chapter 4

Section 5

where

H _{rw} is given in Vol 1, Pt 5, Ch 2, 2.3 Wave environment 2.3.5.

5.3 Residual strength vertical wave bending moments

- 5.3.1 The residual strength wave loads may be derived from the formula given below. The residual strength vertical bending moment specified here is applicable to all mono-hull ships.
- 5.3.2 The residual strength vertical wave bending moment, M_{WRS} , at any position along the ship is given by:

 $M_{WBS} = K_{fBS} M_{W} kN m$

where

M_W = is given in Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments

K _{fRS} = Residual strength area reduction factor, see Vol 1, Pt 5, Ch 4, 5.2 Environmental conditions 5.2.5

- 5.3.3 Alternatively the residual strength wave loads may be derived using direct calculation methods, model tests or similar taking into account the likely range of wave periods and the environmental conditions specified in *Vol 1, Pt 5, Ch 4, 5.2 Environmental conditions*
- 5.3.4 In deriving the residual strength wave bending moment, the longitudinal distribution is to be taken in accordance with the longitudinal distribution factor, D_f , see Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.1. Where appropriate, the hogging and sagging correction factors, F_{fH} and F_{fS} may be used to derive the hogging and sagging bending moments from a direct calculation.
- 5.3.5 For conventional ships, it is not normally necessary to consider the effects of flooded compartments on the wave bending moments and shear forces.
- 5.3.6 For bottom damage assessment as a result of grounding, the residual strength vertical wave bending moment may be based on a $M_{\rm W}$ value derived using a service area factor, $f_{\rm S}$, for a **SA4** service area notation; provided that the ship will not be required to proceed beyond sheltered water. Similarly for other damage assessments which are restricted to sheltered water environments, provided that there is no requirement for operation outside sheltered water areas.

5.4 Residual strength vertical wave shear forces

5.4.1 The residual strength vertical wave shear force, Q_{WRS} , at any position along the ship is given by:

 $Q_{WRS} = K_{fRS} Q_{W} kN$

where

Q_W = is given in Vol 1, Pt 5, Ch 4, 3.4 Vertical wave shear forces

K _{fBS} = residual strength area reduction factor, see Vol 1, Pt 5, Ch 4, 5.2 Environmental conditions 5.2.5

5.4.2 Alternatively the method of derivation of residual strength wave shear forces is to be consistent with that used to derive the bending moments.

5.5 Direct calculation procedures

- 5.5.1 Direct calculation procedures may be used to derive the residual strength hull girder loads. LR's calculation method of the residual strength hull girder loads involves derivation of the short term maximum probable responses.
- 5.5.2 The residual strength hull girder loads are to be based on the probable maximum values that are likely to be experienced during moderately severe sea conditions. The parameters of the seastate, i.e. significant wave height, wave period range and duration of storm, are given in *Vol 1*, *Pt 5*, *Ch 2 Environmental Conditions*.

5.6 Damaged still water shear forces and bending moments

5.6.1 The still water hogging and sagging shear force, Q_{SRS} , and bending moment, M_{SRS} , distributions in the damaged condition are to be calculated taking into account any flooding of the ship as a consequence of damage. If no flooding occurs then

Volume 1, Part 5, Chapter 4

Section 6

the still water values are to be taken from Vol 1, Pt 5, Ch 4, 2.3 Still water shear forces and Vol 1, Pt 5, Ch 4, 2.2 Still water bending moments respectively.

If no flooding occurs

 $M_{SRS} = M_{S} \text{ kN m}$

 $Q_{SRS} = Q_{S} kN$

or if flooding occurs

M SRS = damaged still water bending moment, sagging (negative) and hogging (positive), in kN m

Q _{SRS} = damaged still water shear force, positive and negative, in kN.

5.6.2 The loading conditions used to derive the undamaged still water shear force and bending moment curves are to be used for the assessment of the damaged still water bending moments together with the addition of flood water in damaged compartments.

5.7 Residual strength hull girder design loads

- 5.7.1 The residual strength design vertical bending moment, M_{RRS} , and associated shear forces, Q_{RRS} , for all naval ships are to be determined as follows:
- (a) The residual strength design bending moment, M_{RRS} , is to be taken as ($M_{WRS} + M_{SRS}$), as defined in Vol 1, Pt 5, Ch 4, 5.3 Residual strength vertical wave bending moments and Vol 1, Pt 5, Ch 4, 5.6 Damaged still water shear forces and bending moments, taking into account the appropriate hogging and sagging conditions.
- (b) The residual strength design shear forces, Q _{RRS}, is to be taken as (Q _{WRS} + Q _{SRS}), as defined in *Vol 1, Pt 5, Ch 4, 5.4* Residual strength vertical wave shear forces and *Vol 1, Pt 5, Ch 4, 5.6 Damaged still water shear forces and bending moments*, taking into account the appropriate hogging and sagging conditions.
- 5.7.2 Where it is required that the ship is to be capable of operating at high speed after damage, it may also be necessary to consider the effects of dynamic bending moments and shear forces.

■ Section 6

Loading guidance information

6.1 General

- 6.1.1 Sufficient information is to be supplied to every ship to enable the Commanding Officer or Master to arrange loading and ballasting in such a way as to avoid the creation of unacceptable stresses in the ship's structure.
- 6.1.2 This information should include any limiting criteria that were applied to the structural design of the ship, e.g. the maximum and minimum still water bending moments, service area notation with details of service area restrictions.
- 6.1.3 This information is to be provided by means of a Stability Information Book or Loading Manual and in addition, where required, by means of an approved loading instrument.
- 6.1.4 An Operational manual which contains the ship's assigned operational envelope is to be provided on board, see *Vol 1*, *Pt 1*, *Ch 2*, *2.2 Definitions 2.2.12* and *Vol 1*, *Pt 5*, *Ch 1*, *1.1 General*.

6.2 Loading Manuals or Stability Information Books

6.2.1 A Loading Manual is to be supplied to all ships where longitudinal strength calculations have been required, see Vol 1, Pt 6, Ch 3, 4.2 Hull girder strength and Vol 1, Pt 6, Ch 4, 2.1 General. The Manual is to be submitted for approval in respect of strength aspects. Where both Loading Manual and loading instrument are supplied the Loading Manual must nevertheless be approved from the strength aspect. In this case the Manual is to be endorsed to the effect that any departures from these conditions in service are to be arranged on the basis of the loading instrument and the allowable local loadings shown in the Manual.

Volume 1, Part 5, Chapter 4

Section 6

- 6.2.2 The Loading Manual is to be based on the final data of the ship and is to include well-defined lightweight distribution and buoyancy data.
- 6.2.3 Details of the loading conditions are to be included in the manual as applicable.
- 6.2.4 The Loading Manual is also to contain the following:
- (a) Values of actual and permissible still water bending moments and shear forces and where applicable limitations due to torsional loads.
- (b) The allowable local loadings for the structure.
- (c) Details of the carriage of any substances where there are constraints imposed by the use of an accepted coating in association with a system of corrosion control.
- (d) Where the ship has the capability to significantly alter the draught forward by filling water ballast tanks, then a note saying: 'Scantlings approved for minimum draught forward of...m with ballast tanks No ... filled. In heavy weather conditions the forward draught is not to be less than this value. If, in the opinion of the Commanding Officer or Master, sea conditions are likely to cause regular slamming, then other appropriate measures such as change in speed, heading or an increase in draught forward may also need to be taken.'
- 6.2.5 Where applicable, the Manual is also to contain the procedure for ballast exchange and sediment removal at sea and the correct use of tanks.
- 6.2.6 Where alteration to structure, lightweight, cargo distribution or draught is proposed, revised information is to be submitted for approval.

6.3 Loading instrument

- 6.3.1 In addition to a Loading Manual, an approved loading instrument is to be provided for all ships where LR is greater than 65 m except as noted below. The following ships are exempt from this requirement:
- (a) ships with very limited possibilities for variations in the distribution of cargo and ballast;
- (b) ships with a regular or fixed operational pattern.
- 6.3.2 The loading instrument is to be capable of calculating shear forces and bending moments, and where necessary cargo torque, in any load or ballast condition at specified readout points and is to indicate the permissible values. The instrument is to be certified in accordance with LR procedures for the approval of longitudinal strength and stability calculation programs.
- 6.3.3 The instrument readout points are usually selected at the position of the transverse bulkheads or other obvious boundaries. As many readout points as considered necessary by LR are to be included, e.g. between bulkheads.
- 6.3.4 Where the ship has the capability to significantly alter the draught forward by filling water ballast tanks, then a notice is to be displayed on the loading instrument stating: 'Scantlings approved for minimum draught forward of... m with ballast tanks No ... filled. In heavy weather conditions the forward draught is not be to less than this value. If, in the opinion of the Commanding Officer or Master, sea conditions are likely to cause regular slamming, then other appropriate measures such as change in speed, heading or an increase in draught forward may also need to be taken.'
- 6.3.5 Where alterations to structure are carried out which result in a change in the lightweight or deadweight distribution, the loading instrument is to be modified accordingly and details submitted for approval.
- 6.3.6 The operation of the loading instrument is to be verified by the Surveyor upon installation and at Annual and Periodical Surveys as required in *Vol 1, Pt 5, Ch 3 Local Design Loads*. An Operation Manual for the instrument is to be verified as being available on board.
- 6.3.7 Where an onboard computer system having a longitudinal strength or a stability computation capability is provided as an Owner's option, it is recommended that the system be certified in accordance with LR's document entitled Approval of Longitudinal Strength and Stability Calculation Programs.

General

Volume 1, Part 6, Chapter 1

Section 1

Section

- 1 Application
- 2 General requirements

■ Section 1

Application

1.1 General

- 1.1.1 The Rules apply to sea-going monohull ships of normal form, proportions and speed. Although the Rules are, in general, for steel ships of all welded construction, other materials for use in hull construction will be specially considered on the basis of the Rules.
- 1.1.2 An overview of the structural design process is illustrated in Figure 1.1.1 Overview of the structural design process

1.2 Equivalents

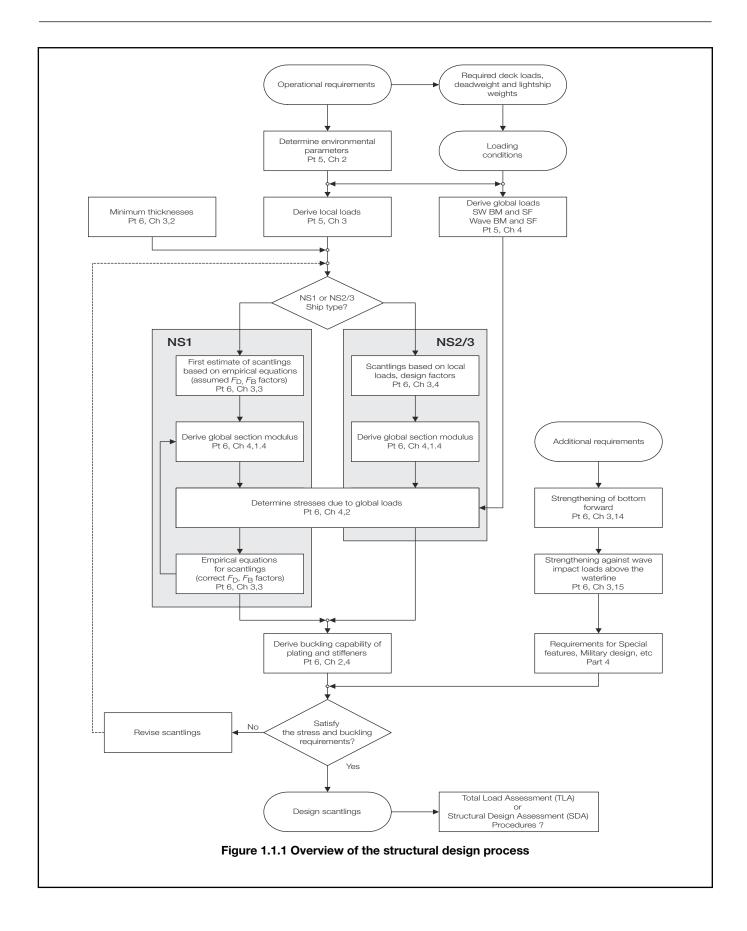

1.2.1 Alternative scantlings and arrangements may be accepted as equivalent to the Rule requirements. Details of such proposals are to be submitted for consideration in accordance with *Vol 1, Pt 3, Ch 1, 3 Equivalents*.

1.3 Symbols and definitions

1.3.1 The symbols and definitions for use throughout this Part are as defined within the appropriate Chapters and Sections.

Volume 1, Part 6, Chapter 1

Section 1

Volume 1, Part 6, Chapter 1

Section 2

■ Section 2

General requirements

2.1 General

2.1.1 Limitations with regard to the application of these Rules are indicated in the various Chapters for differing ship types.

2.2 Plans to be submitted

- 2.2.1 Plans are to be of sufficient detail for plan approval purposes. For all areas of structure listed below the submitted plans are to show all plating thickness, stiffeners sizes and spacings, bracket arrangements and connections. Where appropriate, the plans should clearly show the allowance for corrosion margin or enhanced scantlings. Welding, constructional arrangements and tolerances are also to be submitted and this may be in the form of a booklet.
- 2.2.2 In general all items of steel structure are to be shown except where they are ineffective in supporting hull girder and local loads and do not impinge on such structure.
- 2.2.3 Equipment seating and supports are to be shown where they require additional stiffening and support to be incorporated in items of hull structure. In such cases the loading on the seating is also to be supplied. Generally total combined equipment weights on seating less than 0,5 tonnes need not be considered.
- 2.2.4 Normally the plans for each item will be able to be contained on a few sheets. Unit or production drawings will not be accepted.
- 2.2.5 Plans covering the following items are to be submitted:
- Midship and other critical sections showing longitudinal and transverse material.
- Profile and decks.
- Shell expansion.
- Structural continuity plan showing shadow areas of openings, longitudinally effective material and primary structural continuity material
- Oiltight and watertight bulkheads.
- Double bottom construction.
- Pillars and girders.
- Aft end construction.
- Engine room construction.
- Engine and thrust seatings.
- Fore end construction.
- Storing routes.
- Deckhouses and superstructures.
- Propeller brackets and appendages.
- Rudder, stock and tiller.
- Equipment.
- Loading Manuals and stability information booklets, preliminary and final (where applicable).
- Scheme of corrosion control (where applicable) including; location of anodes, method of attachment, details of cathodic protection system.
- Ice strengthening.
- Welding schedule.
- Hull penetration plans including scuppers, sea connections, overboard discharges, arrangements and fittings.
- Support structure for masts, derrick posts, cranes, RAS points, weapons handling/stowage or machinery lifting point and large items of equipment.
- Bilge keels showing material grades, welded connections and detail design.
- Flight deck arrangement and structure.

Additionally, for in-water survey the following plans and information are to be submitted:

392

General

Volume 1, Part 6, Chapter 1

Section 2

- Details showing how rudder pintle and bush clearances are to be measured and how the security of the pintles in their sockets are to be verified with the ship afloat.
- Details showing how stern bush clearances are to be measured with the ship afloat.
- Details of high resistant paint, for information only.
- 2.2.6 The following supporting documents are to be submitted:
- General arrangement.
- Capacity plan.
- Lines plan or equivalent.
- Dry-docking plan.
- Towing and mooring arrangements.
- Corrosion margin policy.
- 2.2.7 The following supporting calculations are to be submitted:
- Equipment number.
- Hull girder still water and dynamic bending moments and shear forces as applicable.
- Midship section and other critical section modulus.
- Structural items in the aft end, midship and fore end regions of the ship.
- 2.2.8 In the process of plan approval and from Fatigue Design Assessment and Structural Design Assessment certain critical locations may be identified which require special attention. Plans and records of production are to be submitted in accordance with the construction monitoring procedures associated with the notation **CM**.
- 2.2.9 Where the specific notations are applied for additional plans will be required.

2.3 Plans to be supplied to the ship

- 2.3.1 To facilitate the ordering of materials for repairs, plans listed in *Vol 1, Pt 6, Ch 1, 2.2 Plans to be submitted 2.2.5* are to be carried on board the ship. They are to clearly indicate the disposition and grades (other than Grade A) of hull structural steel, the extent and location of higher tensile steel together with details of specification and mechanical properties, and any recommendations for welding, working and treatment of these steels.
- 2.3.2 Similar information is to be provided where aluminium alloy or other materials are used in the construction.
- 2.3.3 A copy of the final Loading Manual or Stability Information booklet, when approved, is to be placed on board the ship.
- 2.3.4 Details of any corrosion control system fitted are to be placed on board the ship.
- 2.3.5 Approved plans and information covering the items detailed in *Vol 1, Pt 6, Ch 1, 2.2 Plans to be submitted 2.2.5* relating to in-water survey are to be placed on board the ship.

2.4 Novel features

2.4.1 Where the proposed construction of any part of the hull or machinery is of novel design, or involves the use of unusual material, or where experience, in the opinion of LR, has not sufficiently justified the principle or mode of application involved, special tests or examinations before and during service may be required. In such cases a suitable notation may be entered in the *Register Book*.

2.5 Enhanced scantlings

2.5.1 Where scantlings in excess of the approved Rule requirement are fitted at defined locations as corrosion margins or for other purposes, the plans submitted for approval are to contain the enhanced scantling plan, together with the nominal thickness, less the enhancement adjacent, in brackets. See also Vol 1, Pt 6, Ch 6, 3.8 Corrosion margin.

2.6 Direct calculations

2.6.1 Direct calculations may be specifically required by the Rules and may be required for ships having novel design features or in support of alternative arrangements and scantlings. LR may, when requested, undertake calculations on behalf of designers and make recommendations with regard to suitability of any required model tests.

General

Volume 1, Part 6, Chapter 1

Section 2

2.7 Exceptions

2.7.1 Ships of unusual form, proportions or speed, with unusual features, or for special or restricted service, not covered specifically by the Rules, will receive individual consideration based on the general requirements of the Rules.

Volume 1, Part 6, Chapter 2

Section

Section

■ Section 1

General

1.1 General

1.1.1 The guidance notes, information and formulae contained within this chapter are to be used in the scantling determination (Vol 1, Pt 6, Ch 3 Scantling Determination) and total load assessment.

1.2 Equivalents

1.2.1 Lloyd's Register (hereinafter referred to as 'LR') will consider direct calculations for the derivation of scantlings as an alternative and equivalent to those derived by Rule requirements in accordance with Vol 1, Pt 3, Ch 1, 3 Equivalents

1.3 Symbols and definitions

- 1.3.1 The symbols used in this Chapter are defined below and in the appropriate Section:
 - Z = section modulus of stiffening member, in cm³
 - $I = \text{moment of inertia, in cm}^4$
 - $A_{\rm w}$ = shear area of stiffener web, in cm²
 - l = overall length of stiffener or primary member, in metres
 - l e e effective span length, in metres, as defined in Vol 1, Pt 6, Ch 2, 2.6 Determination of span length
 - $p = \text{design pressure, in kN/m}^2$
 - s = secondary stiffener spacing, in mm
 - S = primary stiffener spacing, in metres
 - t_p = plating thickness, in mm
 - β = panel aspect ratio correction factor as defined in Vol 1, Pt 6, Ch 2, 2.5 Aspect ratio correction
 - γ = convex curvature correction factor as defined in Vol 1, Pt 6, Ch 2, 2.4 Convex curvature correction
 - k_s = higher tensile steel factor for local loads, see Vol 1, Pt 6, Ch 5, 2.1 Design criteria 2.1.1
 - k L = higher tensile steel factor for global loads, see Vol 1, Pt 6, Ch 5, 2.1 Design criteria 2.1.2
 - σ_0 = guaranteed minimum yield strength of the material, in N/mm²
 - τ_0 = shear strength of the material in N/mm²

Volume 1, Part 6, Chapter 2

Section 1

$$=\frac{\sigma_{0}}{\sqrt{3}}$$

 $E = \text{modulus of elasticity, in N/mm}^2$.

1.4 Rounding policy for Rule plating thickness

1.4.1 Where plating thicknesses as determined by the Rules require to be rounded then this should be carried out to the nearest full or half millimetre, with thicknesses 0,75 and 0,25 being rounded up.

1.5 Material properties

- 1.5.1 The basic grade of steel used in the determination of the Rule scantling requirements is taken as mild steel with the following mechanical properties:
- (a) Yield strength (minimum) $\sigma_0 = 235 \text{ N/mm}^2$
- (b) Tensile strength = 400-490 N/mm²
- (c) Modulus of elasticity, $E = 200 \times 10^3 \text{ N/mm}^2$.

1.6 Higher tensile steel

- 1.6.1 Steels having a yield stress not less than 265 N/mm² are regarded as higher tensile steels.
- 1.6.2 Where higher tensile steels are to be used, due allowance is given in the determination of the Rule requirement for plating thickness, stiffener section modulus, inertia and cross-sectional area by the use of higher tensile steel correction factors k_s and k_L or f_{hts} . Normally, this allowance is included in the appropriate scantling requirements. Where this is not the case, the following correction factors may be applied:
- (a) Plating thickness factor = $\sqrt{k_{\mathrm{S}}}$ for local loads

=
$$\sqrt{k_{\rm L}}$$
 for global loads

(b) Section modulus and cross sectional area factor = k_s

where $k_{\rm S}$ and $k_{\rm L}$ are defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

f hts is defined in Vol 1, Pt 6, Ch 5, 1.3 Higher tensile steel

- 1.6.3 Higher tensile steel may be used for both deck and bottom structures or deck structure only. Where fitted for global strength purposes, it is to be used for the whole of the longitudinal continuous material for the following vertical distances:
- (a) z_{htd} below the line of deck at side

$$Z_{\text{htd}} = \left(1 - \frac{k_{\text{L}}}{F_{\text{D}}}\right) z_{\text{D}} \text{ m}$$

(b) z_{htb} above the top of keel

$$\boldsymbol{Z}_{htb} = \left(\boldsymbol{1} - \frac{\boldsymbol{k}_L}{\boldsymbol{F}_B}\right) \!\! \boldsymbol{z}_B \, \boldsymbol{m}$$

In the above formulae F_D and F_B are to be taken not less than k_L

where

- (a) F_D and F_B are defined in Ch 3,3.6. Note the F_D and F_B factors derived in Vol 1, Pt 6, Ch 3, 3.6 Local reduction factors for NS1 ships may also be applied to ship types NS2 and NS3.
- (b) z_D and z_B are the vertical distances, in m, from the transverse neutral axis of the hull cross-section to the uppermost continuous longitudinally effective material and to the top of the keel respectively.

k L is defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1.

1.6.4 The designer should note that there is no increase in fatigue performance with the use of higher tensile steels.

Volume 1, Part 6, Chapter 2

Section 2

■ Section 2

Structural design

2.1 General

- 2.1.1 This Section gives the basic principles to be adopted in determining the Rule structural requirements given in *Vol 1, Pt 6, Ch 3 Scantling Determination*
- 2.1.2 For derivation of scantlings of stiffeners, beams, girders, etc. the formulae in the Rules are normally based on elastic or plastic theory using simple beam models supported at one or more points and with varying degrees of fixity at the ends, associated with an appropriate concentrated or distributed load.
- 2.1.3 The stiffener, beam or girder strength is defined by a section modulus and moments of inertia requirements. In addition there are local requirements for web thickness or flange thickness.
- 2.1.4 Some of the details given in this section will be specially considered for ships with a military distinction notation MD.

2.2 Effective width of attached plating, b_e

- 2.2.1 The effective geometric properties of rolled or built sections are to be calculated directly from the dimensions of the section and associated effective area of attached plating. Where the web of the section is not normal to the actual plating, and the angle exceeds 20°, the properties of the section are to be determined about an axis parallel to the attached plating.
- 2.2.2 For stiffening members, the geometric properties of rolled or built sections are to be calculated in association with an effective area of attached load bearing plating of thickness $t_{\rm p}$, in mm, and a breadth $b_{\rm e}$, in mm.
- 2.2.3 The effective breadth of attached plating to secondary stiffener members b_e , is to be taken as:

$$b_{\rm e} = 40 \rm t_{\rm p} \, mm$$

or 600 mm, whichever is the greater

or the actual spacing of stiffeners in mm, whichever is the lesser.

2.2.4 The effective breadth of attached plating to primary support members (girders, transverses, webs, etc.), b_e , is to be taken as:

$$b_c = 300S \left(\frac{l}{S}\right)^{2/3}$$
 mm but is not to exceed 1000S

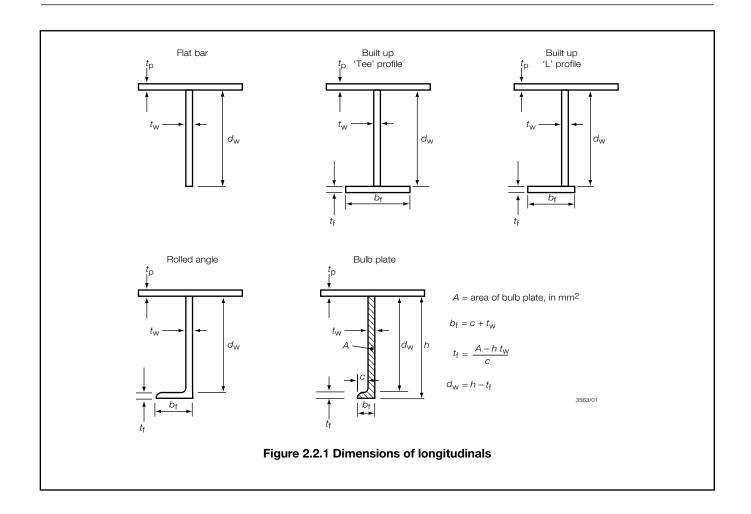

where

S and I are as defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

2.3 Section properties

2.3.1 The dimensions of rolled and built stiffeners are illustrated in *Figure 2.2.1 Dimensions of longitudinals* The section properties of stiffeners can be based on the illustrated dimensions if manufacturer's information is not available.

Section 2

2.3.2 The effective section properties of a corrugation over a spacing *b*, see Figure 2.2.2 Corrugated section, is to be calculated from the dimensions and, for symmetrical corrugations, may be taken as:

Section modulus

$$Z = \frac{d_{w}}{6000} (3b_{e}t_{p} + ct_{w})cm^{3}$$

Moment of inertia

$$I = \frac{Z}{10} \left(\frac{d_{\rm w}}{2} \right) \text{cm}^4$$

Shear area

$$A_{\rm w} = \frac{\rm d_{\rm w} t_{\rm w}}{100} \rm cm^2$$

where

 $d_{\rm w}$, $b_{\rm f}$, $t_{\rm p}$, c and $t_{\rm w}$ are measured, in mm, and are as shown in Figure 2.2.2 Corrugated section. The value of $b_{\rm e}$ is to be taken not greater than $b_{\rm f}$ or:

 $50t_{\rm p}\sqrt{k_{\rm s}}$ for welded corrugations

 $60t_{\rm P}\sqrt{k_{\rm S}}$ for cold formed corrugations

k_s = local high strength steel factor, see Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

The value of θ is to be not less than 40° .

Section 2

2.3.3 The section properties of a double skin primary member over a spacing *b*, see *Figure 2.2.3 Double skin section*, may be calculated as:

Section modulus

$$Z = \frac{d_{w}}{6000} (6 f b t_{p} + d_{w}t_{w}) cm^{3}$$

Moment of inertia

$$I = \frac{Z}{10} \left(\frac{d_{\rm w}}{2} \right) \text{cm}^4$$

Shear area

$$A_{\rm w} = \frac{d_{\rm w}t_{\rm w}}{100} \text{cm}^2$$

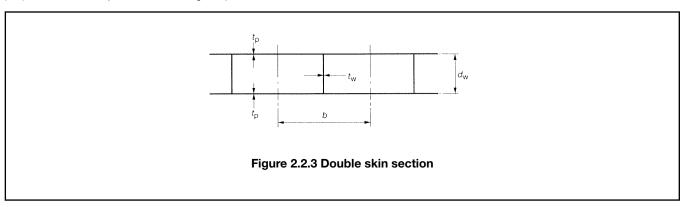

where

 $d_{\rm w}$, b, $t_{\rm p}$ and $t_{\rm w}$ are measured, in mm, and are as shown in Figure 2.2.2 Corrugated section

$$f = 0, 3 \left(\frac{1000l}{b}\right)^{2/3}$$
 mm but is not to exceed 1, 0

NOTE

If the plate flanges of the double bulkhead are of unequal thicknesses, then the equations in Vol 1, Pt 6, Ch 2, 2.3 Section properties 2.3.4 may be used with $b_e = b_f = f b$.

2.3.4 The effective section properties of a built section, see *Vol 1, Pt 6, Ch 2, 2.2 Effective width of attached plating, be 2.2.1*, may be taken as:

Section modulus of flange

Volume 1, Part 6, Chapter 2

Section 2

$$Z_{f} = \frac{A_{f}d_{w}}{10} + \frac{A_{w}d_{w}}{60} \left[I + \frac{2(A_{p} - A_{f})}{2A_{p} + A_{w}} \right] \text{cm}^{3}$$

Neutral axis of section above plating

$$x_{na} = \frac{d_{w}}{A} \left(\frac{A_{w}}{2} + A_{f} \right) mm$$

Moment of inertia about neutral axis

$$I = \frac{z_f}{10} (d_w - x_{na}) cm^4$$

Section modulus at plate

$$Z_{\rm p} = 10 \frac{I}{\rm X_{\rm na}} \rm cm^3$$

Shear area

$$A_{\rm W} = \frac{\rm d_{\rm W}^{\rm t} t_{\rm W}}{100} \rm cm^2$$

where

 A_f = area of face plate of flange in cm²

 $A_{\rm w}$ = area of web plating in cm²

 A_p = area of attached plating in cm², see 2.3.5

$$A = A_f + A_w + A_p$$

d_w = the depth, in mm, of the web between the inside of the face plate and the attached plating. Where the member is at right angles to a line of corrugations, the minimum depth is to be taken

b_e = effective breadth of attached plating, in mm, see Vol 1, Pt 6, Ch 2, 2.2 Effective width of attached plating, be

b f, t f, d w, t w and t p are in mm and are illustrated in Figure 2.2.1 Dimensions of longitudinals.

- 2.3.5 The geometric properties of primary support members (i.e. girders, transverses, webs, stringers, etc.) attached to corrugated bulkheads, are to be calculated in association with an effective area of attached load bearing plating, A_p , determined as follows:
- (a) For a member attached to corrugated plating and parallel to the corrugations:

$$A_{\rm p} = b_{\rm f} t_{\rm p}/100 \, \rm cm^2$$

(See Figure 2.2.2 Corrugated section).

(b) For a member attached to corrugated plating and at right angles to the corrugations:

 $A_{\rm p}$ is to be taken as equivalent to the area of the face plate of the member.

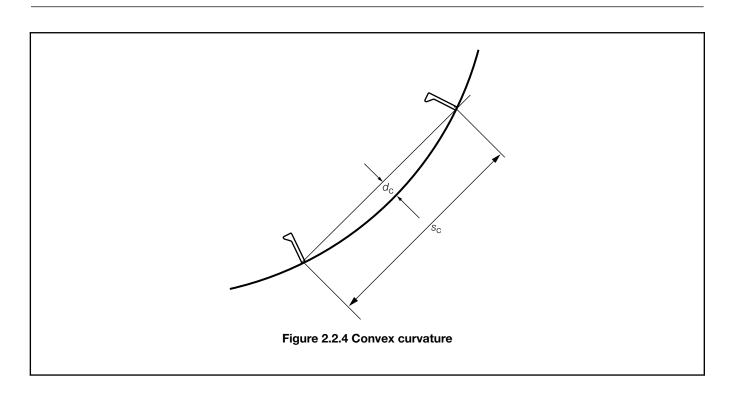

2.4 Convex curvature correction

2.4.1 The thickness of plating as determined by the Rules may be reduced where significant curvature exists between the supporting members. In such cases a plate curvature correction factor may be applied:

 γ = plate curvature factor

= $1 - d_{\rm C}/s_{\rm C}$, and is not to be taken as less than 0,7

 $d_{\rm c}$ = the distance, in mm, measured perpendicularly from the chord length, $s_{\rm c}$, (i.e. spacing in mm) to the highest point of the curved plating arc between the two supports, see *Figure 2.2.4 Convex curvature*

2.5 Aspect ratio correction

2.5.1 The thickness of plating as determined by the Rules may be reduced when the panel aspect ratio is taken into consideration. In such cases a panel aspect ratio correction factor may be applied:

 β = aspect ratio correction factor

$$= A_{\rm R} (1 - 0.25A_{\rm R}) \text{ for } A_{\rm R} \le 2$$

$$= 1 \text{ for } A_{R} > 2$$

A_R = panel aspect ratio

= panel length/panel breadth.

2.6 Determination of span length

- 2.6.1 The effective span length, $l_{\rm e}$, of a stiffening member is generally less than the overall length, $l_{\rm e}$, by an amount which depends on the design of the end connections. The span points, between which the value of $l_{\rm e}$ is measured, are to be determined as follows:
- (a) For rolled or built-up secondary stiffening members:

The span point is to be taken at the point where the depth of the end bracket, measured from the face of the secondary stiffening member, is equal to the depth of the member, see *Figure 2.2.5 Definition of span points*. Where there is no end bracket, the span point is to be measured between primary member webs.

(b) For primary support members:

The span point is to be taken at a point distant, b_s , from the end of the member

$$b_{\rm s} = b_{\rm b} \left(1 - \frac{\rm d_{\rm w}}{\rm d_{\rm b}} \right)$$

where b_s , b_b , d_w and d_s are as shown in Figure 2.2.5 Definition of span points

- 2.6.2 Where the stiffening member is inclined to a vertical or horizontal axis and the inclination exceeds 10°, the span is to be measured along the member.
- 2.6.3 Where the stiffening member is curved then the span is to be taken as the effective chord length between span points.

Volume 1, Part 6, Chapter 2

Section 2

2.6.4 It is assumed that the ends of stiffening members are substantially fixed against rotation and displacement. If the arrangement of supporting structure is such that this condition is not achieved, consideration will be given to the effective span to be used for the stiffener.

2.7 Plating general

- 2.7.1 The equation given in this sub Section is to be used to determine the thickness of plating for NS2 and NS3 ship types. The design pressure, p, is given in the Tables in *Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination* for each structural component and is to be used with the limiting stress coefficient, see *Vol 1, Pt 6, Ch 5, 3.1 Design criteria 3.1.1*, to determine the required plate thickness.
- 2.7.2 The requirements for the thickness of plating, t_p, is, in general, to be in accordance with the following:

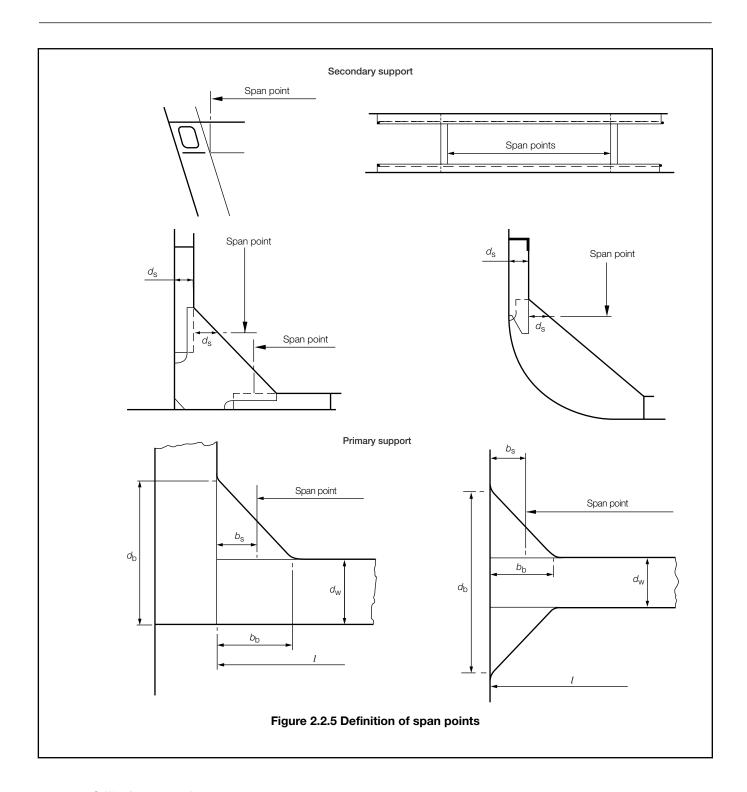

$$t_{\rm p} = 22, 4 \, s \, \gamma \, \beta \sqrt{\frac{p}{f_{\sigma} \sigma_{\rm o}}} \times 10^{-3} \text{mm}$$

where

p = is the design pressure, in kN/m², given in Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination

 f_{σ} = limiting stress coefficient for local plate bending for the plating area under consideration given in *Vol 1*, *Pt* 6, *Ch 5*, 3 Scantling determination for NS2 and NS3 ships $\sigma_{\rm b}$ column in *Table 5.3.2 Allowable stress* factors f 1, see also *Vol 1*, *Pt 6*, *Ch 5*, 3.1 Design criteria 3.1.1.

s, γ , β , σ o are as defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

2.8 Stiffening general

- 2.8.1 The equations given in this sub Section are to be used to derive the scantling requirements for stiffeners. The design pressure, *p*, is given in the Tables in *Vol 1*, *Pt 6*, *Ch 3*, *4 NS2 and NS3 scantling determination* for each structural component and is to be used with the limiting stress coefficient, see *Vol 1*, *Pt 6*, *Ch 5*, *3.1 Design criteria 3.1.1* to determine the required section modulus, web area and inertia of the stiffeners.
- 2.8.2 The requirements for section modulus, inertia and web area of stiffening members subjected to pressure loads are, in general, to be in accordance with the following:

Volume 1, Part 6, Chapter 2

Section 2

(a) For secondary members:

Section modulus:

$$Z = \frac{\varphi_z ps l_e^2}{f_\sigma \sigma_\rho} \text{ cm}^3$$

Inertia

$$I = \frac{100 \,\varphi_{\rm I} \operatorname{ps} l_{\rm e}^{3}}{f_{\delta} E} \,\mathrm{cm}^{4}$$

Web area:

$$A_{\rm W} = \frac{\varphi_{\rm A} ps \, l_{\rm e}}{100 f_{\tau} \, \tau_{\rm o}} \, \text{cm}^2$$

(b) For primary members:

Section modulus:

$$Z = \frac{10^3 \varphi_z pS l_e^2}{f_\sigma \sigma_0} \text{ cm}^3$$

Inertia:

$$I = \frac{10^5 \,\varphi_{\rm I} pS \, l_e^3}{f_{\delta} E} \text{cm}^4$$

Web area:

$$A_{\rm W} = \frac{10 \, \varphi_{\rm A} pS \, l_{\rm e}}{f_{\tau} \tau_{\rm o}} \text{cm}^2$$

where

p = is the design pressure, in kN/m², given in Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination

 φ_Z = section modulus coefficient dependent on the loading model assumption taken from *Table 2.2.1 Section* modulus, inertia and web area coefficients for different load models

 f_{σ} = limiting local stiffener bending stress coefficient for stiffening member given in *Vol 1, Pt 6, Ch 5, 3.1* Design criteria 3.1.1

 $\varphi_{\rm I}$ = inertia coefficient dependent on the loading model assumption taken from Table 2.2.1 Section modulus, inertia and web area coefficients for different load models

f _δ = limiting inertia coefficient for stiffener member given in Vol 1, Pt 6, Ch 5, 3.1 Design criteria 3.1.1

 φ_A = web area coefficient dependent on the loading model assumption taken from *Table 2.2.1 Section* modulus, inertia and web area coefficients for different load models

f_τ = limiting web area coefficient for stiffener member given in Vol 1, Pt 6, Ch 5, 3.1 Design criteria 3.1.1

E, S, s, $l_{\rm e}$, $\sigma_{\rm o}$ and $\tau_{\rm o}$ are as defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1.

- 2.8.3 The requirements for section modulus, inertia and web area of stiffening members subjected to point loads are, in general, to be in accordance with the following:
- (a) For primary and secondary members:

Volume 1, Part 6, Chapter 2

Section 2

Section modulus:

$$Z = \frac{10^3 \varphi_z F l_e}{f_\sigma \sigma_o} \text{cm}^3$$

Inertia

$$I = \frac{10^5 \varphi_1 F l_e^2}{f_{\delta} E} \text{cm}^4$$

Web area

$$A_{\rm W} = \frac{10 \, \varphi_{\rm A} F}{f_{\tau} \tau_{\rm O}} \text{cm}^2$$

where

F =is the design point load, in kN

 Φ_{Z} = section modulus coefficient dependent on the loading model assumption taken from *Table 2.2.1 Section* modulus, inertia and web area coefficients for different load models

 f_{σ} = limiting local stiffener bending stress coefficient for stiffening member given in *Vol 1, Pt 6, Ch 5, 3.1* Design criteria 3.1.1, column $\sigma_{\rm x}$ in *Table 5.3.2 Allowable stress factors f 1*

 $\Phi_{
m I}$ = inertia coefficient dependent on the loading model assumption taken from Table 2.2.1 Section modulus, inertia and web area coefficients for different load models

 f_{δ} = limiting inertia coefficient for stiffener member given in Vol 1, Pt 6, Ch 5, 3.1 Design criteria 3.1.1, column f_{δ} in Table 5.3.2 Allowable stress factors f 1

 Φ_{A} = web area coefficient dependent on the loading model assumption taken from *Table 2.2.1 Section* modulus, inertia and web area coefficients for different load models

 f_{τ} = limiting web area coefficient for stiffener member given in Vol 1, Pt 6, Ch 5, 3.1 Design criteria 3.1.1, column f_{τ} in Table 5.3.2 Allowable stress factors f 1

E, $l_{\rm e}$, and $\sigma_{\rm o}$ are as defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

2.8.4 Where a stiffener is subjected to a combination of loads, then the requirements are to be based on the linear supposition of those loads onto the stiffener. For example the section modulus requirement for a UDL load and a point load will be as follows:

$$Z = \frac{\varphi_Z ps l_e^2}{f_\sigma \sigma_0} + \frac{10^3 \varphi_z F l_e}{f_\sigma \sigma_0} \text{cm}^3$$

2.9 Proportions of stiffener sections

- 2.9.1 From structural stability and local buckling considerations, the proportions of stiffening members are, in general, to be in accordance with *Table 2.2.2 Stiffener proportions* For primary member minimum thickness see *Table 6.6.1 Minimum thickness of primary members* in *Vol 1, Pt 6, Ch 6 Material and Welding Requirements*.
- 2.9.2 Primary members are to be supported by tripping brackets. The tripping brackets supporting asymmetrical sections are to be spaced no more than two secondary frames apart. The tripping brackets supporting symmetrical sections are to be spaced no more than four secondary frames apart.
- 2.9.3 Tripping brackets are in general required to be fitted at the toes of end brackets and in way of heavy or concentrated loads such as the heels of pillars.
- 2.9.4 Where the ratio of unsupported width of face plate (or flange) to its thickness exceeds 16:1, the tripping brackets are to be connected to the face plate and on members of symmetrical section, the brackets are to be fitted on both sides of the web.

Volume 1, Part 6, Chapter 2

Section 2

2.9.5 Intermediate secondary members may be welded directly to the web or connected by lugs in accordance with *Vol 1, Pt 6, Ch 6, 6.3 Secondary member end connections*.

2.10 Grillage structures

2.10.1 For complex girder systems, a complete structural analysis using numerical methods may have to be performed to demonstrate that the stress levels are acceptable when subjected to the most severe and realistic combination of loading conditions intended.

Table 2.2.1 Section modulus, inertia and web area coefficients for different load models

Load	Position (j)		(1)	Web area coefficient	Section modulus coefficient	Inertia coefficient	Application

	$b_{\rm f}$ = face plate (or flange) uns	supported width	n, in mm				
	$t_{\rm f} = {\rm face plate}$ (or flange) thickness, in mm						

- 2.10.2 General or special purpose computer programs or other analytical techniques may be used provided that the effects of bending, shear, axial and torsion are properly accounted for and the theory and idealisation used can be justified.
- 2.10.3 In general, grillages consisting of slender girders may be idealised as frames based on beam theory provided proper account of the variations of geometric properties is taken. For cases where such an assumption is not applicable, finite element analysis or equivalent methods may have to be used.

■ Section 3 Buckling

3.1 General

- 3.1.1 This Section contains the requirements for buckling control of plate panels subject to in-plane compressive and/or shear stresses and buckling control of primary and secondary stiffening members subject to axial compressive and shear stresses.
- 3.1.2 The requirement for buckling control of plate panels is contained in Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements. The requirements for secondary stiffening members are contained in Vol 1, Pt 6, Ch 2, 3.7 Secondary stiffening in direction of compression. The requirements for primary members are contained in Vol 1, Pt 6, Ch 2, 3.9 Buckling of primary members and Vol 1, Pt 6, Ch 2, 3.10 Shear buckling of girder webs

408

Volume 1, Part 6, Chapter 2

Section 3

- 3.1.3 In general all areas of the structure are to meet the buckling strength requirements for the design stresses. The design stresses are to be taken as the global hull girder bending and shear stresses derived in accordance with *Vol 1, Pt 6, Ch 4 Hull Girder Strength*. In addition, where the structural member is subject to local compressive loads, then the design stresses are to be based on these loads.
- 3.1.4 The buckling requirements are to be met using the net scantlings, hence any additional thickness for corrosion margin or enhanced scantlings is not included in the scantlings used to assess the buckling performance. For corrosion margins, see *Vol* 1, *Pt* 6, *Ch* 6, 3.8 Corrosion margin.

3.2 Symbols

3.2.1 The symbols used in this Section are defined below and in the appropriate sub-Section:

 $A_{\rm R}$ = panel aspect ratio

 $=\frac{a}{b}$

a = panel length, i.e. parallel to direction of compressive stress being considered, in mm

b = panel breadth, i.e. perpendicular to direction of compressive stress being considered, in mm

 $S_p = \text{span of primary members, in metres}$

 $\sigma_{\rm e}$ = elastic compressive buckling stress, in N/mm²

 $\sigma_{\rm c}$ = critical compressive buckling stress, including the effects of plasticity where appropriate, in N/mm²

 $\tau_{\rm e}$ = elastic shear buckling stress, in N/mm²

 $\tau_{\rm C}$ = critical shear buckling stress, in N/mm²

$$b_{\text{ eb}} = \text{lesser of 1,9} t_{\text{ p}} \sqrt{\frac{E}{\sigma_{\text{ o}}}} \text{ or 0,8} b \text{ mm}$$

 A_{te} = cross-sectional area of secondary stiffener, in cm², including an effective breadth of attached plating, b_{te}

s = length of shorter edge of plate panel, in mm (typically the spacing of secondary stiffeners)

l = length of longer edge of plate panel, in metres.

S = spacing of primary member, in metres (measured in direction of compression)

3.3 Plate panel buckling requirements

- 3.3.1 The section gives methods for evaluating the buckling strength of plate panels subjected to the following load fields:
- (a) uni-axial compressive loads;
- (b) shear loads;
- (c) bi-axial compressive loads;
- (d) uni-axial compressive loads and shear loads;
- (e) bi-axial compressive loads and shear loads.
- 3.3.2 The plate panel buckling requirements will be satisfied if the buckling interaction equations given in *Table 2.3.1 Plate* panel buckling requirements for the above load fields are complied with.

Volume 1, Part 6, Chapter 2 Section 3

Table 2.3.1 Plate panel buckling requirements

	Stress field	Buckling interaction formula	
(a)	uni-axial compressive loads	$\frac{\sigma}{\sigma} \frac{d}{\sigma} \le 1, 0 \frac{1}{\lambda} \frac{1}{\sigma}$	$y \xrightarrow{\sigma_d} \overline{\qquad}$
(b)	shear loads	$\frac{\tau_{\mathbf{d}}}{\tau_{\mathbf{c}}} \le \frac{1}{\lambda_{\tau}}$	y t _d x
(c)	bi-axial compressive loads	$\begin{split} & \frac{\sigma}{\sigma} \frac{\mathrm{dx}}{\mathrm{dx}} + \frac{\sigma}{\sigma} \frac{\mathrm{dy}}{\mathrm{cy}} \leq 1,0 \\ & \text{for other aspect ratios, i.e. } A_{\mathrm{R}} \neq 1,0 \\ & \frac{\sigma}{\sigma} \frac{\mathrm{dx}}{\mathrm{cx}} + \frac{\sigma}{\sigma} \frac{\mathrm{dy}}{\mathrm{cy}} \leq G \\ & \text{when } G \text{ is taken from } Figure \ 2.3.3 \ Interaction \\ & \text{limiting stress curves of } G \text{ for plate panels subject } \\ & \text{to bi-axial compression} \end{split}$	$\begin{array}{c c} & & & & & & & \\ & & & & & & & \\ \hline & & & &$

Volume 1, Part 6, Chapter 2

Section 3

Symbols

 σ_d = design compressive stress, see Vol 1, Pt 6, Ch 2, 3.1 General 3.1.3

 $\sigma_{\rm C}={\rm critical}$ compressive buckling stress, in N/mm², for uniaxial compressive load acting independently, see Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.5

 σ_{dx} = design compressive stress in x direction

 σ_{dy} = design compressive stress in the y direction

σ_{CX} = critical compressive buckling stress in x direction, see Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.5

σ_{cv} = critical compressive buckling stress in y direction, see Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.5

λ_σ = buckling factor of safety for compressive stresses, see Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.4

λ_τ = buckling factor of safety for shear stresses, see Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.4

 τ_d = design shear stress, in N/mm²

 $\tau_{\rm c}={\rm critical}$ shear buckling stress, in N/mm², acting independently, see Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.5

- 3.3.3 The critical compressive buckling stresses and critical shear buckling stresses required for *Table 2.3.1 Plate panel buckling requirements* are to be derived in accordance with *Vol 1*, *Pt 6*, *Ch 2*, *3.4 Derivation of the buckling stress for plate panels*
- 3.3.4 The buckling factors of safety λ_{σ} and λ_{τ} required by *Table 2.3.1 Plate panel buckling requirements* are to be extracted from *Vol 1, Pt 6, Ch 5 Structural Design Factors* for the structural member concerned.
- 3.3.5 For all structural members which contribute to the hull girder strength, the plate panel buckling requirements for uni-axial compressive loads, *Table 2.3.1 Plate panel buckling requirements*, and shear loads, *Table 2.3.1 Plate panel buckling requirements* are to be complied with.
- 3.3.6 In addition to Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.5, structural members which are subjected to local compressive loads and/on shear loads are to be verified using the plate panel buckling requirements in Table 2.3.1 Plate panel buckling requirements.
- 3.3.7 However, where some members of the structure have been designed such that elastic buckling of the plate panel between the stiffeners is allowable, then the requirements of *Vol 1*, *Pt 6*, *Ch 2*, *3.5 Additional requirements for plate panels which buckle elastically* must be applied to the buckling analysis of the stiffeners supporting the plating. In addition, panels which do not satisfy the panel buckling requirements must be indicated on the appropriate drawing and the effect of these panels not being effective in transmitting compressive loads taken into account for the hull girder strength calculation, see *Vol 1*, *Pt 6*, *Ch 4*, *1.4 Calculation of hull section modulus 1.4.9* and *Vol 1*, *Pt 6*, *Ch 4*, *1.4 Calculation of hull section modulus 1.4.10*
- 3.3.8 In general the plate panel buckling requirements for more complex load fields, see Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.1.(c), Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.1.(d) and Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.1.(e), are to be complied with. Where this is not possible, due to elastic buckling of the panel, then the critical buckling stress, σ_c , may be based on the ultimate collapse strength of the plating, σ_u from Vol 1, Pt 6, Ch 2, 3.5 Additional requirements for plate panels which buckle elastically 3.5.4, instead of the elastic buckling stress, σ_e , derived in Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements 3.3.5. In addition, the requirements of Vol 1, Pt 6, Ch 2, 3.5 Additional requirements for plate panels which buckle elastically are to be met for the supporting secondary stiffeners and primary members.

3.4 Derivation of the buckling stress for plate panels

3.4.1 The critical compressive buckling stress, σ_c , for a plate panel subjected to uni-axial in-plane compressive loads is to be derived in accordance with *Table 2.3.2 Buckling stress of plate panels*

Volume 1, Part 6, Chapter 2

Section 3

Table 2.3.2 Buckling stress of plate panels

Mode	Elastic buckling stress, N/mm² see Note	
(a) Uni-axial compression: (i) Long narrow panels, loaded on the narrow edge (ii) Short broad panels, loaded on the broad edge	$A_R \ge 1$ $\sigma_e = 3,62 \varphi E \left(\frac{t_p}{b}\right)^2$ $A_R < 1$ $\sigma_e = 0,9C \varphi \left(\frac{b}{a} + \frac{a}{b}\right)^2 E \left(\frac{t_p}{b}\right)^2$	σ _d
(b) Pure shear:	$\tau_e = 3,62 \Big(1,335 + \Big(\frac{\mathrm{u}}{\mathrm{v}}\Big)^2\Big) E\Big(\frac{t_\mathrm{p}}{\mathrm{u}}\Big)^2$ NOTE u is to be the minimum dimension	τ_d

NOTE

The critical buckling stresses, in N/mm², are to be derived from the elastic buckling stresses as follows:

$$\sigma_{\rm C} = \sigma_{\rm e}$$
 when $\sigma_{\rm e} < \frac{\sigma_{\rm O}}{2}$

$$\tau_{\text{\tiny C}} = \tau_{\text{\tiny e}}$$
 when $\tau_{\text{\tiny e}} < \frac{\tau_{\ o}}{2}$

$$=\sigma_{\text{O}}\left(1-\frac{\sigma_{\text{O}}}{4\,\sigma_{\text{e}}}\right)\text{when }\sigma_{\text{e}}\!\geq\!\frac{\sigma_{\text{O}}}{2}$$

$$= \tau_{\text{O}} \left(1 - \frac{\tau_{\text{O}}}{4 \, \tau_{\text{e}}} \right) \text{when } \tau_{\text{e}} \geq \frac{\tau_{\text{O}}}{2}$$

 σ_{c} = is defined in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1

 τ_{c} = is defined in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1

 σ_{o} = is defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

 τ_o = is defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

Volume 1, Part 6, Chapter 2

Section 3

Symbols and defini	Symbols and definitions								
A R = panel aspect ratio, see Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1	$E = \text{Young's Modulus of elasticity of material, in } N/\text{mm}^2$								
$\sigma_{e} = \text{ elastic compressive buckling stress, in N/mm}^{2}$	C = stiffener influence factor for panels with stiffeners perpendicular to compressive stress								
$\tau_{\rm e} = {\rm elastic\ shear\ buckling\ stress,\ in\ N/mm^2}$									
a and b are the panel dimensions in mm, see figures above	= 1,3 when plating stiffened by floors or deep girders								
t_{p} = thickness of plating, in mm	= 1,21 when stiffeners are built up profiles or rolled								
Φ = stress distribution factor for linearly varying	angles								
compressive stress across plate width	= 1,10 when stiffeners are bulb flats								
$= 0.47\mu^2 - 1.4\mu + 1.93 \text{ for } \mu \ge 0$	= 1,05 when stiffeners are flat bars								
= 1 for constant stress									
$\mu = \frac{\sigma_{\rm d1}}{\sigma_{\rm d2}} \text{ where } \sigma_{\rm d1} \text{ and } \sigma_{\rm d2} \text{ are the smaller and}$ larger average compressive stresses respectively	= σ_d and τ_d are the design compressive and design shear stresses in the direction illustrated in the figures. With linearly varying stress across the plate panel, σ_d is to be taken as σ_{d2} .								

- 3.4.2 The critical shear buckling stress, τ _c, for a plate panel subjected to pure in-plane shear load is to be derived in accordance with *Table 2.3.2 Buckling stress of plate panels*.
- 3.4.3 For welded plate panels with plating thicknesses below 8 mm, the critical compressive buckling stress is to be reduced to account for the presence of residual welding stresses. The critical buckling stress for plating is to be taken as the minimum of:

$$\sigma_{cr} = \sigma_{e} - \sigma_{r}$$

or

σ_C = as derived using Vol 1, Pt 6, Ch 2, 3.4 Derivation of the buckling stress for plate panels 3.4.1

where

 σ_r = reduction in compressive buckling stress due to residual welding stresses

$$= \frac{2 \beta_{RS} \sigma_o}{b/t_p}$$

 β_{BS} = residual stress coefficient dependent on type of weld (average value of β_{BS} to be taken as 3)

 $t_{\rm p}$ and $\sigma_{\rm o}$ are defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

 σ_c is derived in Vol 1, Pt 6, Ch 2, 3.4 Derivation of the buckling stress for plate panels 3.4.1

b is defined in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1

- 3.4.4 In general the effect of lateral loading on plate panels (for example hydrostatic pressure on bottom shell plating) may be neglected and the critical buckling stresses calculated considering the in-plane stresses only.
- 3.4.5 Unless indicated otherwise, the effect of initial deflection on the buckling strength of plate panels may be ignored.

3.5 Additional requirements for plate panels which buckle elastically

- 3.5.1 Elastic buckling of plate panels between stiffeners occurs when both the following conditions are satisfied:
- (a) The design compressive stress, σ_d , is greater than the elastic buckling stress of the plating, σ_e

$$\sigma_{\rm d} > \sigma_{\rm e}$$

413

Volume 1, Part 6, Chapter 2

Section 3

(a) The elastic buckling stress is less than half the yield stress

$$\sigma_{\rm e} \leq \frac{\sigma_{\rm o}}{2}$$

- 3.5.2 Elastic buckling of local plating between stiffeners, including girders or floors etc. may be allowed if all of the following conditions are satisfied:
- (a) The critical buckling stress of the stiffeners in all buckling modes is greater than the axial stress in the stiffeners after redistribution of the load from the elastically buckled plating into the stiffeners, hence

$$\frac{\sigma_{de}}{\sigma_{c}(i)} \le \frac{1}{\lambda \sigma}$$

= where

$$i = (a), (t), (w) or (f)$$

- (a) Maximum predicted loadings are used in the calculations.
- (b) Functional requirements will allow a degree of plating deformation.

where

 $\sigma_{\rm de}$ is the stiffener axial stress given in Vol 1, Pt 6, Ch 2, 3.5 Additional requirements for plate panels which buckle elastically 3.5.5 $\sigma_{\rm c(i)}$ is given by Table 2.3.3 Buckling stress of secondary stiffeners

where

i is a, t, w or f depending on the mode of buckling.

 λ_{σ} is the buckling factor of safety given in *Table 5.3.2 Allowable stress factors f 1*.

3.5.3 The effective breadth of attached plating for stiffeners, girder or beams that is to be used for the determination of the critical buckling stress of the stiffeners attached to plating which buckles elastically is to be taken as follows:

$$b_{\text{eu}} = \frac{b \sigma_{\text{u}}}{\sigma_{o}} \text{mm}$$

where

 $\sigma_{\rm u}=$ ultimate buckling strength of plating as given in Vol 1, Pt 6, Ch 2, 3.5 Additional requirements for plate panels which buckle elastically 3.5.4

 σ_0 = is defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

b eu = effective panel breadth perpendicular to direction of compressive stress being considered

b is given in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1

- 3.5.4 The ultimate buckling strength of plating, $\sigma_{\rm u}$, which buckles elastically, may be determined as follows:
- (a) shortest edge loaded, i.e. $A_{B} \ge 1$:

$$\sigma_{\rm u} = \sigma_{\rm o} \left(\frac{1,9}{W} - \frac{0,8}{W^2} \right) \text{N/mm}^2$$

(b) longest edge loaded i.e. $A_{\rm B} < 1$:

$$\sigma_{\rm u} = \frac{1,77 \,\sigma_{\rm o} A_{\rm R} \theta,78}{W} \text{N/mm}^2$$

where

$$W = \frac{s}{t_{\rm p}} \sqrt{\frac{\sigma_{\rm o}}{E}}$$

A R and s are defined in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1

Volume 1, Part 6, Chapter 2

Section 3

 $t_{\rm p}$, E and $\sigma_{\rm ow}$ are defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1.

3.5.5 The axial stress in stiffeners attached to plating which is likely to buckle elastically is to be derived as follows:

$$\sigma_{\rm de} = \sigma_{\rm d} \frac{A_{\rm t}}{A_{\rm tb}}$$

where

 $\sigma_{\rm d}$ is the axial stress in the stiffener when the plating can be considered fully effective

$$A_{\rm t} = A_{\rm s} + \frac{\rm bt}{100} \, \rm cm^2$$

$$A_{\rm tb} = A_{\rm s} + \frac{b_{\rm eu}t}{100} \,\rm cm^2$$

where

b and b eu are given in Vol 1, Pt 6, Ch 2, 3.5 Additional requirements for plate panels which buckle elastically 3.5.3

t is the plating thickness, in mm

 $A_{\rm s}$ is the stiffener area in cm².

3.6 Shear buckling of stiffened panels

3.6.1 The shear buckling capability of longitudinally stiffened panels between primary members is to satisfy the following condition:

$$\frac{\tau_{\rm d}}{\tau_{\rm c}} \le \frac{1}{\lambda_{\tau}}$$

where

 $\tau_{\rm c}$ is derived from Vol 1, Pt 6, Ch 2, 3.6 Shear buckling of stiffened panels 3.6.3

 $\tau_{\rm d}$ is the design shear stress

 λ_{τ} is given in *Table 5.3.2 Allowable stress factors f 1*.

3.6.2 The elastic shear buckling stress of longitudinally stiffened panels between primary members may be taken as:

$$\tau_{\rm e} = K_{\rm s} E(\frac{t}{s})^2 \text{ for } A_{\rm R} \ge I$$

where

$$K_{s} = 4, 5 \left(\left(\frac{s}{1000l} \right)^{2} + \frac{1}{N^{2}} + \left(\frac{N^{2} - l}{N^{2}} \right) \left(\frac{\omega}{1 + \omega} \right)^{r} \right)$$

N = number of subpanels

$$= \frac{1000S_{\rm p}}{s}$$

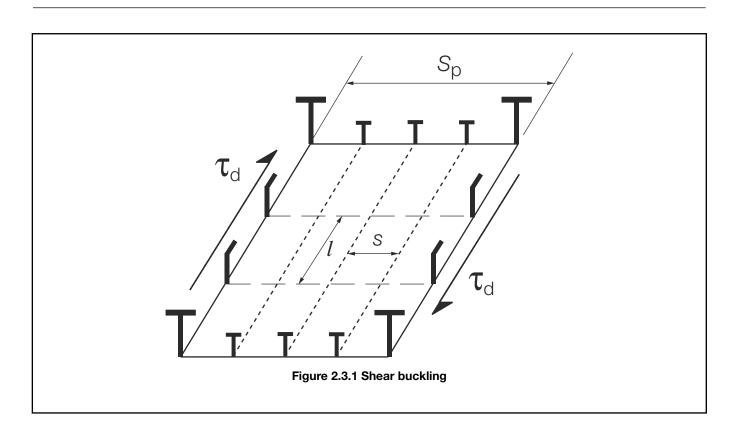

$$\omega = \frac{10I_{\text{se}}}{lt^3}$$

 I_{se} = moment of inertia of a section, in cm⁴, consisting of the longitudinal stiffener and a plate flange of effective width s/2

$$r = 1 - 0.75 \left(\frac{s}{1000I} \right)$$

s, $\it l$, $\it E$ and S $\it p$ are as defined in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1, see also Figure 2.3.1 Shear buckling

3.6.3 The critical shear buckling stress, τ_c , may be determined from τ_e , see Note in Table 2.3.2 Buckling stress of plate panels.

3.7 Secondary stiffening in direction of compression

3.7.1 The buckling performance of stiffeners will be considered satisfactory if the following conditions are satisfied:

$$\frac{\sigma_{d}}{\sigma_{c(a)}} \le \frac{1}{\lambda_{\sigma}} \quad \frac{\sigma_{d}}{\sigma_{c(t)}} \le \frac{1}{\lambda_{\sigma}}$$
$$\frac{\sigma_{d}}{\sigma_{c(w)}} \le \frac{1}{\lambda_{\sigma}} \quad \frac{\sigma_{d}}{\sigma_{c(f)}} \le \frac{1}{\lambda_{\sigma}}$$

where

 $\sigma_{\text{C (a)}}$, $\sigma_{\text{C (t)}}$, $\sigma_{\text{C (t)}}$, $\sigma_{\text{C (w)}}$ and $\sigma_{\text{C (f)}}$ are the critical buckling stress of the stiffener for each mode of failure, see *Vol 1, Pt 6, Ch 2, 3.7 Secondary stiffening in direction of compression 3.7.2*

 σ d is the design compressive stress, see also Vol 1, Pt 6, Ch 2, 3.1 General 3.1.3 and Vol 1, Pt 6, Ch 2, 3.5 Additional requirements for plate panels which buckle elastically

 λ_{σ} is the buckling factor of safety given in *Table 5.3.2 Allowable stress factors f 1* in *Vol 1, Pt 6, Ch 5 Structural Design Factors* The value of λ_{σ} to be chosen depends on the buckling assessment of the attached plating, see Note 3, *Table 5.3.2 Allowable stress factors f 1*

3.7.2 The critical buckling stresses for the overall, torsional, web and flange buckling modes of longitudinals and secondary stiffening members under axial compressive loads are to be determined in accordance with *Table 2.3.3 Buckling stress of secondary stiffeners*

Table 2.3.3 Buckling stress of secondary stiffeners

Mode		Elastic buckling stress, N/mm ²	Critical buckling stress, N/mm ² see Note	
(a)	Overall buckling (perpendicular to plane of plating without rotation of cross-section)	$\sigma_{e(a)} = C_f 0,001 E \frac{I_a}{A_{te}l^2_e}$	$\sigma_{\text{C(a)}}$	

Volume 1, Part 6, Chapter 2

Section 3

(b)	Torsional buckling	$\sigma_{e(t)} = \frac{0,001EI_{w}}{I_{p}l^{2}e} \left(m^{2} + \frac{K}{m^{2}}\right) + 0,385E\frac{I_{t}}{I_{p}}$	$\sigma_{c(t)}$
(c)	Web buckling (excluding flat bar stiffeners)	$\sigma_{e(w)} = 3.8E \left(\frac{t_{w}}{d_{w}}\right)^{2}$	$\sigma_{\mathrm{C}(W)}$
(d)	Flange buckling	$\sigma_{e(f)} = 3.8E \left(\frac{t_f}{b_f}\right)^2$	$\sigma_{c(f)}$

NOTE

The critical buckling stresses are to be derived from the elastic buckling stresses as follows:

$$\sigma_{\text{C}} \; = \; \\ \sigma_{\text{e}} \; \text{when} \; \sigma_{\text{e}} < \frac{\sigma_{\;0}}{2}$$

=
$$\sigma_{o} \left(1 - \frac{\sigma_{o}}{4 \sigma_{e}} \right)$$
 when $\sigma_{e} \ge \frac{\sigma_{o}}{2}$

Symbols

d_w = web depth, in mm, (excluding flange thickness for rolled sections), see Figure 2.2.1 Dimensions of longitudinals

 $t_{\rm w}$ = web thickness, in mm

 b_f = flange width, in mm (including web thickness)

 $t_{\rm f}$ = flange thickness, in mm. For bulb plates, the mean thickness of the bulb may be used, see Figure 2.2.1 Dimensions of longitudinals

 $l_{\rm e}$ = effective span length of stiffener, in metres

 $C_{\rm f}$ = end constraint factor

= 1 where both ends are pinned

= 2 where one end is pinned and the other end fixed

= 4 where both ends are fixed

E = Young's Modulus of elasticity of the material, in N/mm²

 $I_{\rm a}={\rm moment}$ of inertia, in cm⁴, of longitudinal, including attached plating of effective width $b_{\rm eb}$. For stiffeners attached to plating which buckles elastically, see 4.5, the effective width of plating is to be taken as $b_{\rm eu}$.

t _p and σ _o are given in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1 A _{te} and b _{eb} are given in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1

Volume 1, Part 6, Chapter 2

Section 3

 l_t = St. Venant's of inertia, in cm⁴, of longitudinal (without attached plating)

$$= \frac{d_{\mathbf{W}}^t \frac{3}{\mathbf{W}}}{3} 10^{-4} \text{ for flat bars}$$

$$= \frac{1}{3} \left[d_{\mathbf{W}} t^{-3}_{\mathbf{W}} + b_{\mathbf{f}} t^{-3}_{\mathbf{f}} \left(1 - \frac{0,63t_{\mathbf{f}}}{b_{\mathbf{f}}} \right) \right] 10^{-4} \text{ for built up profiles, rolled angles and bulb plates}$$

 $I_{\rm D} = {\rm polar\ moment\ of\ inertia,\ in\ cm^4,\ of\ profile\ about\ connection\ of\ stiffener\ to\ plating}$

$$= \frac{d}{\frac{w^t w}{3}} 10^{-4} \text{ for flat bars}$$

$$= \left(\frac{d}{\frac{3}{w^t w}} + d \frac{2}{w} b_f^t t_f\right) 10^{-4}$$
 for built up profiles, rolled angles and bulb plates

 $I_{\rm w} = {\rm sectional\ moment\ of\ inertia,\ in\ cm^6,\ of\ profile\ and\ connection\ of\ stiffener\ to\ plating}$

$$= \frac{d^{3} w^{t} w^{3}}{36} 10^{-6}$$
 for flat bars

$$= \frac{t_{\rm f}b \, {}^3{}_{\rm f}d \, {}^2{}_{\rm w}}{12} 10^{-6} \, \text{for 'Tee' profiles}$$

$$= \frac{b^3 f^d \frac{2}{w}}{12 \left(b_f + d_w\right)^2} \left(t_f \left(b^2 f + 2b_f d_w + 4d^2 w\right) + 3t_w b_f d_w\right) 10^{-6} \text{ for 'L' profiles, rolled angles and bulb plates}$$

C = spring stiffness exerted by supporting plate panel

$$= \frac{k_{\mathbf{p}}Et \, {}^{3}_{\mathbf{p}}}{3b\left(1 + \frac{1,33k_{\mathbf{p}}d_{\mathbf{w}}^{t} \, {}^{3}_{\mathbf{p}}}{bt \, {}^{3}_{\mathbf{w}}}\right)}$$

 $k_p = 1 - \eta_p$, and is not to be taken as less than zero. For built up profiles, rolled angles and bulb plates, k_p need not be taken less than 0,1

$$\eta_p = \frac{\sigma_d}{\sigma_{en}}$$

 σ_{ep} = elastic critical buckling stress, σ_{e} , in N/mm², of the supporting plate derived from *Table 2.3.2 Buckling stress* of plate panels, (ai)

m is determined as follows: e.g.m = 2 for K = 25

K range	0 ≤ <i>k</i> < 4	4 ≤ <i>k</i> < 36	36 ≤ <i>k</i> < 144	144 ≤ <i>k</i> < 400	400 ≤ <i>k</i> < 900	900 ≤ <i>k</i> < 1764	$(m-1)^2 m^2$ $\leq k < m^2 (m)$
							+ 1)2

Volume 1, Part 6, Chapter 2

Section 3

- 3.7.3 To prevent torsional buckling of secondary stiffeners from occurring before buckling of the plating, the critical torsional buckling stress, $\sigma_{c(t)}$, is to be greater than the critical buckling stress of the attached plating as detailed in *Vol 1*, *Pt 6*, *Ch 2*, 3.4 Derivation of the buckling stress for plate panels 3.4.1
- 3.7.4 The critical buckling stresses of the stiffener web, $\sigma_{\text{C(W)}}$, and flange, $\sigma_{\text{C(f)}}$, are to be greater than the critical torsional buckling stress, hence:

 $\sigma_{\text{C(W)}} > \sigma_{\text{C(t)}}$

 $\sigma_{\text{C(f)}} > \sigma_{\text{C(t)}}$

3.7.5 To ensure that overall buckling of the stiffened panel cannot occur before local buckling of the secondary stiffener, the critical overall buckling stress $\sigma_{c(a)}$, is to be greater than the critical torsional buckling stress, hence:

 $\sigma_{\text{C(a)}} > \sigma_{\text{C(t)}}$

3.8 Secondary stiffening perpendicular to direction of compression

3.8.1 Where a stiffened panel of plating is subjected to a compressive load perpendicular to the direction of the stiffeners, see Figure 2.3.2 Secondary stiffening perpendicular to direction of compression e.g. a transversely stiffened panel subject to longitudinal compressive load, the requirements of this section are to be applied.

Section 3

3.8.2 The minimum moment of inertia of each stiffener including attached effective plating of width, $b_{\rm eb}$, to ensure that overall panel buckling does not precede plate buckling is to be taken as:

$$I_{s} = \frac{D s \left(4 N_{L}^{2} - 1\right) \left(\left(N_{L}^{2} - 1\right)^{2} - 2\left(N_{L}^{2} + 1\right) \kappa + \kappa^{2}\right)}{2 \left(5 N_{L}^{2} + 1 - \kappa\right) \Pi^{4} E} mm^{4}$$

where

$$D = \frac{Et_{\rm p}^2}{12(1-v^2)}$$

Section 3

where

$$\kappa = A_R^2 \Pi^2$$

 A_{R} = plate panel aspect ratio

$$= \frac{s}{1000l}$$

$$\Pi = \frac{S}{I}$$

 N_{\perp} = number of plate panels

 $N_{\perp}-1$ = number of stiffeners

v = 0.3

s, I and S are defined in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1 and shown in Figure 2.3.2 Secondary stiffening perpendicular to direction of compression

 $t_{\rm p}$ and E are defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1.

3.9 Buckling of primary members

- 3.9.1 Where primary girders are subject to axial compressive loading, the buckling requirements for lateral, torsional, web and flange buckling modes detailed in *Vol 1, Pt 6, Ch 2, 3.7 Secondary stiffening in direction of compression* are to be satisfied.
- 3.9.2 To prevent global buckling from occurring before local panel buckling, transverse primary girders supporting axially loaded longitudinal stiffeners are to have a sectional moment of inertia, including attached plating, of not less than the following:

$$I_{\rm g} = \frac{0.35S_{\rm P}^4 I_{\rm S}}{l_{\rm S}^3} \times 10^3 {\rm cm}^4$$

S $_{\rm p}$ and s are as defined in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1

 I_{q} = is the sectional moment of inertia including attached plating

 l_s = moment of inertia of secondary stiffeners, in cm⁴, required to satisfy the elastic column buckling mode specified in *Table 2.3.3 Buckling stress of secondary stiffeners*

$$= \frac{\sigma_{\rm ep}^A {\rm te}^l_{\rm e}^2}{0,001E}$$

where

$$\sigma_{\text{ep}} = \frac{1.2 \,\sigma_{\text{d}} \,\text{N/mm}^2 \,\text{for } \sigma_{\text{e(a)}} < \frac{\sigma_{\text{o}}}{2}$$

$$= \frac{\sigma_{\text{o}^2}}{4(\sigma_{\text{o}} - 1.2 \,\sigma_{\text{d}})} \,\text{for } \sigma_{\text{e(a)}} \ge \frac{\sigma_{\text{o}}}{2}$$

 $\sigma_{\rm d}$ is design stress, in N/mm²

 σ $_{\rm O}$ and A $_{\rm te}$ are as defined in Vol 1, Pt 6, Ch 2, 3.2 Symbols 3.2.1

 σ _{e(a)} is the elastic column buckling stress, see Vol 1, Pt 6, Ch 2, 3.7 Secondary stiffening in direction of compression 3.7.2

E is defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

l_e is defined in Table 2.3.3 Buckling stress of secondary stiffeners

3.10 Shear buckling of girder webs

3.10.1 Local panels in girder webs subject to in-plane shear loads are to satisfy the shear buckling requirements in *Table 2.3.1 Plate panel buckling requirements*, item (b).

Volume 1, Part 6, Chapter 2

Section 4

3.10.2 The critical shear buckling stress, τ_c , is to be determined using the following formula for τ_e and the Note in *Table 2.3.2 Buckling stress of plate panels*

$$\tau_e = 3,62 \left(1,335 + \left(\frac{d_{\text{W}}}{1000l_{\text{p}}}\right)^2\right) E\left(\frac{t_{\text{p}}}{d_{\text{W}}}\right)^2 \text{N/mm}^2$$

where

 $d_{\rm W} = {\rm web \ height, \ in \ mm}$

 l_p = unsupported length of web, in metres

t p and E are defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

3.11 Pillars and pillar bulkheads

3.11.1 Pillars and pillar bulkheads are to comply with the requirements of Vol 1, Pt 6, Ch 3, 12 Pillars and pillar bulkheads

■ Section 4

Vibration control

4.1 General

- 4.1.1 Natural frequencies are to be investigated for local unstiffened and stiffened panels expected to be exposed to excessive structural vibrations being induced from machinery, propulsion unit or other potential excitation sources.
- 4.1.2 Where the structural configurations are such that basic structural elements may be modelled individually the natural frequencies may be derived in accordance with Vol 1, Pt 6, Ch 2, 4.3 Natural frequency of plate, Vol 1, Pt 6, Ch 2, 4.4 Natural frequency of plate and stiffener combination and Vol 1, Pt 6, Ch 2, 4.5 Effect of submergence, as appropriate. Under other circumstances, finite element analysis is to be employed to evaluate the vibration characteristics of the structure considered.

4.2 Frequency band

4.2.1 The natural frequency of panels is generally not to lie within a band of ±20 per cent of a significant excitation frequency.

4.3 Natural frequency of plate

4.3.1 The natural frequency of an homogeneous clamped plate in air is given by the following:

$$f_{\text{air}} = 5537 \frac{t_{\text{p}}}{ls} \sqrt{\left(\frac{1000l}{s}\right)^2 + \left(\frac{s}{1000l}\right)^2 + 0,6045} \text{ Hz}$$

where

l = panel length, in metres

s = panel breadth, in mm

 t_p = panel thickness, in mm.

4.4 Natural frequency of plate and stiffener combination

4.4.1 The natural frequency of a plate stiffener of constant cross-section in air is given by the following:

$$f_{\text{air}} = \frac{k_{i}}{20 \pi l_{b}^{2}} \sqrt{\frac{El}{m \left(1 + \frac{\pi^{2}El}{10^{4}l_{b}^{2}GA}\right)}} \text{Hz}$$

where

Volume 1, Part 6, Chapter 2

Section 5

 l_{b} = length of stiffener, in metres

m = mass per unit length of the stiffener and associated plating, in kg/m

 K_i = constant where i refers to the mode of vibration as given in *Table 2.4.1 First mode of vibration constant* K_i

G = shear modulus of elasticity, in N/mm².

 $A = \text{shear area of stiffener, in cm}^2$

I = Inertia of stiffener, in cm⁴

E = modulus of elasticity, in N/mm²

Table 2.4.1 First mode of vibration constant K_i

End condition	Mode				
	1	2	3	4	5
Simply supported	9,92	_	1	1	1
Fixed ends	22,40	61,70	121,0	200,0	299,0
Simple and fixed	15,4	_	_	_	_

4.5 Effect of submergence

4.5.1 To obtain the frequency, f_{water} , of a plate with one side exposed to air and the other side exposed to a liquid, the frequency calculated in air f_{air} may be modified by the following formula:

$$f_{\text{water}} = \int_{\text{air}} \sqrt{\frac{K_{\text{p}}}{K_{\text{p}} + \frac{\rho \, 1}{\rho_{\text{p}}}}}$$

where

 ρ_{\perp} = density of the liquid, in kg/m³

 $\rho_{p} = \text{density of the plate, in kg/m}^{3}$

$$\kappa_{p} = \frac{\pi t_{p}}{l s} \sqrt{\frac{s^2}{10^6} + l^2}$$

where *l* , s and *t* _p are as defined in Vol 1, Pt 6, Ch 2, 4.3 Natural frequency of plate 4.3.1

■ Section 5

Dynamic loading

5.1 General

5.1.1 The following formulae are to be used to determine the dynamic response of plate and plate stiffener combinations. The natural frequency of structural items can be determined from *Vol 1*, *Pt 6*, *Ch 2*, *4 Vibration control* and the period *T* may then be determined as follows:

Volume 1, Part 6, Chapter 2

Section 5

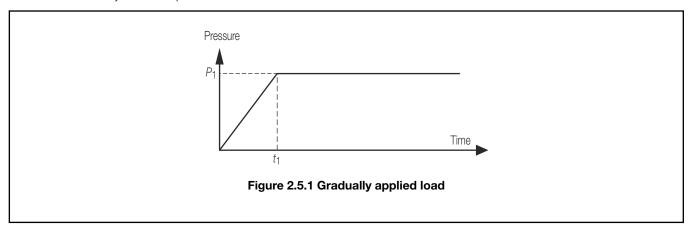

$$T = \frac{1}{f}$$
 seconds

where

- f = the natural frequency and is normally to be taken as f_{air}, see Vol 1, Pt 6, Ch 2, 4.3 Natural frequency of plate 4.3.1 for plating or Vol 1, Pt 6, Ch 2, 4.4 Natural frequency of plate and stiffener combination 4.4.1 for plate and stiffener combination.
- 5.1.2 For bottom impact pressure loads and bow flare and above waterline impact pressure loads required by $Vol\ 1$, $Pt\ 6$, $Ch\ 3$, $14\ Strengthening$ for bottom slamming and $Vol\ 1$, $Pt\ 6$, $Ch\ 3$, $15\ Strengthening$ for wave impact loads above waterline respectively, the impact pressure is assumed to be represented by a triangular pulse load. The rise time, t_1 , for these impact pressures is given in $Vol\ 1$, $Pt\ 5$, $Ch\ 3$, $4.2\ Bottom\ impact\ pressure$, $IPbi\ 4.2.2$ for bottom impact and $Vol\ 1$, $Pt\ 5$, $Ch\ 3$, $4.3\ Bow\ flare\ and\ wave\ impact\ pressures$, $IPbf\ 4.3.2$ for bow flare impact.
- 5.1.3 For flight deck landing loads, the emergency landing load can be represented by a triangular pulse load. The rise time, t_1 , for these impact pressures can be estimated from the time taken to depress the tyre and oleo strut to their maximum deflection and the assumed maximum vertical landing velocity. For fixed wing aircraft, the rise time for a structural element will also depend on forward speed as the aircraft traverses the structure.

5.2 Gradually applied load

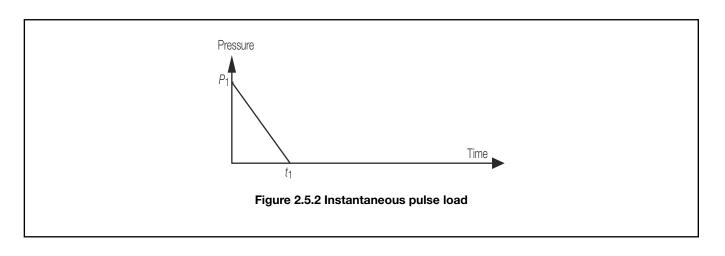

- 5.2.1 For a gradually applied load as shown in Figure 2.5.1 Gradually applied load the maximum dynamic load factor $f_{\rm DLF}$ can be calculated as from Table 2.5.1 Tabulated dynamic load factors. Linear interpolation may be performed to obtain $f_{\rm DLF}$ values for intermediate $t_{\rm 1}/T$ values.
- 5.2.2 The time to maximum response can be calculated from *Table 2.5.1 Tabulated dynamic load factors* with intermediate values determined by linear interpolation.

5.3 Instantaneous load

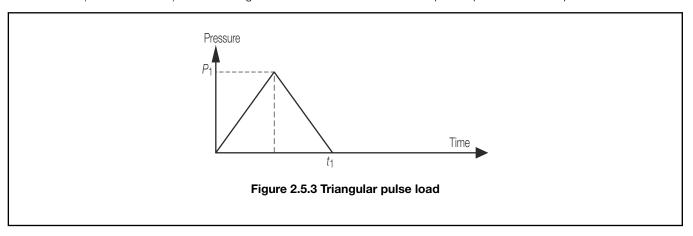

- 5.3.1 For an instantaneous applied load as shown in *Figure 2.5.2 Instantaneous pulse load* the maximum dynamic load factor f_{DLF} can be calculated as from *Table 2.5.1 Tabulated dynamic load factors* Linear interpolation may be performed to obtain f_{DLF} values for intermediate t_{1}/T values. The t_{1} time value is given in the same section that the impulsive pressure load is specified.
- 5.3.2 The time to maximum response can be calculated from *Table 2.5.1 Tabulated dynamic load factors* with intermediate values determined by linear interpolation.

Section 5

5.4 Triangular pulse load

5.4.1 For a triangular pulse load as shown in Figure 2.5.3 Triangular pulse load, the maximum dynamic load factor DLF be calculated from Table 2.5.1 Tabulated dynamic load factors. Linear interpolation may be performed to obtain DLF Rules for intermediate t_1/T values. The t_1 time value is given in the same section that the impulsive pressure load is specified.

5.4.2 The time to maximum response can be calculated from *Table 2.5.1 Tabulated dynamic load factors* with intermediate values determined by linear interpolation.

Table 2.5.1 Tabulated dynamic load factors

		Dynamic load factor		Time to maximum displacement

■ Section 1

General

1.1 Application

- 1.1.1 The requirements of this Chapter are applicable to monohull craft of steel construction as defined in *Vol 1, Pt 1, Ch 2, 2 Scope of the Rules*
- 1.1.2 All NS1, NS2 and NS3 ships as defined in *Vol 1, Pt 1 Regulations* are to comply with the minimum requirements of *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements* and general structural requirements of Sections *Vol 1, Pt 6, Ch 3, 5 Shell envelope plating* to *Vol 1, Pt 6, Ch 3, 16 Masts*.
- 1.1.3 The basic structural scantlings of NS1 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination* and supported where necessary by direct calculations.
- 1.1.4 The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 4 NS2* and NS3 scantling determination and supported by direct calculations where necessary.

1.2 General

- 1.2.1 The formulae used in this Chapter are to be used in conjunction with the design loadings from *Vol 1, Pt 5 Environmental Loads* and design tools in *Vol 1, Pt 6, Ch 2 Design Tools* to determine the rule scantling requirements.
- 1.2.2 All references to longitudinal locations in the rules are to be taken as forward of the aft end of $L_{\rm R}$ unless otherwise stated, e.g. 0,75 $L_{\rm R}$ is 75 per cent of $L_{\rm R}$ forward of the aft end of $L_{\rm R}$

where

L_R is defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

428

Scantling Determination

Volume 1, Part 6, Chapter 3

Section 2

1.3 Direct calculations

- 1.3.1 The extent of direct calculation required will depend on the ship's structural configuration and operational requirements and is to be agreed between the designer, Owner, Naval Administration and Lloyd's Register (hereinafter referred to as 'LR') at an early stage in the plan approval process.
- 1.3.2 In addition, where the ship is of unusual design, form, proportion or has operational requirements such as very high speed, the scantlings will be specially considered and may require direct calculation.

1.4 Equivalents

1.4.1 LR will consider direct calculations for the derivation of scantlings as an alternative and equivalent to those derived by rule requirements in accordance with Vol 1, Pt 3, Ch 1, 2 Direct calculations Vol 1, Pt 3, Ch 1, 2 Direct calculations and Vol 1, Pt 3, Ch 1, 3 Equivalents.

■ Section 2

Minimum structural requirements

2.1 Genera

- 2.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.
- 2.1.2 The scantlings of plating and stiffeners determined from the Rule scantling requirements are not to be less than that given in *Table 3.2.1 Minimum structural requirements* for the ship type. Due consideration is to be given to the vessel type correction factor, ω , as defined in *Table 3.2.2 Vessel type correction factor* (ω)
- 2.1.3 In addition, where plating contributes to the global strength of the ship, the thickness is to be not less than that required to satisfy the global strength requirements detailed in *Vol 1, Pt 6, Ch 4 Hull Girder Strength*

2.2 Corrosion margin

2.2.1 The minimum thicknesses given in *Table 3.2.1 Minimum structural requirements* are based on the assumption that the correct coatings are used and a proper maintenance regime is employed such that there is negligible loss in strength due to corrosion. Where this is not the case the minimum thickness will be specially considered. For corrosion margins, see *Vol 1*, *Pt 6*, *Ch 6*, *3.8 Corrosion margin*

Table 3.2.1 Minimum structural requirements

 ω = vessel type correction factor as determined from Table 3.2.2 Vessel type correction factor (ω)

 $k_{\text{ms}} = 635/(\sigma_{\text{o}} + \sigma_{\text{u}})$

 $\sigma_{\text{o}} = \text{specified minimum yield strength of the material, in N/mm}^2$

 σ_u = specified minimum ultimate tensile strength of the material, in N/mm²

 $b_{\rm p}$ = minimum breadth of cross section of hollow rectangular pillar, in mm

 d_{p} = outside diameter of tubular pillar, in mm

= L_R, B and T are defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

Note 1. Maximum keel breadth 1800 mm.

Note 2. Not to be less than adjacent shell plate. Above the design waterline the bar keel may be the same as the adjacent shell.

Note 3. Face plate thickness not to be less than floor thickness.

Table 3.2.2 Vessel type correction factor (ω)

Vessel type	0
Bottom structure of ships operating aground	1,2
NS1	1,1
NS2 and NS3	1,0

2.3 Impact consideration

2.3.1 Due consideration is to be given to the scantlings of all structures which may be subject to local impact loadings. For example decks in workshops. Impact testing may be required to be carried out at the discretion of LR to demonstrate the suitability of the proposed scantlings for a particular application.

Volume 1, Part 6, Chapter 3

Section 3

2.4 Sheathing

- 2.4.1 Areas of shell and deck which are subject to additional wear by abrasion from, i.e. removal or stores routes, working areas, forefoot region, etc. are to be suitably protected by local reinforcement or sheathing. This sheathing may be of timber, rubber, steel, additional layers of reinforcement, etc. as appropriate. Details of such sheathing and the method of attachment are to be submitted for consideration.
- 2.4.2 The attachment of sheathing by mechanical means such as bolting or other methods is not to impair the watertight integrity of the ship. Through bolting of the hull is to be kept to a minimum and avoided where practicable. The design arrangements in way of any through bolting are to be such that damage to the sheathing will not impair the watertight integrity of the hull.
- 2.4.3 When decks that are not structurally effective or subject to significant inplane stresses are fitted with approved sheathing, the thickness derived may be reduced by 10 per cent for a 50 mm sheathing thickness, or five per cent for 25 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck. Inside deckhouses the thickness may be reduced by a further 10 per cent.

2.5 Special considerations

- 2.5.1 Flight decks and structures in way of launcher ramps, gun platforms, etc. will be subject to special consideration.
- 2.5.2 The minimum plating thickness of ships intended for operation in ice conditions will be specially considered.
- 2.5.3 Ships with shock enhanced notation are not to be fitted with bar keels. Docking arrangements are to be specially considered.
- 2.5.4 For large or novel ships, the scantlings of the stern will be specially considered.
- 2.5.5 Where water jet or sterndrive units are fitted, the scantlings of the plating in way of the nozzles and connections will be specially considered.

2.6 Direct calculations

2.6.1 The thickness requirements derived from *Table 3.2.1 Minimum structural requirements* may be specially considered, where direct calculation procedures are adopted to demonstrate the suitability of the proposed alternative, e.g. shear buckling analysis may be performed on girder or floor webs.

■ Section 3

NS1 scantling determination

3.1 General

- 3.1.1 The scantlings for NS1 ships may be determined from the global and local requirements defined in this Section. In addition the general requirements of Sections *Vol 1, Pt 6, Ch 3, 5 Shell envelope plating* to *Vol 1, Pt 6, Ch 3, 15 Strengthening for wave impact loads above waterline* are to be complied with.
- 3.1.2 The scantlings given in this Section are based on the assumption that the correct coatings are used and a proper maintenance regime is employed such that there is negligible loss in strength due to corrosion. For corrosion margins, see Vol 1, Pt 6, Ch 6, 3.8 Corrosion margin.

3.2 Symbols

- 3.2.1 The symbols used in this Section are defined as follows:
 - F_B = local scantling reduction factor for hull members below the neutral axis, see Vol 1, Pt 6, Ch 3, 3.6 Local reduction factors
 - F_D = local scantling reduction factor for hull members above the neutral axis, see *Vol 1, Pt 6, Ch 3, 3.6 Local reduction factors*

Volume 1, Part 6, Chapter 3

Section 3

 I_{min} = minimum moment of inertia, of the hull midship section about the transverse neutral axis, in m⁴

 Z_D , Z_B = actual hull section moduli, in m³, at strength deck and keel respectively, see Vol 1, Pt 6, Ch 4, 2 Hull girder strength

 Z_{min} = minimum hull midship section modulus about the transverse neutral axis, in m³

 σ_p = permissible combined stress (still water plus wave), in N/mm², see Vol 1, Pt 6, Ch 4, 2 Hull girder strength

 σ_0 = yield strength of material in N/mm²

 σ_D , σ_B = maximum hull vertical bending stress at strength deck and keel respectively, in N/mm² determined from Vol 1, Pt 6, Ch 4, 2 Hull girder strength

k_L = longitudinal high strength steel factor, see Vol 1, Pt 6, Ch 5, 2.1 Design criteria 2.1.2

k_s = the local high strength steel factor, see Vol 1, Pt 6, Ch 5, 2.1 Design criteria 2.1.1

 $L_1 = L_R$ but need not be taken greater than 190 m

 $L_2 = L_R$ but need not be greater than 215 m

s = spacing of secondary stiffeners, in mm

S = spacing of primary members, in metres

 ρ = relative density (specific gravity) of a liquid carried in a tank not to be taken less than 1,025

 $f = \frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$ transverse framing aspect ratio correction L_R is as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

3.3 Hull girder strength

- 3.3.1 For all ships, the hull girder strength requirements of Vol 1, Pt 6, Ch 4, 2 Hull girder strength are to be complied with.
- 3.3.2 As required by Vol 1, Pt 6, Ch 4, 2 Hull girder strength, the hull girder bending and shear stresses for all longitudinally effective material is to be verified against the permissible stresses and the buckling requirements of Vol 1, Pt 6, Ch 2, 3 Buckling. In addition, the lateral and torsional stability of all effective longitudinals together with the web and flange buckling criteria are to be verified in accordance with Vol 1, Pt 6, Ch 2, 3 Buckling
- 3.3.3 In addition, the minimum requirements of Vol 1, Pt 6, Ch 3, 3.4 Minimum hull section modulus and Vol 1, Pt 6, Ch 3, 3.5 Minimum hull moment of inertia are to be satisfied.

3.4 Minimum hull section modulus

3.4.1 The hull midship section modulus about the transverse neutral axis, at the deck or the keel, is to be not less than:

$$Z_{\text{min}} = 0.95k_{\perp} M_{\odot} \times 10^{-5} \text{ m}^3$$

where

M_o is given in Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments 3.3.1

K_L is as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1

3.5 Minimum hull moment of inertia

3.5.1 The hull midship section moment of inertia about the transverse neutral axis is to be not less than the following using the maximum total bending moment, sagging or hogging:

Volume 1, Part 6, Chapter 3

Section 3

$$I_{\text{min}} = 3.0L_{\text{B}} M_{\text{B}} / 175 \times 10^{-5} \,\text{m}^4$$

where

M_R = design bending moment, sagging (negative) and hogging (positive), in kN m, to be taken negative or positive according to the convention given in Vol 1, Pt 5, Ch 4, 3.10 Hull girder design loads

3.6 Local reduction factors

3.6.1 Where the maximum hull vertical bending stress at deck or keel is less than the permissible combined stress, σ_p , reductions in local scantlings within 0,3 L_B to 0,7 L_B may be permitted. The reduction factors are defined as follows:

For hull members above the neutral axis

$$F_D = \sigma_D/\sigma_D$$

For hull members below the neutral axis

$$F_B = \sigma_B/\sigma_D$$

In general the values of σ_D and σ_B to be used are the greater of the sagging or hogging stresses, and F_D and F_B are not to be taken less than 0,67 for plating and 0,75 for longitudinal stiffeners. σ_B , σ_D and σ_D are defined in *Vol 1*, *Pt 6*, *Ch 3*, 3.2 *Symbols 3.2.1*

3.6.2 Where higher tensile steel is used in the hull structure, the values of F_D and F_B for the mild steel part are to be taken as not less than z/z_M

where

z = vertical distance from the hull transverse neutral axis to the position considered, in metres

 $z_{\rm M}$ = vertical distance, in metres, from the hull transverse neutral axis to the minimum limit of higher tensile steel, above or below the neutral axis as appropriate.

3.7 Taper requirements for hull envelope

- 3.7.1 The scantlings determined at amidships are to be maintained between $0.3L_R$ and $0.7L_R$. Outside of this region and forward of $0.075L_R$ and aft of $0.925L_R$ the scantling requirements for the following structural items are to be determined by linear interpolation between the midship section and the forward or after ends as appropriate, see *Figure 3.3.1 Taper requirements*:
- Strength deck plating.
- Deck longitudinals.
- Shell envelope.
- 3.7.2 The taper requirement does not apply to ships where there are large openings in the decks such that the torsional rigidity of the hull is significantly reduced.
- 3.7.3 The thickness may need to be increased above the taper thickness by military features, special features or other requirements such as bottom slamming or bow flare impact.

Volume 1, Part 6, Chapter 3

Section 3

- 3.7.4 The formulae for the taper values are based on the assumption that the yield values of steel is the same at amidships and ends. Where higher tensile steel is used in the midship region and mild steel at the ends, the taper values should be calculated for both yield values of steel. In way of the transition from higher tensile to mild steel, the thickness may be determined in accordance with *Figure 3.3.1 Taper requirements* The aft end thickness is to be tapered in a similar manner.
- 3.7.5 Where the higher tensile steel longitudinals extend beyond the point of transition from higher tensile to mild steel plating, the modulus of the composite section is to be greater than the required mild steel value at the deck plate flange, and k_L times the mild steel value at the higher tensile flange.

3.8 Grouped stiffeners

- 3.8.1 Where stiffeners are arranged in groups of the same scantling, the section modulus requirement of each group is to be based on the greater of the following:
- (a) the mean value of the section modulus required for individual stiffeners within the group;
- (b) 90 per cent of the maximum section modulus required for individual stiffeners within the group.

3.9 Shell envelope plating

3.9.1 Shell envelope plating for both longitudinally and transversely framed ships is to comply with the requirements of *Table 3.3.1 Shell envelope plating*

Volume 1, Part 6, Chapter 3 Section 3

Table 3.3.1 Shell envelope plating

Loca	ation	Minimum thickness, in mm, see also	Vol 1, Pt 6, Ch 3, 5.3 Sheerstrake 5.3.1
		Longitudinal framing	Transverse framing
(1)	Bottom plating and bilge where framed 0,3 $L_{\rm R}$ to 0,7 $L_{\rm R}$ (see Notes 3, 4 and 5)	The greater of the following: (a) $t = 9.0s_1(0.043L_1 + 10)\sqrt{\frac{F_B}{k_L}} \times 10^{-4}$ (b) $t = 4.7s_1\sqrt{\frac{h_{T2}k_S}{1.8 - F_B}} \times 10^{-3}$	The greater of the following: (a) $t = 0.001s_1 f(0.056L_1 + 16.7) \sqrt{\frac{F_B}{k_L}}$ (see Note 4) (b) $t = 5.7s_1 \sqrt{\frac{h_{T2}k_S}{1.8 - F_B}} \times 10^{-3}$

Note 1. Outside the vertical extent of higher tensile steel as defined in Vol 1, Pt 6, Ch 2, 1.6 Higher tensile steel 1.6.3 the value of k_{\perp} may be taken as 1,0.

Note 2. See also Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming and Vol 1, Pt 6, Ch 3, 15 Strengthening for wave impact loads above waterline for requirements for bottom slamming and bow flare impact.

Note 3. For keel plate thickness and breadth, see Table 3.2.1 Minimum structural requirements.

Note 4. Unframed bilge plating will be specially considered.

Note 5. Shell envelope plating from 0,075 $L_{\rm R}$ to 0,3 $L_{\rm R}$ and 0,7 $L_{\rm R}$ to 0,925 $L_{\rm R}$ is to be determined by assuming a linear taper from the midship value given by (1) or (3) as appropriate to $t = (6.0 + 0.03L_{\rm R}) \sqrt{k_{\rm S}}$ at 0,075 $L_{\rm R}$ and 0,925 $L_{\rm R}$. The plating thickness determined is not to be less than the value given by (2) or (4) as appropriate. See also Vol 1, Pt 6, Ch 3, 3.7 Taper requirements for hull envelope.

- 3.9.2 The thickness of the shell envelope plating is in no case to be less than the appropriate minimum requirement given in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements
- 3.9.3 Additional requirements for shell envelope plating are indicated in Vol 1, Pt 6, Ch 3, 5 Shell envelope plating.

3.10 Shell envelope framing

3.10.1 Shell envelope framing for both longitudinally and transversely framed ships is to comply with the requirements of *Table 3.3.2 Shell envelope framing (0,2L* $_R$ to 0,8L $_R$) and *Table 3.3.3 Shell envelope framing forward and aft*

Table 3.3.2 Shell envelope framing $(0.2L_R)$ to $0.8L_R$)

Symbols

 ρ , L_1 , L_2 , s, k_s , S are as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1

L_R, D, T are as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

C_{WI} is as defined in Table 3.3.1 Shell envelope plating

 $F_{\rm B}, F_{\rm D}$ are as defined in Vol 1, Pt 6, Ch 3, 3.6 Local reduction factors

I e are as defined in Vol 1, Pt 6, Ch 2, 2.6 Determination of span length, but is not to be taken less than 1,5 m except in way of the centre girder brackets required by Vol 1, Pt 6, Ch 3, 8.5 Bracket floors3 where a minimum span of 1,25 m may be used

 $I_{e1} = I_{e}$ in metres, but is not to be taken less than 2,5 m and need not be taken greater than 5,0 m

 $F_{\rm s}$ is a fatigue factor for side longitudinals defined in Table 3.3.3 Shell envelope framing forward and aft

$$C_1 = \frac{60}{225 - 165F_{\text{D}}} \text{ at deck}$$

$$= 1,0 \text{ at } \frac{D}{2}$$

$$= \frac{75}{225 - 150F_{\text{B}}} \text{ at base line}$$
Intermediate values by interpolation

$$F_1 = \frac{DC_1}{4D + 20h_5} \text{ for side longitudnals above } \frac{D}{2}$$

$$= \frac{DC_1}{25D + 20h_5} \text{ for side longitudnals below } \frac{D}{2}$$
minimum $F_1 = 0, 14$

and bottom longitudinals

where

z = height above base, in metres

 $f_{cw} = 0.5$ at base line

 $f_{\text{cw}} = 1.0 \text{ at } T$

 $f_{cw} = 0$ at 1,6T and above

Volume 1, Part 6, Chapter 3

Section 3

(f cw Intermediate values by interpolation)

 H_9 = weather head, h_1 , or stores head, h_2 , in metres, as defined in *Table 3.3.7 Deck longitudinals (longitudinal framing)* whichever is applicable

 $D_1 = 1,67$ but not less than 10 or greater then 16 (see Note 1)

H = vertical framing depth in m I, but not less than 2,5 m, see Note 2

 $h_{T1} = (T - z + f_{cw} C_{WL}) F_{\lambda} \text{ below } T$

= $f_{cw} C_{WL} F_{\lambda}$ above T but not less than the greater of $F_{\lambda} L_{1}/70$ or 1,2 m

 $h_{T2} = (T + 0.5C_{WL}) F_{\lambda}$

 $= h_{T_1}$ and h_{T_2} need not exceed (1,6 $T - z + D_1/8$) below 1,6T and ($z - 1,6T + D_1/8$) above 1,6T

 $h_{T3} = 0.9h_4 - 0.25T$, in metres, at the base line

= 0,9h₄, in metres, at and above T/4 from the base line, intermediate values by linear interpolation

h₄ = load head required by Table 3.3.5 Watertight and deep tank bulkhead and deck scantlings for deep tanks

 h_5 = measured from the mid length of the stiffener to the strength deck at side

 $h = h_4$ or h_5 whichever is greater

 $F_{\lambda} = 1.0 \text{ for } L_{R} \leq 200 \text{ m}$

 $= [1,0 + 0,0023(L_R - 200)]$ for $L_R > 200$ m

C =end connection factor

= 3,1 where two Rule standard brackets are fitted

= 3,1 (1,8 – 0,8 l_a/l_b) where one Rule standard bracket and one reduced bracket fitted

= 3,1 (2,15 – 1,15 l am/ l b) where two reduced brackets are fitted

= 5,5 where one Rule standard bracket is fitted

= $5.5 (1.2 - 0.2 l_a/l_b)$ where one reduced bracket is fitted

= 6,4 where no bracket is fittedThe requirements for frames where brackets larger than Rule standard are fitted will be specially considered

 l_{a} = equivalent arm length, in mm, as derived from Vol 1, Pt 6, Ch 6, 6.4 Scantlings of end brackets 6.4.5

l_b = as defined in Vol 1, Pt 6, Ch 6, 6.4 Scantlings of end brackets 6.4.5

 $l_{\rm am}$ = mean equivalent arm length, in mm, for both brackets

Volume 1, Part 6, Chapter 3

Section 3

 l_s = span of supported beam or transverse in metres

Note 1. The scantlings of members above D/2 may require special consideration on the basis of structural configuration and the distribution of bending stress at the section concerned.

Note 2. Where frames are inclined at more than 15° to the vertical, H, is to be measured along a chord between span points of the frame.

Note 3. If the modulus obtained from (6) for frames under deck transverses exceeds that obtained from (4) and (5), the intermediate frames may be reduced provided that the combined modulus is maintained and the reduction in any intermediate frame is not greater than 35 per cent. The reduced modulus is to be not less than that given by (4)(b).

Note 4. For single bottom structure a plate floor is to be fitted at every frame.

Section 3

 L_{1} , L_{2} , s, k_{s} are as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1 L_{R} , D, T are as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars C_{WL} as defined in Table 3.3.1 Shell envelope plating F_{λ} as defined in Table 3.3.2 Shell envelope framing (0,2 L_{R} to 0,8 L_{R})

- $l_{\rm e} = {\rm as~defined~in~\it Vol~1,\,\it Pt~6,\,\it Ch~2,\,\it 2.6~\it Determination}$ of span length but is to be taken not less than 1.5 m
- $D_2 = T + H_b$ metres, where H_b is the minimum bow height, in metres, obtained from Vol 1, Pt 3, Ch 2, 5.3 Minimum bow height and extent of forecastle
- H = vertical framing depth, in metres, of sideframes,but is to be taken not less than 2,5 m (see Note1)
- S_1 = vertical spacing of peak stringers or height of lower deck above the peak, in metres
- S_2 = vertical spacing of panting stringers, in metres
- C = end connection factor, see Table 3.3.2
- $f_{L} = 1,32 \text{ aft of } 0,15L_{R}$
 - = 1,0 from 0,2 L_{R} to 0,8 L_{R}
 - = 1,71 fwd of 0,85L _RIntermediate positions by interpolation
- z = height above baseline in metres

- $h_{T1} = (T z + f_L f_{cw} C_{WL}) F_{\lambda}$ below T
 - = $f_{\perp} f_{cw} C_{WL} F_{\lambda}$ above T but not less than $f_{\perp} F_{\lambda}$ $L_{\perp}/70$

 $f_{\rm cw} = 0.5$ at baseline

- = 1,0 at 0,65D₂ and above
 Intermediate positions by interpolation (see Note
 5)
- $f_1 = 3.5$ forward and 3.2 aft
- $F_{\rm s}={
 m fatigue}$ factor for side longitudinals For built symmetric sections, flat bars, bulbs and T bars
 - = 1,05 at keel, 1,1 at T, 1,0 at 1,6T and above
 For angle bars:
 - $= 0.5 \left(1 + \frac{1.1}{k_s}\right) \text{ at keel}$
 - $= \frac{1,1}{k_{\rm S}} \operatorname{at} \frac{D}{2}$
 - = 1,0 at 1,6 *T* and above

Intermediate values by linear interpolation

Built asymetric sections will be specially considered.

- Note 1. Where frames are inclined at more than 15° to the vertical, H is to be measured along a chord between the span points of the frame.
- **Note** 2. The modulus for these members need not exceed that derived from (4) using H in place of S_1 .
- **Note** 3. Where struts are fitted midway between transverses in double skin construction, the modulus of the side longitudinals may be reduced by 50k per cent from that obtained for locations (2) and (3) as applicable.
- **Note** 4. Shell framing is also to comply with the requirements for bottom slamming and bow flare impact in Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming and Vol 1, Pt 6, Ch 3, 15 Strengthening for wave impact loads above waterline respectively.

Note 5. For ships where $T > 0.65D_1$, the distribution of f_{cw} will be specially considered.

3.10.2 Shell envelope primary structure for both longitudinally and transversely framed ships is to comply with the requirements of *Table 3.3.4 Shell envelope primary structure*.

Table 3.3.4 Shell envelope primary structure

Item and location	Modulus, in cm ³	Inertia, in cm ⁴

Intermediate

values by linear

interpolation

- = ρ , s, S, k_s are as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1
- = D, T, L_R are as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars
- h_4 = tank head, in metres, as defined in *Table 3.3.6* Deck plating
 - L = load head, in metres, measured from mid-point of span to upper deck at side amidships
- $l_{\rm e}$ = effective length of stiffening member, in metres, see Vol 1, Pt 6, Ch 2, 2.6 Determination of span length
- h T1 = as defined in Table 3.3.3 Shell envelope framing forward and aft

- f_{γ} = measured at midspan of member fwd of 0,8 $L_{\rm R}$
 - = 1,0 at base line
 - $= B_f$ at 0,6D above base
 - = $0.5 (B_f 1) + 1 \text{ at } D$ above base
 - = 1,0 at any depth aft of $0.8L_{\rm R}$

 $B_{\rm f} = {\rm see} \, {\it Figure} \, 3.3.2 \, {\it Bow fullness factor} \, {\rm for \, frame}$ members fwd of 0,8 $L_{\rm R}$

= 1 for framing members aft of $0.8L_{R}$

 $C_2 C_3$ = from Figure 3.3.4 Framing Factors C2 (C3)

H = vertical height between decks in metres

Note 1. For primary structure in way of machinery spaces and also forward of 0,8*L*_R the minimum web depth is not to be less than 2,5 times the depth of adjacent frames or longitudinals as appropriate. Stringers forward of 0,8*L*_R may be 2,2 times the depth of the adjacent stiffener.

Note 2. For stringers and webs in fore peak tanks or deep tanks, see Vol 1, Pt 3, Ch 2, 3.8 Deep tank structure.

Note 3. The breadths and effective length should be measured along the line of the shell.

Conditions for ϕ

- 1. ϕ to be deduced at 0,975 L_R
- 2. Aft of fore peak tank $\boldsymbol{\varphi}$ is to be deduced at section being considered
- For ships with a bulbous bow the angle φ is to be measured from the narrowest point of the bow between 0,6D from base and upper deck

Bow fullness factor $B_f=2,\!45\cos\varphi\tan\theta$ but not to be taken less than 1,0

Figure 3.3.2 Bow fullness factor

3.10.3 Additional requirements for shell envelope framing are indicated in Vol 1, Pt 6, Ch 3, 6 Shell envelope framing

3.11 Watertight bulkheads and deep tanks

3.11.1 Watertight bulkhead and deep tank scantlings are to comply with the requirements of *Table 3.3.5 Watertight and deep tank bulkhead and deck scantlings* Factors for the stiffener end connection type are given in *Figure 3.3.3 Bulkhead end constraint factors*

Volume 1, Part 6, Chapter 3

Section :

Table 3.3.5 Watertight and deep tank bulkhead and deck scantlings

			$\sqrt{2,2k_S}$ adth, $b = 760 \text{ mm}$	

Symbols

s, S, L $_1$, ρ , k $_L$, k $_S$, f are as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1

s $_{\rm b}$ = As defined in Table 3.3.1 Shell envelope plating, except of aft of 0,05L $_{\rm R}$ equal to 850 mm

L_R as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

F_D = as defined in Vol 1, Pt 6, Ch 3, 3.6 Local reduction factors

s $_{1}$ as defined in Table 3.3.1 Shell envelope plating breadth of $A_{\rm f}$ = girder face area in cm² increased plating, in mm

Note 1. The thickness derived in accordance with (1) is also to satisfy the buckling requirements of Vol 1, Pt 6, Ch 2, 3 Buckling and minimum thickness requirements.

Note 2. The deck thickness is to be not less than the basic end deck thickness as given in (4).

Note 3. Where a deck loading exceeds 43,2 kN/m², the thickness of plating will be specially considered.

Note 4. The exposed deck taper thickness is to extend into a forecastle or poop for at least one third of the beam, *B*, from the superstructure end bulkhead.

Note 5. For decks forming the boundary of a tank the plating thickness is to be 1,0 mm in excess of the requirements in *Table 3.3.5 Watertight* and deep tank bulkhead and deck scantlings for deep tanks.

Note 6. Strength deck plating from 0,075 $L_{\rm R}$ to 0,3 $L_{\rm R}$ and 0,7 $L_{\rm R}$ to 0,925 $L_{\rm R}$ is to be determined by assuming a linear taper from the midship value (1) to $t = (5.0 + 0.018L_{\rm R}) \sqrt{k_{\rm S}}$ at 0,075 $L_{\rm R}$ and 0,925 $L_{\rm R}$. The plating thickness determined is not to be less than (4). The total area of strength deck plating at 0,075 $L_{\rm R}$ and 0,925 $L_{\rm R}$ is not to be less than 30 per cent of the midship value, see *Vol 1*, *Pt 6*, *Ch 3*, 3.7 Taper requirements for hull envelope.

Volume 1, Part 6, Chapter 3

Section 3

3.12.2 Deck framing for both longitudinally and transversely framed ships is to comply with the requirements of *Table 3.3.7* Deck longitudinals (longitudinal framing) and for transversely framed ships *Table 3.3.8* Deck beams (transverse framing)

Table 3.3.7 Deck longitudinals (longitudinal framing)

$Z = 0.039 s k_{s} h_{T1} l_{e}^{2} F_{1}$ $Z = s k_{s} (360h_{1} + 0.0045 (l_{e} L_{2})^{2}) \times 10^{-4}$
$Z = s k_s (360h_1 + 0,0045 (l_e L_2)^2) \times 10^{-4}$
$Z = f_{L} s k_{s} (360h_{1} + 0,0045 (l_{e} L_{1})^{2}) \times 10^{-4}$ $Z = 0,0067s k_{s} h_{1} l_{e}^{2} \text{ or (a) above whichever is }$ greater
$Z = s k_{s} (5,4L_{1} + 23h_{2} l_{e}^{2}) \times 10^{-4}$ $Z = 0,0045s k_{s} h_{2} l_{e}^{2}$ $Z = s k_{s} (4,7L_{1} + 23h_{2} l_{e}^{2}) \times 10^{-4}$ $Z = 0,0039s k_{s} h_{2} l_{e}^{2}$
To be specially considered
_

Symbols

ρ, L₁, L₂, s, k_s as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1

D, T, L $_{\rm R}$ as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

F_D as defined in Vol 1, Pt 6, Ch 3, 3.6 Local reduction factors

$$C_1 = \frac{60}{225 - 165F_{\rm D}}$$

 d_{W} = web depth of longitudinal, in mm, see Note 2

$$F_1 = 0,25C_1$$

 $l_{\rm e}$ = as defined in Vol 1, Pt 6, Ch 2, 2.6 Determination of span length, but not to be taken less than 1,5 m

$$h_{\text{T1}} = \frac{L_1}{\text{the greater of } \frac{L_1}{70} \text{ or 1,20 m}}$$

$$f_{\text{FB}} = \frac{0,0914 + 0,003L_{\text{R}}}{D - T} - 0,15$$

 h_2 = deck pressure head (see Note 4)

= 2,6 for machinery spaces, workshops or hangers

= 2,0 for stores

= 1,2 for accommodation decks and void spaces

= $h_{\rm m}$ for general cargo spaces

Volume 1, Part 6, Chapter 3

Section 3

 $h_{\rm m}$ = general cargo deck pressure head, to be taken as equivalent to the pressure head produced by filling the hold to its full depth at a stowage rate of 1,39 m³/tonne, unless specified otherwise (see Note 6).

fwd of 0,925 $L_{\rm R}$

$$f_{L} = 1,57$$

$$h_1 = 1.8$$

from $0.88L_{R}$ to $0.925L_{R}$

$$f_{L} = 1,43$$

$$h_1 = 1,5$$

aft of 0,88L R

 $f_{L} = 1,23 \text{ (see Note 3)}$

$$h_1 = 1.2 + 2.04 f_{FB}$$

Note 1. Where weather decks are intended to carry deck equipment and the load is in excess of 8,5 kN/m², the scantlings of longitudinals will be specially considered.

Note 2. The web depth of longitudinals, $d_{\rm w}$ is to be not less than 60 mm.

Note 3. For taper end modulus calculation $f_L = 1,23$ at $0,925L_R$

Note 4. Where the deck forms the boundary of a tank, the additional requirements of *Table 3.3.5 Watertight and deep tank bulkhead and deck scantlings* for deep tanks are to be applied.

Note 5. The modulus of strength deck longitudinals from $0.075L_R$ to $0.3L_R$ and $0.7L_R$ to $0.925L_R$ is to be determined by assuming a linear taper from the midship value (1) to the basic weather deck value (2) at $0.075L_R$ and $0.925L_R$. The modulus determined is not to be less than 2(b) or 2(c), as appropriate, see *Vol 1*, *Pt 6*, *Ch 3*, *3.7 Taper requirements for hull envelope*. The total area of longitudinals at $0.075L_R$ is not to be less than 50 per cent of the midship's value.

Note 6. If the hold does not have a uniform cross-section the breadth and/or length averaged over the averaged depth, to an equivalent rectangular section, may be used when determining the volume of the hold.

Table 3.3.8 Deck beams (transverse framing)

Location	Modulus, in cm ³

 $l_{\rm e}$ = effective length of stiffening member as defined in Vol 1, Pt 6, Ch 2, 2.6 Determination of span length

f FB = see Table 3.3.7 Deck longitudinals (longitudinal framing)

P dh = deckhouse pressure, see Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd

P wd = weatherdeck pressure, see Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd

P in = internal deck pressure, see Vol 1, Pt 5, Ch 3, 5.3 Pressure on internal decks, Pin

Note 1. The section modulus of side frames forming part of the side shell is to comply with the requirements for shell envelope framing.

Note 2. The section modulus of superstructure stiffening is not to be less than that required by *Table 3.3.7 Deck longitudinals (longitudinal framing)* and *Table 3.3.8 Deck beams (transverse framing)* for full width superstructures.

- 3.13.3 The section modulus of deck girders and transverses is to be in accordance with the requirements of *Vol 1*, *Pt 6*, *Ch 3*, 3.12 Deck structures 3.12.3 using H_g equal to 0,1 P_{wd} , 0,1 P_{dh} or 0,1 P_{in} as appropriate, where P_{wd} , P_{dh} and P_{in} are defined in *Vol 1*, *Pt 5*, *Ch 3*, 3.5 *Pressure on exposed and weather decks, Pwd*
- 3.13.4 The thickness of the superstructures and deckhouses is in no case to be less than the appropriate minimum requirements given in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements
- 3.13.5 Additional requirements for superstructures, deckhouses and bulwarks are indicated in Vol 1, Pt 6, Ch 3, 11 Superstructures, deckhouses and bulwarks
- 3.13.6 Superstructure deckhouse and bulwark stiffeners are to be continuous or efficiently bracketed top and bottom. Where this is impractical the modulus is to be increased by 20 per cent and the ends welded to the deck all round.

3.14 Single and double bottom structures

- 3.14.1 Single bottom scantlings are to comply with the appropriate minimum requirements given in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements For the forward region, the requirements of Table 3.3.12 Single bottom construction forward, minimum requirements are to be complied with.
- 3.14.2 Double bottom scantlings are to comply with Table 3.3.11 Double bottom requirements (0,2L $_R$ to 0,8L $_R$) and the appropriate minimum requirements given in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements

Table 3.3.11 Double bottom requirements $(0.2L_R)$ to $0.8L_R$

Location	Thickness, in mm
Inner bottom plating,(see Note)	$t = 0,00122(s+660)(k_s^2 L_B T)^{0.25}$
Longitudinal framing	modulus, in cm ³

Volume 1, Part 6, Chapter 3 Section 3

Inner bottom longitudinals	The greater of the following:	
	(a) $Z = (0,0017l_{e1} + 0,035)sk_sh_{T2}l^2e^Fs^F1$	
	(b) $Z = (0,0017l_{e1} + 0,035)sk_sh_{T3}l^2e^F_sF_1$	
Transverse framing		
Inner bottom transverse frames	$Z = 1.7 \text{sk}_{\text{s}} \text{Tl}_{\text{e}} \text{x} 10^{-2}$	
Symbols		
s, k _s are as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1		
L _R , T are as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars		
$l_{\rm e1}, l_{\rm e}, h_{\rm T2}, h_{\rm T3}, F_{\rm 1}$ are as defined in Table 3.3.2 Shell envelope framing (0,2L $_{R}$ to 0,8L $_{R}$)		
$F_{\rm s}$ is as defined in Table 3.3.3 Shell envelope framing forward and aft		
Note The thickness of the margin plate, where fitted, is to be increased by 20 per cent.		

Table 3.3.12 Single bottom construction forward, minimum requirements

Area	ltem	Requirement	
Longitudinal framing minimum requirements			
Centreline girder:	Thickness, in mm	$t = (0,007 \mathrm{d_f} + 1) \sqrt{\mathrm{k_S}}$	
		$t = (0,007 d_{f} + 1)\sqrt{k_{S}}$ $t = (0,006 d_{f} + 1)\sqrt{k_{S}} butneednotexceed 12\sqrt{k_{S}}$	
Floors and Girders	Thickness, in mm Depth (d f), in mm	As midship region, see Table 3.2.1 Minimum structural requirements	
Bottom Transverses	Spacing, in m	See Vol 1, Pt 3, Ch 2, 3.4 Shell framing 3.4.4	
Transverse framing minimum require	ements		
Centreline girder	Thickness, in mm	$t = 0.95 \sqrt{L_{\rm R} k_{\rm S}}$ but not less than 6 mm forward of 0,925L _R . Between	
		0,925 $L_{\rm R}$ and 0,7 $L_{\rm R}$ the thickness may taper to the midship thickness	
	Modulus, in cm ³	the greater of:	
		$Z = 8k_sSh_5l_{e^2}$	
		$Z = 8k_sSh_4l_{e^2}$	
	Inertia, in cm ⁴	$I = \frac{2,51}{k_s} \frac{Z}{k_s}$	
		K _S	
Floors in tanks	Spacing	every frame	
	Depth, in mm	$d_{\rm f} = 83D + 150$ or 1400 whichever is less	
	Thickness, in mm	$t = (5, 5 + 0, 023L_2)\sqrt{S_2/800}$	
	Face plate area, in cm ²	$A_{\rm f} = 0.85 L_{\rm s} B$	
Girders in tanks	Spacing, in metres	0,003s _f	
	Depth, in mm	as for floors	
	Scantlings	as midship region, see Table 3.2.1 Minimum structural requirements

	Scantlings	as midship region, see Table 3.2.1 Minimum structural requirements	
Symbols			

 L_2 , S, s, k_s , ρ are as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1

L_R, B, D are as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

 l_{e} = effective length of stiffening member

 h_4 = tank head, in metres, as defined in Table 3.3.5 Watertight and deep tank bulkhead and deck scantlings

 h_5 = distance, in metres, from mid-point of span to the following positions:

(a) forward of 0,85L_B: 3 m above the deck height obtained from Vol 1, Pt 3, Ch 2, 5.3 Minimum bow height and extent of forecastle

(b) at $0.8L_R$: the upper deck at side

(c) between 0,85L_R and 0,8L_R, by interpolation between (a) and (b)

 s_F = transverse frame spacing, in mm

 s_2 = spacing of stiffener, in mm, but to be taken not less than 800 mm

Note 1. For ships having one or more longitudinal bulkheads the maximum spacing may be increased but is not to exceed that for the midship region.

Note 2. Frame structure is to comply with the requirements of Table 3.3.5 Watertight and deep tank bulkhead and deck scantlings

Note 3. See also the requirements for bottom slamming and bow flare impact.

3.14.3 In the forward region, the requirements of Table 3.3.13 Double bottom construction forward are to be complied with.

Table 3.3.13 Double bottom construction forward

Item and parameter	Requirements	
	Transverse framing	Longitudinal framing
(1 Centreline girder:) (a) Thickness forward of 0,075 <i>L</i> _R from the F.P.	$t = (0,007 \ d_{\text{DB}} + 2) \sqrt{k_{_{\rm S}}} \ \text{mm (see Note 2)}$	
(2 Plate floors:) (a) Maximum spacing forward of 0,8L _R	0,002s _F m	2,5 m
(b) Maximum spacing aft of 0,8L _R (c) Scantlings	As for midship region As for midship region	As for midship region, see <i>Table 3.2.1 Minimum</i> structural requirements As for midship region, see <i>Table 3.2.1 Minimum</i> structural requirements
(3 Watertight floors and bracket) floors	As for midship region	As for midship region

Volume 1, Part 6, Chapter 3

Section 3

(4 Side girders (see Note 1):) (a) Maximum spacing forward of 0,8L _R	0,003s _F m	0,004s _L or 3,7 m whichever is the lesser	
(b) Maximum spacing aft of $0.8L_{\rm R}$	As for midship region	As for midship region, see Table 3.2.1 Minimum structural requirements	
(c) Scantlings	As for midship region	As for midship region, see Table 3.2.1 Minimum structural requirements	
(5 Inner bottom plating (see Note 2):) (a) Thickness at or forward of 0,925L R $t = \left(0,00115(s+660)\sqrt[4]{k^2}_{\rm s}L_{\rm R}T\right)$ mm or 5,5 mm, whichever is the greater, see Note 2			
(b) In way of deep tanks or holds used for the carriage of water ballast or where the double bottom tank is common with a wing ballast tank	$t=0.0057S\beta\sqrt{h_4k_{\rm S}}$ mm or 5,5 mm, whichever is the greater		
(6 Inner bottom longitudinals)	As for midship region		
	Symbols		
L _R ,T are as defined in Vol 1, Pt 3, Ch	1, 5.2 Principal particulars		
S, s, k _s are as defined in Vol 1, Pt 6, C	th 3, 3.2 Symbols 3.2.1		
d DB = minimum depth of centre girder as required by Table 3.2.1 Minimum structural requirements			
h_4 = tank head, in metres, as defined in <i>Table 3.3.6 Deck plating</i>			
s_F = transverse frame spacing, in mm			
s_{L} = spacing of bottom longitudinals, in mm			
β = aspect ratio correction factor, Vol 1, Pt 6, Ch 2, 2.5 Aspect ratio correction 2.5.1.			
Note 1. The girders forward of $0.8L_R$ are to be suitably scarfed into the midship girder arrangement. Note 2. From $0.7L_R$ to $0.925L_R$ the taper thickness is to be used.			

- 3.14.4 Additional requirements for single and double bottom structures are indicated in Vol 1, Pt 6, Ch 3, 7 Single bottom structures and Vol 1, Pt 6, Ch 3, 8 Double bottom structures.
- 3.14.5 Where there are large unsupported areas of double bottom and single bottom structure, the designer's calculations are to be submitted.

3.15 Fore peak structure

3.15.1 Internal structure in the fore peak is to comply with the requirements of *Table 3.3.14 Fore peak structure*

Volume 1, Part 6, Chapter 3

Section 3

Table 3.3.14 Fore peak structure

ltem	Parameter	Requirements
(1) Perforated flats and wash bulkheads excluding lowest strake of plating (see Note)	Plating thickness Stiffener modulus	$t = 5.5 + 0.013L_{R} \sqrt{s_1/800} \text{ mm}$ $Z = \frac{0.0052sk_sh_6l^2e}{f_s}$
(2) Diaphragms in bulbous bows and the lowest strake of plating	Plating thickness	$t = (5,5 + 0,23L_{R}) \sqrt{s_1/800} \text{ mm}$
Sym	nbols	
$L_{\rm R}$ is as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars s, $k_{\rm S}$ are as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1	· ·	ective length of the stiffening member, see Vol Pt 6, Ch 2, 2.6 Determination of span length
f_s = 1,4 for rolled or built sections 1,6 for flat bars h_6 = vertical distance, in metres, from the mid depth of the tank to the top of the tank.	·	acing of stiffeners, in mm, but to be taken not as than 800 mm

Note For horizontal flats supporting vertical webs in the fore peak tank the thickness of the flat in the web is to comply with the requirements of $t = a/(80 + 20a/b) \sqrt{k_g}$ for horizontal stiffening or $t = a/(73 + 27(a/b)^2) \sqrt{k_g}$ for vertical stiffening

Note where a is the lesser dimension of the unstiffened plate panel b is the greater dimension of the unstiffened plate panel.

Table 3.3.15 Magazine bulkhead and deck scantlings

Item and requirement	Magazine bulkheads and decks	
Plating		
(1) Plating thickness for plane, symmetrically corrugated and double plate bulkheads	$t = 0,004s \beta \sqrt{h_5 k_5} \text{ mm}$	
Secondary stiffening		
(2) Modulus of rolled and built stiffeners	$Z = \frac{sk_{s}h_{5}l_{e}^{2}}{71f_{s}(\omega_{1} + \omega_{2} + 2)} \text{ cm}^{3}$	
Primary stiffening		
(3) Modulus of stringers or webs supporting vertical or horizontal stiffening	$Z = 5.0k_S h_5 S l_{e^2 \text{ cm}^3}$	
Symbols		

Volume 1, Part 6, Chapter 3

Section 4

- s, S, k_s as defined in Table 3.2.1 Minimum structural requirements
 - I_e = effective length of stiffening member in metres and for bulkhead stiffeners, see Figure 3.3.3 Bulkhead end constraint factors
 - f_s = 1,4 for rolled or built sections and double plate bulkheads
 - = 1.6 for flat bars
 - = 1,0 for symmetrical corrugations of magazine bulkheads
 - $h_5 = 0.1P_{mag}$

P mag is the quasi-static design pressure defined in Vol 1, Pt 5, Ch 3, 5.11 Design pressure for magazine decks and bulkheads

 ω 1 and ω 2 are bulkhead end constraint factors, see Figure 3.3.3 Bulkhead end constraint factors

β = aspect ratio correction factor, see Vol 1, Pt 6, Ch 2, 2.5 Aspect ratio correction 2.5.1

Note Corrugated bulkheads are to comply with the requirements of *Vol 1, Pt 6, Ch 2, 2.3 Section properties*. Both the plate panels and section inertia and modulus requirements are to be assessed.

3.16 Magazine structure

3.16.1 Magazine structure which is assessed in accordance with *Vol 1, Pt 4, Ch 1, 6.4 Structure* is to comply with the requirements of *Table 3.3.15 Magazine bulkhead and deck scantlings*.

■ Section 4

NS2 and NS3 scantling determination

4.1 General

- 4.1.1 The scantlings for NS2 and NS3 ships may be determined from the global and local requirements defined in this Section. In addition, the general requirements of *Vol 1, Pt 6, Ch 3, 5 Shell envelope plating* to *Vol 1, Pt 6, Ch 3, 15 Strengthening* for wave impact loads above waterline are to be complied with.
- 4.1.2 This section contains various Tables indicating the design pressures, beam models and stiffener type coefficients which may be used in conjunction with the appropriate scantling formulae indicated in *Vol 1, Pt 6, Ch 2 Design Tools* and the structural design factors in *Vol 1, Pt 6, Ch 5 Structural Design Factors* to determine the required scantlings for both plating and stiffening members of NS2 and NS3 type ships.
- 4.1.3 In the determination of scantlings for stiffening members assumptions have been made about the degree of end fixity in way of their end connections. Where it can be demonstrated that the degree of end fixity is greater than that assumed then consideration will be given to lesser scantling requirements. In such cases the builders/designers are to submit sufficient information to enable an assessment of the degree of end fixity to be made and are to obtain acceptance of their proposals prior to submission of the scantling plans.
- 4.1.4 The geometric properties of stiffener sections are to be in accordance with Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections
- 4.1.5 The scantlings in this Section are based on the assumption that the correct coatings are used and a proper maintenance regime is employed such that there is negligible loss in strength due to corrosion. For corrosion margins, see Vol 1, Pt 6, Ch 6, 3.8 Corrosion margin.

4.2 Hull girder strength

- 4.2.1 For all ships, the hull girder strength requirements of Vol 1, Pt 6, Ch 4, 2 Hull girder strength are to be complied with.
- 4.2.2 As required by Vol 1, Pt 6, Ch 4, 2 Hull girder strength, the hull girder bending and shear stresses for all longitudinally effective material is to be checked against the permissible stresses and the buckling requirements of Vol 1, Pt 6, Ch 2, 3 Buckling

Volume 1, Part 6, Chapter 3

Section 4

The lateral and torsional stability of all effective longitudinals, together with the web and flange buckling criteria, is to be verified in accordance with Vol 1, Pt 6, Ch 2, 3 Buckling.

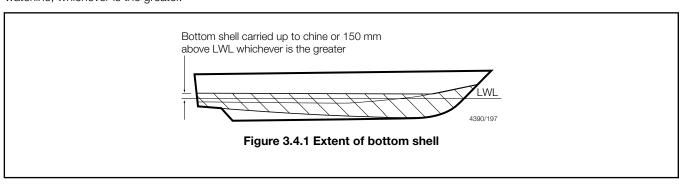

4.3 Shell envelope plating

- 4.3.1 The requirements of this Section are applicable to longitudinally and transversely framed shell envelope plating.
- 4.3.2 The thickness of the shell envelope plating is in no case to be less than the appropriate minimum requirement given in *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements*
- 4.3.3 Additional requirements for shell envelope plating are indicated in Vol 1, Pt 6, Ch 3, 5 Shell envelope plating
- 4.3.4 The thickness requirement for shell envelope plating may be determined from the general equations given in *Vol 1*, *Pt 6*, *Ch 2*, *2.7 Plating general*, the pressures given in *Table 3.4.1 Shell envelope plating* and the structural design factors in *Vol 1*, *Pt 6*, *Ch 5 Structural Design Factors*.

Table 3.4.1 Shell envelope plating

Structural element	Design pressure		
Bottom plating	Below waterline, the greater of		
Bilge plating	(a) $P_h + 1,26P_W$		
Side shell plate	(b) 1,26P _{dl}		
Sheerstrake			
	Above the waterline		
	1,26P _s		
Symbols			

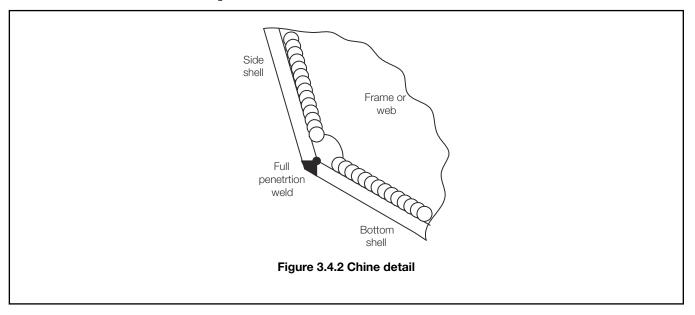

- P_h = the hydrostatic pressure on the shell plating, as defined in Vol 1, Pt 5, Ch 3, 3.3 Hydrostatic pressure on the shell plating, Ph
- P_W = the hydrodynamic wave pressure on the shell plating, as defined in Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure,
- P_s = the design pressure on the shell envelope, as defined in Vol 1, Pt 5, Ch 3, 3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating, Ps
- P_{dl} = the bottom impact pressure for planing hull forms as defined in Vol 1, Pt 5, Ch 3, 4.5 Bottom impact pressure for ships operating in the planing regime This is not applicable for displacement hull forms.
- 4.3.5 For NS3 ships the minimum thickness requirement for bottom shell plating, see Figure 3.4.1 Extent of bottom shell, as detailed in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements, is to extend to the chine line or 150 mm above the design waterline, whichever is the greater.

Volume 1, Part 6, Chapter 3

Section 4

- 4.3.6 Where a chine or knuckle is fitted between the bottom shell and side shell plating, the chine plate thickness is to be equivalent to the bottom shell thickness required to satisfy the Rule pressure loading, increased by 20 per cent, or 6 mm, whichever is the greater.
- 4.3.7 Where tube is used in chine construction, the minimum wall thickness is to be not less than the thickness of the bottom shell plating increased by 20 per cent.
- 4.3.8 Full penetration welding of shell plating in way of chine is to be maintained.
- 4.3.9 Chine details are to be such that the continuity of structural strength across the panel is maintained. Details of chines are to be submitted for consideration, see *Figure 3.4.2 Chine detail*

4.4 Shell envelope framing

- 4.4.1 The requirements of this Section are applicable to longitudinally and transversely framed shell envelopes.
- 4.4.2 Additional requirements for shell envelope framing are indicated in Vol 1, Pt 6, Ch 3, 6 Shell envelope framing
- 4.4.3 The section modulus, inertia and web area requirements for shell envelope stiffening may be determined from the general equations given in *Vol 1*, *Pt 6*, *Ch 2*, *2.8 Stiffening general*, the pressures given in *Table 3.4.2 Shell envelope framing* and the structural design factors in *Vol 1*, *Pt 6*, *Ch 5 Structural Design Factors*

Volume 1, Part 6, Chapter 3

Table 3.4.2 Shell envelope framing

- P_h = the hydrostatic pressure on the shell envelope, as defined in Vol 1, Pt 5, Ch 3, 3.3 Hydrostatic pressure on the shell plating, Ph
- P w = the hydrodynamic wave pressure on the shell envelope, as defined in Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure,
- P s = the design pressure on the shell envelope, as defined in Vol 1, Pt 5, Ch 3, 3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating, Ps
- $P_{
 m dl}$ = the bottom impact pressure for planing hull forms, as defined in Vol 1, Pt 5, Ch 3, 4.5 Bottom impact pressure for ships operating in the planing regime This is not applicable for displacement hull forms.

Note 1. Longitudinal and transverse frame stiffeners are secondary stiffening members, see Vol 1, Pt 3, Ch 2, 2.3 Definitions and structural terms 2.3.1 In general, secondary stiffening members, are to be designed using beam model 'B', see Table 2.2.1 Section modulus, inertia and web area coefficients for different load models. Such members are in general to be continuous or made effectively continuous by means of suitable bracketing.

Note 2. Guidelines for the design of primary stiffening members are given in Vol 1, Pt 3, Ch 2, 3.2 Primary members 3.2.1. In general, primary stiffening members are to be designed using load model 'A', see Table 2.2.1 Section modulus, inertia and web area coefficients for different load models. Primary members are to be substantially bracketed at their end connections.

4.5 Inner bottom structures

- 4.5.1 The requirements of this Section are applicable to longitudinally and transversely framed inner bottom structure.
- The thickness of the inner bottom plating is in no case to be less than the appropriate minimum requirement given in Vol 4.5.2 1, Pt 6, Ch 3, 2 Minimum structural requirements.

460 LLOYD'S REGISTER

Volume 1, Part 6, Chapter 3

Section 4

- 4.5.3 Additional requirements for inner bottom structures are indicated in Vol 1, Pt 6, Ch 3, 8 Double bottom structures.
- 4.5.4 The thickness requirement for inner bottom plating may be determined from the general equations given in *Vol 1*, *Pt 6*, *Ch 2*, *2.7 Plating general*, the pressures given in *Table 3.4.3 Inner bottom structures* and the structural design factors in *Vol 1*, *Pt 6*, *Ch 5 Structural Design Factors*

Table 3.4.3 Inner bottom structures

Structural element	Design pressure	Beam model Stiffening type factor, $\delta_{\rm f}$		Remarks	
Inner bottom plating	P _{hd} + 1,26P _{w,da}				
Longitudinal framing					
Inner bottom longitudinals	$\delta_{\rm f} (P_{\rm hd} + 1,26 P_{\rm w,da})$	В	0,8	See Note 1	
Transverse framing					
Inner bottom transverse frames	$\delta_{\rm f} (\!P_{\rm hd} + 1,\!26P_{\rm w,da}\!)$	В	0,8	See Note 1	
Symbols					

 P_{hd} = is the P_h value for the local damaged draft, where P_h is the hydrostatic pressure on the shell envelope, as defined in *Vol 1*, $Pt \ 5$, $Ch \ 3$, $3.3 \ Hydrostatic pressure on the shell plating, <math>Ph$

P_{w,da} = the hydrodynamic wave pressure on the shell envelope, P_w, as defined in Vol 1, Pt 5, Ch 3, 3.4 Hydrodynamic wave pressure, Pw, but based on a reduction in the local wave height for the damaged situation. The local wave height factor, f_{Hs}, used to derive P_w may be taken as specified in Vol 1, Pt 5, Ch 3, 1.2 Environmental conditions 1.2.2 but may be reduced by a factor of 1,85.

Hence $P_{w,da} = P_w/1,85$

Note 1. Longitudinal and transverse frame stiffeners are secondary stiffening members, see *Vol* 1, *Pt* 3, *Ch* 2, 2.3 Definitions and structural terms 2.3.1. In general, secondary stiffening members are to be designed using load model 'B', see *Table 2.2.1 Section modulus, inertia and web area coefficients for different load models*. Such members are in general to be continuous or made effectively continuous by means of suitable bracketing.

Note 2. Where the inner bottom forms the boundary of a deep tank, the deck is to be examined for compliance with the requirements for deep tanks, see *Table 3.4.4 Watertight and deep tank bulkhead scantlings*

Note 3. Where the inner bottom forms the boundary of a watertight subdivision, the inner bottom is to be examined for compliance with the requirements for watertight bulkheads, see *Table 3.4.4 Watertight and deep tank bulkhead scantlings*

Note 4. Where the inner bottom is subject to cargo deck or internal deck loadings, the inner bottom is to be examined for compliance with the requirements for lower decks and internal decks, see *Table 3.4.5 Deck structures*

Note 5. Where the inner bottom is subject to wheel loadings arising from vehicles or helicopters/aircraft, the inner bottom is to be examined for compliance with the requirements for vehicle decks, see *Vol 1, Pt 4, Ch 3, 2 Vehicle decks and fixed ramps*, or aircraft operation, see *Vol 1, Pt 4, Ch 2, 10 Aircraft operations*, as appropriate.

4.5.5 The section modulus, inertia and web area requirements for inner bottom stiffening may be determined from the general equations given in Vol 1, Pt 6, Ch 2, 2.8 Stiffening general, the pressures given in Table 3.4.3 Inner bottom structures and the structural design factors in Vol 1, Pt 6, Ch 5 Structural Design Factors

4.6 Watertight bulkheads and deep tanks

- 4.6.1 The requirements of this Section are applicable to longitudinally and transversely framed watertight bulkhead and deep tank structure.
- 4.6.2 The thickness of the bulkhead plating is in no case to be less than the appropriate minimum requirement given in *Vol 1*, *Pt 6, Ch 3, 2 Minimum structural requirements*
- 4.6.3 Additional requirements for watertight bulkhead and deep tank structure are indicated in Vol 1, Pt 6, Ch 3, 9 Bulkheads and deep tanks

Volume 1, Part 6, Chapter 3

Section 4

- 4.6.4 The thickness requirement for bulkhead plating may be determined from the general equations given in *Vol 1*, *Pt 6*, *Ch 2*, *2.7 Plating general*, the pressures given in *Table 3.4.4 Watertight and deep tank bulkhead scantlings* and the structural design factors in *Vol 1*, *Pt 6*, *Ch 5 Structural Design Factors*
- 4.6.5 The section modulus, inertia and web area requirements for bulkhead stiffening may be determined from the general equations given in *Vol 1*, *Pt 6*, *Ch 2*, *2.8 Stiffening general*, the pressures given in *Table 3.4.4 Watertight and deep tank bulkhead scantlings* and the structural design factors in *Vol 1*, *Pt 6*, *Ch 5 Structural Design Factors*

Table 3.4.4 Watertight and deep tank bulkhead scantlings

Structural element	Design pressure	Beam model	Stiffening type factor, δ_{f}	Remarks
(1 Watertight bulkheads and decks)				
Plating	P bhp	_	_	
Secondary stiffeners	P bhs	В	_	See Note 1
Primary stiffeners	P bhs	А	_	See Note 2
(2 Deep tank bulkheads and decks)				
Plating	P bhp	_	_	
Secondary stiffeners	P bhs	В	_	See Note 1
Primary stiffeners	P bhs	А	_	See Note 2
(3 Collision bulkhead)				
Plating	P bhp	_	_	
Secondary stiffeners	P bhs	В	_	See Note 1
Primary stiffeners	P bhs	А	_	See Note 2

Symbols

P bhp and P bhs = are the watertight bulkhead and deep tank pressure values of the plate panel and stiffener respectively, as defined in Vol 1, Pt 5, Ch 3, 5.8 Design pressures for watertight and deep tank bulkheads and boundaries.

P _{bhp} and P _{bhs} = pressure are the pressure values for the plate panel and stiffeners of the collision bulkhead as defined in *Vol 1*, *Pt 5*, *Ch 3*, 5.9 *Design pressures for collision bulkheads*.

Note 1. Secondary stiffening members are, in general, defined in *Vol* 1, *Pt* 3, *Ch* 2, 2.3 Definitions and structural terms 2.3.1. In general, secondary stiffening members are to be designed using load model 'B', see *Table* 2.2.1 Section modulus, inertia and web area coefficients for different load models. Such members are in general to be continuous or made effectively continuous by means of suitable bracketing.

Note 2. Guidelines for the design of primary stiffening members are given in *Vol* 1, *Pt* 3, *Ch* 2, 2.3 Definitions and structural terms 2.3.1 In general, primary stiffening members are to be designed using load model 'A', see *Table* 2.2.1 Section modulus, inertia and web area coefficients for different load models. Primary members are to be substantially bracketed at their end connections.

4.7 Deck structures

- 4.7.1 The requirements of this Section are applicable to longitudinally and transversely framed deck structure.
- 4.7.2 The thickness of the deck plating is in no case to be less than the appropriate minimum requirement given in *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements*
- 4.7.3 Additional requirements for deck structures are indicated in Vol 1, Pt 6, Ch 3, 10 Deck structures

Volume 1, Part 6, Chapter 3

Section 4

- 4.7.4 The thickness requirement for deck plating may be determined from the general equations given in *Vol 1, Pt 6, Ch 2, 2.7 Plating general*, the pressures given in *Table 3.4.5 Deck structures* and the structural design factors in *Vol 1, Pt 6, Ch 5 Structural Design Factors*
- 4.7.5 The section modulus, inertia and web area requirements for deck stiffening may be determined from the general equations given in *Vol 1, Pt 6, Ch 2, 2.8 Stiffening general*, the pressures given in *Table 3.4.5 Deck structures* and the structural design factors in *Vol 1, Pt 6, Ch 5 Structural Design Factors*

	Symbols		1	1			

Volume 1, Part 6, Chapter 3

Section 4

- P wd = the pressure acting on exposed and weather decks, as defined in Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd, see also Vol 1, Pt 5, Ch 3, 5.2 Pressure on external decks
- P in = the pressure acting on internal decks, as defined in Vol 1, Pt 5, Ch 3, 5.3 Pressure on internal decks, Pin
- P cd = the pressure acting on decks designed to carry cargo or heavy equipment loads, as defined in Vol 1, Pt 5, Ch 3, 5.4

 Loads for decks designed for cargo or heavy equipment loads, Pcd and Wcd, where appropriate
- P ra = the pressure on ramps and lifts, as defined in Vol 1, Pt 5, Ch 3, 6.2 Loads for ramps and lifts, Pra
- **Note** 1. In general, secondary stiffening members are to be designed using load model 'B', see *Table 2.2.1 Section modulus, inertia and web* area coefficients for different load models. Such members are in general to be continuous or made effectively continuous by means of suitable bracketing.
- **Note** 2. Guidelines for the design of primary stiffening members are given in *Table 3.2*. In general, primary stiffening members are to be designed using load model 'A', see *Table 2.2.1 Section modulus, inertia and web area coefficients for different load models*. Primary members are to be substantially bracketed at their end connections.
- Note 3. In general, primary lift and ram stiffening members are to be designed using load model 'E', see Table 2.2.1 Section modulus, inertia and web area coefficients for different load models
- **Note** 4. Where a deck forms the boundary of a deep tank, the deck is to be examined for compliance with the requirements for deep tanks, see *Table 3.4.4 Watertight and deep tank bulkhead scantlings*
- **Note** 5. Where a deck forms the boundary of a watertight subdivision or part of the shell envelope, the deck is to be examined for compliance with the requirements for watertight bulkheads, see *Table 3.4.4 Watertight and deep tank bulkhead scantlings*, or the shell envelope respectively, see *Table 3.4.2 Shell envelope framing*
- **Note** 6. Where a deck is subject to wheel loadings arising from vehicles or helicopters/aircraft, such decks are to be examined for compliance with the requirements for vehicle decks, see *Vol 1, Pt 4, Ch 3, 2 Vehicle decks and fixed ramps*, or aircraft operation, see *Vol 1, Pt 4, Ch 2, 10 Aircraft operations*, as appropriate.

4.8 Superstructures, deckhouses and bulwarks

- 4.8.1 The requirements of this Section are applicable to longitudinally and transversely framed superstructure, deckhouse and bulwark structures.
- 4.8.2 The thickness of the superstructure and deckhouse plating is in no case to be less than the appropriate minimum requirement given in *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements*
- 4.8.3 Additional requirements for superstructure, deckhouse and bulwark structures are indicated in *Vol 1, Pt 6, Ch 3, 11 Superstructures, deckhouses and bulwarks*
- 4.8.4 The thickness requirement for superstructure, deckhouse and bulwark may be determined from the general equations given in *Vol 1, Pt 6, Ch 2, 2.7 Plating general*, the pressures given in *Table 3.4.6 Superstructure, deckhouse and bulwark structures* and the structural design factors in *Vol 1, Pt 6, Ch 5 Structural Design Factors*
- 4.8.5 The section modulus, inertia and web area requirements for superstructure, deckhouse and bulwark stiffening may be determined from the general equations given in *Vol 1, Pt 6, Ch 2, 2.8 Stiffening general*, the pressures given in *Table 3.4.6 Superstructure, deckhouse and bulwark structures* and the structural design factors in *Vol 1, Pt 6, Ch 5 Structural Design Factors*

Symbols

- P wd = the pressure acting on exposed and weather decks, as defined in Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd, see also Vol 1, Pt 5, Ch 3, 5.2 Pressure on external decks
- P in = the pressure acting on internal decks, as defined in Vol 1, Pt 5, Ch 3, 5.3 Pressure on internal decks, Pin
- P dh = the pressure acting on deckhouses, bulwarks and superstructures, as defined in Vol 1, Pt 5, Ch 3, 5.5 Loads for deckhouses, bulwarks and superstructures, Pdh
- **Note** 1. In general, secondary stiffening members are to be designed using load model 'B', see *Table 2.2.1 Section modulus, inertia and web* area coefficients for different load models. Such members are in general to be continuous or made effectively continuous by means of suitable bracketing.
- **Note** 2. Guidelines for the design of primary stiffening members are given in *Vol* 1, *Pt* 3, *Ch* 2, 3.2 *Primary members* 3.2.1. In general, primary stiffening members are to be designed using load model 'A', see *Table* 2.2.1 *Section modulus, inertia and web area coefficients for different load models*. Primary members are to be substantially bracketed at their end connections.
- **Note** 3. Bulwark stays are to be designed using load model 'D' see *Table 2.2.1 Section modulus, inertia and web area coefficients for different load models*. The webs of the stays are to be carefully aligned with underdeck stiffeners and hard spots are to be avoided in way of end connections.
- **Note** 4. Where a deck is subject to wheel loadings arising from vehicles or helicopters/aircraft, such decks are to be examined for compliance with the requirements for vehicle decks, see *Vol 1, Pt 4, Ch 3, 2 Vehicle decks and fixed ramps*, or aircraft operation, see *Vol 1, Pt 4, Ch 2, 10 Aircraft operations* as appropriate.

■ Section 5

Shell envelope plating

5.1 General

- 5.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.
- 5.1.2 The requirements of this Section are applicable to longitudinally and transversely framed shell envelope plating. The basic structural scantlings of NS1 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination* The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination*. The arrangement of shell plating is to be in accordance with *Vol 1, Pt 3, Ch 2, 3.3 Shell plating*
- 5.1.3 The thickness of the shell envelope plating is in no case to be less than the appropriate minimum requirements given in *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements*.
- 5.1.4 Ships which operate aground are to comply with the requirements of Vol 1, Pt 4, Ch 3 Special Features
- 5.1.5 For ships with external blast notation the side shell above the waterline is to be in accordance with Vol 1, Pt 4, Ch 2 Military Load Specification.
- 5.1.6 Where appropriate all ship types are to comply with the requirements of Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming for bottom slamming and Vol 1, Pt 6, Ch 3, 15 Strengthening for wave impact loads above waterline for bow flare impact or wave impact above the waterline.

Volume 1, Part 6, Chapter 3

Section 5

5.2 Plate keel

- 5.2.1 The width and thickness of the plate keel are to be maintained throughout the ship from the transom to a point not less than 25 per cent of the freeboard (measured at the forward perpendicular) above the deepest load waterline on the stem. Thereafter the keel thickness may be reduced to that required by *Table 3.2.1 Minimum structural requirements* for the stem. For ships with an after cut up, the keel thickness aft of the cut up can be reduced to that of the shell plating.
- 5.2.2 Cast or forged stems are to comply with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials*, *Ch 3 Rolled Steel Plates, Strip, Sections and Bars* for rolled steel flat bars, or *Ch 5 Steel Forgings* for solid round bars. Cast or forged pieces or inserts are to comply with *Ch 4 Steel Castings* or *Ch 5 Steel Forgings* as appropriate.

5.3 Sheerstrake

- 5.3.1 The sheerstrake thickness is to be increased by 20 per cent at the ends of a superstructure extending out to the ship's side. In the case of a superstructure longer than $0.15L_{\rm R}$, the side plating at the ends of the superstructure is also to be increased by 25 per cent and tapered gradually into the sheerstrake.
- 5.3.2 Where an angled gunwale is fitted, the top edge of the sheerstrake is to be kept free of all notches and isolated welded fittings, such as spurnwaters, fairlead stools, stancheons. Bulwarks are not to be welded to the top of the sheerstrake within 0,3 to $0.7L_{\rm B}$.
- 5.3.3 Where a rounded gunwale is adopted, the welding of fairlead stools, spurnwaters, stancheons and other fittings to this plate is to be kept to the minimum, and the design of the fittings is to be such as to minimise stress concentration. The radius in general is not to be less than $15t_p$.
- 5.3.4 For ships with a shock enhanced notation, see Vol 1, Pt 4, Ch 2, 5 Underwater explosion (shock)

5.4 Skegs

5.4.1 The thickness of the skeg plating is to be not less than the thickness of the adjacent bottom shell.

5.5 Transom

5.5.1 The thickness of the stern or transom is to be not less than that required for the side or bottom shell as appropriate. Where water jet or sterndrive units are fitted, the scantlings of the plating in way of the nozzles and connections will be specially considered.

5.6 Shell openings

- 5.6.1 The thickness of the shell envelope plating around sea inlet or other opening is to be 2 mm thicker than the adjacent shell plating, or 6 mm, whichever is the greater. Arrangements are to be in accordance with Vol 1, Pt 3, Ch 2, 3.3 Shell plating
- 5.6.2 The detail and steel grade corners of large openings in the side shell will be specially considered. Generally they are to be in accordance with the requirements for large deck openings, see *Vol 1, Pt 6, Ch 3, 10.4 Deck openings 10.4.1*

5.7 Sea inlet boxes

- 5.7.1 The thickness of the sea inlet box plating is to be 2 mm thicker than the adjacent shell plating, or 6 mm, whichever is the greater. If the thickness of the adjacent shell plating is greater than 12,5 mm, the sea inlet box may be the same thickness as the shell and it need not exceed 25 mm.
- 5.7.2 Arrangements are to be in accordance with *Vol 1, Pt 3, Ch 2, 3.3 Shell plating*. Stiffeners are to be suitably supported by brackets or equivalent.

5.8 Local reinforcement/Insert plates

- 5.8.1 The thickness of the shell envelope plating is to be increased locally in way of sternframe, propeller brackets, rudder horn, stabilisers, hawse pipes, anchor recess, sea inlets, sonar openings, etc. by generally not less than 50 per cent. Details of such reinforcement are to be submitted for approval.
- 5.8.2 Insert plates are to extend outside the line of adjacent supporting structure and then be tapered over a distance of not less than three times the difference in thickness, see also Vol 1, Pt 6, Ch 6, 6.8 Insert plates

Volume 1, Part 6, Chapter 3

Section 6

5.9 Novel features

5.9.1 Where the Rules do not specifically define the requirements for novel features then the scantlings and arrangements are to be determined by direct calculation. Such calculations are be carried out on the basis of the Rules or recognised standards. Details are to be submitted for consideration.

■ Section 6

Shell envelope framing

6.1 General

- 6.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.
- 6.1.2 The requirements in this Section apply to longitudinally and transversely framed shell envelopes. The basic structural scantlings of NS1 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination*. The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination*. The arrangement of framing is to be in accordance with *Vol 1, Pt 3, Ch 2, 3.4 Shell framing*
- 6.1.3 The geometric properties of stiffener sections are to be in accordance with Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections
- 6.1.4 Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length, see also Vol 1, Pt 6, Ch 6, 6.5 Arrangement at intersection of continuous secondary and primary members
- 6.1.5 Stiffeners and brackets on side transverses which are connected to higher tensile steel longitudinals are to have their heels well radiused to reduce stress concentrations. Alternative arrangements will be considered if supported by appropriate direct calculations, see also Vol 1, Pt 6, Ch 6, 6.5 Arrangement at intersection of continuous secondary and primary members
- 6.1.6 Where higher tensile steel side longitudinals pass through transverse bulkheads in the $0.4L_{\rm R}$ amidships, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection. Particular attention should be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations.
- 6.1.7 Where higher tensile steel asymmetrical sections are adopted in double bottom tanks which are interconnected with double skin side tanks, the requirements of *Vol 1, Pt 6, Ch 3, 6.1 General 6.1.5* and *Vol 1, Pt 6, Ch 3, 6.1 General 6.1.6* are to be complied with regarding arrangements to reduce stress concentrations. Alternatively, it is recommended that bulb plate or symmetrical sections are adopted.
- 6.1.8 Where appropriate all ship types are to comply with the requirements of Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming for bottom slamming and Vol 1, Pt 6, Ch 3, 15 Strengthening for wave impact loads above waterline for wave impact above the waterline.

6.2 Frame struts or cross ties

- 6.2.1 Where struts are fitted to side shell transverse web frames or longitudinal stringers to carry axial loads, the strut cross-sectional area is to be derived as for pillars in *Vol 1, Pt 6, Ch 3, 12 Pillars and pillar bulkheads*. If the strut is fitted at the primary member half span point, the primary member section modulus may be taken as half the modulus derived above.
- 6.2.2 Design of end connections is to be such that the area of the welding is to be not less than the minimum required cross-sectional area of the strut. To achieve this, full penetration welding may be required. The weld connections between the face flats and webs of the supporting structure are to be welded using double continuous welding of an equivalent area.

Volume 1, Part 6, Chapter 3

Section 7

■ Section 7

Single bottom structures

7.1 General

- 7.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.
- 7.1.2 The basic structural scantlings of NS1 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination*. The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination* The arrangement of single bottoms are to be in accordance with *Vol 1, Pt 3, Ch 2, 3.5 Single bottom structure*.
- 7.1.3 The scantlings of the single bottom are to comply with the minimum requirements given in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements
- 7.1.4 Where appropriate all ships are to comply with the requirements of Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming for bottom slamming.
- 7.1.5 Watertight girders and floors or girders and floors forming the boundaries of tank spaces are to comply with the requirements for watertight bulkheads and deep tanks as detailed in *Vol 1, Pt 6, Ch 3, 9 Bulkheads and deep tanks*. For corrosion margins, see *Vol 1, Pt 6, Ch 6, 3.8 Corrosion margin*

7.2 Centreline girder

- 7.2.1 The web depth of the centreline girder is in general to be equal to the depth of the floors at the centreline. The minimum requirements for web depth and thickness are specified in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements
- 7.2.2 The geometric properties of the centre girder are to be in accordance with *Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections*. The buckling requirements of *Vol 1, Pt 6, Ch 2, 3 Buckling* are to be satisfied.
- 7.2.3 The face flat area of the centreline girder outside 0,3 to 0,7L _R may be 80 per cent of the value given in *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements*
- 7.2.4 The face flat thickness is to be not less than the thickness of the web.
- 7.2.5 The ratio of the width to thickness of the face flat is to be not less than 8 but is not to exceed 16.

7.3 Side girders

7.3.1 The face flat area and thickness of side girders are to comply with the requirements for plate floors as defined in *Vol 1*, *Pt 6*, *Ch 3*, *2 Minimum structural requirements* and *Vol 1*, *Pt 6*, *Ch 3*, *7.4 Floors - general*. The buckling requirements of *Vol 1*, *Pt 6*, *Ch 2*, *3 Buckling* are to be satisfied.

7.4 Floors - general

7.4.1 The web thickness, $t_{\rm w}$, of plate floors, is to be accordance with *Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections* and is to be taken as not less than:

for NS1 ships

$$t_{\rm w} = 0.9\sqrt{k_{\rm s}} \left(\frac{d_{\rm f}}{100} + 3 \right)$$
mm

for NS2 and NS3 ships

$$t_{\rm w} = \sqrt{k_{\rm s}} \left(\frac{3,4d_{\rm f}}{1000} + 2,25 \right) (S+0,5) \,\text{mm}$$

where

d_f is to be determined from *Table 3.2.1 Minimum structural requirements*

k_s and S are as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1

Where the floor spacing, S is greater than 2,0 m it is recommended that the floor thickness is calculated by direct calculations.

469

Volume 1, Part 6, Chapter 3

Section 8

7.4.2 In addition the area of face plate for NS1 ships is not to be less than

$$A_{\rm f} = 4,5T k_{\rm s} \, {\rm cm}^2$$

k_s is as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1

T, B are as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars.

- 7.4.3 If the side frames of the ship are attached to the floors by brackets, the depth of floor may be reduced by 15 per cent and the floor thickness determined using the reduced depth. The brackets are to be flanged and have the same thickness as the floors, and their arm lengths clear of the frame are to be the same as the reduced floor depth given above.
- 7.4.4 The face flat thickness is to be not less than the thickness of the web plate. The ratio of the breadth of the face flat to the thickness of the face flat is to be not less than 8 but is not to exceed 16.
- 7.4.5 Additionally floors are to comply with the requirements for bottom transverse web frames.

7.5 Single bottom structure in machinery spaces

- 7.5.1 The arrangement of structure in machinery spaces is to be in accordance with Vol 1, Pt 3, Ch 2, 6 Machinery space arrangements
- 7.5.2 The thickness, $t_{\rm w}$, of the floors in machinery spaces is to be 1 mm greater than that required by *Vol 1, Pt 6, Ch 3, 7.4 Floors general*
- 7.5.3 The depth and section modulus of floors anywhere between engine or gearbox girders is to be not less than that required to maintain continuity of structural integrity or 50 per cent of the depth given in *Vol 1, Pt 6, Ch 3, 7.4 Floors general* The face flat area and web thickness for such reduced floor heights are to be increased appropriately in order to maintain continuity of structural strength.
- 7.5.4 In way of machinery spaces situated amidships the minimum depth of floors is to be at least 10 per cent greater than that required in *Vol 1, Pt 6, Ch 3, 7.4 Floors general.* If the top of the floors is recessed in way of the engines, the depth of the floors in way of the recess should generally be not less than that required by *Vol 1, Pt 6, Ch 3, 7.4 Floors general*, but this will be specially considered in each case in relation to the arrangements proposed.
- 7.5.5 The general requirements for machinery or raft seatings are given in Vol 1, Pt 6, Ch 3, 13 Machinery and raft seatings.

7.6 Rudder horns

7.6.1 The shell plating thickness in way of the rudder horn is to be increased locally, by generally not less than 50 per cent but need not to be taken as greater than the keel thickness required by *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements*. The scantlings of rudder horns will be specially considered.

7.7 Forefoot and stem

- 7.7.1 The thickness of plate stems at the waterline is to comply with the minimum requirements for plate keels given in *Vol 1*, *Pt 6*, *Ch 3*, *2 Minimum structural requirements*, see also *Vol 1*, *Pt 6*, *Ch 3*, *5.2 Plate keel*
- 7.7.2 The forefoot and stem is to be additionally reinforced with floors.

■ Section 8

Double bottom structures

8.1 General

- 8.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.
- 8.1.2 The basic structural scantlings of NS1 ships are to be determined in accordance with Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination. The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination. The scantlings of the double bottom structure are also to comply with the appropriate minimum requirements given in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements. The arrangements of double bottoms are to comply with the requirements of Vol 1, Pt 3, Ch 3, 2.6 Rudder force

470

Volume 1, Part 6, Chapter 3

Section 8

- 8.1.3 Where a double bottom is required to be fitted, its depth at the centreline, *d* _{DB}, is to be in accordance with *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements*
- 8.1.4 This Section provides for longitudinal or transverse framing in the double bottom, but for NS1 and NS2 ships longitudinal framing is in general to be adopted. See Vol 1, Pt 3, Ch 2, 3.1 General
- 8.1.5 Where appropriate all ship types are to comply with the requirements of *Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming* for bottom slamming.
- 8.1.6 Where a floor, girder or inner bottom plating forms the boundary of a tank or part of the watertight subdivision, the requirements of *Vol 1, Pt 6, Ch 3, 9 Bulkheads and deep tanks* for deep tanks and watertight bulkheads are to be complied with. For corrosion margins, see *Vol 1, Pt 6, Ch 6, 3.8 Corrosion margin*

8.2 Centreline girder

- 8.2.1 A centreline girder is to be fitted throughout the length of the ship. The web thickness, $t_{\rm w}$, is not to be less than that required by *Vol 1*, *Pt 6*, *Ch 3*, *2 Minimum structural requirements*
- 8.2.2 The geometric properties of the girder section are to be in accordance with Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections. The buckling requirements of Vol 1, Pt 6, Ch 2, 3 Buckling are to be satisfied.
- 8.2.3 The depth of the double bottom and centreline girder is to be not less than 630 mm and it is to be sufficient to give access to all of the double bottom.
- 8.2.4 Where appropriate, vertical stiffeners are to be fitted at every bracket floor. They are to have a depth not less than the depth of the tank top frame or 150 mm, whichever is the greater. For NS2 and NS3 ships stiffeners are to have a depth of not less than $1,65L_{\rm R}$ mm with a minimum of 50 mm. The thickness is to be as required for the girder.

8.3 Side girders

- 8.3.1 The thickness of the side girders is not to be less than that of the plate floors. The buckling requirements of *Vol 1, Pt 6, Ch 2, 3 Buckling* are to be satisfied.
- 8.3.2 Vertical stiffeners are to be fitted at every bracket floors fitted and if midway between floors in accordance with *Vol 1, Pt* 6, *Ch 3,* 8.2 Centreline girder 8.2.4

8.4 Plate floors

- 8.4.1 The thickness need not be greater than 15 mm but without suitable stiffening the ratio of depth of floor at the centre to thickness must be less than 130.
- 8.4.2 Vertical stiffeners are to be fitted to all plate floors at each longitudinal. Each stiffener is to have a depth of not less than $10t_{\rm W}$ or 50 mm and a thickness of not less than $t_{\rm W}$, where $t_{\rm W}$ is the thickness of the plate floor as calculated in *Vol 1*, *Pt 6*, *Ch 3*, *2 Minimum structural requirements*. For NS1 ships, the depth of stiffeners is not to be less than 150 mm.

8.5 Bracket floors

- 8.5.1 Between plate floors, the shell and inner bottom plating centreline girders and side girders may be supported by bracket floors. The brackets are to have the same thickness as plate floors and are to be stiffened on the unsupported edge.
- 8.5.2 Where struts are fitted to reduce the unsupported span of the frames, reverse frames and longitudinals, they are to have a cross-sectional area of not less than:

(a)
$$A_{\rm S} = 0.32 Z_{\rm BF} \, {\rm cm}^2 \, {\rm for} \, Z_{\rm BF} \le 83.5 \, {\rm or}$$

(b)
$$A_s = 23, 2 + \frac{Z_{BF}}{25} \text{ cm}^2 \text{ for } Z_{BF} > 83, 5$$

where Z_{BF} is the modulus, in cm³, of the frame or longitudinal based on the effective length between floors as defined in *Vol 1*, *Pt* 6, *Ch 2*, *2.6 Determination of span length*

8.6 Additional requirements for watertight floors

8.6.1 The scantlings of watertight floors are to comply with the requirements for plate floors as given in *Vol 1, Pt 6, Ch 3, 8.5 Bracket floors*

Volume 1, Part 6, Chapter 3

Section 9

8.7 Inner bottom plating

8.7.1 Where the inner bottom also acts as the plating of a vehicle deck, stores deck or similar, the requirements of *Vol 1, Pt 6, Ch 3, 10 Deck structures* are to be complied with.

8.8 Inner bottom longitudinals

- 8.8.1 Where the double bottom tanks are interconnected with side tanks or cofferdams, the scantlings are to be not less than those required for deep tanks, see Vol 1, Pt 6, Ch 3, 9 Bulkheads and deep tanks.
- 8.8.2 Higher tensile steel inner bottom longitudinals are to be continuous as far as practicable throughout the length of the ship.

8.9 Double bottom tanks

8.9.1 The scantlings of double bottom tanks are to comply with the requirements for deep tanks given in *Vol 1, Pt 6, Ch 3, 9 Bulkheads and deep tanks*

8.10 Margin plates

8.10.1 A margin plate, if fitted, is to have a thickness as required for inner bottom plating.

8.11 Double bottom structure in machinery rooms

- 8.11.1 The arrangements of the structure in machinery spaces are to be in accordance with Vol 1, Pt 3, Ch 2, 6 Machinery space arrangements
- 8.11.2 The scantlings of floors clear of the main engine seatings, are generally to be as required in *Vol 1, Pt 6, Ch 3, 8.4 Plate floors*. In way of engine seatings the floors are to be increased in thickness, see *Vol 1, Pt 6, Ch 3, 7.5 Single bottom structure in machinery spaces* and *Vol 1, Pt 6, Ch 3, 13 Machinery and raft seatings*
- 8.11.3 Where the double bottom is longitudinally framed and transverse floors are fitted in way of the engine seatings as required by *Vol 1*, *Pt 3*, *Ch 2*, *6.6 Double and single bottom structure 6.6.4*, no additional longitudinal stiffening is required in way of the engines other than the main engine girders, provided that the spacing of girders does not exceed 1,5 times the normal spacing of longitudinals. Where this spacing of girders is exceeded, shell longitudinals are to be fitted. These are to scarf into the longitudinal framing clear of the machinery spaces. The scantlings of the longitudinals are to be determined in accordance with the appropriate requirements for bottom shell longituduals using a minimum span of 1,3 m.

■ Section 9

Bulkheads and deep tanks

9.1 General

- 9.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.
- 9.1.2 The requirements of this Section apply to a vertical system of stiffening on bulkheads. They may also be applied to a horizontal system of stiffening provided that equivalent end support and alignment are provided.
- 9.1.3 The basic structural scantlings of NS1 ships are to be determined in accordance with Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination The minimum requirements in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements are also to be complied with. Arrangements are to be in accordance with Vol 1, Pt 3, Ch 2, 3 Main hull structure and Vol 1, Pt 6, Ch 2, 3 Buckling.
- 9.1.4 The buckling requirements of Vol 1, Pt 6, Ch 2, 3 Buckling are also to be satisfied.
- 9.1.5 The scantlings of bulkheads are to be suitably increased where bulkhead stiffeners support deck girders, transverses or pillars over, see *Vol 1*, *Pt 6*, *Ch 3*, *12 Pillars and pillar bulkheads*.
- 9.1.6 For bulkheads in way of partially filled holds or tanks, sloshing forces may be required to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculations.

Volume 1, Part 6, Chapter 3

Section 9

- 9.1.7 For RAS tanks or other tanks subjected to increased loads such loads are to be indicated on the plans submitted.
- 9.1.8 For ships with an internal blast notation certain bulkheads will require to be strengthened in accordance with Vol 1, Pt 4, Ch 2 Military Load Specification
- 9.1.9 Where a watertight bulkhead includes a shaft seal, the maximum deflection is to be limited to the lesser of:
- (a) the seal manufacturer's stated tolerances in the axial and radial directions and;
- (b) the criteria as defined in Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination or Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination (NS2 and NS3 ships).

9.2 Deep tank stiffening

9.2.1 Deep tank bulkhead stiffeners are to be bracketed at both ends. The thickness of the brackets is to be not less than the web thickness of the stiffener, see Vol 1, Pt 6, Ch 6, 6 Construction details

9.3 Gastight bulkheads

- 9.3.1 Where gastight bulkheads are fitted, in accordance with the requirements of Vol 1, Pt 3, Ch 2, 4 Bulkhead arrangements the general scantling equations for bulkheads, see Vol 1, Pt 6, Ch 3, 3.12 Deck structures for NS1 ships and Vol 1, Pt 6, Ch 3, 4.6 Watertight bulkheads and deep tanks for NS2 and NS3 ships, are to be complied with using a design pressure of 2 times the test pressure.
- 9.3.2 In addition the requirements for pillar bulkheads and minimum thickness requirements of *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements* are to be complied with where appropriate.

9.4 Non-watertight or partial bulkheads

- 9.4.1 Where a bulkhead is structural but non-watertight, the scantlings are in general to be as for watertight bulkheads or equivalent in strength to web frames/primary stiffeners in the same position.
- 9.4.2 Partial bulkheads which are neither watertight nor structural are to have scantlings and arrangements which are suitable for the intended purpose, such bulkheads are outwith the scope of classification.

9.5 Corrugated bulkheads

- 9.5.1 The plating thickness and section modulus for symmetrical corrugated bulkheads are to be in accordance with watertight bulkheads or deep tank bulkheads as appropriate. The spacing, s, is to be taken as b, as defined in Figure 2.2.2 Corrugated section in Vol 1, Pt 6, Ch 2 Design Tools
- 9.5.2 In addition, the section geometric properties of *Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections* are to be complied with.
- 9.5.3 The actual section modulus may be derived in accordance with Vol 1, Pt 6, Ch 2, 2.3 Section properties 2.3.1

9.6 Wash plates

- 9.6.1 Stiffeners are to be fitted at every frame and efficiently bracketed at top and bottom.
- 9.6.2 The plate thickness is to be not less than the structural element from which the wash bulkhead is formed.
- 9.6.3 The general stiffener requirements are to be in accordance with *Vol 1, Pt 6, Ch 3, 3.11 Watertight bulkheads and deep tanks* for NS1 ships and 4.6 for NS2 and NS3 ships. However, the section modulus may be 50 per cent of that required if the end connections are bracketed.
- 9.6.4 The area of perforation is to be not less than 5 per cent and not more than 10 per cent of the total area of the bulkhead.

9.7 Cofferdams

9.7.1 The scantlings of cofferdams are to comply with the requirements of deep tank bulkheads or non-watertight bulkheads as appropriate.

Volume 1, Part 6, Chapter 3

Section 10

■ Section 10

Deck structures

10.1 General

- 10.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.
- 10.1.2 The basic structural scantlings of NS1 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination*. The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with *Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination* The thickness of the deck plating is in no case to be less than the appropriate minimum requirement given in *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements*. Arrangements of structures are to be in accordance with *Vol 1, Pt 3, Ch 2, 3.7 Deck structure*
- 10.1.3 The geometric properties of stiffener sections are to be in accordance with *Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections*. Web depth of secondary longitudinals is in general not to be less than 60 mm.
- 10.1.4 Primary and secondary stiffener end connection arrangements are, in general, to be in accordance with *Vol 1, Pt 6, Ch 6, 6 Construction details*
- 10.1.5 For vehicle decks and areas for aircraft operations, the deck scantlings are to comply with the requirements of *Vol 1*, *Pt 4*, *Ch 3*, 2 *Vehicle decks and fixed ramps* and *Vol 1*, *Pt 4*, *Ch 2*, 10 *Aircraft operations* respectively.
- 10.1.6 Decks forming the boundary of a tank are to comply with the requirements for the appropriate deck and are to be additionally examined for compliance with the requirements for deep tank plating.
- 10.1.7 Decks forming subdivision or watertight internal boundaries are to comply with the requirements for the appropriate deck and are to be additionally examined for compliance with the requirements for watertight plating and stiffening.
- 10.1.8 Deck areas and deck structures subject to weapon recoil, blast or efflux loads are to be additionally examined for compliance with the requirements of Vol 1, Pt 6, Ch 3, 10.1 General 10.1.2 for the loads defined in Vol 1, Pt 4, Ch 2, 9 Military installation and operational loads as applicable.

10.2 Deck plating

10.2.1 The thickness of the strength deck stringer plate is to be increased by 20 per cent at the ends of superstructures extending out to the ship side, deckhouses, poop and forecastle. The thickness of the strength deck is to be increased by 20 per cent in way of the corners of effective superstructures that are not full width.

10.3 Deck stiffening

- 10.3.1 Higher tensile steel deck longitudinals where used are to be continuous irrespective of the ship length.
- 10.3.2 The geometric properties of stiffener sections are to be in accordance with Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections
- 10.3.3 The stiffening arrangements and end connection of primary supporting members are to be in accordance with *Vol 1, Pt 6, Ch 6, 6 Construction details*
- 10.3.4 Where the depth of web of a longitudinal girder at the strength deck within 0,3L _R to 0,7L _R exceeds:
- (a) 55t w for mild steel members
- (b) $55t \le \sqrt{k_{\mathrm{L}}}$ for higher tensile steel members

 k_{\perp} is defined in Vol 1, Pt 6, Ch 5, 3 Scantling determination for NS2 and NS3 ships.

Additional longitudinal web stiffeners are to be fitted at a spacing not exceeding the value in (a) or (b) as appropriate, with a maximum of $65t_{\rm W}\sqrt{k_{\rm L}}$ for higher tensile steel members. In cases where this spacing is exceeded, the web thickness is, in general, to be suitably increased. Alternative proposals will be considered.

10.3.5 Web stiffeners may be flat bars of thickness $t_{\rm w}$ and depth 0,1 $d_{\rm w}$, or 50 mm, whichever is greater. Alternative sections of equivalent inertia may be adopted.

Volume 1, Part 6, Chapter 3

Section 11

10.4 Deck openings

- 10.4.1 The steel grade for the corner plating or inserts in way of large openings as required by *Vol 1, Pt 3, Ch 2, 3.7 Deck* structure for both NS1 and NS2 ships is to be in accordance with *Table 6.2.1 Material classes and grades* in *Vol 1, Pt 6, Ch 6 Material and Welding Requirements*. The required thickness of the insert plate is to be not less than 25 per cent greater than the adjacent deck thickness outside the line of openings with a minimum increase of 4 mm. The increase need not exceed 7 mm.
- 10.4.2 The steel grade for corner inserts in way of openings for lifts, or cut outs in the deck plating for side doors, etc. is to be Grade E or EH.
- 10.4.3 Welded attachments close to or on the free edge of the large opening corner plating are to be avoided. The butt welds of corner insert plates to the adjacent deck plating are to be located well clear of butts in the opening coaming or bulkheads.
- 10.4.4 Where minor deck openings, within 0,3L _R to 0,7L _R, have a total breadth or shadow area breadth in one transverse section that exceeds the limitation given in *Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.13* and *Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.14*, compensation will be required to restore the excess. This is generally to be arranged by increasing the deck plate thickness, but other proposals will be considered.
- 10.4.5 Plate panels in which openings are cut are to be adequately stiffened, where necessary, against compression and shear buckling. The corners of all openings are to be well rounded and the edges smooth.
- 10.4.6 Minor openings in the strength deck outside the line of major deck openings having a stress concentration factor in excess of 2,4 will require edge reinforcement in the form of a spigot of adequate dimensions, but alternative arrangements will be considered. The area of any edge reinforcement which may be required is not to be taken into account in determining the required sectional area of compensation for the opening. For example, elliptical openings having their major axis fore and aft and a ratio of length to breadth not less than 2 to 1 will not normally require edge reinforcement.
- 10.4.7 Where long, wide openings are arranged on lower decks, it may be necessary to increase the deck plating thickness to ensure effective support for side framing.
- 10.4.8 Lower deck openings should be kept clear of the corners of major openings and other areas of high stress, so far as possible. Compensation will not, in general, be required unless the total width of openings in any frame space, or between any two transverses, exceeds 15k s per cent of the original effective plating width. The requirements of *Vol 1, Pt 6, Ch 3, 10.4 Deck openings 10.4.1* also apply to lower deck openings except that:
- (a) the thickness of inserts, if required, for the lower deck large opening corners is to be 2,5 mm greater than the deck thickness;
- (b) inserts will not generally be required for large opening corners on non-effective decks or platform decks; and
- (c) reinforcement will not generally be required for circular openings, provided that the plate panels in which they are situated are otherwise adequately stiffened against compression and shear buckling.

10.5 Sheathing

10.5.1 The requirements for deck sheathing given in Vol 1, Pt 6, Ch 3, 2.4 Sheathing are to be complied with.

10.6 Decks used as ramps

10.6.1 Where any deck forms a ramp, such decks are to be examined for compliance with the requirements for cargo ramps, see Vol 1, Pt 4, Ch 3, 5 Movable decks, lifts, internal and external ramps

■ Section 11

Superstructures, deckhouses and bulwarks

11.1 General

- 11.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3.
- 11.1.2 The basic structural scantlings of NS1 ships are to be determined in accordance with Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination. The basic structural scantlings of NS2 and NS3 ships are to be determined in accordance with Vol 1, Pt 6, Ch 3, 4 NS2 and NS3 scantling determination. Arrangements of the structure are to be in accordance with the requirements of Vol 1, Pt 3, Ch 2, 7 Superstructures, deckhouses, bulwarks, sponsons and appendages

Volume 1, Part 6, Chapter 3

Section 12

- 11.1.3 The plating thickness of superstructures, deckhouses and bulwarks is in no case to be less than the appropriate minimum requirements given in Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements
- 11.1.4 Stiffener sections and geometric properties are to be in accordance with Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections
- 11.1.5 For ships with an external blast notation, the superstructure strength is to be in accordance with *Vol 1, Pt 4, Ch 2, 2 External blast*
- 11.1.6 Superstructures, deckhouses and bulwarks should be positioned so as to avoid direct weapon recoil, blast or efflux loads, however, where this is not possible they are to be additionally examined for compliance with the requirements of *Vol 1*, *Pt 6*, *Ch 3*, *11.1 General 11.1.2* for the loads defined in *Vol 1*, *Pt 4*, *Ch 2*, *9 Military installation and operational loads* as applicable.

11.2 Forecastle requirements

- 11.2.1 The forecastle side plating may be a continuation of the hull side shell plating or fitted as a separate assembly. Where fitted as a separate assembly, suitable arrangements are to be made to ensure continuity of the effect of the sheerstrake at the break and at the upper edge of the forecastle side. Full penetration welding is to be used.
- 11.2.2 The deck plating thickness is to be increased by 20 per cent in way of the end of the forecastle if this occurs at a position aft of $0.75L_{\rm R}$. No increase is required if the forecastle end bulkhead lies forward of $0.8L_{\rm R}$. The increase at intermediate positions of end bulkhead is to be obtained by interpolation.

11.3 Superstructures formed by extending side structures

- 11.3.1 The side plating of such superstructures having a length of $0.15L_{\rm R}$ or greater is to be increased in thickness by 25 per cent at the ends of the structure, and is to be tapered into the sheerstrake, see *Vol 1, Pt 6, Ch 3, 5.3 Sheerstrake 5.3.1* This plating is to be efficiently stiffened at the upper edge and supported by web plates not more than 1,5 m from the end bulkhead. Proposals for alternative arrangements, including the use of higher tensile steel, will be individually considered.
- 11.3.2 Where the superstructure contributes to the hull girder strength, the shear capability of the superstructure may need to be verified.

11.4 Mullions

- 11.4.1 The scantlings of mullions are to be not less than as required for a stiffener in the same position.
- 11.4.2 When determining the stiffener requirements, the width of effective plating is in no case to be taken as greater than the distance between adjacent window openings.
- 11.4.3 Where significant shear forces are to be carried by superstructures and deckhouses which have large windows, doors, vents and other openings in their side structures, adequate shear rigidity is to be verified by direct calculation.

11.5 Sheathing

11.5.1 Sheathing arrangements are to comply with the requirements of Vol 1, Pt 6, Ch 3, 2.4 Sheathing

■ Section 12

Pillars and pillar bulkheads

12.1 Application

12.1.1 The requirements of this Section, unless specified otherwise, are applicable to all ship types, NS1, NS2 and NS3. Arrangements of pillars are to be in accordance with Vol 1, Pt 3, Ch 2, 8 Pillars and pillar bulkheads

12.2 Determination of span length

12.2.1 The effective span length of the pillar, $l_{\rm ep}$, is in general the distance between the head and heel of the pillar. Where substantial brackets are fitted, $l_{\rm ep}$ may be reduced by two thirds the depth of the bracket at each end.

Volume 1, Part 6, Chapter 3

Section 12

12.3 Design loads

12.3.1 The design loading, L_{pi} , to be used in the determination of pillar scantlings is as follows:

$$L_{pi} = S_{gt} b_{gt} P_c + L_a kN$$

where

 L_{pi} = design load supported by the pillar, to be taken as not less than 5 kN

 $P_{\rm C}={\rm basic}$ deck girder design pressure, as appropriate, plus any other loadings directly above the pillar, in ${\rm kN/m^2}$

 L_a = load from pillar or pillars above, assumed zero if there are no pillars over, in kN

S _{qt} = spacing, or mean spacing, of girders or transverses, in metres

 $b_{\rm gt} = {\rm distance}$ between centres of two adjacent spans of girders or transverses supported by the pillar, in metres

12.4 Scantling determination

- 12.4.1 The minimum wall thickness of tubular pillars is to be in accordance with Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements
- 12.4.2 The cross-sectional area of the pillar, $A_{\rm p}$, is not to be less than:

$$A_{\rm p} = 10 \frac{L_{\rm pi}}{\sigma_{\rm p}} \, \, \rm cm^2$$

where

L pi = design load, in kN, supported by the pillar as determined from Vol 1, Pt 6, Ch 3, 12.3 Design loads

 σ_{p} = permissible compressive stress, in N/mm²

$$= \frac{f_{\rm pi} \, \sigma_o}{1 + 0,0051 \, \sigma_o C_{\rm f} \left(\frac{l_{\rm ep}}{r}\right)^2} \, \text{N/mm}^2$$

where

 $f_{\rm pi}$ = pillar location factor defined in *Table 3.12.1 Pillar location factors*

 σ_0 = specified minimum yield strength of the material, in N/mm²

 C_f = pillar end fixity factor

= 0,25 for full fixed/bracketed

= 0,50 for partially fixed

= 1,0 for free ended

r = least radius of gyration of pillar cross-section, in cm

$$= \sqrt{\frac{I_{\rm p}}{A_{\rm p}}} \, \, \rm cm$$

 I_p = least moment of inertia of cross-section of pillar or stiffener/plate combination, in cm⁴

l ep = effective span of pillar, in metres, or bulkhead as defined in Vol 1, Pt 6, Ch 3, 12.2 Determination of span

Volume 1, Part 6, Chapter 3

Section 12

Table 3.12.1 Pillar location factors

Location	f pi
Supporting weather deck	0,50
Supporting vehicle deck	0,50
Supporting stores equipment and routes	0,50
Supporting accommodation/inner deck	0,75
Supporting deckhouse top	1,00

12.5 Slenderness ratio

12.5.1 The slenderness ratio (l_{e}/r) of pillars should not in general exceed 1,1. Pillars with slenderness ratio in excess of 1,1 may be accepted subject to special consideration on a case by case basis and provided that the remaining requirements of the Rules are complied with.

12.6 Pillars in tanks

12.6.1 The tensile stress in the pillar and its end connections is not to exceed 108 N/mm² at the tank test pressure.

12.7 Pillar bulkheads

- 12.7.1 The stiffener/plate combination used in the determination of pillar bulkhead scantlings is to be that of a stiffener with an effective width of attached plating as determined from Vol 1, Pt 6, Ch 2, 2.2 Effective width of attached plating, be
- 12.7.2 The cross-sectional area of the pillar bulkhead, $A_{\rm pb}$, is to be determined in accordance with *Vol 1, Pt 6, Ch 3, 12.4 Scantling determination* using the design loading, $L_{\rm pb}$, as follows:

$$L_{pb} = S_{pb} B_{pb} P_{c} + L_{c} + L_{p} + L_{a} kN$$

where

- L_{pb} = design load supported by the stiffener plate combination of the pillar bulkhead, to be taken as not less than 5 kN
- $P_{\rm c}$ = basic deck girder design pressure, as appropriate, directly above the pillar bulkhead, in kN/m²
- $L_{\rm c}=$ point loads applied to load area supported by the pillar bulkhead, and not included in $P_{\rm c}$, in kN Point loads supported by the pillar bulkhead which should include point loads within the load patch plus point loads from outside the load patch, which distribute to the pillar bulkhead. Point loads which fall between pillar bulkheads should be shared proportionately between support points
- L_p = load resulting from uniformly distributed loads on decks above, excluding the deck directly above, which have been carried through by pillars or pillar bulkheads above, in kN
- L_a = point load, in kN, from above
 - = zero if there are no pillars or pillar bulkheads over
 - = 65 per cent of the point load from pillar bulkhead over, provided the pillar bulkhead spans between primary support points
 - = full load from pillar or pillars over
 - = full load from pillar bulkhead or pillar bulkheads over that do not span between primary support points
- S_{pb} = spacing, or mean spacing, of bulkheads or effective transverses/longitudinal stiffeners, in metres

Volume 1, Part 6, Chapter 3

Section 13

- $B_{\rm pb}=$ distance between centres of two adjacent spans of girders or transverses supported by the pillar bulkhead, in metres, and can be taken as the distance between pillar bulkhead stiffeners where the stiffeners at the top of the bulkhead effectively distribute the load evenly into the stiffeners.
- 12.7.3 The thickness of the bulkhead plating is in no case to be taken as less than 4 mm
- 12.7.4 The scantlings of the pillar bulkhead are not to be less than those of any bulkhead or pillar bulkhead in the direct support line above that being considered.

12.8 Direct calculations

12.8.1 As an alternative to *Vol 1, Pt 6, Ch 3, 12.4 Scantling determination* and *Vol 1, Pt 6, Ch 3, 12.7 Pillar bulkheads*, pillars and pillar bulkheads may be designed on the basis of direct calculation. The method adopted and the stress levels proposed for the material of construction are to be submitted together with the calculations for consideration.

12.9 Novel features

12.9.1 Where unusual or novel pillars designs are proposed that are unable to comply with the requirements of this Section, their design together with the direct calculations are to be submitted for special consideration.

■ Section 13

Machinery and raft seatings

13.1 General

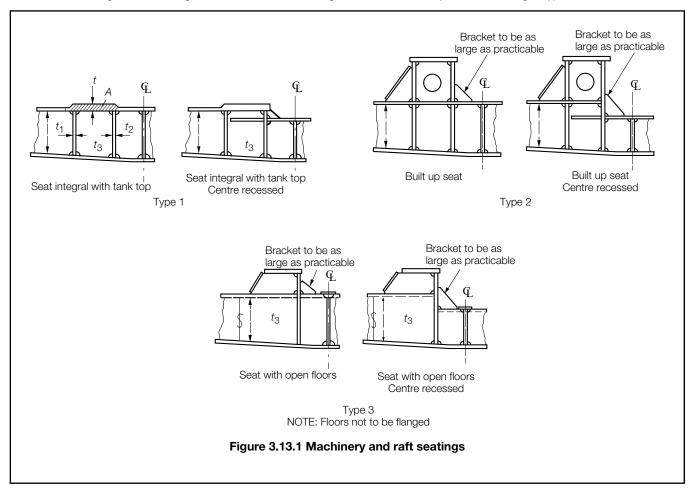

- 13.1.1 Main and auxiliary engine seatings are to be effectively secured to the hull structure. The scantlings of such seatings are to be adequate for the intended purpose, with due account taken of the gravitational, thrust, torque and vibrating forces together with the load increases resulting from sea motions and shock which may be imposed upon them.
- 13.1.2 In determining the scantlings of seats for engines, consideration is to be given to the general rigidity of the engine itself and to its design characteristics with regard to out of balance forces.
- 13.1.3 The longitudinal girders forming the engine seatings are to extend as far forward and aft as practicable and are to be adequately supported by transverse floors or brackets. The webs of the longitudinal girders are to be welded to the bottom shell plating.
- 13.1.4 The seats are to be so designed that they distribute the forces from the engine(s) as uniformly as possible into the supporting structure. Longitudinal girders supporting the seatings are to be arranged in single or double bottoms, and are, in general to extend over the full length of the machinery space. The ends of the girders are to be scarfed into the bottom structure for at least two frame spaces. Adequate transverse brackets are to be arranged in line with floors. Half floors, transverse brackets or hanging brackets will in general be required under the top plate in way of holding down bolts.
- 13.1.5 Where rafts are proposed for supporting the main and auxiliary engines the arrangements of such rafts are to be in accordance with Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems
- 13.1.6 Welding in way of all machinery seating is be double continuous and where appropriate full penetration.
- 13.1.7 Large areas of unstiffened flat plate are to be avoided.
- 13.1.8 The number openings of lightening holes in the seating structure are to be kept to the minimum necessary for access essential for maintenance, etc. Lightening holes are to be as small as practicable and are in no case to be greater than one half of the corresponding dimension of the plate in which they are positioned. Lightening holes with dimensions which are in excess of one third the corresponding dimension of the plate in which they are positioned are to be suitably edge stiffened by spigots or other equivalent means.
- 13.1.9 Machinery seatings are additionally to be examined for compliance with the bottom stiffening requirements as appropriate for their location, with due account taken of both local and global loadings.

Volume 1, Part 6, Chapter 3

Section 13

13.2 Seats for engines

- 13.2.1 In determining the scantlings of seats for engines, consideration is to be given to the general rigidity of the engine itself and to its design characteristics in regard to out of balance forces.
- 13.2.2 In the case of higher power engines or turbine installations the seatings should generally be integral with the bottom structure. The tank top plating in way of the engine foundation plate or the turbine gear case and the thrust bearing should be substantially increased in thickness, see Figure 3.13.1 Machinery and raft seatings, Type 1.
- 13.2.3 If the main machinery is supported on seatings of Type 2 as shown in *Figure 3.13.1 Machinery and raft seatings*, these are to be so designed that they distribute the forces from the engine as uniformly as possible into the supporting structure. Longitudinal members supporting the seating are to be arranged in line with girders in the double bottom, and adequate transverse stiffening is to be arranged in line with floors, see *Figure 3.13.1 Machinery and raft seatings*, Type 2.

13.2.4 In ships having open floors in the machinery space the seatings are generally to be arranged above the level of the top of floors and securely bracketed to them, see *Figure 3.13.1 Machinery and raft seatings*, Type 3.

13.3 Seats for turbines

13.3.1 Seats are to be so designed as to provide effective support for the turbines and ensure their proper alignment with the gearing, and (where applicable) allow for thermal expansion of the casings. In general, the seats are not to be arranged in way of breaks or recesses in the double bottom.

13.4 Seats for boilers

13.4.1 Boiler seats are to be of substantial construction and efficiently supported by transverse and horizontal brackets. These should generally be arranged in line with plate floors and girders in a double bottom or with suitable deep beams or transverses and girders at boiler flats. Suitable allowance is to be made in the design of the supporting structure for the variation in loading due to thermal expansion effects.

Volume 1, Part 6, Chapter 3

Section 14

13.5 Seats for auxiliary machinery

13.5.1 Auxiliary machinery is to be secured on seatings, of adequate scantlings, so arranged as to distribute the loadings evenly into the supporting structure.

■ Section 14

Strengthening for bottom slamming

14.1 General

- 14.1.1 This section may be used to determine the additional scantlings for strengthening in respect of the bottom structure forward for NS1 and NS2 type ships.
- 14.1.2 The additional scantlings for strengthening in respect of the bottom structure forward for NS3 type ships will be specially considered on the basis of this Section.

14.2 Strengthening of bottom forward

- 14.2.1 The bottom forward is to be additionally strengthened where the ship has a draught forward of less than $0.045L_R$ in any operational loading condition. This minimum draught, T_{FB} , see *Vol 1, Pt 6, Ch 3, 14.2 Strengthening of bottom forward 14.2.7*, is to be indicated on the shell expansion plan, the plan showing the internal strengthening, the Loading Manual and loading instrument, where fitted.
- 14.2.2 The requirements for the additional strengthening apply to ships where $L_{\rm R}$ is greater than 65 m.
- 14.2.3 The scantling requirements outside the areas which have been strengthened for bottom slamming are to be suitably tapered to maintain adequate continuity of strength in both longitudinal and transverse directions.

Table 3.14.1 Additional strengthening of bottom forward

Item	Require	ements
(1) Longitudinally framed bottom shell plating (including keel) (see Notes 1 and 2)	$t = 0,003s f \sqrt{h_S k_S}$	
	$\begin{split} \frac{d_{\mathbf{w}}}{t_{\mathbf{w}}} &\leq 55\sqrt{k_{\mathbf{s}}} \\ \frac{d_{\mathbf{w}}t_{\mathbf{w}}}{100} &\geq 0,00033k_{\mathbf{s}}h_{\mathbf{s}}\mathbf{s} \text{ c} \left(\mathbf{S} - \frac{\mathbf{s}}{2000}\right)\text{cm}^{2} \\ Z &\geq 6,8 \times 10^{-6}h_{\mathbf{s}}sk_{\mathbf{s}} \left[\left(17,5_{1\mathbf{s}}\right)^{2} - \left(0,011_{\mathbf{s}}\right)^{2} + d_{\mathbf{w}}c\left(\mathbf{S} - \frac{\mathbf{s}}{2000}\right) \right]\text{cm}^{3} \\ \frac{\left(A_{1}\overline{\tau} + \alpha\right)}{\mathbf{p}} \times 10^{-1} &\geq 1 \\ A_{\mathbf{w}} &\geq 0,84A_{1} \end{split}$	
(3) Bottom longitudinals – flat bars	Will be specially considered	
	Transverse framing	Longitudinal framing

Volume 1, Part 6, Chapter 3

Section 14

(4) Primary structure in way of single bottoms

(a) Centreline girder:

Scantlings as required by *Table 3.3.12* Single bottom construction forward, minimum requirements as appropriate, except that in determining Z in way of a deep tank forward of $0.8L_{\rm R}$ the value of h_5 is to be increased by the following percentages: where $T_{\rm FB} \leq 0.03L_2$, 30 per cent where $T_{\rm FB} \geq 0.04L_2$, 0 per cent The increase in h_5 for intermediate values of $T_{\rm FB}$ to be obtained by interpolation

(b) Floors:

Scantlings as required by Table 3.3.12 as appropriate, except that in way of dry spaces the minimum face area is to be increased by the following percentages: where $T_{\rm FB} \leq 0.03L_2$, 50 per cent where $T_{\rm FB} \geq 0.04L_2$, 0 per cent The increase of minimum face area for intermediate values of $T_{\rm FB}$ to be obtained by interpolation

(c) Side girders:

Arrangement and scantlings as required by *Table 3.3.12 Single bottom* construction forward, minimum requirements as appropriate, with the addition of intermediate half-height girders or equivalent fore and aft stiffening

- (a) Ships having one or more longitudinal bulkheads:
 - (i) Centreline girder Scantlings as required by Table 3.3.12 Single bottom construction forward, minimum requirements as appropriate (ii) Bottom transverses Maximum spacing as for midships region, scantlings as required by Section 2, as appropriate (iii) For horizontally stiffened longitudinal bulkheads and girders the depth to thickness ratio of the panel attached to the bottom shell plate is not to exceed $55\sqrt{k_{\rm S}}$
 - (iv) Where T _{FB} <0,025L ₂ the scantlings and arrangements will receive individual consideration
- (b) Other ship arrangements will receive individual consideration

(5) Primary structure in way of double bottoms (see Note 3)	(a)	Plate floors:	(a)	Plate floors:
		Maximum spacing, every frame Scantlings as required by Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements		Maximum spacing: $0.002s_{\rm F}$ m for $T_{\rm FB}$ < $0.04L_2$ $0.003s_{\rm F}$ m for $T_{\rm FB}$ $\geq 0.04L_2$ but not to exceed that required by Table 3.3.12 Single bottom construction forward, minimum requirements as appropriate
	(b)	Centreline and side girders:	(b)	Centreline and side girders:
		Maximum spacing, 0,003s _F m Scantlings as required by <i>Vol 1, Pt 6,</i> <i>Ch 3, 2 Minimum structural</i> requirements		Maximum spacing: $0.003s_L$ m for $T_{FB} < 0.04L_2$ $0.004s_L$ m for $T_{FB} \ge 0.04L_2$ but not to exceed that required by Table 3.3.12 Single bottom construction forward, minimum requirements, as appropriate
	(c)	Intermediate half-height girders to be arranged midway between side girders:	Sing	untlings as required by <i>Table 3.3.12</i> gle bottom construction forward, imum requirements, as appropriate
	1	antlings as required for non-watertight e girders by Section 2		
(6) Primary structure in way of double bottoms supported by longitudinal bulkheads		-	rece of c	e scantlings and arrangements will eive individual consideration on the basis lirect calculations using, if necessary, a ably defined two-dimensional grillage del
Symbols

 s_F = spacing of transverse frames, in mm, for longitudinally framed side and bottom construction s_F may be taken as s_I

 s_L = spacing of bottom longitudinals, in mm

 $t_{\rm w}$ = web thickness, in mm

 A_f = cross-sectional area of primary member web stiffener, in cm²

 A_{fc} = effective area of primary member web stiffener in way of butted end connection to the longitudinal, in cm²

 A_{L} = area of weld of lapped connection, in cm², calculated as total length of weld, in cm x throat thickness, in cm

 $A_{\rm W} = {\rm area~of~weld~of~lug~and~web~connection~to~the~longitudinal,~in~cm^2,~calculated~as~total~length~of~weld~in~cm~x}$ throat thickness, in cm

 A_1 = effective total cross-sectional area of the lug and web connection to the longitudinal, in cm²

T_{FB} = draught, in metres, at the F.P., as defined in Vol 1, Pt 6, Ch 3, 14.2 Strengthening of bottom forward 14.2.1

 $\alpha = A_f \overline{\sigma}$ for the web stiffeners

= $A_{fc} \overline{\sigma}$ for a butted connection to the longitudinals

= $A_{\perp} \overline{\tau}$ for a lapped connection

 $\overline{\sigma}$ = permissible direct stress, in N/mm², given in Table 3.14.2 Permissible stresses

 $\overline{\tau}$ = permissible shear stress, in N/mm², given in Table 3.14.2 Permissible stresses

Note 1. If intermediate stiffening is fitted the thickness of the bottom shell plating may be 80 per cent of that required by (1) but is to be not less than the normal taper thickness.

Note 2. For transverse framing the bottom shell plating is to be specially considered.

Note 3. Particular care is to be taken to limit the size and number of openings in way of the ends of floors or girders or to fit suitable reinforcement where such openings are essential.

Note 4. The welding requirements of Vol 1, Pt 6, Ch 6, 4 Requirements for welded construction are also to be complied with.

Volume 1, Part 6, Chapter 3 Section 14

 $A_{\rm f}, A_{\rm L}, A_{\rm 1}$ are as defined in Table 3.14.1 Additional strengthening of bottom forward

d = stiffener depth, in mm

k _s as defined in *Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1*

t = stiffener web thickness, in mm

Note $\overline{\sigma}$ is to be taken no greater than $\frac{220}{k_{_{\mathrm{S}}}}$

- 14.2.4 The scantling requirements for the additional strengthening are given in *Vol 1, Pt 6, Ch 3, 3.14 Single and double bottom structures 3.14.1*, or may be obtained by direct calculation. Where $T_{\rm FB}$ is less than 0,01 $L_{\rm R}$, the additional strengthening is to be specially considered.
- 14.2.5 Bottom longitudinals are to pass through and be supported by the webs of primary members. The vertical web stiffeners are to be connected to the bottom longitudinals. The cross-sectional area of the connections is to comply with the requirements given in *Table 3.14.1 Additional strengthening of bottom forward*
- 14.2.6 The scantlings required by this Section must in no case be less than those required by other Sections in *Vol 1, Pt 6, Ch 3, 3 NS1 scantling determination*
- 14.2.7 For NS1 ships with a block coefficient, C_b , greater than 0,6, the equivalent slamming pressure expressed as a head of water, h_s , is to be obtained from *Figure 3.14.1 Pressure heads* where, h_{max} is calculated from the following expressions:

$$65 < L_{R} \le 169 \,\mathrm{m}, \ h_{\text{max}} = 10 \sqrt{L_{R}} \,F \,\mathrm{m}$$

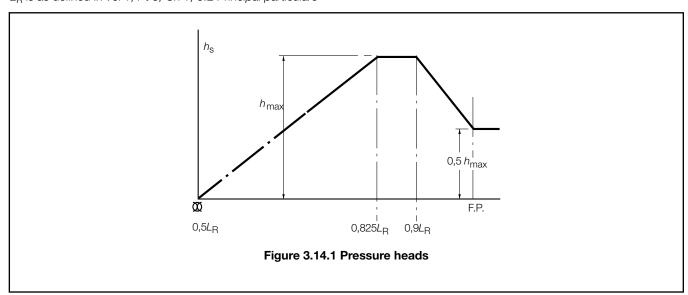

$$L_{\rm R} > 169 \text{ m}, \ \ h_{\rm max} = 130 \text{F m}$$

where

$$F = 5,95 - 10,5 \left(\frac{T_{\text{FB}}}{L_{\text{R}}}\right)^{0,2}$$

 $T_{\it FR}$ is the minimum draft at the location under consideration

L_R is as defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars

14.2.8 For NS1 ships where C_b < 0,6 and for NS2 and NS3 ships, the equivalent bottom impact pressure head, h_s , is to be derived in accordance with the following:

$$h_{\rm S} = \frac{IP_{\rm bi}}{10} \,\mathrm{m}$$

486

Volume 1, Part 6, Chapter 3

Section 15

where

IP_{bi} = instantaneous bottom impact pressure as given in Vol 1, Pt 5, Ch 3, 4.2 Bottom impact pressure, IPbi

Section 15

Strengthening for wave impact loads above waterline

15.1 General

- 15.1.1 This Section may be used to determine the required scantlings for strengthening against bow flare slamming for NS1 and NS2 type ships and for wave impacts on the shell envelope. Direct calculations may also be used to determine the required scantling.
- 15.1.2 The required scantlings for strengthening against wave impact loads for NS3 type ships will be specially considered on the basis of this Section.
- 15.1.3 The scantling requirements contained in this Section are based on no permanent set of plating. If acceptable, special consideration will be given to an alternative plating performance standard where specified. Areas designed in accordance with an alternative performance specification are to be clearly marked on the plans. Direct calculations may be used to determine the required scantlings.

15.2 Strengthening against bow flare wave impacts

- 15.2.1 The shell envelope above the design waterline is to be strengthened against bow flare wave impact pressures. The strengthening is to extend vertically to the uppermost deck level, including the forecastle deck, if fitted.
- 15.2.2 The equivalent bow flare wave impact head, h_s , is to be taken as:

$$h_{\rm S} = \frac{IP_{\rm bf}}{10} \, \text{m}$$

where

 $IP_{
m bf}$ is the bow flare or above waterline wave impact pressure, see Vol 1, Pt 5, Ch 3, 4.3 Bow flare and wave impact pressures, $IP_{
m bf}$

15.2.3 The thickness of the side shell is to be not less than:

$$t = 3, 2s_c \sqrt{k_s h_s} C_R \times 10^{-2} \text{mm}$$

where

s_c = spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Figure 3.15.1 Chord spacing and mean chord spacing for secondary members

 $h_{\rm S}={\rm bow}$ flare wave impact head, in metres, as defined in Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.2

 C_{R} = panel ratio factor

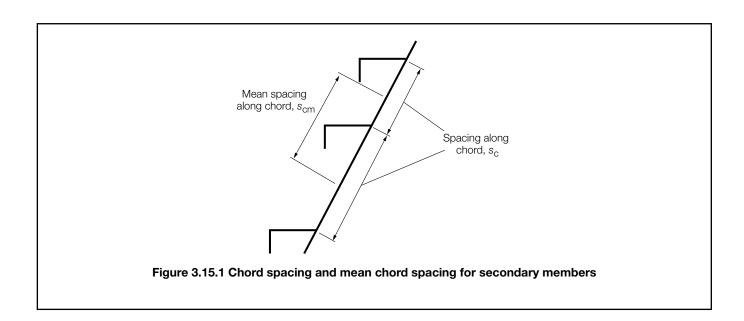

=
$$\left(\frac{l}{S_c}\right)^{0.41}$$
 but is not to be taken less than 0.06 or greater than 0.1

l = overall panel length, in metres, measured along a chord between the primary members

 k_s = as defined in Vol 1, Pt 6, Ch 3, 3.2 Symbols 3.2.1

487

Section 15

15.2.4 The scantlings of primary members are not to be less than:

(a) Section modulus of primary members

$$Z = 2 \gamma z k_s h_s q v l_e^2 cm^3$$

(a) Web area of primary members

$$A = 0, 2 \gamma_A k_s h_s q v l_e \text{ cm}^2$$

(a) The web of the primary member is to be adequately stiffened.

where

 h_s = bow flare wave impact head, in metres, as defined in Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.2

= and

= γ_A and γ_Z are strength factors dependant on the load position

for
$$q < 1$$
 $\gamma_A = q^3 - 2q^2 + 2$ and $\gamma_Z = 3q^3 - 8q^2 + 6q$

for
$$q = 1$$
 $\gamma_A = 1$ and $\gamma_Z = 1$

$$q = \frac{u}{l_e}$$
 but ≤ 1

for web frames:

 $u = \text{ is the minimum of } g_{\text{ bfv}} \text{ or } l_{\text{ e}}$

v =is the minimum of g_{bfh} or S_{cm}

for primary stringers:

where

 $u = \text{ is the minimum of } g_{\text{ bfh}} \text{ or } l_{\text{ e}}$

 $v = \text{ is the minimum of } g_{\text{ bfv}} \text{ or } S_{\text{ cm}}$

where

 $l_{\rm e}$ = is the effective length of the primary member, in m

where

 S_{cm} = is the mean spacing between primary members along the plating, in m, see Figure 3.15.2 Mean spacing between primary members, S_{cm} and the extents of the bow flare wave impact pressure, g_{bfh} and g_{bfv}

g _{bfv} and g _{bfh} are defined in *Vol 1, Pt 5, Ch 3, 4.3 Bow flare and wave impact pressures, IPbf 4.3.3* Other symbols are as defined in *Vol 1, Pt 6, Ch 2, 1 General*.

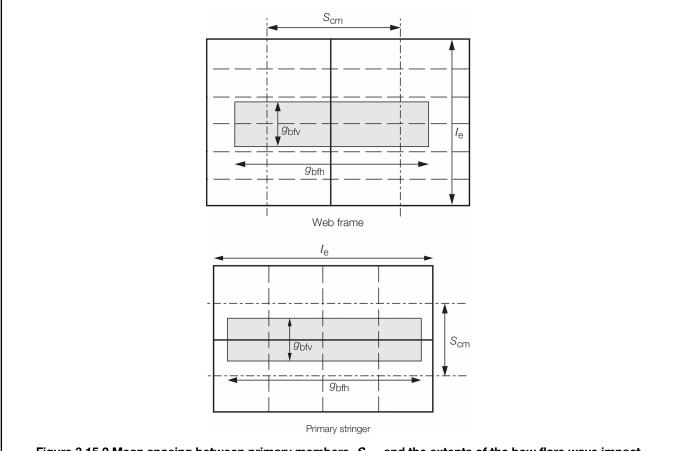

Figure 3.15.2 Mean spacing between primary members, $S_{\rm cm}$ and the extents of the bow flare wave impact pressure, $g_{\rm bfh}$ and $g_{\rm bfv}$

15.2.5 The scantlings of secondary stiffeners are not to be less than:

(a) Effective plastic section modulus of stiffeners:

$$Z_{\rm p} = 3,75h_{\rm s}s_{\rm cm}k_{\rm s}l_{\rm e}^2 \times 10^{-3} \,{\rm cm}^3$$

where

h_s = wave impact head, in metres, as defined in *Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.2*

 s_{cm} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in *Figure 3.15.1 Chord spacing and mean chord spacing for secondary members*

Other symbols are as defined in Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.3 and Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.4

(b) Web area of secondary stiffeners

Volume 1, Part 6, Chapter 3

Section 15

$$A = 3.7 s_{\rm cm} k_{\rm s} h_{\rm s} \left(l_{\rm e} - \frac{s_{\rm cm}}{2000} \right) \times 10^{-4} \,{\rm cm}^2$$

where

 s_{cm} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in *Figure 3.15.1 Chord spacing and mean chord spacing for secondary members*

 $h_{\rm S}={\rm bow}$ flare wave impact head, in metres, as defined in Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.2

Other symbols are as defined in Vol 1, Pt 6, Ch 2, 1 General.

15.2.6 The effective section properties of secondary stiffeners are to be taken as:

(a) Plastic section modulus of secondary stiffeners, Z_p is to be taken as:

$$Z_p = (2.8 \times 10^{-4} \text{ s}_{\text{cm}} t_p^2) - (10^{-3} b_f b_{\text{fc}} t_f \sin \theta_e) + (5 \times 10^{-4} (h_w^2 t_w + 2b_f t_f h_w) \cos \theta_e) \text{ cm}^3$$

where

 $\theta_e = C_o (90 - \phi)$

 $C_0 = 1,1$

 ϕ = the angle between the stiffener and the side shell, in degrees

 $b_{fc} = 0.5(b_f - t_w)$ for L profiles

= 0 for flat bar and T profiles

= $\frac{c}{2}$ see Figure 2.2.1 Dimensions of longitudinals in Chapter 2, for bulb profiles for c

 $h_{\rm W}$ = height of web, in mm

 $t_{\rm w} = {\rm web} \ {\rm thickness}, {\rm in} \ {\rm mm}$

 $b_{\rm f}$ = breadth of flange, in mm

 $t_{\rm f}$ = flange thickness, in mm

 t_p = thickness of attached plating, in mm

s_{cm} = defined in Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.5.

(b) Web area of secondary stiffeners, A_s is to be taken as:

$$A_{s} = 0.01 (h_{w} + t_{p}) t_{w} \sin\phi \text{ cm}^{2}$$

- 15.2.7 For primary members with cut-outs for the passage of secondary stiffeners, and which may have web stiffeners connected to the secondary stiffener, buckling checks are to be carried out to ensure that the primary member web plating and web stiffener will not buckle under the design load. The buckling procedure to be followed is given in *Table 3.15.1 Buckling procedure for primary member web plating and web stiffener* Where the web stiffener is fitted with a bracket, the buckling capability of the web stiffener in way of the cut-out is to take into account the bracket. Where no web stiffener is fitted, the buckling capability of the primary member web plating is to be checked for the total load transmitted to the connection.
- 15.2.8 The structural scantlings required in areas strengthened against bow flare wave impact are to be tapered to meet the normal shell envelope requirements.
- 15.2.9 Where the stiffener web is not perpendicular to the plating, tripping brackets may need to be fitted in order to obtain adequate lateral stability.
- 15.2.10 Where the angle between the primary structure web and the plating is less than 70°, the effective section modulus and shear area are to take account of the non-perpendicularity.
- 15.2.11 The side structure scantlings required by this Section must in no case be taken less than those required by other Sections of Vol 1, Pt 6, Ch 3 Scantling Determination

490

Volume 1, Part 6, Chapter 3

Section 15

15.3 Strengthening against wave impact loads

15.3.1 The requirements of Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts are to be applied to areas of plating which are liable to be subjected to wave impact loads; for example, bottom plating of wide transom sterns, undersides of sponsons for aircraft lifts.

Table 3.15.1 Buckling procedure for primary member web plating and web stiffener

Steps	Members	
	Primary member web plating	Primary member web stiffener
Determination of the design compressive stress, $\sigma_{a}, N/mm^2 (kgf/mm^2)$	$\sigma_{a}^{} = \frac{1000 P_{W}^{}}{A_{W}^{}}$	$\sigma_{a} = \frac{1000P_{s}}{A_{s}}$
Determination of the elastic critical buckling stress, $\sigma_{e},$ in compression, $$N/mm^2$$ (kgf/mm²)	$\sigma_{e} = \frac{9,87EI_{W}}{1_{w}^{2}A_{w}}$	$\sigma_{\rm e} = \frac{9,87 \text{EI}_{\rm S}}{1_{\rm S}^2 A_{\rm S}}$
Determination of the corrected critical buckling stress, $\sigma_{\text{cr}},$ in compression, N/mm² (kgf/mm²)	$\sigma_{\text{cr}} = \sigma_0 \left(1 - \frac{\sigma_0}{4\sigma_e} \right)$ $\sigma_{\text{cr}} = \sigma_e$	where $\sigma_{e} > \frac{\sigma}{2}$ $\text{where } \sigma_{e} \leq \frac{\sigma}{2}$
Requirement	$\sigma_{ ext{cr}} \geq \sigma_{ ext{a}}$	

Symbols

 $b_{\rm W}$, $b_{\rm S}$, $l_{\rm W}$ and $l_{\rm S}$ are dimensions, in mm, as shown in Figure 3.15.3 Dimensions of critical areas of (a) primary member web plating and (b) primary member web stiffener

 h_s = equivalent bow flare slamming head, in metres, as defined in Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.2

 s_{cm} = mean spacing of secondary stiffeners, in mm, as defined in Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.4

 $t_{\rm S}$ = thickness of primary member web stiffener, in mm

 $t_{\scriptscriptstyle
m W}$ = thickness of primary member web plating, in mm

 $A_s = b_S t_S \text{ mm}^2$

 $E = \text{modulus of elasticity, in N/mm}^2$

= 206000 N/mm² for steel

$$I_{s} = b_{s}t^{3} \frac{3}{12} \text{mm}^{4}$$

$$I_{w} = b_{w}^{t} \frac{3}{12} \text{mm}^{4}$$

Volume 1, Part 6, Chapter 3

Section 16

P = total load transmitted to the connection

 $= 10,06 S_{cm} s_{cm} h_{s} \times 10^{-3} kN$

 P_s = load transmitted through the primary member web stiffener, in kN, to be determined from $P_2 = P - P_1$, in kN, or by direct calculations. Where P_1 = pressure transmitted through collar arrangement and P = total load transmitted to the primary member.

 $P_{\rm w}$ = load transmitted through the primary member web plating, in kN

= $P - P_s$, or by direct calculations

 S_{cm} = mean spacing of primary members, in metres, as defined in Vol 1, Pt 6, Ch 3, 15.2 Strengthening against bow flare wave impacts 15.2.5

 σ_0 = specified minimum yield stress, in N/mm²

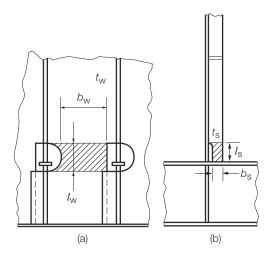

Figure 3.15.3 Dimensions of critical areas of (a) primary member web plating and (b) primary member web stiffener

■ Section 16

Masts

16.1 General

16.1.1 This Section may be used to determine the required scantlings for stayed or unstayed single masts of conventional design on NS1, NS2 and NS3 type ships. Additional requirements for masts are given in *Vol 1, Pt 4, Ch 1, 5.3 Masts and externally mounted sensors or equipment.*

16.2 Pole masts

16.2.1 The maximum allowable combined bending and direct stress in pole masts is not to exceed the value given in *Table 3.16.1 Allowable stresses in masts*. The maximum allowable shear stress is not to exceed 0,58 times the value given in *Table 3.16.1 Allowable stresses in masts*.

Volume 1, Part 6, Chapter 3

Section 16

Table 3.16.1 Allowable stresses in masts

	ltem	Allowable stress, in N/mm ²
(1)	Stayed mast:	0,50σ _y
(2)	Unstayed mast:	0,55σ _y
(3)	Cross trees, outriggers, etc:	$0.55\sigma_{ m y}$

16.2.2 The forces acting on the mast are to be calculated in accordance with Vol 1, Pt 5, Ch 3, 6.4 Loads for masts.

16.3 Unstayed masts

16.3.1 The total stress (σ_t) at any particular location is to be taken as:

$$\sigma_{\rm t} = [(\sigma_{\rm b} + \sigma_{\rm c}) 2 + 3q^2] \frac{1}{2} \text{ N/mm}^2$$

where

 σ_{b} = the bending stress at that location due to the bending moments acting on the mast

 σ_{c} = the direct compressive stress at that location due to the vertical components of force. In general, the weight of the mast and cross trees may be ignored in this calculation

q = the shear stress due to torque in the mast. The effect of torque need only be considered where cross trees are fitted.

16.3.2 The total stress is to be determined at each change of plate thickness or other change of section along the mast. It is recommended that a plot or table of stress to a base of mast length be prepared.

16.4 Stayed masts

- 16.4.1 In the absence of stays the mast will deflect under the influence of the imposed forces. Where stays are fitted they will extend under tension, the amount of elongation being related to the deflection of the mast at the point of attachment of the stays. The distribution of forces in the mast and stays may therefore be obtained by consideration of:
- (a) The equilibrium between the deflection of the mast and the corresponding elongations of the stays.
- (b) The equilibrium between the imposed loads on the mast and the reactions in the mast and the stays.
- 16.4.2 These calculations are to be made using appropriately defined co-ordinate axes. Attention is drawn to the importance of assigning the correct sign to the angles and dimensions used. Any stay which would be required to work in compression is to be ignored.
- 16.4.3 Elongation of the stays is to be calculated on the basis of the area enclosed by a circle of diameter equal to the nominal diameter of the rope in association with an effective modulus of elasticity of 61300 N/mm² (6250 kgf/mm²). Consideration will, however, be given to the use of a higher modulus of elasticity where this is demonstrated by suitable tests to be applicable.
- 16.4.4 The total stress in the mast at any particular location is to be determined. Attention is drawn to the fact that increased stiffness of the mast leads to a rapid increase in stress in the mast with a corresponding reduction in the effectiveness of the stays. It is desirable, therefore, to design the mast for the required section modulus in association with the least practicable moment of inertia.
- 16.4.5 Wire rope stays are to be in one length and their construction is to comply with the requirements of *Ch 8 Fittings, Loose Gear and Ropes* of the *Code for Lifting Appliances in a Marine Environment* (LAME).
- 16.4.6 The scantlings of a stay are to be such as to provide the tensile force and elongation to meet these requirements. The breaking load of a stay is to be not less than 3,5 times the maximum calculated force on that stay.

Volume 1, Part 6, Chapter 4

Section 1

Section

- 1 General
- 2 Hull girder strength
- 3 Extreme Strength Assessment, ESA
- 4 Residual Strength Assessment, RSA

■ Section 1

General

1.1 Application

- 1.1.1 The requirements for longitudinal and transverse global strength are contained within this Chapter.
- 1.1.2 This Chapter contains Sections detailing the analysis requirements for the following topics:
- Hull girder strength.
- Extreme strength assessment.
- Residual strength assessment
- 1.1.3 **Section 2, Hull girder strength.** This Section specifies the hull girder strength requirements based on the conventional elastic design and buckling analyses. All ships are to comply fully with the requirements of this Section.
- 1.1.4 **Section 3, Extreme strength assessment.** This Section specifies the requirements for the assessment of the extreme hull girder strength to withstand wave loads that have a low probability of occurring during the life of the ship. This is an optional assessment and ships which comply with the extreme strength requirements can apply for the notation **ESA1** or **ESA2**, see *Vol 1*, *Pt 1*, *Ch 2*, 3.7 *Hull strength notations 3.7.1*
- 1.1.5 **Section 4, Residual strength assessment.** This Section specifies the requirements for the assessment of the residual hull girder strength after the ship has sustained structural damage. This is an optional assessment and ships which comply with the residual strength requirements can apply for the notation **RSA1**, **RSA2** or **RSA3**, see *Vol 1*, *Pt 1*, *Ch 2*, 3.7 *Hull strength notations 3.7.1*.

1.2 Hull girder strength notations

- 1.2.1 The following notations are available for all ships with regard to global hull girder strength aspects:
- **ESA1, ESA2** Extreme strength assessment.
- **RSA1, RSA2, RSA3** Residual strength assessment.

A distinction is made between levels of performance and levels of assessment; the numeral in the notation reflects the level of assessment. Levels of performance are denoted by the letters A, B, C for collision or grounding damage and numerals I, II and III for damage from military threats and are confidential to the Owner. See Vol 1, Pt 6, Ch 4, 4.2 Extent of damage and analysis for non-military threats and Vol 1, Pt 4, Ch 2, 7 Residual strength for military threats.

- 1.2.2 The performance of the ship with respect to extreme hull girder strength aspects may be evaluated at two levels. **ESA1**, the lowest level offers a basic assessment of the ship's capability. **ESA2**, the higher level is a much more rigorous assessment of the hull's capability to withstand extreme sea states.
- 1.2.3 It is recommended that ships of groups NS1 and NS2 should comply with **ESA1**. However, it is the responsibility of the Owner to specify the level of extreme strength assessment required.
- 1.2.4 The extreme strength assessment level adopted must reflect the performance level required by other notations.
- 1.2.5 The two levels of assessment available for the extreme strength assessment notation are summarised as follows:

Volume 1, Part 6, Chapter 4

Section 1

- **ESA1** = This uses elastic theory, based on the section moduli and area, and determination of the buckling strength to resist the global hull girder loads. The assessment is to be made at a minimum of three locations.
- **ESA2** = Uses a '2D' ultimate strength beam representation and a failure level criterion based on the section ultimate bending moments being satisfactory compared to the design bending moments in both hogging and sagging. This will require assessment using ultimate strength calculations at all critical longitudinal locations.
- 1.2.6 The performance of the ship with respect to residual strength aspects may be evaluated at several levels. The lowest level offers a basic assessment of the ship's capability to survive. Higher residual strength levels are designed to show that the ship has an improved performance with respect to hull's capability to withstand increased damage extents and scenarios.
- 1.2.7 Three assessment and performance levels are available for the residual strength assessment notation. **RSA1**, the assessment Level 1 residual strength assessment, and performance level A are recommended as a minimum for all ships of groups **NS1** and **NS2**. However, it is the responsibility of the Owner to specify the level of residual strength assessment required.
- 1.2.8 The residual strength assessment level adopted must reflect the performance level required by other notations.
- 1.2.9 The three levels of assessment available for the residual strength assessment notation are summarised as follows:
 - **RSA1** = This uses elastic theory, based on the remaining section moduli and area after damage, and determination of the buckling strength to resist the global hull girder loads. The assessment is to be made at a minimum of three critical sections.
 - **RSA2** = Uses a '2D' ultimate strength beam representation and a failure level criterion based on the section ultimate bending moments being satisfactorily compared to the design bending moments in both hogging and sagging. The assessment is to be made at a minimum of three critical sections.
 - **RSA3** = Uses a '3D' definition of a section of the hull girder and relies on geometric and material failure criteria implicit in the chosen finite element code. It could also include coupled Euler-Lagrange formulations to specifically account for internal and external blast effects, UNDEX shock and whipping.

1.3 Symbols and definitions

1.3.1 The symbols and definitions applicable to this Chapter are defined below or in the appropriate sub-Section.

 $L_{\rm B}$ = Rule length of the ship, in metres

B = moulded breadth of ship, see Vol 1, Pt 3, Ch 1, 5.2 Principal particulars in metres

 σ_0 = specified minimum yield strength of the material, in N/mm²

$$\tau_0 = \sigma_0 / \sqrt{3}$$

f hts = higher tensile steel correction factor, see Table 5.1.1 High tensile steel stress correction factor f hts

- 1.3.2 The strength deck is to be taken as follows:
- (a) Where there is a complete upper deck, the strength deck is the upper deck.
- (b) Where the upper deck is stepped, as in the case of ships with a raised quarterdeck, the strength deck is also stepped, see *Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus*. Adequate provision should be made for the transfer of load between the stepped decks.

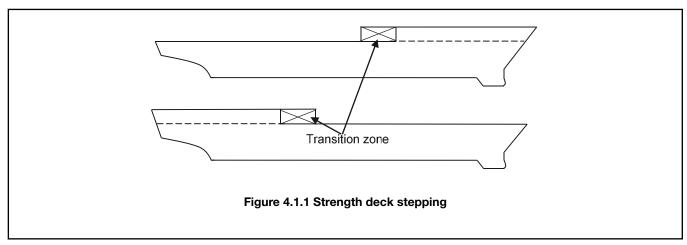

1.4 Calculation of hull section modulus

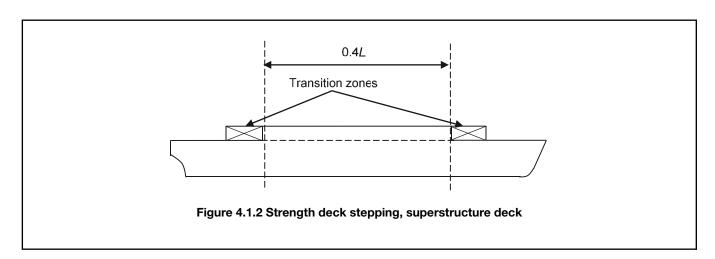

- 1.4.1 In general, the effective sectional area of continuous longitudinal strength members, after deduction of openings, is to be used for the calculation of midship section modulus.
- 1.4.2 Structural members which contribute to the overall hull girder strength are to be carefully aligned so as to avoid discontinuities resulting in abrupt variations of stresses and are to be kept clear of any form of openings which may affect their structural performances.

Volume 1, Part 6, Chapter 4

Section 1

- 1.4.3 In general, short superstructures or deckhouses will not be accepted as contributing to the global longitudinal or transverse strength of the ship. However, where it is proposed to include substantial, continuous stiffening members, special consideration will be given to their inclusion on submission of the designer's/builder's calculations, see also Vol 1, Pt 6, Ch 4, 2.5 Superstructures global strength
- 1.4.4 A transition zone, see *Figure 4.1.1 Strength deck stepping*, is to be assumed at the ends of stepped decks where the longitudinal structural material cannot be included in the calculation of the section modulus of hull sections. The length of the zone is to be taken as four times the deck height. Local insert plates are to be fitted in the side shell as appropriate with a thickness at least 25 per cent greater than the adjacent plating. They are to extend a minimum of one primary frame spacing forward and aft, but are to be not less than 1500 mm each way from the end of the transition zone. For vessels with complex arrangements or geometries, shadow area plans are to be submitted.
- 1.4.5 A superstructure deck can only be considered as a strength deck and included in the calculation of the section modulus of hull sections if it extends over the full $0.4L_R$ midship region and out to the side shell with the transition zones being located outside the $0.4L_R$ midship region, see Figure 4.1.2 Strength deck stepping, superstructure deck.

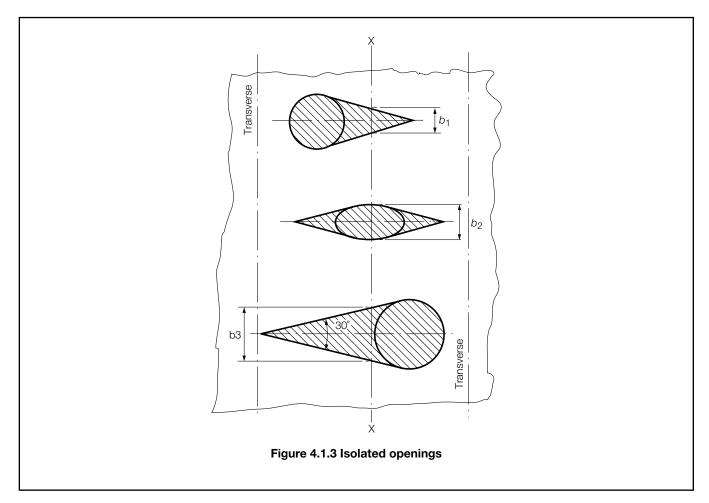

- 1.4.6 Where continuous deck longitudinals or deck girders are arranged above the strength deck, special consideration may be given to the inclusion of their sectional area in the calculation of the hull section modulus, Z. The lever is to be taken to a position corresponding to the height of the longitudinal member above the moulded deck line at side amidships. Each such case will be individually considered.
- 1.4.7 Adequate transition arrangements are to be fitted at the ends of effective continuous longitudinal strength members in the deck and bottom structures.
- 1.4.8 Scantlings of all continuous longitudinal members of the hull girder based on the minimum section stiffness requirements determined from 2.2 are to be maintained within $0.4L_{\rm R}$ amidships. However, in special cases, based on consideration of type of

Volume 1, Part 6, Chapter 4

Section 1

ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the $0.4L_{\rm R}$ part, bearing in mind the desire not to inhibit the ship's loading and operational flexibility.

- 1.4.9 Structural material which is longitudinally continuous but which is not considered to be fully effective for longitudinal strength purposes will need to be specially considered. The global longitudinal strength assessment must take into account the presence of such material when it can be considered effective. The consequences of failure of such structural material and subsequent redistribution of stresses into or additional loads imposed on the remaining structure must be considered.
- 1.4.10 In particular, all longitudinally continuous material will be fully effective in tension whereas this may be not be so in compression due to a low buckling capability. In this case, it may be necessary to derive and apply different hull girder section moduli to the hogging and sagging bending moment cases.
- 1.4.11 Openings in decks, longitudinal bulkheads and other longitudinal effective material having a length in the fore and aft directions exceeding 0,1*B* m or 2,5 m or a breadth exceeding 1,2 m or 0,04*B* m, whichever is the lesser, are in all cases to be deducted from the sectional areas used in the section modulus calculation.
- 1.4.12 Openings smaller than stated in Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.11, including manholes, need not be deducted provided they are isolated and the sum of their breadths or shadow area breadths, see Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.15, in one transverse section does reduce the section modulus at deck or bottom by more than 3 per cent.
- 1.4.13 The expression 0,06 (B_1 Σb_1), where B_1 equals the breadth of the ship at the section considered and Σb_1 equals the sum of breadths of deductible openings, may be used for deck openings in lieu of the 3 per cent limitation of reduction of section modulus in Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.12.

- 1.4.14 Where a large number of openings are proposed in any transverse space, special consideration will be required.
- 1.4.15 Where calculating deduction-free openings, the openings are assumed to have longitudinal extensions as shown by the shaded areas in *Figure 4.1.3 Isolated openings* The shadow area is obtained by drawing two tangent lines to an opening angle of

Volume 1, Part 6, Chapter 4

Section 2

- 30°. The section to be considered is to be perpendicular to the centreline of the ship and is to result in the maximum deduction in each transverse space.
- 1.4.16 Isolated openings in longitudinals or longitudinal girders need not be deducted if their depth does not exceed 25 per cent of the web depth or 75 mm, whichever is the lesser.
- 1.4.17 Openings are considered isolated if they are spaced more than 1 m apart.
- 1.4.18 A reduction for drainage holes and scallops in beams and girders, etc. is not necessary so long as the global section modulus at deck or keel is reduced by no more than 0,5 per cent.

1.5 General

1.5.1 The Level 1 assessment procedures specified in Lloyd's Register's (hereinafter referred to as 'LR') Structural Detail Design Guide for fatigue design assessment, **FDA**, are to be generally applied to the construction details of all ships.

1.6 Direct calculations

- 1.6.1 Direct calculations using finite element analysis may be necessary for ships with complicated longitudinal structural arrangements such as ships:
- · of novel design;
- with significant discontinuous longitudinal material;
- with large deck openings, or where warping stresses in excess of 14,7 N/mm² are likely to occur;
- with large openings in the side shell, especially in way of the sheerstrake.

■ Section 2

Hull girder strength

2.1 General

- 2.1.1 Longitudinal strength calculations are to be submitted for all ships with a Rule length, $L_{\rm R}$, exceeding 50 m and are to cover the range of operating conditions proposed in order to determine the required hull girder strength. The still water, wave and dynamic bending moments and shear forces are to be calculated in accordance with the requirements of *Vol 1*, *Pt 5*, *Ch 4 Global Design Loads*
- 2.1.2 For ships of ordinary hull form with a Rule length, $L_{\rm R}$, less than 50 m, the minimum hull girder strength requirements are generally satisfied by scantlings obtained from local strength requirements. However, longitudinal strength calculations may be required by LR, dependent upon the form, constructional arrangement and proposed loading.

2.2 Bending strength

- 2.2.1 The effective geometric properties of all critical transverse sections along the length of the ship are to be calculated directly from the dimensions of the section using only effective material elements which contribute to the global longitudinal strength irrespective of the grades of steel incorporated in the construction, see *Vol 1*, *Pt 6*, *Ch 4*, *1.4 Calculation of hull section modulus*
- 2.2.2 Where higher tensile is fitted to satisfy global strength requirements, the extent of higher tensile steel is to be as specified in *Vol 1, Pt 6, Ch 2, 1.6 Higher tensile steel 1.6.3* Where a mix of steel grades is used for plating and associated stiffeners, then the lower of the steel grades is to be used for the derivation of the permissible stresses, see 2.2.3.
- 2.2.3 The longitudinal strength of the ship is to satisfy the following criteria for the hogging and sagging conditions:

$$\sigma_{\rm B} < \sigma_{\rm p}$$

$$\sigma_{\rm D} < \sigma_{\rm p}$$

$$\sigma_{\rm ws} < f_{\sigma_{\rm WS}} \sigma_{\rm 0(MS)}$$

where

 $\sigma_{\rm D}$ = maximum permissible hull vertical bending stress, in N/mm²

Volume 1, Part 6, Chapter 4

Section 2

$$\sigma_{\rm D} = f_{\rm ohq} f_{\rm hts} \sigma_{\rm O}$$

 f_{sha} = limiting hull bending stress coefficient, derived as follows:

= (i) from $0.3L_{\rm R}$ to $0.7L_{\rm R}$

$$f_{\sigma hq} = 0.75$$

(ii) for continuous longitudinal structural members aft of 0,3L R and forward of 0,7L R

$$f_{\text{shg}} = 0.319 + 2.311 \text{ x/L}_{\text{R}} - 2.974 (\text{x/L}_{\text{R}})^2$$

where

x = the distance, in metres, from the F.P. for locations within the forward end of L_R and from the A.P. for locations within the aft end of L_R

 $f_{\text{GWS}} = 1,2$, limiting working stress coefficient

= NOTE, the σ_{ws} criterion may be relaxed if it can be demonstrated that either:

(i) a continuous fatigue control monitoring system is to be adopted for the in-service life of the ship

(ii) a fatigue design assessment procedure is applied which demonstrates that a higher limiting working stress coefficient, f_{rws} , may be applied

 $\sigma_{\rm o \, (MS)}$ = specified yield stress, in N/mm², for mild steel

 $\sigma_{\rm B}$, $\sigma_{\rm D}$ and $\sigma_{\rm ws}$ are given in Table 4.2.1 Longitudinal component stresses

 $f_{\rm hts}$ and $\sigma_{\rm o}$ are defined in Vol 1, Pt 6, Ch 4, 1.3 Symbols and definitions 1.3.1

Table 4.2.1 Longitudinal component stresses

Component stress type	Nominal stress (N/mm²)	
Hull girder bending stress at strength deck, see Note 1	$\sigma_{\rm D} = \frac{M_{\rm R}}{1000Z_{\rm D}}$	
Hull girder bending stress at keel, see Note 1	$\sigma_{\rm B} = \frac{M_{\rm R}}{1000Z_{\rm B}}$	
Hull girder bending stress range, see Note 2	$\sigma_{\text{WS}} = \frac{M_{\text{WHog}} - M_{\text{WSag}}}{1000Z_{\text{D}}}$	
Symbols		

 $M_{\rm R}$ = Rule bending moment, in kNm, given in Vol 1, Pt 5,

Ch 4, 3.10 Hull girder design loads

 $M_{
m WHog}$ = hogging value of $M_{
m W}$, in kNm, given in Vol 1, Pt 5,

Ch 4, 3.3 Vertical wave bending moments

 $M_{
m WSag}$ = sagging value of $M_{
m W}$, in kNm, given in Vol 1, Pt 5,

Ch 4, 3.3 Vertical wave bending moments

 $Z_{\rm D}$ = actual section modulus at deck, in m³

Volume 1, Part 6, Chapter 4

Section 2

 $Z_{\rm B}$ = actual section modulus at keel, in m³

Note 1. The hogging and sagging bending moments are to be considered.

Note 2. The stress range at the keel or other longitudinally effective material should be used if it is greater than the stress range at the strength deck.

- 2.2.4 Special consideration will be given to increasing the permissible stress outside $0.3L_R$ to $0.7L_R$ provided that sufficient buckling checks are carried out.
- 2.2.5 The requirements for ships of special or unusual design and for special operations will be individually considered.
- 2.2.6 Where different grades of steel are used then it should be ensured that the design stress in each structural member is less than the permissible hull vertical bending stress, i.e.

$$\sigma_{\rm hg} < \sigma_{\rm p}$$

where

 σ_{hg} = is given in Vol 1, Pt 6, Ch 4, 2.2 Bending strength 2.2.7

 σ_D = is given in Vol 1, Pt 6, Ch 4, 2.2 Bending strength 2.2.3

2.2.7 The design stress due to hull girder bending, σ_{hg} , for each structural member is given by

$$\sigma_{\rm hg} = \left(\frac{M_{\rm R}}{1000Z_{\rm i}}\right) N/{\rm mm}^2$$

where

 Z_i = actual section modulus at structural element being considered, in m³

M_R is given in Table 4.2.1 Longitudinal component stresses.

2.3 Shear strength

- 2.3.1 The shear strength of all ships is to satisfy the requirements given in this Section.
- 2.3.2 Generally, the shear strength is to be assessed in accordance with Vol 1, Pt 6, Ch 4, 2.3 Shear strength 2.3.6. Alternatively the shear strength can be assessed using shear flow in association with the maximum permissible shear stress, τ_p , given in Vol 1, Pt 6, Ch 4, 2.3 Shear strength 2.3.6.
- 2.3.3 For ships with large openings in the side shell and/or a complex arrangement of longitudinal bulkheads and decks is proposed, shear flow calculations or direct calculation may be required.
- 2.3.4 Where shear flow calculation procedures other than those available within ShipRight are employed, the requirements of *Vol 1, Pt 6, Ch 3, 1.4 Equivalents* are to be complied with.
- 2.3.5 The assessment of still water shear stresses is to take into consideration the effectiveness of the following:
- continuous superstructures;
- the sizes and arrangements of window and door openings;
- access openings or cut-outs in side shell, longitudinal bulkheads, etc.
- 2.3.6 The shear strength of the ship at any position along the length is to satisfy the following criterion:

$$\frac{|Q_{R}|A_{Z}}{I\delta_{Q}} \leq \tau_{p}$$

where

 δ_o is to be taken as the minimum value of $\delta_{\text{i}},$ and

 $\tau_{\rm D} = \text{maximum permissible shear stress, in N/mm}^2$

500

Volume 1, Part 6, Chapter 4

Section 2

$$= f_{\tau h g} \tau_o$$

 $f_{\tau hg} = 0.75 f_{hts}$, limiting hull shear stress coefficient

Q_R = Rule shear force, in kN, determined from Vol 1, Pt 5, Ch 4, 3.10 Hull girder design loads

I = the inertia of the hull about the transverse neutral axis at the section concerned, in m^4

 A_z = the first moment of area of the longitudinal members about the neutral axis, in m³

Only longitudinally effective members that lie between the vertical level being considered and the vertical extremity are to be included

$$\delta_{i} = \frac{t_{i}}{k_{i}}$$

i = structural member index for the hull configuration under consideration, see Table 4.2.2 k_i factors

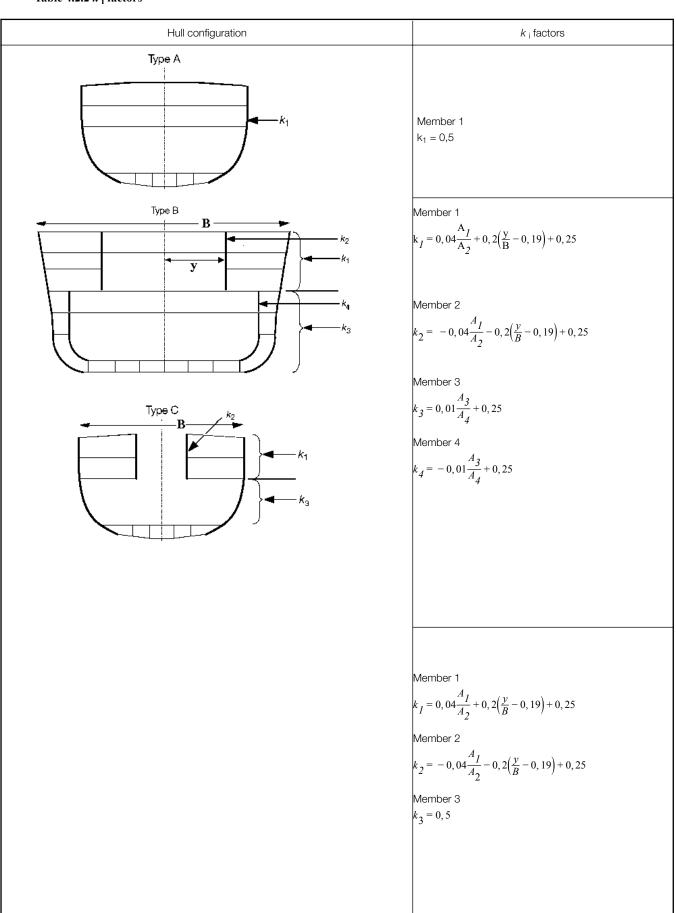

t_i = the plate thickness of the structural member at the vertical level and section under consideration, in mm

 k_i = factors determined from Table 4.2.2 k_i factors for the hull configuration under consideration

 f_{hts} and τ_{o} are defined in Vol 1, Pt 6, Ch 4, 1.3 Symbols and definitions 1.3.1.

Section 2

Table 4.2.2 k_i factors

Volume 1, Part 6, Chapter 4

Section 2

Symbols

Note i = structural index for different hull configurations

Note = 1 or 3, the side shell at the section under consideration

Note = 2 or 4, the longitudinal bulkheads at the section of consideration

Note A_T = half the total effective shear area at the section under consideration, in cm², $A_T = A_i$

Note A_i = the area of structural member i at the section under consideration, in cm²

Note In the event of part of the structural member being non-vertical A_i is to be calculated using the projected area in the vertical direction, see Figure 4.2.2 Calculation of A_i for non vertical parts of structural members (referenced from Table 4.2.2)

Note y is the distance of structural member 2 from the centreline

Note B is given in Vol 1, Pt 6, Ch 4, 1.3 Symbols and definitions 1.3.1

Note 1. For hull configurations not included above, k_i factors are to be specially considered.

Note 2. Where it is necessary to increase the thickness of the side shell or longitudinal bulkhead(s) to meet these requirements, the original thicknesses are to be used in the calculation of the cross-sectional areas A_i.

2.3.7 The design shear stress for each structural member, τ_{hg} , due to hull girder shear forces is given by

$$\tau_{\rm hg} = \frac{\mid Q_{\rm R} \mid A_{\rm Z}}{I \, \delta_{\rm i}}$$

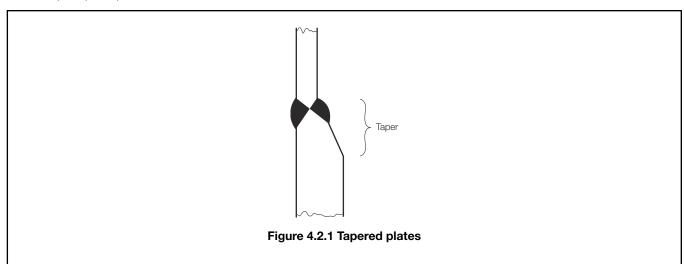

where

Q R, A z, I and δ_i are given in Vol 1, Pt 6, Ch 4, 2.3 Shear strength 2.3.6

2.3.8 Where a plate is tapered, the permissible combined shear stress is not to be exceeded at any point in way of the taper, see Figure 4.2.1 Tapered plates

2.4 Torsional strength

- 2.4.1 Torsional stresses are typically small for mono-hulls of ordinary form and can generally be ignored.
- 2.4.2 The calculation of torsional stresses and/or deflections may be required when considering ships with large deck openings, unusual form or proportions, or special operating modes which induce significant torsional stresses. Calculations may in general be required to be carried out using direct calculation procedures. Such calculations are to be submitted in accordance with Vol 1, Pt 6, Ch 4, 1.5 General

Section 2

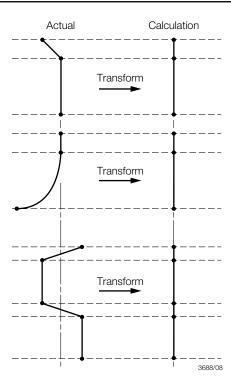

Figure 4.2.2 Calculation of A_i for non vertical parts of structural members (referenced from Table 4.2.2)

2.5 Superstructures global strength

2.5.1 The effectiveness of the superstructure in absorbing hull girder bending loads is to be established where the first tier of the superstructure extends within $0.4L_R$ amidships and where:

$$l_1 > b_1 + 3h_1$$

where

 l_1 = length of first tier, in metres

 b_1 = breadth of first tier, in metres

 h_1 = 'tween deck height of first tier, in metres

2.5.2 For superstructures with one or two tiers extending outboard to the ship's side shell, the effectiveness in absorbing hull girder bending loads in the uppermost effective tier may be assessed by the following factor:

$$η_s = 7 ((ε - 5) γ^4 + 94 (5 - ε) γ^3 + 2800 (ε - 5,8) γ^2 + 27660 (9 - ε) γ) f(λ, N) x 10^{-7}$$

(a) where

$$f(1, N = 1) = 1$$

$$f(\lambda, N = 2) = 0.90\lambda^3 - 2.17\lambda^2 + 1.73\lambda + 0.50$$

and

$$N = 1 \text{ if } l_2 < 0.7 l_1$$
$$= 2 \text{ if } l_2 \ge 0.7 l_1$$

504

$$\lambda = \frac{l_{\mathrm{W}}}{L_{\mathrm{R}}}$$
 or 1, whichever is less

$$\varepsilon = \frac{b_1}{h_1}$$
 or 5, whichever is less

$$\gamma = \frac{l_{\text{W}}}{h_{\text{I}}}$$
 or 25, whichever is less

$$l_{W} = l_{1} \text{ for N} = 1$$

= $(2 l_{1} + l_{2})/3 \text{ for N} = 2$

L_R is defined in Vol 1, Pt 6, Ch 4, 1.2 Hull girder strength notations 1.2.1, in metres

l₁, b₁, h₁ are defined in Vol 1, Pt 6, Ch 4, 2.5 Superstructures global strength 2.5.1, in metres.

 l_2 = length of second tier, in metres.

2.5.3 The design stress due to hull girder bending, σ_{hg} , in the uppermost effective tier at side may be derived according to the following formula:

$$\sigma_{\text{hg}} = \frac{\eta_{\text{s}} M_{\text{R}}}{1000 Z_{\text{s}}} \text{ N/mm2}$$

where

 $M_{\rm R}=$ hull girder bending moment at amidships due to sagging as determined in, Vol 1, Pt 5, Ch 4, 3 Global hull girder loads in kNm

 Z_s = section modulus at the structural element being considered, in m³. The section modulus is to include the superstructure tiers, assuming the tiers to be η_s effective.

 η_s = as defined in Vol 1, Pt 6, Ch 4, 2.5 Superstructures global strength 2.5.2

- 2.5.4 The stresses in the superstructure decks and sides are to be checked against buckling in accordance with *Vol 1*, *Pt 6*, *Ch 4*, *2.6 Buckling strength* These stresses should also comply with the stress criteria in *Vol 1*, *Pt 6*, *Ch 4*, *2.2 Bending strength* 2.2.3
- 2.5.5 The uppermost effective tier may need to fulfil the requirements for strength deck when the following applies:

$$\eta_{\rm S} > \left(1 + \frac{Z_0 h}{I_{100}}\right)^{-1}$$

where

 η_{S} is defined in Vol 1, Pt 6, Ch 4, 2.5 Superstructures global strength 2.5.2

 Z_0 = section modulus of hull only at hull upper deck, in m³

 I_{100} = moment of inertia of hull and effective tiers, assuming tiers to be 100 per cent effective, in m⁴

h = height from hull upper deck to uppermost effective tier, in metres.

2.6 Buckling strength

2.6.1 The buckling requirements in *Vol 1*, *Pt 6*, *Ch 2*, *3 Buckling* are to be applied to plate panels and longitudinals subject to hull girder compression and shear stresses. The design stresses are to be based on the design values of still water and wave bending moments and shear forces and are given in *Vol 1*, *Pt 6*, *Ch 4*, *2.2 Bending strength 2.2.4* and *Vol 1*, *Pt 6*, *Ch 4*, *2.3 Shear strength 2.3.7* The design factors of safety are given in *Vol 1*, *Pt 6*, *Ch 5 Structural Design Factors*

Volume 1, Part 6, Chapter 4

Section 3

2.6.2 When a Level 2 extreme strength assessment is applied, the Owner may specify in the tailoring document that the buckling assessment of plate panels subject to compressive stresses is not required. In this case the buckling requirements of *Vol* 1, *Pt* 6, *Ch* 2, 3.3 Plate panel buckling requirements may be relaxed. The requirements of *Vol* 1, *Pt* 6, *Ch* 2, 3.6 Shear buckling of stiffened panels for shear buckling and the remainder of *Vol* 1, *Pt* 6, *Ch* 2, 3 Buckling must always be complied with.

■ Section 3

Extreme Strength Assessment, ESA

3.1 General

- 3.1.1 The extreme hull girder strength of the ship is to be adequate to withstand wave loads that have a very low probability of occurring during the ship's service life at sea.
- 3.1.2 The Owner may specify that an extreme strength assessment is not required. In this case, the extreme strength **ESA1** or **ESA2** notation and all other notations which require the extreme strength notation will not be assigned.
- 3.1.3 The extreme strength capability of the ship to survive severe sea conditions can be assessed using fairly simple or more advanced analysis procedures. The level of complexity and thoroughness of the analysis procedure is reflected in the extreme strength assessment notation level assigned.
- 3.1.4 Two assessment levels are available for the extreme hull girder strength assessment notation. These are summarised below:

ESA1 - Level 1

- Extreme hull girder strength considered at a minimum of three longitudinal locations.
- · Capability assessed using elastic analysis, limiting stress criteria and buckling factors of safety.

ESA2 - Level 2

- Extreme hull girder strength considered at all critical longitudinal locations.
- Capability assessed using elasto-plastic ultimate strength methods to determine extreme hull girder strength.
- 3.1.5 For the **ESA1** assessment, the extreme hull girder strength is to be verified using elastic theory, based on the actual section moduli and determination of the buckling strength to resist the global hull girder loads. The assessment criteria are given in *Vol 1, Pt 6, Ch 4, 3.3 Bending strength Simplified assessment method ESA1* and *Vol 1, Pt 6, Ch 4, 3.4 Shear strength Simplified assessment method ESA1* Alternatively the strength may be verified using ultimate strength methods.
- 3.1.6 For the **ESA2** assessment, the extreme hull girder strength is to be verified using ultimate strength methods based on non linear stress strain curves which include the stress strain relationship in the post buckling phase. The assessment criteria are given in Vol 1, Pt 6, Ch 4, 3.5 Bending and shear strength Ultimate strength analysis method ESA2

3.2 Determination of critical sections

- 3.2.1 A critical section is defined as a transverse cross-section of the hull where the hull girder bending or shear section structural properties are lowest. Typically there will be critical sections in way of machinery spaces, large deck openings and at the ends of superstructure blocks.
- 3.2.2 The effective geometric properties of critical sections are to be calculated in accordance with Vol 1, Pt 6, Ch 4, 2.2 Bending strength 2.2.1 and Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus In defining the longitudinal position of each critical section, the shadow areas specified in Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.15 are to be considered together with the proximity of other openings, see Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.17.
- 3.2.3 For the **ESA1** assessment, critical sections are to be considered at approximately the longitudinal positions $L_R/4$, $L_R/2$ and $3L_R/4$. Other longitudinal positions may also need to be considered depending on the structural arrangement of the ship.
- 3.2.4 For the **ESA2** assessment, critical sections are to be considered at all positions along the length. Typically it is expected that the local critical transverse section between adjacent main watertight bulkheads will be evaluated.

Volume 1, Part 6, Chapter 4

Section 3

3.3 Bending strength - Simplified assessment method ESA1

- 3.3.1 If the simplified analysis method is adopted for extreme strength assessment, the longitudinal strength of the ship at each critical section is to satisfy the following criteria for the hogging and sagging conditions:
- (a) $\sigma_{BEX} < \sigma_{p}$
- (b) $\sigma_{DEX} < \sigma_p$

where

 σ_p = is the maximum permissible hull vertical bending stress, in N/mm²

$$= f_{\sigma EX} \sigma_{O}$$

 $f_{\sigma EX}$ = 0,9, limiting hull bending stress coefficient

 $\sigma_{\text{DEX}}~=~$ is the extreme hull girder bending stress at strength deck

$$= \frac{M_{\text{REX}}}{1000Z_{\text{D}}}$$

 σ_{BEX} = is the extreme hull girder bending stress at keel

$$= \frac{M_{\text{REX}}}{1000Z_{\text{B}}}$$

M_{REX} = extreme vertical wave and still water bending moment, in kNm, given in *Vol 1, Pt 5, Ch 4, 4.7 Extreme hull girder design loads*

 Z_D = actual section modulus at deck, in m³

 $Z_{\rm B}$ = actual section modulus at keel, in m³

 f_{hts} and σ_{o} are defined in Vol 1, Pt 6, Ch 4, 1.3 Symbols and definitions 1.3.1.

3.3.2 The design extreme stress due to the extreme hull vertical bending moment, σ_{ex} , for each structural member is given by

$$\sigma_{\rm ex} = \frac{M_{\rm REX}}{1000Z_{\rm i}}$$

where

 Z_i = actual section modulus at structural element being considered, in m³

M_{REX} = is defined in Vol 1, Pt 6, Ch 4, 3.3 Bending strength - Simplified assessment method ESA1 3.3.1

- 3.3.3 It is not necessary to satisfy the plate panel buckling requirements for compressive stresses provided that shear buckling of plate panels and stiffened panels and all buckling modes of failure for longitudinal girders and stiffeners are satisfied. The design factors of safety are given in *Vol 1*, *Pt 6*, *Ch 5 Structural Design Factors*
- 3.3.4 Consequently, the following sections on buckling control are to be complied with, based on compressive stresses derived in accordance with Vol 1, Pt 6, Ch 4, 3.3 Bending strength Simplified assessment method ESA1 3.3.2
- (a) Secondary stiffening in direction of compression, Vol 1, Pt 6, Ch 2, 3.7 Secondary stiffening in direction of compression.
- (b) Secondary stiffening perpendicular to direction of compression, Vol 1, Pt 6, Ch 2, 3.8 Secondary stiffening perpendicular to direction of compression
- (c) Buckling of primary members, Vol 1, Pt 6, Ch 2, 3.9 Buckling of primary members

3.4 Shear strength - Simplified assessment method ESA1

3.4.1 If the simplified analysis method is adopted for extreme strength assessment, the shear strength of the ship at each critical section is to satisfy the following criterion:

Volume 1, Part 6, Chapter 4

Section 3

$$\frac{\mid Q_{\rm REX} \mid A_{\rm Z}}{I \, \delta_0} \leq \, \tau_{\rm p}$$

where

 δ_0 is to be taken as the minimum value of δ_i

 τ_p = maximum permissible mean shear stress, in N/mm²

 $= f_{\tau EX} \tau_o$

 $f_{\tau EX} = 0.9$, limiting hull shear stress coefficient

Q_{REX} = extreme vertical wave and still water shear force, in kN, at the appropriate longitudinal position determined from *Vol 1, Pt 5, Ch 4, 4.7 Extreme hull girder design loads*

 A_z , I and δ_i , are given in Vol 1, Pt 6, Ch 4, 2.3 Shear strength 2.3.6

 f_{hts} and τ_{o} are defined in Vol 1, Pt 6, Ch 4, 1.3 Symbols and definitions 1.3.1

3.4.2 The design extreme shear stress due to extreme hull vertical shear forces for each structural member, τ_{ex} , due to hull girder is given by

$$\tau_{\rm ex} = \frac{\mid Q_{\rm REX} \mid A_Z}{I \, \delta_{\rm i}} \le \tau_{\rm p}$$

where

Q REX is given in Vol 1, Pt 6, Ch 4, 3.4 Shear strength - Simplified assessment method ESA1 3.4.1

A ₇, I and δ_i are given in Vol 1, Pt 6, Ch 4, 3.4 Shear strength – Simplified assessment method ESA1 3.4.1

- 3.4.3 The following Sections on buckling control are to be complied with based on shear stresses derived in accordance with *Vol 1, Pt 6, Ch 4, 3.4 Shear strength Simplified assessment method ESA1 3.4.2*:
- (a) Plating subject to pure in-plane shear, Vol 1, Pt 6, Ch 2, 3.3 Plate panel buckling requirements
- (b) Shear buckling of stiffened panels, Vol 1, Pt 6, Ch 2, 3.6 Shear buckling of stiffened panels

The design factors of safety are given in Vol 1, Pt 6, Ch 5 Structural Design Factors.

3.5 Bending and shear strength - Ultimate strength analysis method ESA2

- 3.5.1 The extreme strength capability of the hull girder may be assessed using a direct calculation ultimate strength analysis method. In this case the longitudinal strength of the ship at each critical section is to satisfy the following criteria for hogging and sagging conditions:
- (a) $M_{REX} < f_{UEX} M_{UEX}$
- (b) Q_{REX} , $f_{LIEX}Q_{LIEX}$

where

M_{REX} = extreme vertical wave and still water bending moment, in kNm, given in Vol 1, Pt 5, Ch 4, 4.7 Extreme hull girder design loads

 M_{UFX} = ultimate bending strength of the critical section, in kNm

Q _{REX} = extreme vertical wave and still water shear force, in kN, at the appropriate longitudinal position determined from *Vol 1, Pt 5, Ch 4, 4.7 Extreme hull girder design loads*

Q_{UEX} = ultimate shear strength of the critical section, in kN

 $f_{\text{UFX}} = 0.9$, limiting ultimate strength coefficient for extreme hull girder strength assessment.

3.5.2 The ultimate strength of each critical section is to be derived by direct calculation using elasto-plastic analysis methods.

Volume 1, Part 6, Chapter 4

Section 4

3.5.3 If the methods used to derive the ultimate strength do not include allowance for shear loading, then the shear strength requirements of *Vol 1*, *Pt 6*, *Ch 4*, *3.4 Shear strength – Simplified assessment method ESA1* are to be applied.

Section 4

Residual Strength Assessment, RSA

4.1 Application

- 4.1.1 This Section gives the requirements and procedures to be adopted for the application of the residual strength assessment procedure.
- 4.1.2 The following definition gives the basic default mission statement for the residual strength capability. The ship is required to have a 95 per cent probability of surviving for 96 hours, after sustaining structural damage as a consequence of military action, collision or grounding, in wave conditions that have a probability of occurring for 80 per cent of the time.
- 4.1.3 Three assessment levels are available for the residual strength assessment notation as detailed in *Vol 1, Pt 6, Ch 4, 1.2 Hull girder strength notations*
- 4.1.4 For the **RSA1** residual strength assessments the residual strength after damage is to be verified using the simplified assessment method given in *Vol 1*, *Pt 6*, *Ch 4*, *4.4 Bending strength Simplified assessment method RSA1* and *Vol 1*, *Pt 6*, *Ch 4*, *4.5 Shear strength Simplified assessment method RSA1*. This uses elastic theory, based on the remaining section moduli and area after damage, and determination of the buckling strength to resist the global hull girder loads.
- 4.1.5 For the **RSA2** residual strength assessments, the residual strength after damage is to be verified using the ultimate strength analysis method which determines the ultimate strength of the hull after damage using direct calculation methods. The assessment criteria are given in *Vol 1*, *Pt 6*, *Ch 4*, *4.6 Bending and shear strength Ultimate strength analysis method RSA2*
- 4.1.6 For the **RSA3** residual strength assessments, the residual strength after damage is to be verified using a recognised finite element code suitable for this type of analysis. The failure will be determined by the criteria implicit in the finite element code chosen. Several assessment codes are available and the calculation should be performed by a competent and experienced body with relevant experience.
- 4.1.7 All critical sections to be assessed are to be considered for all damage scenarios, irrespective of whether the critical section is damaged or not.
- 4.1.8 In addition, the residual strength of the hull girder or main deck following the failure of any single critical structural element is also to be considered. See Vol 1, Pt 3, Ch 2, 2.3 Definitions and structural terms. A review of the structural arrangement is to be made to establish the locations of any critical structure and a separate assessment made as to the impact of their individual failure on the strength of any main deck or the hull girder. The method of review and assessment are to be agreed with LR.
- 4.1.9 For damage scenarios that involve flooding of the ship, the effects of the flood water on the still water shear forces and bending moments are to be considered in the residual strength assessment at all critical locations whether they are damaged or not. In the latter case the capability of the undamaged critical section will be based on the structural capability of the intact section.

4.2 Extent of damage and analysis

- 4.2.1 The extent of damage to be considered is defined below. Unless otherwise specified by the Owner it will not be necessary to consider the consequences of combining damage extents from different weapon threats or damage scenarios.
- 4.2.2 The extent of damage due to military threats is defined as the minimum of the shock or blast damage that is likely to result from a specified weapon threat. The weapon threat may be specified by any of the following:
- the residual strength notation threat level, see Vol 1, Pt 4, Ch 2, 7 Residual strength
- the Owner;
- as a direct consequence of requirements of other notations.
- 4.2.3 Collision damage to the side shell. The standard damage extent is to be taken as:

Level A

• 5 m longitudinally between bulkheads

Volume 1, Part 6, Chapter 4

Section 4

- from the waterline up to the main deck
- inboard for B/5 m.

Level B and C

- 5 m longitudinally anywhere including bulkheads
- from the bilge keel up to the main deck
- inboard for B/5 m.
- 4.2.4 Grounding or raking damage to the bottom structure. The standard grounding damage extent is to be taken as:

Level A

- length of 5 m anywhere forward of midships
- upwards for 1 m or to the underside of the inner bottom, whichever is less
- breadth of 2,5 m.

Level B and C

- length of 0,1L R anywhere forward of midships
- upwards for 1 m or to the underside of the inner bottom, whichever is less
- breadth of 5 m
- 4.2.5 For the Levels A and B residual strength assessment, the residual strength is to be considered at a minimum of three critical sections for each anticipated damage extent. The critical sections are to be taken in the midship region and near each quarter length location. For the Level C residual strength assessment, the residual strength is to be considered at all critical sections along the length for each anticipated damage extent.
- 4.2.6 The damage requirements used for the residual strength assessment should be clearly identified in the Loading Manual or Stability Information Book.

4.3 Determination of critical sections

- 4.3.1 The effective geometric properties of critical transverse sections in way of the damaged area are to be calculated in accordance with Vol 1, Pt 6, Ch 4, 2.1 General and Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus. In defining the longitudinal position of each critical section, the shadow areas associated with the damage and other openings specified in Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.15 are to be considered together with the proximity of other openings, see Vol 1, Pt 6, Ch 4, 1.4 Calculation of hull section modulus 1.4.17. The effectiveness of the superstructure may also need to be reevaluated.
- 4.3.2 Due attention is to made to the effectiveness of structure which may have been plastically deformed, as a consequence of the damage, on the ultimate strength after damage.
- 4.3.3 For Level 1 and 2 residual strength assessments, damaged areas are to be considered at approximately the longitudinal positions $L_{\rm R}/4$, $L_{\rm R}/2$ and $3L_{\rm R}/4$. The geometric properties of critical transverse sections in way of these damaged areas are to be considered. Other longitudinal positions may also need to be considered depending on the internal arrangement or structural arrangement of the ship or the specified residual strength requirements.
- 4.3.4 For Level 3 residual strength assessment, damaged areas are to be considered at all positions along the length. Typically, it is expected that the local critical transverse section between adjacent main watertight bulkheads will be evaluated.

4.4 Bending strength - Simplified assessment method RSA1

4.4.1 If the simplified analysis method is adopted for residual strength assessment, the longitudinal strength of the ship at each critical section is to satisfy the following criteria for the hogging and sagging conditions:

$$\begin{split} &\sigma_{BRS} < \sigma_{p} \\ &\sigma_{DRS} < \sigma_{p} \end{split}$$

where

 $\sigma_{\rm D}$ = is the maximum permissible hull vertical bending stress, in N/mm²

 $= f_{\sigma RS} \sigma_{o}$

510

Volume 1, Part 6, Chapter 4

Section 4

 $f_{\sigma BS} = 0.9$, limiting hull bending stress coefficient

 σ_{DRS} is the hull girder bending stress at strength deck

$$= \frac{M_{\rm RRS}}{1000Z_{\rm DRS}}$$

 σ_{BRS} is the hull girder bending stress at keel

$$= \frac{M_{\rm RRS}}{1000Z_{\rm BRS}}$$

M_{RRS} = residual strength design vertical bending moment, in kNm, given in Vol 1, Pt 5, Ch 4, 5.7 Residual strength hull girder design loads

Z _{DRS} = actual section modulus at deck of damaged section, in m³, see also Vol 1, Pt 6, Ch 4, 4.1 Application 4.1.9

Z _{BRS} = actual section modulus at keel of damaged section, in m³, see *also Vol 1, Pt 6, Ch 4, 4.1 Application 4.1.9*

 f_{hts} and σ_{o} are defined in Vol 1, Pt 6, Ch 4, 1.3 Symbols and definitions 1.3.1.

4.4.2 The design residual strength stress due to the Residual strength design vertical bending moment, σ_{rs} , for each structural member is given by:

$$\sigma_{\rm rs} = \frac{M_{\rm RRS}}{1000Z_{\rm i}}$$

where

 Z_i = actual section modulus at structural element being considered, in m³

M _{RRS} is defined in Vol 1, Pt 6, Ch 4, 4.4 Bending strength – Simplified assessment method RSA1 4.4.1

- 4.4.3 It is not necessary to satisfy the plate panel buckling requirements for compressive stresses provided that shear buckling of plate panels and all buckling modes of failure for longitudinal girders and stiffeners are satisfied. The design factors of safety are given in Vol 1, Pt 6, Ch 5 Structural Design Factors
- 4.4.4 Consequently, the following Sections on buckling control are to be complied with, based on compressive stresses derived in accordance with Vol 1, Pt 6, Ch 4, 4.4 Bending strength Simplified assessment method RSA1 4.4.2
- (a) Secondary stiffening in direction of compression, Vol 1, Pt 6, Ch 2, 3.7 Secondary stiffening in direction of compression
- (b) Secondary stiffening perpendicular to direction of compression, Vol 1, Pt 6, Ch 2, 3.8 Secondary stiffening perpendicular to direction of compression
- (c) Buckling of primary members, Vol 1, Pt 6, Ch 2, 3.9 Buckling of primary members

4.5 Shear strength – Simplified assessment method RSA1

4.5.1 If the simplified analysis method is adopted for residual strength assessment, the shear strength of the ship after damage at each damaged critical section is to satisfy the following criterion:

$$\frac{\mid Q_{\rm RRS} \mid A_{\rm Z}}{I \delta_0} \leq \tau_{\rm p}$$

where

 δ_0 is to be taken as the minimum value of $\delta_{\text{i}},$

and

 τ_D = maximum permissible mean shear stress, in N/mm²

$$= f_{\tau \to X} \tau_{O}$$

Volume 1, Part 6, Chapter 4

Section 4

 $f_{\tau EX} = 0.9$, limiting hull shear stress coefficient

Q _{RRS} = residual strength design shear force, in kN, at the appropriate longitudinal position determined from *Vol* 1, *Pt* 5, *Ch* 4, 5.7 *Residual strength hull girder design loads*

 A_z , I and δ_i , are to be calculated in accordance with the method in *Vol 1*, *Pt 6*, *Ch 4*, *2.3 Shear strength* for the damaged section, see also *Vol 1*, *Pt 6*, *Ch 4*, *4.1 Application 4.1.9*.

 f_{hts} and τ_0 are defined in Vol 1, Pt 6, Ch 4, 1.3 Symbols and definitions 1.3.1.

4.5.2 The design extreme shear stress due to residual strength design shear force for each structural member, τ_{rs} , is given by

$$\tau_{\rm rs} = \frac{|Q_{\rm RRS}| A_{\rm Z}}{I \delta_{\rm O}}$$

where

Q RBS is given in Vol 1, Pt 6, Ch 4, 4.5 Shear strength - Simplified assessment method RSA1 4.5.1

 A_{7} , I and δ_{i} are given in Vol 1, Pt 6, Ch 4, 2.3 Shear strength 2.3.6

- 4.5.3 The following Sections on buckling control are to be complied with based on shear stresses derived in accordance with Vol 1, Pt 6, Ch 4, 4.5 Shear strength Simplified assessment method RSA1 4.5.2:
- (a) Plating subject to pure in-plane shear, Vol 1, Pt 6, Ch 2, 4.3 Natural frequency of plate.
- (b) Shear buckling of stiffened panels, Vol 1, Pt 6, Ch 2, 3.6 Shear buckling of stiffened panels.

The design factors of safety are given in Vol 1, Pt 6, Ch 5 Structural Design Factors

4.6 Bending and shear strength – Ultimate strength analysis method RSA2

4.6.1 The residual strength capability of the damaged hull girder may be assessed using a direct calculation ultimate strength analysis method. In this case the longitudinal strength of the ship at each critical section is to satisfy the following criteria for the hogging and sagging conditions:

where

 $M_{\rm RRS} < f_{\rm URS} M_{\rm URS}$

 $Q_{RRS} < f_{URS} Q_{URS}$

M_{RRS} = residual strength design vertical bending moment, in kNm, given in Vol 1, Pt 5, Ch 4, 5.7 Residual strength hull girder design loads

M _{URS} = ultimate bending strength of the damaged critical section, in kNm, see also Vol 1, Pt 6, Ch 4, 4.1 Application 4.1.9

Q _{RRS} = residual strength design shear force, in kN, at the appropriate longitudinal position determined from *Vol* 1, *Pt 5, Ch 4, 5.7 Residual strength hull girder design loads*

Q URS = ultimate shear strength of the damaged critical section, in kN

 $f_{\text{URS}} = 0.9$, limiting ultimate strength coefficient for residual strength assessment.

- 4.6.2 The ultimate strength of each critical section is to be derived by direct calculation using elasto-plastic analysis methods.
- 4.6.3 If the methods used to derive the ultimate strength do not include allowance for shear loading, then the shear strength requirements of *Vol 1*, *Pt 6*, *Ch 4*, *4.5 Shear strength Simplified assessment method RSA1* are to be applied.

Section

- 1 Structural design factors
- 2 Scantling determination for NS1 ships
- 3 Scantling determination for NS2 and NS3 ships

■ Section 1

Structural design factors

1.1 Application

1.1.1 The requirements of this Chapter are applicable to ships of steel construction.

1.2 General

- 1.2.1 This Chapter gives the allowable design criteria to be used to assess the structure.
- 1.2.2 These design criteria are to be used in the design formulae in *Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements* as the design criteria for the scantling determination of NS2 and NS3 ships.
- 1.2.3 These criteria are also to be used when direct calculation methods are proposed as a supplement to the scantling determination procedures for all ships including NS1 ships.
- 1.2.4 For finite element and grillage analysis, the deflection criteria will be specially considered based on the function of the structure, analysis, and the type of load cases applied.
- 1.2.5 Where higher tensile steel is used in the ship structure special consideration is to be given to the fatigue performance in accordance with *Vol 1*, *Pt 6*, *Ch 6*, *2.5 Mechanical properties for design*

1.3 Higher tensile steel

- 1.3.1 Where higher tensile steels are used, the yield stress is to be adjusted by a factor f_{hts} , where f_{hts} is to be taken from Table 5.1.1 High tensile steel stress correction factor f_{hts}
- 1.3.2 The f_{hts} factor is to be separately calculated for stresses that are a direct consequence of global loads and for stresses that are a direct consequence of local loads, as indicated in *Table 5.1.1 High tensile steel stress correction factor f* hts

Table 5.1.1 High tensile steel stress correction factor $f_{\rm hts}$

$\begin{array}{c} \text{Minimum yield stress} \\ \sigma_{\text{0}} \\ \text{N/mm}^{2} \end{array}$	f _{hts} factor			
	Global loads	Local loads		
235	1,000	1,00		
265	0,964	1,00		
315	0,956	1,00		
355	0,919	1,00		
>390	$0,886 \left(\frac{390}{\sigma_{0}}\right)$	$0.91 \left(\frac{390}{\sigma_{0}} \right)$		

 $\textbf{Note} \ \textbf{1.} \ \textbf{Intermediate values may be obtained by linear interpolation.}$

Note 2. The higher tensile steel stress correction factor f_{hts} is applicable for NS1 ships as well as NS2 and NS3 ships.

Volume 1, Part 6, Chapter 5

Section 2

■ Section 2

Scantling determination for NS1 ships

2.1 Design criteria

2.1.1 The local scantling requirements of higher tensile steel plating, longitudinals, stiffeners and girders may be based on a k s factor determined as follows:

$$k_{\rm s} = \frac{235}{\sigma_0}$$

or 0,66 whichever is greater

where

 σ_0 = specified minimum yield strength of material in N/mm²

2.1.2 The global scantling requirements of higher tensile steel plating, stiffeners and primary members are based on a k_{\perp} factor defined as follows, see *Vol* 1, *Pt* 6, *Ch* 5, 2.1 Design criteria 2.1.3:

$$k_{L} = \frac{235}{f_{hts} \sigma_{o}}$$

where

f hts is the higher tensile steel correction factor for global loads, see Vol 1, Pt 6, Ch 5, 1.3 Higher tensile steel

2.1.3 Where different grades of steel are used for the plating and attached stiffeners, then the higher tensile steel factor, k_{\perp} is to be based on the lower material yield strength.

■ Section 3

Scantling determination for NS2 and NS3 ships

3.1 Design criteria

3.1.1 The allowable stress coefficients for plating and stiffening required by Vol 1, Pt 6, Ch 3, 2 Minimum structural requirements for use in plating and stiffening design equations in Vol 1, Pt 6, Ch 2, 2.7 Plating general and Vol 1, Pt 6, Ch 2, 2.8 Stiffening general are to be determined as follows:

$$f_{\sigma} = f_{1} f_{hts}$$

$$f_{\tau} = f_1 f_{\text{hts}}$$

$$f_{\delta} = f_{1}$$

where

f₁ is taken from Table 5.3.2 Allowable stress factors f₁ as specified by Table 5.3.1 Specification of design criteria value f₁

f hts is the correction factor for higher tensile steel given in Vol 1, Pt 6, Ch 5, 1.3 Higher tensile steel

- 3.1.2 The buckling factors of safety for plating and stiffeners are given in *Table 5.3.2 Allowable stress factors f 1* and are to be used in conjunction with the buckling requirements specified in *Vol 1, Pt 6, Ch 2, 3 Buckling*
- 3.1.3 The assessment of scantling requirements to satisfy the impact or slamming pressure loads for plating and stiffening are given in Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming and Vol 1, Pt 6, Ch 3, 15 Strengthening for wave impact loads above waterline

Volume 1, Part 6, Chapter 5 Section 3

Table 5.3.1 Specification of design criteria value f_1

Failure mode	Stress factor	Column for f ₁ in Table 5.3.2 Allowable stress factors f 1			
Plating requirements					
Membrane stresses	f _o	Use $\sigma_{\rm x}$ or $\sigma_{\rm y}$ column (1)			
Local plate bending	f _o	Use σ_{b} column			
Shear stresses	f_{τ}	Use $ au_{xy}$ column			
Buckling, hull girder stresses	λ_{σ}	Use λ_{σ} column			
Shear buckling, hull girder stresses	$\lambda_{ au}$	Use $\lambda_{ au}$ column			
Stiffener requirements					
Section modulus	f _o	Use σ_{x} or σ_{y} column (1)			
Web area	f_{τ}	Use $ au_{xy}$ column			
Inertia	f_{δ}	Use f_δ column			
Buckling modes	λ_{σ}	Use λ_σ column			
Note Use the σ_X or σ_y column as appropriate to the structure under consideration.					

Table 5.3.2 Allowable stress factors f_1

Structural item			Li	imiting stres	s and other criteria		
Longitudinally effective structure	Combine d Stress	Longitudi nal stress or stiffener bending stresses	Shear stress in Plating and Stiffener webs	Local plate bending	Deflection ratio for primary members and secondary stiffeners (3)	Buckling factor (5) Compres sive stresses	Buckling factor (7) Shear stresses

	primary members	-	1,00 (8)	1,00	-	0,00100 (2)	-	-

Symbols

 f_2 is applicable to stiffeners and plating subjected to global hull girder bending stresses and local bending stresses and is to be taken as follows:

for NS2 ships

 f_2 = 0,9 (1,83- $\frac{\sigma_{\rm hg}}{\sigma_{\rm a}}$) but not greater than 0,95. Note for initial design assessment f_2 may be taken as 0,75.

for NS3 ships

$$f_2 = 0.75$$

where

 σ_{hg} is the stress due to hull girder bending in the appropriate structural item, see Vol 1, Pt 6, Ch 4, 2 Hull girder strength

 σ_a is the lower of

(1) allowable hull girder bending stress, σ_p , given in Vol 1, Pt 6, Ch 4, 2.2 Bending strength 2.2.3

(2)
$$\frac{\sigma}{\lambda} \frac{\text{cr}}{\sigma}$$

 λ_{σ} is the buckling factor for this item

 σ_{cr} is the critical buckling stress, see Vol 1, Pt 6, Ch 2, 3 Buckling.

Additional design factors for deep tank and watertight bulkheads and boundaries

 $f_{DT} = 0.90$

 $f_{\rm WT}$ = 1,40 Note watertight plating is assessed using plastic design methods

Note 1. Deflection ratio for secondary stiffeners, expressed as a ratio of the stiffener's span, i.e. $\delta \le f_{\delta}$ span where δ is the deflection.

Note 2. Deflection ratio for primary structure, expressed as a ratio of the primary member's span, i.e. $\delta \le f_{\delta}$ span.

Note 3. The deflection ratios are applicable to the primary members and secondary stiffeners attached to the specified plating areas. The ratios are not applicable to the plating.

Volume 1, Part 6, Chapter 5

Section 3

- **Note** 4. The buckling factor of safety for stiffeners attached to plating which is allowed to buckle in the elastic mode due to the applied loads is to be taken as 1,25 see also Vol 1, Pt 6, Ch 2, 4.5 Effect of submergence.
- Note 5. Buckling factor of safety to be applied to the compressive stress due to global longitudinal stresses.
- Note 6. Buckling factor of safety to be applied to the compressive stress due to local stresses, either vertical or transverse.
- Note 7. Buckling factor of safety to be applied to the shear stress.
- **Note** 8. For longitudinally effective primary structure and longitudinal stiffeners, the stress factor is to be reduced by:0% at 0,0*L* _R,30% at 0,3*L* _R,30% at 0,7*L* _R,

0% at 1,0 $L_{\rm R}$,

with intermediate values determined by interpolation.

- 2 Materials
- **3** Corrosion protection
- 4 Requirements for welded construction
- 5 Welded joints and connections
- 6 Construction details
- 7 Inspection and testing procedures

■ Section 1

General

1.1 Application

1.1.1 The requirements of this Chapter are applicable to mono-hull ships of steel construction as defined in *Pt 1, Ch 2, 2.2 Definitions 2.2.5*.

1.2 General

- 1.2.1 This Chapter contains the general Rule requirements for the construction of steel ships using electric arc welding processes. Where alternative methods of construction are proposed, details are to be submitted for consideration by Lloyd's Register (hereinafter referred to as 'LR').
- 1.2.2 Specific requirements containing detailed information on testing, inspection and construction details can be found in the relevant Chapters of the *Naval Survey Guidance for Steel Ships*, or an otherwise specified and agreed standard.

1.3 Symbols and definitions

1.3.1 The symbols and definitions used in this Chapter are defined in the appropriate Section.

1.4 Builder's facilities

- 1.4.1 The buildings used for production and storage are to be of suitable construction and equipped to provide the required environment, and are also to comply with any specified standard(s)
- 1.4.2 The Surveyor is to be allowed unrestricted access during working hours to such parts of the Builder's establishment as may be necessary to ensure that the requirements of the Rules are being complied with.

1.5 Works inspection

- 1.5.1 Prior to the commencement of construction, the facilities are to be inspected to the satisfaction of the attending Surveyor. This will include the minimum quality control arrangements outlined in Vol 1, Pt 6, Ch 6, 1.6 Quality control
- 1.5.2 The Surveyor is to be satisfied that the Builder has the organisation and capability to construct ships to the standards required by the Rules.
- 1.5.3 The Builder is to be advised of the result of the inspection and all deficiencies are to be rectified prior to the commencement of production.
- 1.5.4 Where structural components are to be assembled and welded by subcontractors, the Surveyors are to inspect the sub-contractor's works to ensure that compliance with the requirements of this Chapter can be achieved.

Section :

1.6 Quality control

- 1.6.1 For compliance with Vol 1, Pt 6, Ch 6, 1.5 Works inspection 1.5.2, LR's methods of survey and inspection for hull construction and machinery installation are to include procedures involving the shipyard management, organisation and quality systems.
- 1.6.2 The extent and complexity of the quality systems will vary considerably depending on the size and type of ships and production output. LR will consider certification of the Builder in accordance with the requirements of one of the following systems:
- (a) Quality Assurance System in accordance with an International or National Standard (i.e. ISO 9000 and BS ENISO 9001) with assessment and certification carried out by a nationally accredited body.
- (b) LR's Quality Assurance Scheme for the Hull Construction of Ships.
- (c) LR's Quality Assurance Scheme for the Construction of Special Service Craft.
- (d) LR's locally accepted Quality Control System The Builder is implementing a documented Quality Control System which controls the following activities:
 - (i) Receipt storage and issue of materials, equipment, etc.
 - (ii) Fabrication environment.
 - (iii) Weld procedures and welder performance.
 - (iv) Production fabrication.
 - (v) Inspection of production processes.
 - (vi) Installation of machinery, Mobility and Ship Type systems.
 - (vii) Fitting-out.
 - (viii) Tests and trials.
 - (ix) Drawings and document control.
 - (x) Records.
- 1.6.3 The 'documented' quality control system will in general require the Builder to have written procedures that describe clearly and unambiguously which of the activities specified in 1.6.2(d) is carried out, when it is carried out and by whom. These procedures will form part of the system manual which is also to contain a statement of management policy, organisation chart and statements of responsibilities. The manual is to be controlled in respect to the formal issue and revision.
- 1.6.4 Further details of LR's requirements are available on request from the local LR office.

1.7 Building environment

1.7.1 The ship is to be suitably protected during the building period from adverse weather and climatic conditions.

1.8 Storage areas

- 1.8.1 All materials are to be stored safely and in accordance with the manufacturer's requirements. Storage arrangements are to be such as to prevent deterioration through contact with heat, sunlight, damp, cold and poor handling.
- 1.8.2 All storage spaces provided by the Builder for welding consumables are to be suitable for maintaining them in good condition and are to be in accordance with the manufacturer's recommendations.
- 1.8.3 All materials are to be fully identifiable in the storage areas, and identification is to be maintained during issue to production.
- 1.8.4 Material suspected of being non-conforming is to be segregated from acceptable materials.

1.9 Materials handling

- 1.9.1 The Builder is to maintain purchasing documents containing a clear description of the materials ordered for use in hull construction and the standards to which the material must conform, together with the identification and certification requirements.
- 1.9.2 The Builder is to be responsible for ensuring that all incoming plates, sections, castings, components, fabrications and consumables and other materials used in the hull construction are inspected or otherwise verified as conforming to purchase order requirements.
- 1.9.3 The Builder is to have procedures for the inspection, storage and maintenance of Owner supplied materials and equipment.

Section :

- 1.9.4 The Builder is to record, on receipt, the manufacturing date, or use-by date of critical materials. Any materials which have a shelf life are to be used in order of manufacturing date to ensure stock rotation.
- 1.9.5 The Builder is to establish and maintain a procedure to ensure that materials and consumables used in the hull construction process are identified (by colour-coding and/or marking as appropriate) from arrival in the yard through to fabrication in such a way as to enable the type and grade to be readily recognised.
- 1.9.6 Where materials are found to be defective they are to be rejected in accordance with the Builder's quality control procedure.

1.10 Faults

- 1.10.1 All identified faults are to be recorded under the requirements of the quality control systems. Faults are to be classified according to their severity and are to be monitored during Survey.
- 1.10.2 Production faults are to be discussed with the Owner and attending Surveyor, and a rectification scheme agreed. Deviations from the approved plans are to be locally approved by the attending Surveyor and a copy forwarded to the plan approval office for record purpose.

1.11 New building inspection

- 1.11.1 On acceptance of a 'Request for Services' the attending Surveyor is to inform the Builder of the key stages of the production that are to be inspected and the extent of the inspection to be carried out.
- 1.11.2 It is the Builder's responsibility to carry out required inspections in accordance with the accepted quality control system.
- 1.11.3 It is the Surveyor's responsibility to monitor the Builder's quality control records and carry out inspections at key stages and during periodic visits.
- 1.11.4 Adequate facilities are to be provided to enable the Surveyor to carry out a satisfactory inspection. Consideration also needs to be given to provide arrangements that facilitate subsequent in-service maintenance. These are to include the provision of access holes in restricted spaces and removable linings.
- 1.11.5 During inspections all deviations are to be dealt with in accordance with Vol 1, Pt 6, Ch 6, 1.6 Quality control 1.6.3
- 1.11.6 Building and repair tolerances are given in the Naval Ship Survey Guidance Manual.

1.12 Acceptance criteria

- 1.12.1 Classification is dependent upon the work being carried out in accordance with the approved plans and the requirements of an accepted quality control system.
- 1.12.2 The work is to be carried out to the satisfaction of the attending Surveyor. This will include the verification of the quality control documentation and the remedial action associated with all defects and deficiencies recorded.
- 1.12.3 Proposed deviations from the approved plans are subject to LR approval and in the first instance are to be discussed with the attending Surveyor. Where applicable, an amended plan is to be submitted to the plan appraisal office. Such deviations will be recorded as endorsements to the classification unless specifically agreed otherwise with the plan appraisal office.
- 1.12.4 Where the above requirements are met the attending Surveyor will arrange for the relevant certification to be issued.

1.13 Repair

- 1.13.1 Minor repairs are to be agreed with the attending Surveyor and a rectification scheme agreed with the Builder. The Builder is to incorporate details of the agreed repair procedures in the quality control system in accordance with *Vol 1, Pt 6, Ch 6, 1.6 Quality control 1.6.3*
- 1.13.2 Repairs which affect the structural integrity are to be discussed with the Builder and the Builder's proposed rectification scheme is to be submitted to the plan appraisal office for consideration.

Section 2

■ Section 2

Materials

2.1 General

- 2.1.1 The Rules relate in general to the construction of steel ships, although consideration will be given to the use of other materials.
- 2.1.2 Materials used in the construction of the ship are to be manufactured and tested in accordance with the requirements of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2 (hereinafter referred to as the Rules for Materials.
- 2.1.3 Materials for which provision is not made therein or covered by this Section may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

2.2 Grade of steel

- 2.2.1 The grade of steel, supply condition and its mechanical properties are to be indicated on the construction plans.
- 2.2.2 In order to distinguish between the material grade requirements for different hull members at varying locations along the ship, material classes are assigned, as shown in *Table 6.2.1 Material classes and grades*. For each class, depending on thickness, the material grade requirements are not to be lower than those given in *Table 6.2.2 Steel grades for normal operation*.

Table 6.2.1 Material classes and grades

	Structural member category	Material class/Minimum grade
SECO	ONDARY	
A1.	Longitudinal bulkhead strakes, other than belonging to the Primary category	Class I within 0,4L _R amidships
A2.	Deck plating exposed to weather, other than that belonging to the Primary or Special category	Grade A/AH outside 0,4L _R amidships
A3.	Side plating	
PRIM	ARY	
B1.	Bottom plating, including keel plate	
B2.	Strength deck plating, excluding that belonging to the Special category	Class II within 0,4 L _R amidships
B3.	Continuous longitudinal plating of strength members above strength deck	Grade A/AH outside 0,4L _R amidships
B4.	Uppermost strake in longitudinal bulkhead	
SPEC	DIAL	
C1.	Sheerstrake (or rounded gunwale) and stringer plate at strength deck, see Note 1	Class III within 0,4L _R amidships
C2.	Deck strake at longitudinal bulkhead, see Note 1	Class II outside 0,4 $L_{\rm R}$ amidships
		Class I outside 0,6 $L_{\rm R}$ amidships
C3.	Strength deck plating at corners of large hatch openings	Class III within 0,6 <i>L</i> _R amidships
		Class II outside 0,6 <i>L</i> _R amidships
C4.	Bilge strake in ships with double bottom over the full breadth and	Class II within 0,6 $L_{\rm R}$ amidships
	length less than 150 m	Class I outside 0,6 <i>L</i> _R amidships

Section 2

C5.	Bilge strake in other ships, see Note 1	Class III within 0,6L _R amidships
		Class II outside 0,4 <i>L</i> _R amidships
		Class I outside 0,6 <i>L</i> _R amidships
ADDIT	TIONAL MINIMUM REQUIREMENTS FOR SINGLE STRENGTH DECK	SHIPS OF LENGTH GREATER THAN 150 m
D1.	Longitudinal plating of strength deck where contributing to the longitudinal strength	Grade B/AH within 0,4 <i>L</i> _R amidships
D2.	Continuous longitudinal strength plating of members above strength deck	
D3.	Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and strength deck	
ADDIT	TIONAL MINIMUM REQUIREMENTS FOR SHIPS OF LENGTH GREAT	ER THAN 250 m
E1.	Sheerstrake (or rounded gunwale) and stringer plate at strength deck, see Note 1	Grade E/EH within 0,4L _R amidships
E2.	Bilge strake, see Note 1	Grade D/DH within 0,6L _R amidships
4		

- **Note** 1. Single strakes required to be of Class III or of Grade E/EH and within $0.4L_R$ amidships are to have breadths not less than $800 + 5L_R$ mm, but need not be greater than 1800 mm, unless limited by the geometry of the ship's design.
- Note 2. For strength members not mentioned, Grade A/AH may be generally used.
- Note 3. Steel grade is to correspond to the as-fitted thickness.
- **Note** 4. Plating materials for sternframes supporting the rudder and propeller boss, rudders, rudder horns and shaft brackets are, in general, not to be of lower grades than corresponding to Class II. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semispade rudders or at upper part of spade rudders) Class III is to be applied.
- **Note** 5. RAS seating and support structure are to be of Grade D/DH for $t \le 20$ mm and Grade E/EH for t > 20 mm. For ships operating in cold weather RAS seating and support structure are to be of Grade E/EH.
- **Note** 6. Corner inserts in way of complex openings such as for lifts and side doors which may impinge on the deck plating or stringer plate are to be of Grade D/DH for $t \le 20$ mm and Grade E/EH for t > 20 mm.
- **Note** 7. The material class used for reinforcement and the quality of material (i.e. whether mild or higher tensile steel) used for welded attachments, such as waterway bars and bilge keels, is to be similar to that of the hull envelope plating in way. Where attachments are made to rounded gunwale plates, special consideration will be given to the required grade of steel, taking account of the intended structural arrangements and attachment details.
- Note 8. The material class for deck plating, sheerstrake and upper strake of longitudinal bulkhead within $0.4L_{\rm R}$ amidships is also to be applied at structural breaks of the superstructure, irrespective of position.
- Note 9. Engine seat top plates outside 0,6L R amidships may be Grade A/AH. Steel grade requirement for top plates within 0,6L R amidships will be specially considered.

Table 6.2.2 Steel grades for normal operation

Thickness,	Material Class							
in mm		I		II		III		
	Mild steel	H.T. steel	Mild steel	H.T. steel	Mild steel	H.T. steel		
≤10	А	АН	А	АН	А	AH		
10-15	А	AH	А	AH	А	AH		
15-20	A	AH	А	AH	В	AH		
20-25	А	AH	В	AH	D	DH		
25-30	A	AH	D	DH	D	DH		

Section 2

30-35	В	AH	D	DH	Е	EH
35-40	В	AH	D	DH	Е	EH
40-45	D	DH	E	EH	E	EH
45-50	D	DH	E	EH	Е	EH

- 2.2.3 The material class and minimum grade requirements specified in *Table 6.2.1 Material classes and grades* and *Table 6.2.2 Steel grades for normal operation* for normal operation are applicable for normal service, which assumes navigation to areas where the lowest mean daily average air temperature is not less than -10°C
- 2.2.4 The material grade of the exposed structure of ships intended to operate in external air temperatures below -10°C, including all ships designed for sea area **SA1**, is to be in accordance with *Vol 1*, *Pt 6*, *Ch 6*, *2.4 Ships operating in cold weather conditions*.
- 2.2.5 Ships operating in certain environmental conditions, and those where operational requirements may lead to a risk of impact damage, or ships with military notations, may require higher toughness grades.
- 2.2.6 Where a ship has the notations **FDA**, **ESA** or **RSA**, the toughness requirements for steel will be specially considered on the basis of fatigue crack limitation and subsequent propagation through the structure.
- 2.2.7 Where tee or cruciform connections employ full penetration welds and the plate material, is subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties, and tested in accordance with *Ch 3*, 8 *Plates with specified through thickness properties* of the Rules for Materials. The plan should indicate the material grade followed by the letter Z (e.g. DZ, DHZ).

2.3 Refrigerated spaces

- 2.3.1 Where the minimum design temperature of the steel falls below 0°C in refrigerated spaces, the grade of steel for the following items is to comply, in general, with the requirements of *Table 6.2.3 Grades of steel for refrigerated spaces with a minimum design temperature below 0 Degrees C*:
- Deck plating.
- Webs of deck girders.
- Longitudinal bulkhead strakes attached to deck.

 $Table \ 6.2.3 \ Grades \ of \ steel \ for \ refrigerated \ spaces \ with \ a \ minimum \ design \ temperature \ below \ 0 \ Degrees \ C$

Minimum design temperature, in °C	Thickness, in mm	Grades of steel
0 to -10	<i>t</i> ≤12,5	В/АН
	12,5 < <i>t</i> ≤ 25,5	D/DH
	t > 25,5	E/EH
< -10 to -25	<i>t</i> ≤ 12,5	D/DH
	<i>t</i> > 12,5	E/EH
< -25 to -40	<i>t</i> ≤ 12,5	E/EH
	t > 12,5	FH/LT-FH (see also Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service)

2.3.2 Unless a temperature gradient calculation is carried out to assess the design temperature in the items defined in *Vol 1*, *Pt 6, Ch 6, 2.3 Refrigerated spaces 2.3.1*, the temperature to which the steel deck may be subjected is to be assessed as shown in *Table 6.2.4 Assessment of deck temperature*

Section 2

Table 6.2.4 Assessment of deck temperature

Arrangement	Deck temperature				
(1) Deck not covered with insulation in the refrigerated space	Temperature of the refrigerated space				
(2) Deck covered with insulation in the refrigerated space and not insulated on the other side	Temperature of the space on the uninsulated side				
(3) Deck covered with insulation on both sides					
(a) Temperature difference not greater than 11°C	Mean of the temperatures of the spaces above and below the deck				
(b) Temperature difference	Mean of the temperatures of the				
greater than 11°C but not	spaces above and below the				
greater than 33°C	deck less 3°C				
(c) Temperature difference	Deck temperature will be				
greater than 33°C	specially assessed				
Note Where one of the internal spaces concerned is not refrigerated, the temperature of the space is to be taken as 5°C.					

2.4 Ships operating in cold weather conditions

- 2.4.1 For ships intended to operate in areas with external air temperatures below -10°C MDAT, e.g. regular operations during winter seasons to Arctic or Antarctic waters, the material grade requirements of structures above the Cold Waterline are not to be of lower grades than those given in Table 6.2.5 Material classes and grades for structures exposed to low temperatures , Table 6.2.6 Materials for Class II for low air temperatures, Table 6.2.7 Materials for Class III for low air temperatures for the specified design air temperature.
- 2.4.2 The specified design air temperature is to be selected by the Owner based on the lowest mean daily average temperature (MDAT) for the area and period of operations considered in the Concept of Operations.

where

Mean = statistical mean over a minimum of 20 years

Average = average during one day and one night

Lowest = lowest during the year

MDHT = Mean Daily High Temperature

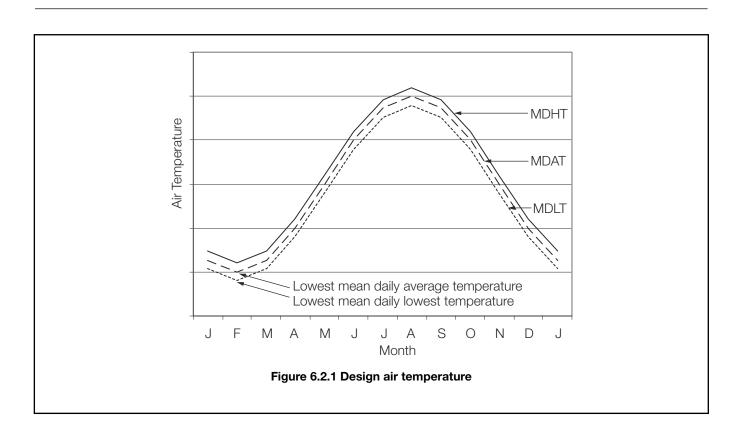

MDAT = Mean Daily Average Temperature

MDLT = Mean Daily Low Temperature

Note The MDLT is used as the reference baseline for the *Rules for the Winterisation of Ships, July 2021* and IMO Polar Code, and is typically taken as 3°C lower than the MDAT.

Figure 6.2.1 Design air temperature shows the definition graphically.

Section 2

- 2.4.3 Unless otherwise specified, all ships designed for sea area **SA1** are to be designed for a lowest mean daily average design air temperature of -30°C MDAT or lower. However, where agreed, materials for **SA1** ships not intended for operations in cold weather conditions may be based on requirements for normal service for higher design air temperatures (-10°C MDAT or higher).
- 2.4.4 Where the material class in *Table 6.2.1 Material classes and grades* is higher than in *Table 6.2.5 Material classes and grades for structures exposed to low temperatures*, the higher material class is to be applied.
- 2.4.5 For ships where the optional **Winterisation H** notation is applied, see *Rules for the Winterisation of Ships, July 2021*, note that the external design air temperature defined in the *Rules for the Winterisation of Ships, July 2021* is taken as 13°C lower than the design air temperature, i.e. if the design air temperature is -12°C MDAT, then the external design air temperature for the application of the *Rules for the Winterisation of Ships, July 2021* is -25°C (-12°C MDAT minus 13°C).
- 2.4.6 For ships where a Polar Service Temperature (PST) is to be assigned, note that the PST is taken as 13°C lower than the design air temperature, i.e. if the design air temperature is -12°C MDAT, then the PST for the application of the Polar Code is -25°C (-12°C MDAT minus 13°C).

Table 6.2.5 Material classes and grades for structures exposed to low temperatures

	Structural member category	Material class
SECONDAR	Y	
A1.	Deck plating exposed to weather, other than that belonging to the Primary or Special category	Class I
A2.	Side plating above the Cold Waterline (CWL), see Note 4	
A3.	Transverse bulkheads above CWL, see Note 4	
PRIMARY		
B1.	Strength deck plating, excluding that belonging to the Special category, see Note 1	Class II within 0,4L _R amidships
B2.	Continuous longitudinal members above strength deck	Class I outside 0,4L _R amidships

Section 2

B3.	Longitudinal bulkhead above CWL, see Note 4	
SPECIAL		
C1.	Sheerstrake (or rounded gunwale) and stringer plate at strength deck, see Note 2	Class III within 0,4L _R amidships
C2.	Deck strake at longitudinal bulkhead, see Note 3	Class II outside 0,4L _R amidships

Note 1 Plating at the corners of deck openings, superstructure ends and other structural discontinuity is to be specially considered. The requirements of Class III are to be applied in positions where high local stresses may occur but the material is not to be less than Grade E/EH.

Note 2 Not to be less than Grade E/EH within 0,4LR amidships in ships with length exceeding 250 m.

Note 3 In ships with breadth exceeding 70 m at least three deck strakes are to be Class III.

Note 4 The Cold Waterline (CWL) is to be taken as 0,3 m below the minimum design Ballast Waterline (BWL).

Note . MS and HT are defined as Mild Steel and High Tensile Steel respectively.

- 2.4.7 All bulwarks, spurn-waters, unlagged gas turbine intake structures, side screens, tie down points, etc. are to be constructed of steel of equivalent toughness to that of the material to which they are attached.
- 2.4.8 Steel grades for rudder horn and stem (including the adjacent strake of shell plating), are given in *Table 6.2.9 Steel* grades for rudder horn, shaft brackets and stem for ships intended to navigate in Arctic or Antarctic conditions. The steel grades of internal members attached to these items are to be of the same grade (or equivalent) with due account taken of difference in thickness.
- 2.4.9 For non-exposed structures and structures below the Cold Waterline, the material grades are not to be lower than those given in *Table 6.2.1 Material classes and grades*.
- 2.4.10 Structure attached to and within a distance of 2,0 m within unheated spaces and 0,75 m for heated spaces of the exposed boundary plating is to be of the same material grade as that of the exposed plating, but the grade may be adjusted depending on the material thickness of the attached structure.

Section 2

Table 6.2.9 Steel grades for rudder horn, shaft brackets and stem for ships intended to navigate in Arctic or Antarctic conditions

Item	Condition	Construction	Steel grade ⁽²⁾⁽³⁾			
			f < 25(1)	f ≥ 25(1)		
Rudder horn	Fully immersed	Cast steel	Carbon manganese steel Grade 400	Carbon manganese steel Grade 400		
		Fabricated	Grade EH	Grade EH		
	Periodically immersed or exposed	Cast steel	Carbon manganese steel Grade 460	2 1/4 Ni steel or equivalent		
		Fabricated	Grade FH	1 1/2 Ni steel or equivalent		
Shaft brackets	Fully immersed	Cast steel	Special Grade	Special Grade		
		Fabricated	Class B/AH	Class B/AH		
	Periodically immersed or exposed	Cast steel	Carbon manganese steel Grade 400	Carbon manganese steel Grade 460		
		Fabricated	Class II	Grade FH		
Stem including adjacent	Fully immersed	Fabricated	Class B/AH	Class B/AH		
strake of shell plating		Cast steel	Carbon manganese steel Grade 400	Carbon manganese steel Grade 400		
	Periodically immersed or	Fabricated	Class II	Class II		
	exposed	Cast steel	2 1/4 Ni steel	2 1/4 Ni steel		
Rudder stock		Forged	see Ch 5, 2.4 Mechanical tests 2.4.7 of the Rules for Materials			
		Cast steel	Carbon manganese steel grade 400			

Note 1.
$$f = \sqrt{P_0^{\triangle}} \times 10^{-3}$$

Note where P_0 is the maximum propulsion shaft power, in kW, for which the machinery is classed Δ is displacement, in tonnes, at Ice Load Waterline or Deepest Ice Operation Waterline when floating in water of relative density of 1,0.

Note 2. For cast steel, see *Ch 4*, 7 *Ferritic steel castings for low temperature service* of Rules for Materials. The requirements for carbon manganese steel grades 400 and 460 are to include the additional compositional requirements for Special grade in accordance with *Ch 4*, 2.2 Chemical composition of the Rules for Materials.

Note 3. For C–Mn LT60 and Ni plates, see Ch 3, 6 Carbon–manganese and nickel alloy steels for low temperature service of Rules for Materials.

Note 4. For Special grade, see Ch 4, 2.2 Chemical composition of the Rules for Materials.

2.5 Mechanical properties for design

2.5.1 The scantlings determined within this Part of the Rules assume that mild steel has the following mechanical properties:

N/mm²

Yield strength (minimum)

235

Rules and Regulations for the Classification of Naval Ships, January 2022

Material and Welding Requirements Volume 1, Part 6, Chapter 6

Section 3

Tensile strength 400-490Modulus of elasticity 200×10^3

- 2.5.2 Steels having a minimum yield stress not less than 265 N/mm² are regarded as higher tensile steels.
- 2.5.3 Factors for structural assessment are given in Vol 1, Pt 6, Ch 5 Structural Design Factors
- 2.5.4 For the application of the requirements of *Vol 1, Pt 6, Ch 6, 2.5 Mechanical properties for design 2.5.3* special consideration will be given to steel where $\sigma_0 \ge 390 \text{ N/mm}^2$. Where such steel grades are used in areas which are subject to fatigue loading the structural details are to be verified using fatigue design assessment methods.

Section 3

Corrosion protection

3.1 General

- 3.1.1 All steelwork is to be suitably protected against corrosion by a suitable protective coating. All coatings are to be in accordance with the requirements of this Section.
- 3.1.2 Where the **PCWBT, ACS (B)** or **ACS (V)** notations have been assigned, the requirements of *Vol 1, Pt 3, Ch 6, 6 Protective Coatings* are to be complied with.
- 3.1.3 At the time of new construction, all salt-water ballast spaces having boundaries formed by the hull envelope shall have an efficient protective coating, epoxy or equivalent, applied in accordance with the manufacturer's recommendations, see *Ch 15 Corrosion Prevention* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1* & 2.
- 3.1.4 For ships that are required to comply with IMO Resolution MSC.215(82) Performance Standard for Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers (Adopted on 8 December 2006), all dedicated sea-water ballast tanks are to comply with all the requirements of the Resolution, Ch 15 Corrosion Prevention of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.
- 3.1.5 Details and recommendations regarding protective coatings are given in LR's *List of Paints, Resins, Reinforcements and Associated Materials*.
- 3.1.6 Integral tanks that contain only fuel can be coated or, where applicable, be protected by a system of cathodic protection or both, see *Vol 1, Pt 6, Ch 6, 3.4 Internal hull protection*.
- 3.1.7 Steelwork is to be suitably cleaned and cleared of millscale before the application of any coating.
- 3.1.8 Paints or other coatings are to be suitable for the intended purpose in the locations where they are to be used. Coatings are to be of adequate film thickness, applied in accordance with the paint manufacturer's specification.
- 3.1.9 The paint or coating applied is to be compatible with any previously applied primer.
- 3.1.10 Paint containing more than 10 per cent aluminum by weight in the dry film should not, in general, be used in positions where oil or fuel vapours can accumulate, unless it has been shown by appropriate tests that the paint to be used does not increase the incendive sparking hazard.
- 3.1.11 Paints, varnishes and similar preparations having a nitrocellulose or other highly flammable base are not to be used in accommodation or machinery spaces.

3.2 Prefabrication primers

3.2.1 Prefabrication primers are to be approved in accordance with *Ch 15 Corrosion Prevention* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*

3.3 External hull protection

3.3.1 External hull surfaces are to be protected from corrosion by the use of appropriate anti-corrosive measures, which can include the application of suitable coating systems to all external surfaces.

Section 3

- 3.3.2 Details of coating systems are to be submitted in accordance with *Ch 15 Corrosion Prevention* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*
- 3.3.3 Where a cathodic protection system is fitted, plans showing the proposed layout of anodes and hull penetrations are to be submitted in accordance with *Ch 15 Corrosion Prevention* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*
- 3.3.4 All equipment is to be suitable for its intended location.
- 3.3.5 The arrangements for glands, where cables pass through the shell, are to include a small cofferdam.
- 3.3.6 Cables which pass through ballast tanks are to be enclosed in a steel tube of at least 10 mm thickness.
- 3.3.7 Cables to anodes are not to pass through tanks intended for the storage of low flash point products; including, but not limited to, oils.
- 3.3.8 Cables which pass through cofferdams of storage tanks which may contain low flash point products are to be enclosed in a steel tube of at least 10 mm thickness, see also Vol 2, Pt 9, Ch 5 Hazardous Areas.
- 3.3.9 Where an *IWS (In-Water Survey) notation is to be assigned (see also Vol 1, Pt 1, Ch 2, 7 Classification of ship with *IWS notation), protection of the underwater portion of the hull is to be provided by means of a suitable high resistance paint applied in accordance with the manufacturer's requirements. Details of the high resistance paint are to be submitted for information in accordance with Ch 15 Corrosion Prevention of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.

3.4 Internal hull protection

- 3.4.1 The requirements for cathodic protection of internal tanks in *Ch 15 Corrosion Prevention* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* are to be complied with.
- 3.4.2 When a cathodic protection system is to be fitted in tanks for the carriage of liquid with flash point not exceeding 60°C, a plan showing details of the locations and attachment of anodes is to be submitted. The arrangements will be considered for safety against fire and explosion aspects only. Impressed current cathodic protection systems are not permitted in any tank.
- 3.4.3 Particular attention is to be given to the locations of anodes in relation to the structural arrangements and openings of the tank.
- 3.4.4 Anodes are to be of approved design and sufficiently rigid to avoid resonance in the anode support. Steel cores are to be fitted, and these are to be so designed as to retain the anode even when the latter is wasted.
- 3.4.5 Anodes are to be attached to the structure in such a way that they remain secure, both initially and during service. The following methods of attachment are acceptable:
- (a) Steel core connected to the structure by continuous welding of adequate section.
- (b) Steel core bolted to separate supports, provided that a minimum of two bolts with lock nuts are used at each support. The separate supports are to be connected to the structure by continuous welding of adequate section.
- (c) Approved means of mechanical clamping.
- 3.4.6 Anodes are to be attached to stiffeners, or are to be aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.
- 3.4.7 When locating anodes, care is to be taken to ensure that they do not cause a stress concentration. Where cores or supports are welded to the main structure, they are to be kept clear of the toes of brackets and similar stress raisers. Where they are welded to asymmetrical stiffeners, they are to be connected to the web with the welding kept at least 25 mm away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection shall be made to the web or to the centreline of the face plate but well clear of the free edges. However, it is recommended that anodes not be fitted to face plates of higher tensile steel longitudinals.

3.5 Aluminium and magnesium anodes

3.5.1 Aluminium and aluminium alloy anodes are permitted in tanks which can contain explosive or flammable vapour, or in tanks adjacent to tanks which can contain explosive or flammable vapour, but only at locations where the potential energy of the anode does not exceed 275 J. The weight of the anode is to be taken as the weight at the time of fitting, including any inserts and fitting devices. The height of the anode is, in general, to be measured from the bottom of the tank to the centre of the anode. Where the anode is located on a horizontal surface (such as a bulkhead stringer) not less than 1 m wide, provided with an

Section 3

upstanding flange or face plate projecting not less than 75 mm above the horizontal surface, the height of the anode can be measured above that surface.

- 3.5.2 Aluminium anodes are not to be located under tank hatches unless protected by adjacent structure.
- 3.5.3 Magnesium and magnesium alloy anodes are not permitted in tanks which can contain explosive or flammable vapour, or in tanks adjacent to tanks which can contain explosive or flammable vapour. Where permitted for other tanks, adequate venting must be provided.

3.6 Bimetallic connections

- 3.6.1 The design shall ensure that the location of all bimetallic connections allows for regular inspection and maintenance of the joints and penetrations during service.
- 3.6.2 Where bimetallic connections are made involving dissimilar metals, measures are to be incorporated to mitigate galvanic corrosion.
- 3.6.3 Special attention is to be given to the penetrations of and connections to the hull, bulkheads and decks by piping and equipment where dissimilar materials are involved.

3.7 Deck coverings

- 3.7.1 The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck.
- 3.7.2 Deck coverings within accommodation spaces, control stations, stairways and passageways are to be of a type which will not readily ignite or cause smoke or toxic or explosive hazards at elevated temperatures in accordance with the requirements of the *International Code for the Application of Fire Test Procedures or Naval Administration*.
- 3.7.3 Where plated decks are sheathed with wood or an approved composition, reductions in plate thickness may be allowed.

3.8 Corrosion margin

- 3.8.1 The scantlings determined from the formulae provided in the Rules assume that the materials used are selected, manufactured and protected in such a way that there is negligible loss in strength due to corrosion.
- 3.8.2 Where steel is not protected against corrosion by painting or other approved means, the scantlings may require to be further considered.
- 3.8.3 For naval vessels with scantlings in accordance with either the *Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5* **NS(SR)** or the *Rules and Regulations for the Classification of Special Service Craft, July 2021, incorporating Notice No. 1, 2 & 3* **NS(SSC),** the corrosion margins, where specified in those Rules, are to be applied.
- 3.8.4 It is the responsibility of the Owner to specify corrosion margins which meet their operational requirements. Where the Owner does not specify corrosion margins, it is recommended that corrosion margins be applied to net scantlings calculated by these Rules in areas of the ship's structure where corrosion or wear is expected to occur in service. The following recommendations are offered as guidance:
 - +0,5 mm all hull envelope plating below a line, 1,0 m above the design waterline
 - + 0,5 mm of all plating forming the boundary of tanks
 - + 0,5 mm plating forming the lower boundary of wet spaces as appropriate
 - +2,0 mm to the keel plate
 - + 1,5 mm to flight deck plating.

Consideration should also be given to the addition of a corrosion margin in the following areas:

- the lower portion of stiffeners located within wet spaces;
- stiffeners located within tanks;
- all tanks containing corrosive fluids and areas where spillage of corrosive fluids could occur;
- the base of mast structures;
- all uncoated structures.
- 3.8.5 Where a corrosion margin is specified, these are to clearly shown on the submitted plans in accordance with *Vol 1, Pt 6, Ch 1, 2.2 Plans to be submitted 2.2.1*.

Section 4

Section 4

Requirements for welded construction

4.1 General

- 4.1.1 The requirements of this Section are applicable to grades of steel welded using electric arc welding processes. Where it is proposed to use alternative welding processes, details are to be submitted for approval, prior to the start of fabrication.
- 4.1.2 Symbols are defined as necessary in each Section.
- 4.1.3 Ships with enhanced shock notation are to additionally comply with the requirements of Vol 1, Pt 4, Ch 2 Military Load Specification

4.2 Information to be submitted

- 4.2.1 The plans and information submitted for approval are clearly to indicate details of the welded connections of the main structural members, including the type, disposition and size of welds. This requirement includes welded connections to steel castings.
- 4.2.2 The information to be submitted should include the following:
- (a) Whether weld sizes given are throat thicknesses or leg lengths.
- (b) Grades and thicknesses of materials to be welded.
- (c) Location, types of joints and angles of abutting members.
- (d) Reference to welding procedures to be used.
- (e) Sequence of welding of assemblies and joining up of assemblies.

4.3 Welding equipment

4.3.1 Welding plant and equipment are to be in accordance with the requirements specified in *Ch 13, 1.8 Welding equipment* and welding consumables of the Rules for Materials.

4.4 Welding consumables

- 4.4.1 The requirements for welding consumables are to be in accordance with the requirements specified in *Ch 13, 1.8 Welding equipment and welding consumables* of the Rules for Materials.
- 4.4.2 The approval of welding consumables is to be in accordance with *Ch 11 Approval of Welding Consumables* of the Rules for Materials.

4.5 Welding procedures

- 4.5.1 Welding procedures are to be established for the welding of all joints in accordance with the requirements specified in *Ch 13, 1.9 Welding procedure and welder qualifications* of the Rules for Materials.
- 4.5.2 All welding procedures are to be tested and qualified in accordance with the requirements of *Ch 12 Welding Qualifications* of the Rules for Materials and are to be approved by the Surveyor prior to construction.
- 4.5.3 Welders and welding operators are to be proficient in the type of work to be undertaken and are to be qualified in accordance with the requirements specified in *Ch 12 Welding Qualifications* of the Rules for Materials.

4.6 Inspection of welds

- 4.6.1 Effective arrangements are to be provided by the Shipbuilder for the inspection of all finished welds in order to ensure that all welding has been satisfactorily completed.
- 4.6.2 All finished welds are to be subjected to non-destructive examination in accordance with the requirements specified in Ch 13, 2.12 Non-destructive examination of steel welds of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2, and the general NDE requirements as per Ch 1, 5.1 General NDE requirements of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2. Details of weld defect levels are given in the Naval Survey Guidance for Steel Ships.

Section 4

4.6.3 Typical locations for volumetric examination and number of checkpoints to be taken are as shown in *Table 6.4.1* Recommended extent of NDE checkpoints. A list of the proposed items to be examined is to be submitted for approval.

Table 6.4.1 Recommended extent of NDE checkpoints

Item	Location	Checkpoints (see Note 1)
Intersections of butts and seams of	Throughout:	
fabrication and section welds	(a) The hull envelope plating:	
	at critical locations identified by FDA, see Note 2	All
	at other highly stressed areas, see Note 3	All
	• remainder	1 in 2
	(b) longitudinal and transverse bulkheads	1 in 2
	(c) inner bottom	1 in 2
Butt welds in plating	Throughout	1 m in 25 m (see Notes 4 and 5)
Seam welds in plating	Throughout	1 m in 100 m
Butts in longitudinals	Hull envelope within 0,4L amidships	1 in 10 welds
	Hull envelope outside 0,4L amidships	1 in 20 welds
Bilge keel butts	Throughout	1 in 10 welds
Structural items when made with full penetration welding as follows: sheerstrake to deck stringer plate or angle	Throughout	1 m in 20 m

- Note 1. The length of each checkpoint is to be between 0,3 m and 0,5 m.
- Note 2. FDA signifies the fatigue design assessment procedure.
- Note 3. Typically those at shear strake, deck stringer, keel strake and turn of bilge.
- Note 4. Checkpoints in butt welds and seam welds are in addition to those at intersections.
- Note 5. Welds at inserts used to close openings in hull envelope plating are to be checked by non-destructive examination.
- Note 6. Agreed locations are not to be indicated on the blocks prior to the welding taking place, nor is any special treatment to be given at these locations.
- **Note** 7. Particular attention is to be given to repair rates in longitudinal butts. Additional welds are to be tested in the event that defects such as lack of fusion or incomplete penetration are repeatedly observed.
- 4.6.4 For the items butt and seam welds in plating, shown in *Table 6.4.1 Recommended extent of NDE checkpoints*, consideration may be given for a reduction in inspection frequency for welds where volumetric inspection and the quality assurance techniques applied indicate satisfactory quality.

Section 8

Section 5

Welded joints and connections

5.1 General

- 5.1.1 Requirements are given in this Chapter for welding connection details, aluminium/steel transition joints, steel/wood connection, rivetting of light structure and adhesive bonding.
- 5.1.2 Welded joints are to be detailed such that crevices or inaccessible pockets capable of retaining dirt or moisture are avoided. Where cavities are unavoidable, they are to be sealed by welding or protective compounds or made accessible for inspection and maintenance.

5.2 Weld symbols

5.2.1 Weld symbols, where used, are to conform to a recognised National or International Standard. Details of such Standards are to be indicated on the welding schedule, which is to be submitted for appraisal.

5.3 Welding schedule

- 5.3.1 A welding schedule containing not less than the following information is to be submitted:
- (a) Weld throat thickness or leg lengths.
- (b) Grades, tempers and thicknesses of materials to be welded.
- (c) Locations, types of joints and angles of abutting members.
- (d) Reference to welding procedures to be used.
- (e) Welded connections to steel castings.

5.4 Butt welds

- 5.4.1 All structural butt joints are to be made by means of full penetration welds and, in general, the edges of plates to be joined by welding are to be bevelled on one or both sides of the plates. Full details of the proposed joint preparation are to be included in the approval welding procedure.
- 5.4.2 Where butt welds form a T-junction, the leg of the T is, where practicable, to be completed first including any back run. During the welding operation special attention is to be given to the completion of the weld at the junction, which is to be chipped back to remove crater cracks, etc. before the table is welded.
- 5.4.3 For ships with shock enhanced notation, see Vol 1, Pt 4, Ch 2, 4 Fragmentation protection

5.5 Fillet welds

5.5.1 The throat thickness of fillet welds is to be determined from:

Throat =
$$t_p \times \text{ weld factor } \times \left(\frac{d}{s}\right) \text{ mm}$$

where

s= the length of correctly proportioned weld fillet, clear of end craters, in mm, and is to be 10 x plate thickness, $t_{\rm p}$, or 75 mm, whichever is the lesser, but in no case to be taken less than 40 mm

d = the distance between successive weld fillet, in mm

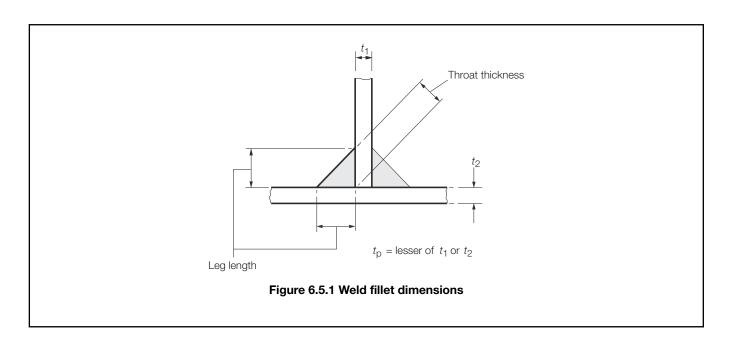

t D = plate thickness, in mm, on which weld fillet size is based, see Vol 1, Pt 6, Ch 6, 5.5 Fillet welds 5.5.4

Weld factors are contained in Table 6.5.1 Weld factors and Figure 6.5.1 Weld fillet dimensions

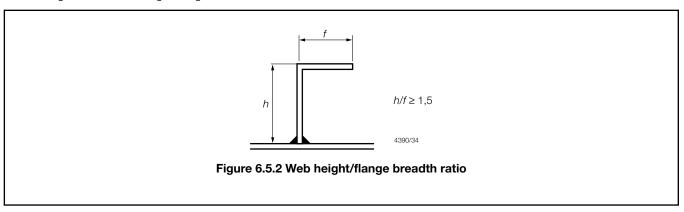

NOTE: for double continuous fillet welding $\left(\frac{d}{\epsilon}\right)$ is to be taken

as 1, see Vol 1, Pt 6, Ch 6, 5.8 Double continuous fillet welding 5.8.1.

Section 5

5.5.2 For ease of welding, it is recommended that the ratio of the web height to the flange breadth is greater than or equal to 1,5, see Figure 6.5.2 Web height/flange breadth ratio

- 5.5.3 The leg length of the weld is to be not less than $\sqrt{2}$ times the specified throat thickness.
- 5.5.4 The plate thickness t_p to be used in *Vol 1*, *Pt 6*, *Ch 6*, 5.5 *Fillet welds 5.5.1* is generally to be that of the thinner of the two parts being joined. Where the difference in thickness is considerable, the size of fillet weld will be specially considered.
- 5.5.5 Where the thickness of the abutting member of the connection (e.g. the web of a stiffener) is greater than 15 mm and exceeds the thickness of the table member (e.g. plating), the welding is to be double continuous and the throat thickness of the weld is to be not less than the greatest of the following:
- (a) 0,21 x thickness of the table member. The table member thickness used need not exceed 30 mm.
- (b) 0,21 (0,27 in tanks) x half the thickness of the abutting member.
- (c) As required by item 3 in Table 6.5.2 Throat thickness limits

Table 6.5.1 Weld factors

	ltem	Weld factor	Remarks
(1)	General application:		except as required below
	Shell envelope boundary, including sea chests and hull penetrations	Full penetration	For hull penetrations, fitted with a flange or other support, equivalent arrangements may be considered.
	Watertight plate boundaries	0,34	
	Non-tight plate boundaries	0,13	
	Longitudinals, frames, beams, and other secondary members to shell,	0,10	
	deck or bulkhead plating	0,13	in tanks
		0,21	in way of end connections
	Panel stiffeners, etc.	0,10	
	Overlap welds generally	0,27	
	Longitudinals of the flat-bar type to plating		See Vol 1, Pt 6, Ch 6, 5.5 Fillet welds 5.5.5
(2)	Bottom construction in way of tanks:		
	Non-tight centre girder:		
	to keel	0,27	
	to inner bottom	0,21	no scallops
	Non-tight boundaries of floors, girders and brackets	0,21	in way of 0,2 x span at ends
		0,27	in way of brackets at lower end of main frame
	Watertight bottom girders	0,34	
	Connection of girder to inner bottom in way of longitudinal bulkheads supported on inner bottom	0,44	
	Inner bottom longitudinals or reverse frames	0,13	
	Connection of floors to inner bottom in way of bulkheads, supported	0,44	Weld size based on floor thickness
	on inner bottom. The supporting floors are to be continuously welded to the inner bottom		Weld material compatible with floor material
(3)	Hull framing:		
	Webs of web frames and stringers:		
	to shell	0,16	
	to face plate	0,13	
	Tank side brackets to shell and inner bottom	0,34	
(4)	Decks and supporting structure:		
	Strength deck plating to shell		as shown in Table 6.5.5 Weld connection of strength deck plating to sheerstrake but alternative proposals will be considered

		I	I
	Other decks to shell and bulkheads (except where forming tank boundaries)	0,21	generally continuous
	Webs of cantilevers to deck and to shell in way of root bracket	0,44	
	Webs of cantilevers to face plate	0,21	
	Pillars: fabricated	0,10	
	end connections	0,34	see Note
	end connections (tubular)	full penetration	
	Girder web connections and brackets in way of pillar heads and heels and end brackets	0,21	continuous
	Girder web connections general	0,1	
(5)	Bulkheads and tank construction:		
	Plane, double plate and corrugated watertight bulkhead boundary at bottom, bilge, inner bottom, deck and connection to shelf plate, where fitted	0,44	Weld size to be based on thickness of bulkhead platingWeld material to be compatible with bulkhead plating material
	Shelf plate connection to stool	0,44	Weld size to be based on thickness of stool at junction with shelf plate. Weld material to be compatible with stool material
	Plane, double plate and corrugated main watertight bulkhead boundaries	0,44	
	- Boundary at bottom, bilge, inner bottom and deck		
	- Connection of bulkhead plating to side shell	0,44	
	Deep tank horizontal boundaries at vertical corrugations	Full penetration	
	Secondary members where acting as pillars	0,13	
	Non-watertight pillar bulkhead boundaries	0,13	
	Perforated flats and wash bulkhead boundaries	0,10	
(6)	Structure in machinery space:		
	Centre girder to keel and inner bottom	0,27	no scallops to inner bottom
	Floors to centre girder in way of engine, thrust and boiler bearers	0,27	
	Floors and girders to shell and inner bottom	0,21	
	Main engine foundation girders:		
	to top plate	deep penetration to depend on	edge to be prepared with maximum root 0,33tp deep penetration generally
	to hull structure	design	o,ootp deep perioration generally
	Floors to main engine foundation girders	0,27	
	Brackets, etc. to main engine foundation girders	0,21	
	Transverse and longitudinal framing to shell	0,13	
(7)	Construction forward 0,75L _R :		
	Floors and girders to shell and inner bottom	0,21	
	Bottom longitudinals to shell	0,13	

	Transverse and longitudinal side framing to shell	0,13	
	Tank side brackets to frame and inner bottom	0,13	
	Panting stringers to shell and frames	0,34	
	Fore peak construction:	0,01	
	all internal structure	0,13	unless a greater weld factor is required
(8)	After peak construction:		
,	All internal structure and stiffeners on afterpeak bulkhead	0,21	unless a greater weld factor is required
(9)	Superstructure and deckhouses:		
	Connection of external bulkheads to deck	0,34	1st and 2nd tier erections
		0,21	elsewhere
	Internal bulkheads	0,13	
(10)	Steering control systems:		
	Rudder:		
	Fabricated mainpiece and mainpiece to side plates and webs	0,44	
	Slot welds inside plates	0,44	
	Remaining construction	0,21	
	Fixed and steering nozzles:		
	Main structure	0,44	
	Elsewhere	0,21	
	Fabricated housing and structure of thruster units, stabilisers, etc.:		
	Main structure	0,44	
	Elsewhere	0,21	
(11)	Miscellaneous fittings and equipment:		
	Rings for manhole type covers, to deck or bulkhead	0,34	
	Frames of shell and weathertight bulkhead doors	0,34	
	Stiffening of doors	0,21	
	Ventilator, air pipe, etc. coamings to deck	0,34	
	Ventilator, etc. fittings	0,21	
	Scuppers and discharges, to deck	0,44	
	Masts, derrick posts, crane pedestals, etc. to deck	0,44	full penetration welding may be required
	Deck machinery seats to deck	0,21	generally
	Mooring equipment seats	0,21	generally, but increased or full penetration welding may be required
	Bulwark stays to deck	0,21	
	Bulwark attachment to deck	0,34	
	Guard rails, stanchions, etc. to deck	0,34	

Section 8

Bilge keel ground bars to shell	0,34	Continuous fillet weld, minimum throat thickness 4 mm
Bilge keels to ground bars	0,21	Continuous fillet weld, minimum throat thickness 3 mm
Fabricated anchors	full penetration	
Raft seatings	0,27	
Weapon seatings	0,44	full penetration welding may be required

Note Where pillars are fitted inside tanks or under watertight flats, the end connection is to be such that the tensile stress in the weld does not exceed 108 N/mm².

Table 6.5.2 Throat thickness limits

Item		Throat thickness, in mm		
		Minimum	Maximum	
(1)	Double continuous welding	0,21t _p	0,44t p	
(2)	Intermittent welding	0,27t _p	0,44t _p or 4,5	
(3)	All welds, overriding minimum:(a) Plate thickness t $_{\rm p} \leq$	3,0	-	
	7,5 mmHand or automatic weldingAutomatic deep penetrationwelding	3,0	-	
	(b) Plate thickness $t_{\rm p}$ > 7,5 mmHand or automatic	3,25	-	
	weldingAutomatic deep penetrationwelding	3,0	-	

Note 1. In all cases, the limiting value is to be taken as the greatest of the applicable values given above.

Note 2. Where t_p exceeds 25 mm, the limiting values may be calculated using a notional thickness equal to 0,5 (t_p + 25) mm.

Note 3. The maximum throat thicknesses shown are intended only as a design limit for the approval of fillet welded joints. Any welding in excess of these limits is to be to the Surveyor's satisfaction.

5.6 Throat thickness limits

5.6.1 The throat thickness limits given in *Table 6.5.2 Throat thickness limits* are to be complied with.

5.7 Single sided welding

- 5.7.1 Where the main welding is carried out from one side only, this should be in accordance with the approved single sided welding procedure.
- 5.7.2 Where internal access for welding is impracticable, backing bars are to be fitted in way of butt welds, or alternative means of obtaining full penetration welds are to be agreed. Backing bars may be permanent or temporary, subject to agreement.
- 5.7.3 Permanent backing bars are to be of the same material as the base metal and of thickness not less than the thickness of the plating being joined or 4 mm, whichever is the lesser. The weld is to be thoroughly fused to the backing bar, subject to agreement.
- 5.7.4 Backing bars are to be continuous for the full length of the weld and joints in the backing bar are to be by full penetration welds, ground smooth.
- 5.7.5 Temporary backing bars for single sided welding may be glass tape, ceramic, or steel of the same grade as the base metal.
- 5.7.6 Temporary non-metallic backing bars are to be suitably grooved in way of the weld to ensure full penetration.

Section 5

5.8 Double continuous fillet welding

- 5.8.1 Where double continuous fillet welding is proposed the throat thickness is to be in accordance with *Vol 1, Pt 6, Ch 6, 5.5 Fillet welds 5.5.1* taking *d/s* equal to 1.
- 5.8.2 Double continuous fillet welding is to be adopted in the following locations and may be used elsewhere if desired:
- (a) Boundaries of weathertight decks and erections and all other openings.
- (b) Boundaries of tank and watertight compartments.
- (c) Main engine and equipment seatings and rafts.
- (d) Bottom framing structure in machinery spaces of high speed ships.
- (e) The side and bottom shell structure in the impact area of high speed ships.
- (f) Structure in way of rudders, propeller brackets, stabilisers, thrusters, bilge keels, foundations and other areas subject to high stresses.
- (g) The shell structure in the vicinity of the propeller blades.
- (h) Stiffening members to plating in way of end connections scallops and of end brackets to plating in the case of lap connections.
- (i) Face flats to webs of built-up/fabricated stiffening members in way of knees/end brackets and for a distance beyond such knees/end brackets of not less than the web depth of stiffener in way.
- (j) All structure in the after peak and after peak bulkhead stiffeners.
- (k) Forward tanks.
- (I) Lap welds in tanks.
- (m) Primary and secondary members to bottom shell forward of 0,7L.
- (n) Where Vol 1, Pt 6, Ch 6, 5.5 Fillet welds 5.5.5 applies.
- (o) Other connections or attachments where necessary in particular minor items to high tensile steel plating.

5.9 Intermittent and single sided fillet welding

- 5.9.1 The requirements for intermittent fillet welding (staggered and chain) are given in Figure 6.5.1 Weld fillet dimensions
- 5.9.2 As an alternative to intermittent welding, single sided welding may be used. Only mechanised single sided welding is acceptable.
- 5.9.3 Where staggered intermittent or single sided fillet welding is used, the welding is to be made continuous round the ends of brackets, lugs, scallops, etc.
- 5.9.4 Staggered intermittent or single sided fillet welding is not to be used in the bottom shell structure of high speed ships.
- 5.9.5 Chain intermittent welding may be used, outside of the impact area in the bottom shell structure of high speed ships.
- 5.9.6 Scalloped construction, intermittent or single sided fillet welding is not to be used in structure on or below the strength deck of ships with shock enhancement or in structure strengthened for blast enhancement, see *Vol 1, Pt 4, Ch 2 Military Load Specification*.
- 5.9.7 Scalloped construction, intermittent or single sided fillet welding is not to be used in structure complying with the requirements of the internal blast station.
- 5.9.8 For ships with a shock enhanced notation, the extent of intermittent or single sided fillet welding will be specially considered on the basis of the threat levels

5.10 Connections of primary structure

5.10.1 Weld factors for the connections of primary structure are given in *Table 6.5.3 Connections of primary structure*.

Table 6.5.3 Connections of primary structure

Primary member face area, in cm ²		Position ⁽¹⁾	Weld factor			
			In tanks In dry spa		In dry spaces	
Exceeding	Not exceeding		To face plate	To plating	To face plate	To plating

Section 5

	30,0	At ends	0,21	0,27	0,21	0,21
		Remainder	0,10	0,16	0,10	0,13
30,0	65,0	At ends	0,21	0,34	0,21	0,21
		Remainder	0,13	0,27	0,13	0,16
65,0	95,0	At ends	0,34	0,44 ⁽³⁾	0,21	0,27
		Remainder	0,27 ⁽²⁾	0,34	0,16	0,21
95,0	130,0	At ends	0,34	0,44 ⁽³⁾	0,27	0,34
		Remainder	0,27 ⁽²⁾	0,34	0,21	0,27
130,0		At ends	0,44	0,44 ⁽³⁾	0,34	0,44 ⁽²⁾
		Remainder	0,34	0,34	0,27	0,34

Note 1. The weld factors 'at ends' are to be applied for 0,2 x the overall length of the member from each end, but at least beyond the toes of the member end brackets. On vertical webs the increased welding may be omitted at the top, but is to extend at least 0,3 x overall length from the bottom.

Note 2. Where the web plate thickness is increased locally, the weld size may be based on the thickness clear of the increase, but is to be not less than 0,34 x the increased thickness.

Note 3. The weld factor of the connection of bottom transverses to shell, and of side transverses to shell and vertical webs to longitudinal and transverse bulkheads all in the lower half depth, is to be not less than 0,34.

Note 4. The final throat thickness of the weld fillet to be not less than $0.34t_p$ in oil tanks.

5.10.2 The weld connection to shell, deck or bulkhead is to take account of the material lost in the notch where longitudinals or stiffeners pass through the member. Where the width of notch exceeds 15 per cent of the stiffener spacing, the weld factor is to be multiplied by:

$\frac{0,85 \times \text{ stiffener spacing}}{\text{length of web plating between notches}}$

- 5.10.3 Where direct calculation procedures have been adopted, the weld factors for the 0,2 x overall length at the ends of the members will be considered in relation to the calculated loads.
- 5.10.4 The throat thickness limits given in *Table 6.5.2 Throat thickness limits* are to be complied with.
- 5.10.5 Where a margin angle is not fitted the sheerstrake connection is to be in accordance with *Table 6.5.5 Weld connection* of strength deck plating to sheerstrake

5.11 Primary and secondary member end connection welds

- 5.11.1 Welding of end connections of primary members is to be such that the area of welding is not less than the cross-sectional area of the member, and the weld factor is to be not less than 0,34 in tanks or 0,27 elsewhere.
- 5.11.2 The welding of secondary member end connections is to be not less than as required by *Table 6.5.4 Primary and secondary member end connection welds* Where two requirements are given, the greater is to be complied with.
- 5.11.3 The area of weld, $A_{\rm w}$, is to be applied to each arm of the bracket or lapped connection.
- 5.11.4 Where a longitudinal strength member is cut at a primary support and the continuity of strength is provided by brackets, the area of weld is to be not less than the crosssectional area of the member.
- 5.11.5 The scantlings of brackets are to be in accordance with Vol 1, Pt 6 Hull Construction in Steel, as appropriate.
- 5.11.6 The throat thickness limits given in *Table 6.5.2 Throat thickness limits* are to be complied with.

Section 5

Table 6.5.4 Primary and secondary member end connection welds

	Connection	Weld area, A w, in cm ²	Weld factor
(1)	Stiffener welded direct to plating	$0,25A_{\rm S}$ or $6,5~{\rm cm^2}$ whichever is the greater	0,34
(2)	Bracketless connection of stiffeners or stiffener lapped to bracket or bracket lapped to stiffener:(a) in dry space(b) in tank(c) in 0,15L forward	$1,2\sqrt{Z}\ 1,4\sqrt{Z}\ as\ (a)\ or\ (b)$	0,270,34
(3)	Bracket welded to face of stiffener and bracket connection to plating	_	0,34
(4)	Stiffener to plating for 0,1 x span at ends, or in way of end bracket if that be greater	_	0,34
	Symbols		•

 $A_{\rm S} = {\rm cross\text{-}sectional}$ area of the stiffener, in cm²

 $A_{\rm W}$ = the area of the weld, in cm², and is calculated as total length of weld, in cm, x throat thickness, in cm

Z = the section modulus, in cm², of the stiffener on which the scantlings of the bracket are based.

Note For maximum and minimum weld fillet sizes, see Table 6.5.2 Throat thickness limits.

Section 8

Table 6.5.5 Weld connection of strength deck plating to sheerstrake

Item	Stringerplate thickness,mm	Weld type		
1	<i>t</i> ≤ 15	Single vee preparation to provide included angle of 45° with root $R \le 1/3$ in conjunction with a continuous fillet weld having a weld factor of 0,39		
2	15 < t ≤ 25	Double vee preparation to provide included angle of 60° with root $R \le 1/3$ t in conjunction with a continuous fillet weld having a weld factor of 0,39		
3	t > 25	Triple vee preparation to provide included angles of 50° with root $R \le 1/3$ t but not to exceed 10 mm		
	45°	60°		

Note 2 See also Vol 1, Pt 6, Ch 6, 5.13 Intersection of primary and secondary members 5.13.1.

Note 3 For thickness *t* in excess of 20 mm the stringer plate may be bevelled to achieve a reduced thickness at the weld connection. The length of the bevel is in general to be based on a taper not exceeding 1 in 3 and the reduced thickness is in general to be not less than 0,65 times the thickness of stringer plate or 20 mm, whichever is the greater.

Note 4 Alternative connections will be considered.

5.12 Tank boundary penetrations

5.12.1 Where structural members pass through the boundary of a tank, and leakage into the adjacent space could be hazardous or undesirable, full penetration welding is to be adopted for the members for at least 150 mm on each side of the boundary. Alternatively a small scallop of suitable shape may be cut in the member close to the boundary outside the compartment, and carefully welded all round.

5.13 Intersection of primary and secondary members

- 5.13.1 The weld area of the connections is to be generally not less than the following:
- (a) Connection of primary member stiffener to the secondary member:
 - $A_{\rm W} = 0.25A_{\rm f}$ or 6,5 cm², whichever is the greater, corresponding to a weld factor of 0,34 for the throat thickness
- (b) Connection of secondary member to the web of the primary member:

 $A_{\rm w} = 0.5 \sqrt{Z}$ corresponding to a weld factor of 0.34 in tanks or 0.27 in dry spaces for the throat thickness.

where

 $A_{\rm w} = {\rm weld~area,~in~cm^2,~and~is~calculated~as~total~length~of~weld,~in~cm,~multiplied~by~throat~thickness,~in~cm}$

 $A_{\rm f} = {\rm cross\text{-}sectional}$ area of the primary member web stiffener, in cm², in way of connection

Z = the section modulus, in cm³, of the secondary member.

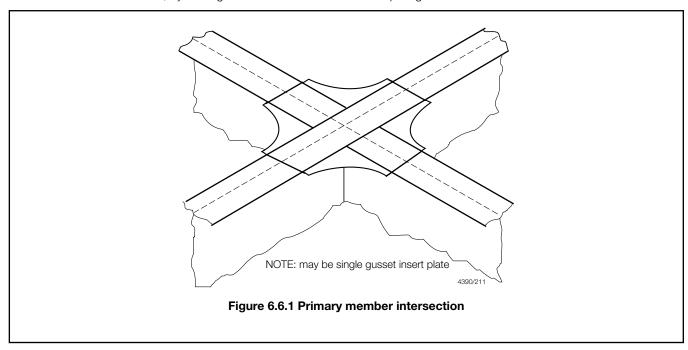

Section 6

Section 6

Construction details

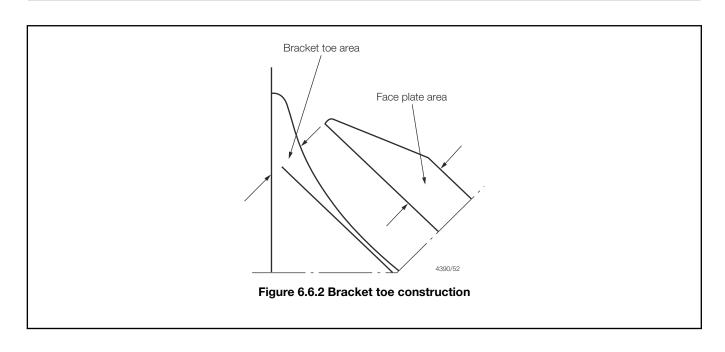

6.1 Continuity and alignment

- 6.1.1 Continuity is to be maintained where primary members intersect and where the members are of the same depth, a suitable gusset plate or brackets are to be fitted, see *Figure 6.6.1 Primary member intersection*
- 6.1.2 The toes of brackets, etc. are not to land on unstiffened panels of plating. Special care is to be taken to avoid notch effects at the toes of brackets, by making the toe concave or otherwise tapering it off.

6.1.3 Particular care is to be paid to the design of the end bracket toes in order to minimise stress concentrations. Sniped face plates which are welded onto the edge of primary member brackets are to be carried well around the radiuses bracket toe and are to incorporate a taper not exceeding one in three. Where sniped face plates are welded adjacent to the edge of primary member brackets, adequate cross-sectional area is to be provided through the bracket toe at the end of the snipe. In general, this area measured perpendicular to the face plate, is to be not less than 60 per cent of the full cross-sectional area of the face plate, see Figure 6.6.2 Bracket toe construction

Section 6

6.2 Primary end connections

- 6.2.1 The requirements for section modulus and inertia (if applicable) of primary members are given in the appropriate Chapter. The scantling requirements for primary member end connections in dry spaces and in tanks of all ship types are generally to comply with the requirements of *Vol 1*, *Pt 6*, *Ch 2 Design Tools,Vol 1*, *Pt 6*, *Ch 3 Scantling Determination*, taking *Z* as the section modulus of the primary member.
- 6.2.2 Guidance on the arrangement of primary stiffeners is given in Vol 1, Pt 3, Ch 2, 3.2 Primary members
- 6.2.3 Connections between primary members forming ring system are to minimise stress concentrations at the junctions. Integral brackets are generally to be radiused or well rounded at their toes. The arm length of the bracket, measured from the face of the member, is to be not less than the depth of the smaller member forming the connection.
- 6.2.4 The requirements of this Section may be modified where direct calculation procedures are adopted to analyse the stress distribution in the primary structure.
- 6.2.5 The geometric properties of the members are to be calculated in association with an effective width of attached plating determined in accordance with Vol 1, Pt 6, Ch 2, 2.2 Effective width of attached plating, be
- 6.2.6 The minimum thickness or area of material in each component part of the primary member is given in *Table 6.6.1 Minimum thickness of primary members*.

Table 6.6.1 Minimum thickness of primary members

	Item	Requirement
(1)	Member web plate (see Note)	$t_{\rm w}$ = 0,01S $_{\rm w}$ but not less than 6 mm in dry spaces and not less than 7 mm in tanks
(2)	Member face plate	A $_{\rm f}$ not to exceed $\frac{d_{ m w}t_{ m W}}{150}$ cm 2
(3)	Deck plating forming the upper flange of underdeck girders	Plate thickness not less than $\sqrt{\frac{A_{\mathbf{f}}}{1,8k}} \; \mathrm{mm}$
	Symbols	•

Section 6

 $d_{\rm w}$ = depth of member web, in mm

k = higher tensile steel factor, see Vol 1, Pt 6, Ch 2 Design Tools

 $t_{\rm w}$ = thickness of member web, in mm

 A_f = area of member face plate or flange, in cm²

 S_{w} = spacing of stiffeners on member web, or depth of unstiffened web, in mm

Note For primary members having a web depth exceeding 1500 mm, the arrangement of stiffeners will be individually considered, and stiffening parallel to the member face plate may be required.

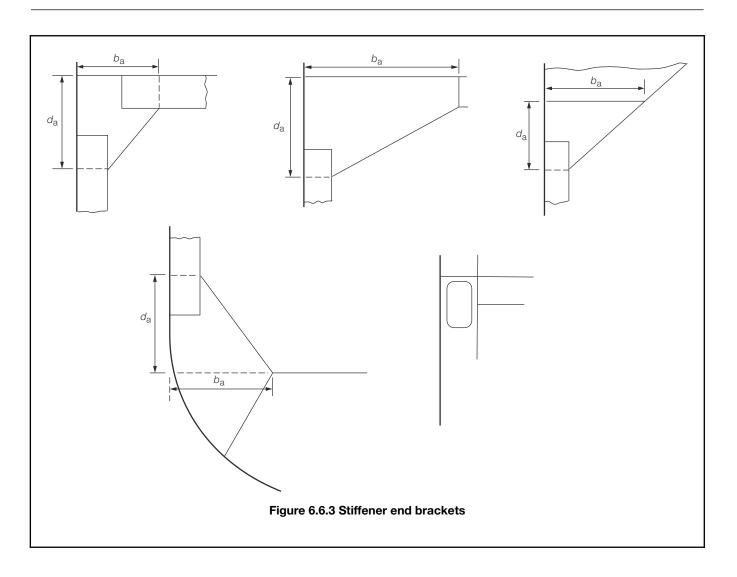

6.3 Secondary member end connections

- 6.3.1 Secondary members, that is longitudinals, beams, frames and bulkhead stiffeners forming part of the hull structure, are to be effectively continuous and are to be suitably bracketed at their end connections. Where it is desired to adopt bracketless connections, the proposed arrangements will be individually considered, see also Table 6.5.3 Connections of primary structure.
- 6.3.2 Where bracketed end connections are fitted in accordance with these requirements, they may be taken into account in determining the effective span of the member.
- 6.3.3 The scantlings of secondary member end connections are to be in accordance with *Vol 1, Pt 6, Ch 6, 6.4 Scantlings of end brackets*.

6.4 Scantlings of end brackets

- 6.4.1 For a naval ship, longitudinal strength members are to be continuous through primary supports. In exceptional cases for ships having a military distinction notation **MD** and in areas not subject to significant fatigue loading, longitudinal strength members may be cut at a primary support and the continuity of strength is to be provided by brackets. In such cases the scantlings of the brackets are to be such that their section modulus and effective cross-sectional area are not less than those of the member. Care is to be taken to ensure correct alignment of the brackets on each side of the primary member.
- 6.4.2 In other cases the scantlings of the bracket are to be based on the modulus as follows:
- (a) Bracket connecting stiffener to primary member modulus of the stiffener.
- (b) Bracket at the head of a main transverse frame where frame terminates modulus of the frame.
- (c) Brackets connecting lower deck beams or longitudinals to the main frame in the forward 0,5L _B modulus of the frame.
- (d) Elsewhere the lesser modulus of the members being connected by the bracket.
- 6.4.3 The web thickness and face flat area of end brackets are not in general to be less than those of the connecting stiffeners. Additionally, the stiffener proportion requirements of *Vol 1, Pt 6, Ch 2, 2.9 Proportions of stiffener sections* are to be satisfied.
- 6.4.4 Typical arrangements of stiffener end brackets are shown diagrammatically in Figure 6.6.3 Stiffener end brackets.

Section 6

6.4.5 The lengths, d_a and b_a , of the arms are to be measured from the plating to the toe of the bracket and are to be such that:

- (a) $d_a + b_a \ge 2.0l_b$
- (b) $d_a \ge 0.8l_b$
- (c) $b_a \ge 0.8l_b$

where

a and b are the actual lengths of the two arms of the bracket, in mm, measured from the plating to the toe of the bracket

$$l_{\rm b} = 90 \left(2 \sqrt{\frac{Z}{14 + \sqrt{Z}}} - 1 \right) \, \rm mm$$

Z = the section modulus of the secondary member, in cm³. In no case is I_b to be taken as less than twice the web depth of the stiffener on which the bracket scantlings are to be based.

6.4.6 The scantlings of deep web frames are based on the inclusion of the standard brackets specified in *Vol 1*, *Pt 6*, *Ch 6*, 6.4 Scantlings of end brackets 6.4.5 at top and bottom, while the scantlings of side frames are normally to be based on a standard bracket at the top only. Where the actual arm lengths fitted, d_{a1} , and b_{a1} (in mm) are smaller than Rule size above or the bracket is omitted then, for comparison purposes, an equivalent arm length, l_a , is to be derived from:

(a)
$$l_{a} = \frac{\left(d_{a1} + b_{a1}\right)}{2}$$

(b) $d_{a1} \ge 0.8I_a$

- (c) $b_{a1} \ge 0.8I_a$
- (d) $I_a = 0$

where

- (i) bracket is omitted from the upper or lower ends of the frame, or
- (ii) lower frame bracket at bilge is at same level as the inner bottom, or
- (iii) lower frame is welded directly to the inner bottom.
- 6.4.7 The free edge of the bracket is to be stiffened where any of the following apply:
- (a) The section modulus, Z, exceeds 2000 cm³.
- (b) The length of free edge exceeds 50 times the bracket thickness.
- (c) The bracket is fitted at the lower end of main transverse side framing.
- 6.4.8 Where a face flat is fitted, its breadth, b_f , is to be not less than:

$$b_{\rm f} = 40\left(1 + \frac{z}{1000}\right)$$
 mm but not less than 50 mm.

- 6.4.9 Where the edge is stiffened by a welded face flat, the cross-sectional area of the face flat is to be not less than:
- (a) $0.009k_s b_f t_b \text{ cm}^2$ for offset edge stiffening.
- (b) $0.014k_s b_f t_b \text{ cm}^2$ for symmetrically placed stiffening.

 b_f = breadth of face flat, in mm

 $t_{\rm b}=$ the thickness of the bracket, in mm $k_{\rm s}$ is as defined in Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

- 6.4.10 Where the stiffening member is lapped on to the bracket, the length of overlap is to be adequate to provide for the required area of welding. In general, the length of overlap is not to be less than $10\sqrt{Z}$ mm , or the depth of stiffener, whichever is the greater.
- 6.4.11 Where the free edge of the bracket is hollowed out, it is to be stiffened or increased in size to ensure that the modulus of the bracket through the throat is not less than that of the required straight edged bracket.
- 6.4.12 The arrangement of the connection between the stiffener and the bracket is to be such that at no point in the connection is the actual modulus reduced to less than that of the stiffener with associated plating.
- 6.4.13 The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint.
- 6.4.14 The thickness of the bracket is to be not less than as required by *Table 6.6.2 Thickness of end brackets*.

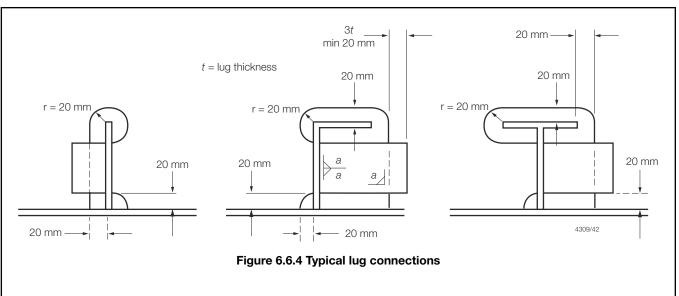

Table 6.6.2 Thickness of end brackets

Bracket		Thickness, in mm	Lln	nits
			Minimum, in mm	Maximum, in mm
With edge	e stiffened:			
(a)	in dry spaces	$3,5 + 0,25 \sqrt{Z}$	6,5	12,5
(b)	in deep tanks	$4,5 + 0,25 \sqrt{Z}$	7,5	13,5
Unstiffene	ed brackets:			
(a)	in dry spaces	$5,5+\left(\frac{Z}{55}\right)-\left(\frac{Z}{168}\right)^{1/3}$	7,5	
(b)	in deep tanks	$6,5 + \left(\frac{Z}{55}\right) - \left(\frac{Z}{168}\right)^{1/3}$	8,5	

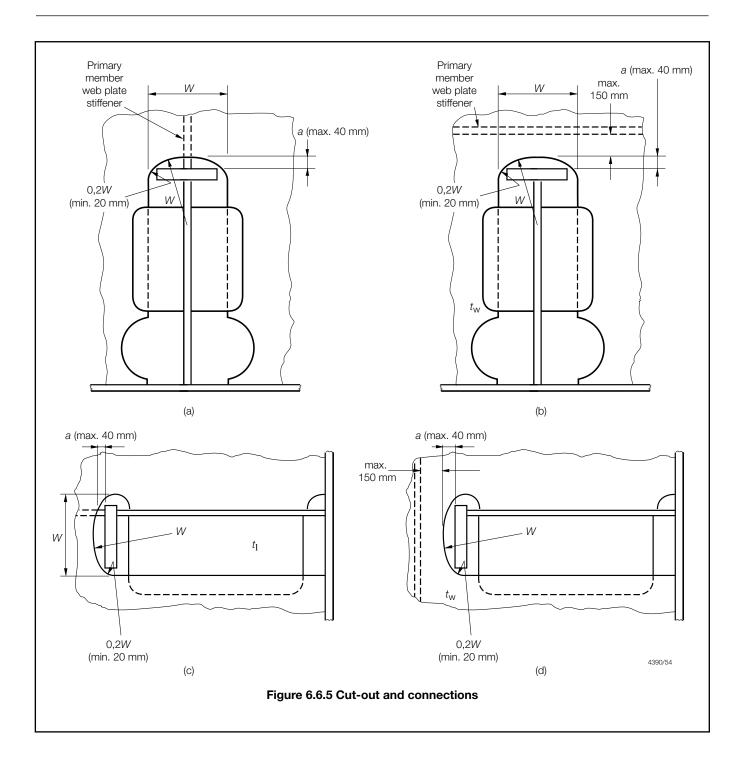

Section 6

6.5 Arrangement at intersection of continuous secondary and primary members

- 6.5.1 Lugs or tripping brackets are to be fitted where shell longitudinals are continuous through web frames in way of highly stressed areas of the side shell (e.g. in way of equipment supports, bollards, fenders, etc.).
- 6.5.2 Lugs or tripping brackets are also to be fitted where continuous secondary stiffeners are greater than half the depth of the primary stiffeners.
- 6.5.3 Cut-outs in primary members are to comply with the requirements of Vol 1, Pt 3, Ch 2, 3.2 Primary members 3.2.11 and Vol 1, Pt 3, Ch 2, 3.2 Primary members 3.2.12
- 6.5.4 Cut-outs for the passage of secondary members through the webs of primary members, and the related collaring arrangements, are to be designed to minimise stress concentrations around the perimeter of the opening and in the attached hull envelope or bulkhead plating. The critical shear buckling stress of the panel in which the cut-out is made is to be investigated. Cut-outs for longitudinals will be required to have double lugs in areas of high stress. Some typical lug connections are shown in *Figure 6.6.4 Typical lug connections* and *Figure 6.6.5 Cut-out and connections*, see *Vol 1*, *Pt 6*, *Ch 6*, *6.5 Arrangement at intersection of continuous secondary and primary members 6.5.12*
- 6.5.5 The breadth of cut-outs is to be as small as practicable, with the top edge suitably radiused. Cut-outs are to have smooth edges, and the corner radii are to be as large as practicable. Where the web depth is greater than 100 mm the corner radii are to be a minimum of 20 per cent of the breadth of the cut-out or 20 mm, whichever is the greater, and for large cut-outs greater than 250 mm deep, the web plate connection to the hull envelope, or bulkhead, should end in a smooth tapered 'soft toe'. Recommended shapes of cut-out are shown in *Figure 6.6.4 Typical lug connections*, but consideration will be given to other shapes on the basis of maintaining equivalent strength and minimising stress concentration.
- 6.5.6 Consideration is to be given to the provision of adequate drainage and unimpeded flow of air and water when designing the cut-outs and connection details.
- 6.5.7 Asymmetrical secondary members are to be connected on the heel side to the primary member web plate. Additional connection by lugs on the opposite side may be required.
- 6.5.8 Symmetrical secondary members are to be connected by lugs on one or both sides, as necessary.
- 6.5.9 Where a bracket is fitted to the primary member web plate in addition to a connected stiffener it is to be arranged on the opposite side to, and in alignment with the stiffener. The arm length of the bracket is to be not less than the depth of the stiffener, and its cross-sectional area through the throat of the bracket is to be included in the calculation of *A* _f, see *Vol 1*, *Pt 6*, *Ch 6*, 5.13 *Intersection of primary and secondary members 5.13.1*.
- 6.5.10 In general where the primary member stiffener is connected to the secondary member it is to be aligned with the web of the secondary member, except where the face plate of the latter is offset and abutted to the web, in which case the stiffener connection is to be lapped. Lapped connections of primary member stiffeners to mild steel bulb plate or rolled angle secondary members may also be permitted. Where such lapped connections are fitted, particular care is to be taken to ensure that the primary member stiffener wrap around weld connection is free from undercut and notches.

Section 6

- 6.5.11 Fabricated longitudinals having the face plate welded to the underside of the web, leaving the edge of the web exposed, are not recommended for side shell and longitudinal bulkhead longitudinals. Where it is proposed to fit such sections, a symmetrical arrangement of connection to transverse members is to be incorporated. This can be achieved by fitting backing brackets on the opposite side of the transverse web or bulkhead. The primary member stiffener and backing brackets are to be lapped to the longitudinal web, see *Vol 1, Pt 6, Ch 6, 6.5 Arrangement at intersection of continuous secondary and primary members 6.5.10.*
- 6.5.12 The cross-sectional areas of the connections are to be determined from the proportion of load transmitted through each component in association with the appropriate permissible stress given in *Table 6.6.2 Thickness of end brackets*

Section 6

Table 6.6.3 Permissible stresses

ltem	Direct stress N/mm	Shear stress N/mm
Primary web plate stiffener adjacent to connection with secondary member	157	_
Welded connection of primary member web plate stiffener to secondary member:		
Double continuous fillet	1177	
Automatic deep penetration	117,7 157	_
Lug or collar plate and weld connection	_	98,1

6.5.13 The load transmitted through the intersection arrangement is to be determined using the design pressure for the structural element being assessed in accordance with *Vol 1, Pt 5, Ch 3 Local Design Loads*.

6.5.14 Total load, P, transmitted to the primary member from the secondary member is to be derived by:

$$P = \frac{s}{1000} \left(S - \frac{S}{2000} \right) p$$
 in kN

where

s = secondary stiffener spacing, mm

S = primary stiffener spacing, m

 $p = \text{design plating pressure, kN/m}^2$

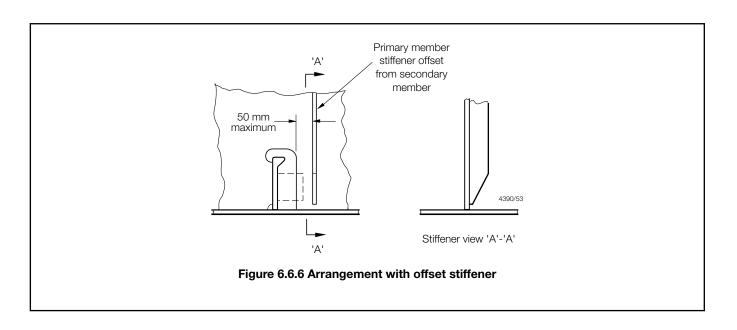

P = total load, kN

6.5.15 The arrangement of lug/collar/direct connection to the primary web stiffener determines the load apportioned to each component. The effect on each component of the intersection is to be assessed for shear and direct stress. Where the web stiffener is not connected to the secondary member, the load, *P*, is transmitted through the lug/collar/direct connection.

6.6 Arrangement with offset stiffener

6.6.1 Where the stiffeners of the double bottom floors and transverse bulkheads are unconnected to the secondary members and offset from them (see Figure 6.6.6 Arrangement with offset stiffener) the collar arrangement for the secondary members are to satisfy the requirements of Vol 1, Pt 6, Ch 6, 6.5 Arrangement at intersection of continuous secondary and primary members 6.5.4. In addition, the fillet welds attaching the lugs to the secondary members are to be based on a weld factor of 0,44 for the throat thickness. To facilitate access for welding the offset stiffeners are to be located 50 mm from the slot edge furthest from the web of the secondary member. The ends of the offset stiffeners are to be suitably tapered and softened.

Section 6

- 6.6.2 Alternative arrangements will be considered on the basis of their ability to transmit load with equivalent effectiveness. Details of the calculations made and testing procedures are to be submitted.
- 6.6.3 For ships with shock enhancement notation, see Vol 1, Pt 4, Ch 2, 4 Fragmentation protection

6.7 Watertight collars

- 6.7.1 Watertight steel collars are to be fitted, where stiffeners are continuous through watertight or oiltight boundaries.
- 6.7.2 Watertight steel collars or equivalent are to be fitted at gastight boundary.

6.8 Insert plates

- 6.8.1 Where thick insert plates are butt welded to thin plates, the edge of the thick plate may require to be tapered. The slope of the taper is generally not to exceed one in three.
- 6.8.2 The corners of insert plates are generally to be suitably radiused.
- 6.8.3 For ships with shock enhancement, see Vol 1, Pt 4, Ch 2 Military Load Specification

6.9 Doubler plates

- 6.9.1 Doubler plates are to be avoided and are not to be fitted in areas where corrosion may be a problem and access for inspection and maintenance is limited.
- 6.9.2 Where doubler plates are fitted, they are to have well radiused corners and the perimeter is to be continuously welded. Large doubler plates are also to be suitably slot welded, the details of which are to be submitted for consideration.

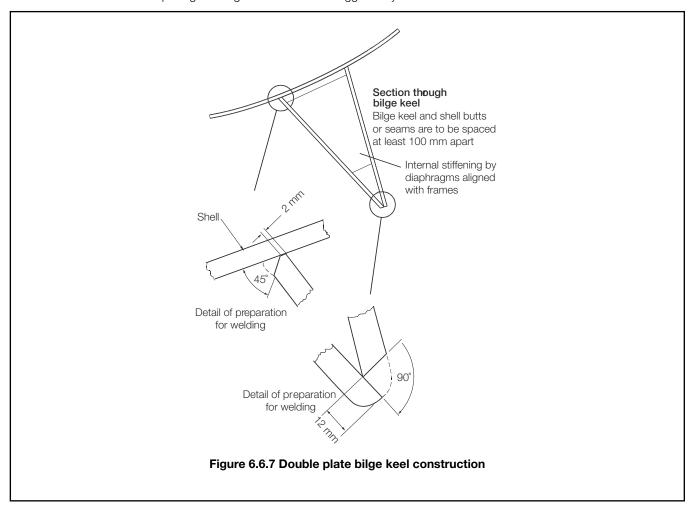

6.10 Other fittings and attachments

- 6.10.1 Gutterway bars and spurnwaters are not to be welded to boundary angles, or within 100 mm of the deck edge.
- 6.10.2 Minor attachments, such as pipe clips, staging lugs and supports, are generally to be kept clear of toes of end brackets, corners of openings and similar areas of high stress. Where connected to asymmetrical stiffeners, the attachments may be in line with the web providing the fillet weld leg length is clear of the offset face plate or flange edge. Where this cannot be achieved the attachments are to be connected to the web, and in the case of flanged stiffeners they are to be kept at least 25 mm clear of the flange edge. On symmetrical stiffeners, they may be connected to the web or to the centreline of the face plate in line with the web.
- 6.10.3 Where necessary in the construction of the ship, lifting lugs may be welded to the hull plating but they are not to be slotted through.

Section 6

6.11 Bilge keels and ground bars

6.11.1 Bilge keel plating is to be attached to the shell plating as shown in *Figure 6.6.7 Double plate bilge keel construction*. Butt and seam welds in shell plating and bilge keels are to be staggered by at least 100 mm.

- 6.11.2 The shell plating in way of the bilge keel is to be at least grade D. Insert plates of 50 per cent greater thickness than the as fitted surrounding shell plate are to be fitted. They are to be greater than 300 x 300mm² with well rounded corners.
- 6.11.3 The thickness of the bilge keel is to be assessed using the appropriate scantling equation for shell envelope plating. To prevent possible damage to the shell, the bilge keel plate is not to be thicker than the adjacent shell plate. The material class, grade and quality of the bilge keel plating is to be the same as the adjacent shell plating, see *Table 6.2.1 Material classes and grades*.
- 6.11.4 Full continuous welding is to be used to connect the bilge keel to the shell.
- 6.11.5 The ends of the bilge keels are to have a 1 in 3 taper and terminate within 300 mm to 100 mm past an internal frame. Suitable internal framing is to be arranged in way of the ends of the bilge keels where, for hydrodynamic reasons, a steeper taper is necessary, the termination of the bilge keels will be especially considered.
- 6.11.6 For ships over 65 m in length, all welds are to be subject to non-destructive examination.
- 6.11.7 Bilge keels of an alternative design from that shown in *Figure 6.6.6 Arrangement with offset stiffener* with single plate construction or fitted with ground bars will be specially considered.
- 6.11.8 Internal stiffening is to be arranged in line with hull framing but is not to be attached to the shell plating.
- 6.11.9 Bilge keels are to be watertight and tested in accordance with Vol 1, Pt 6, Ch 6, 7 Inspection and testing procedures
- 6.11.10 The internal surfaces of the bilge keel and stiffening are to be suitably protected against corrosion.

Section 6

6.12 Rivetting of light structure

- 6.12.1 Where it is proposed to adopt rivetted construction, full details of the rivets or similar fastenings, including mechanical test results, are to be indicated on the construction plans submitted for approval or a separate rivetting schedule is to be submitted.
- 6.12.2 Samples may be required of typical rivetted joints made by the Builder under representative construction conditions and tested to destruction in the presence of the Surveyor in shear, tension, compression or peel at LR's discretion.
- 6.12.3 Where rivetting strength data sheets have been issued by a recognised Authority, the values quoted in these sheets will normally be accepted for design purposes.
- 6.12.4 Where two dissimilar metals are to be joined by rivetting, precautions are to be taken to eliminate electrolytic corrosion to LR's satisfaction, and where practicable, the arrangements are to be such as to enable the joint to be kept under observation at each survey without undue removal of lining and other items.
- 6.12.5 Where a sealing compound is used to obtain an airtight or watertight joint, details are to be submitted of its proposed use and of any tests made or experience gained in its use for similar applications.
- 6.12.6 Sealing paints or compounds are not to be used with hot driven rivets.

6.13 Adhesive bonding of structure

- 6.13.1 Where adhesive bonding of any load-bearing structure is proposed, details of the materials and the processes to be used are to be submitted for approval. These details are to include test results of samples manufactured under LR survey under workshop conditions to verify the strength, ageing effects and moisture resistance of a typical joint.
- 6.13.2 The adhesive manufacturer's recommendations in respect of the specified jointing system, comprising preparation of the surfaces to be adhered, the adhesive, bonding and curing processes, are to be strictly followed as variation of any step can severely affect the performance of the joint.
- 6.13.3 Meticulous preparation is essential where the joint is to be made by chemical bonding. The method of producing bonded joints is to be documented so that the process is repeatable after the procedure has been properly established.
- 6.13.4 Bonded joints are suitable for carrying shear loads, but are not, in general, to be used in tension or where the load causes peeling or other forces tending to open the joint. Loads are to be carried over as large an area as possible.
- 6.13.5 Bonded joints are to be suitably supported after assembly for the period necessary to allow the optimum bond strength of the adhesive to be developed. Air pockets are to be avoided.
- 6.13.6 The use of adhesive for main structural joints is not to be contemplated unless considerable testing has established its validity, including environmental testing and fatigue testing where considered necessary by LR.

6.14 Triaxial stress considerations

6.14.1 Particular care is to be taken to avoid triaxial stresses which may result from poor joint design.

6.15 Aluminium/steel transition joints

- 6.15.1 Provision is made in this Section for bi-metallic composite aluminium/steel transition joints used for connecting aluminium structures to steel plating. Such joints are to be used in accordance with the manufacturer's requirements, see also Ch 8, 4 Aluminium/steel transition joints of the Rules for Materials.
- 6.15.2 Where a manufacturer is not approved, details of the materials to be used and the manufacturing procedures are to be submitted for approval before use.
- 6.15.3 Bimetallic joints where exposed to seawater or used internally within wet spaces are to be suitably protected to prevent galvanic corrosion.
- 6.15.4 Control of heat input is required when welding the transition joints to the steel structure in order to prevent disbondment.

6.16 Steel/wood connection

6.16.1 To minimise corrosion of steel when in contact with wood in a damp or marine environment the timber is to be primed and painted in accordance with good practice. Alternatively the surface of the steel in contact with the timber is to be coated with a substantial thickness of a suitable sealant.

Section 7

■ Section 7

Inspection and testing procedures

7.1 General

- 7.1.1 The test procedures detailed in this Section are to be used to confirm the watertightness of tanks and watertight boundaries, the structural adequacy of tanks and the weathertightness of structures.
- 7.1.2 A structural and leak test plan is to be submitted defining the compartments or tanks to be tested and the method of testing in accordance with the requirements of this Section.
- 7.1.3 Although referred to as watertight, some compartments or tanks may require to be tested as gastight or oil-tight.
- 7.1.4 The testing requirements for gravity tanks, defined as tanks subject to a vapour pressure not greater than 70 kN/m², independent tanks and watertight and weathertight compartments, are listed in *Table 6.7.1 Testing requirements*. Tests are to be carried out in the presence of the Surveyor at a stage sufficiently close to completion such that the strength and tightness are not subsequently impaired by subsequent work and prior to any sealing and cement work being applied over joints.
- 7.1.5 For naval vessels which are also required to comply with SOLAS, structural testing is to be carried out for all tanks forming part of the watertight sub-division of the ship in accordance with SOLAS requirements unless:
- (a) the shipyard provides documentary evidence of the Owner's agreement to a request to the appropriate Naval or Flag Administration for an exemption from the application of SOLAS Chapter II-1 Regulation 11 Initial testing of watertight bulkheads, etc., or for an exemption agreeing that the proposed alternative approach is equivalent to SOLAS Chapter II-1 Regulation 11 Initial testing of watertight bulkheads, etc.; and
- (b) the above-mentioned exemption/equivalency has been granted by the responsible Naval or Flag Administration.
- 7.1.6 The testing of structures not listed in this Section is to be specially considered.

7.2 Test types

- 7.2.1 The types of test specified in this Section are:
- (a) Structural test, which is to be conducted to verify the tightness and structural adequacy of the construction of tanks. This may be a hydrostatic test or, where the situation warrants, a hydropneumatic test.
- (b) Leak test, which is to be used to verify the tightness of a boundary. Unless a specific test is indicated, this may be a hydrostatic, hydropneumatic test, air or other medium test.
- (c) Gastight test, which is to be used to verify the gas tightness of a boundary using a pressure drop test.

Table 6.7.1 Testing requirements

Item to be tested	Testing procedure	Installation testing requirement
Double bottom tanks	Leak and structural	The greater of: (3) — head of water up to the top of the overflow — head of water representing the maximum pressure experienced in service for which elastic design criteria were used. — head of water 2,4 m above top of tank for NS1 ships
		(3) — head of water 1,8 m above top of tank for NS2 and NS3 ships (3)

Section 7

Peak tanks (2)	Leak and structural	The greater of: (3)
		- head of water up to the top of the overflow
		 head of water 2,4 m above top of tank for NS1 ships (3)
		 head of water 1,8 m above top of tank for NS2 and NS3 ships (3)
Deep tanks	Leak and structural	The greater of: (3)
Scupper and discharge pipes in way of tanks	Leak and structural	head of water up to the top of the overflow
		- head of water 2,4 m above top of tank for NS1 ships
		 head of water 1,8 m above top of tank for NS2 and NS3 ships
		 head of water up to top of tank, plus setting of fitted pressure relief valves
Sea inlet boxes Sonar spaces	Leak	See Vol 1, Pt 6, Ch 6, 7.5 Leak testing
Speed and depth instrument compartments	Structural (1)	See Vol 1, Pt 6, Ch 6, 7.5 Leak testing
Double plate rudders blades and bilge keels	Leak	See Vol 1, Pt 6, Ch 6, 7.5 Leak testing
Watertight bulkheads, shaft funnels, flats and recesses, etc.	Leak (4)	Vol 1, Pt 6, Ch 6, 7.5 Leak testing
Watertight doors, hatches and closing appliances (below the vertical limit of watertight integrity) when fitted in place	Leak (4), (5) and (9)	
Shell doors when fitted in place	Leak (4) and (6)	
Weathertight hatch covers, doors and closing appliances (above the vertical limit of watertight integrity)	Leak (4)	
Shaft tunnel clear of deep tanks	Leak (4)	
Cofferdams	Leak	
Peak spaces with equipment	Leak	
Peak voids	Leak	
chain locker	Hose (2)	
Chain locker	Leak and structural	Head of water up to the top of the spurling pipe
Independent/separate fuel oil tanks (11) Filing trunks	Leak and structural	Head of water equal to the maximum to which the tanks/trunks may be subjected, but not less than 2,5 m above the top of the tank/trunk. (3)
Magazines	Leak (8)	See Vol 1, Pt 6, Ch 6, 7.5 Leak testing
Double bottom and double side voids (1)	Leak	Vol 1, Pt 6, Ch 6, 7.5 Leak testing
LO sump tanks and other similar tanks/spaces under main engines	Leak (10)	Vol 1, Pt 6, Ch 6, 7.5 Leak testing
Ballast ducts	Leak and structural	The greater of:
		ballast pump maximum pressure
		setting of pressure relief valve

Note 1. See Vol 1, Pt 6, Ch 6, 7.7 Definitions and details of tests 7.7.2. Includes double bottom dry compartments and duct keels as well as voids used for the protection of fuel oil tanks and pump rooms.

Section 7

- Note 2. Testing of the after peak is to be carried out after the sterntube has been fitted.
- Note 3. The top of the tank is generally to exclude hatchways.
- Note 4. A hose test will be considered, see Vol 1, Pt 6, Ch 6, 7.7 Definitions and details of tests 7.7.3.
- Note 5. Watertight doors and hatches not confirmed watertight by a prototype test are to be subject to a hydrostatic test.
- **Note** 6. For shell doors providing watertight closure, watertightness is to be demonstrated through prototype testing before installation. The testing procedure is to be agreed with LR prior to testing.
- **Note** 7. Other testing methods listed in *Vol 1, Pt 6, Ch 6, 7.7 Definitions and details of tests* can be considered, subject to the adequacy of such testing methods being verified.
- **Note** 8. If the magazine is required to contain an overpressure, for example due to a fire munitions reaction, the testing requirements are to be specified by the magazine safety standard. Where magazines are not required to contain an overpressure, or required to be watertight, leak testing may be replaced by a visual examination.
- **Note** 9. All watertight doors and hatches are to be hose tested after installation. Hose testing is to be carried out from each side of a door unless, for a specific application, flooding is anticipated from only one side. Where a hose test is not practicable because of possible damage to machinery, electrical equipment insulation or outfitting items, it may be replaced by an ultrasonic leak test or an equivalent test.
- **Note** 10. Where LO sump tanks and other similar spaces under main engines intended to hold liquid form part of the watertight sub-division of the ship, they are to be tested in accordance with the requirements for deep tanks (other than those listed elsewhere).
- Note 11. Independent tanks not confirmed watertight by a prototype test are to be subject to a hydrostatic test. A leak test is to be carried out after installation on board.
- **Note** 12. Where hose testing cannot be performed without damaging possible outfittings already installed, it can be replaced by a careful visual inspection of all the crossings and welded joints. Where necessary, dye penetrant test or ultrasonic leak test could be required.

7.3 Structural testing – general requirements

- 7.3.1 Tanks which are intended to hold liquids, and which form part of the watertight sub-division of the ship, shall be tested for tightness and structural strength as indicated in *Table 6.7.1 Testing requirements*. Tanks which do not form part of the watertight sub-division of the ship need not be structurally tested providing that the watertightness of all boundaries of these spaces is verified by leak tests and thorough inspection.
- 7.3.2 Where a structural test is specified in *Table 6.7.1 Testing requirements* unless specified otherwise, a hydrostatic test is to be carried out in accordance with *Vol 1, Pt 6, Ch 6, 7.7 Definitions and details of tests 7.7.1*. Where practical limitations prevent a hydrostatic test being carried out, a hydropneumatic test in accordance with *Vol 1, Pt 6, Ch 6, 7.7 Definitions and details of tests 7.7.2* may be conducted. All external boundaries of the tested space are to be examined for structural distortion, bulging, buckling, or other related damage and/or leaks.
- 7.3.3 A hydrostatic test or hydropneumatic test can be carried out afloat to confirm the structural adequacy of tanks, provided that a leak test is carried out and the results are confirmed as satisfactory before the vessel is afloat. The testing afloat is to be carried out by separately filling each tank and cofferdam to the test head given in *Table 6.7.1 Testing requirements*. An internal inspection of the tanks is to be made whilst the ship is afloat.
- 7.3.4 Consideration is to be given to the selection of tanks to be structurally tested. Selected tanks are to be chosen so that all representative structural members are tested for the expected tension and compression. Tank boundaries are to be tested from at least one side.
- 7.3.5 Compartments to be tested are to be structurally complete and all fittings which affect the watertight integrity of the compartment such as doors, hatches, manholes, penetrations, valves and glands are to be fitted.
- 7.3.6 In compartments containing the stabiliser fins, rudder stocks, sonar hull outfit, echo sounders, etc. the bearing houses are to be installed and the seating arrangements completed before testing.
- 7.3.7 Arrangements are to be provided to ensure the free passage of air from the top of the tank tested. The air pipe or indicator test plug may be used for this purpose.
- 7.3.8 Where necessary, additional temporary supports are to be fitted to the hull to prevent excessive deformation.

Section 7

- 7.3.9 It is recommended that a leak test in accordance with *Vol 1, Pt 6, Ch 6, 6.7 Watertight collars* is carried out before the structural test commences to identify any leak paths which may compromise the structural test.
- 7.3.10 Where it is intended to carry out structural tests after the protective coating has been applied, welds are to be leak tested prior to the coating application.
- 7.3.11 For welds other than manual and automatic erection welds, manual fillet welds on tank boundaries and manual penetration welds, the leak test may be waived provided that careful visual inspection is carried out, to the satisfaction of the Surveyor, before the coating is applied. The cause of any discolouration or disturbance of the coating during the test is to be ascertained, and any deficiencies repaired.
- 7.3.12 Equivalent proposals for testing will be considered.
- 7.3.13 Where it is intended to carry out structural tests after the protective coating has been applied, welds are to be leak tested prior to the coating application.

7.4 Structural testing for Naval ships

- 7.4.1 For tanks of the same structural design, configuration and the same general workmanship, as determined by the attending Surveyor, a structural test need only be carried out on one tank, provided that all subsequent tanks are tested for leaks by an air test.
- 7.4.2 Where the structural adequacy of a tank has been verified by structural testing on a previous vessel in a series, tanks of structural similarity on subsequent vessels within that series (which are built at the same shipyard) need not be structurally tested, provided that the watertightness of all exempt tanks is verified by leak tests and thorough inspection. However, structural testing is to be carried out for at least one tank of each type of tank on every vessel in the series.
- 7.4.3 For sister ships built two or more years after the delivery of the last ship of the series, the application of the provisions of *Vol 1, Pt 6, Ch 6, 7.4 Structural testing for Naval ships 7.4.2* will be specially considered provided that the general practices, equipment and workmanship of the shipyard have been maintained continuously, and an non-destructive testing programme is implemented for the tanks not subject to structural tests.
- 7.4.4 Tanks exempted from structural testing in *Vol 1, Pt 6, Ch 6, 7.4 Structural testing for Naval ships 7.4.2* will require structural testing if found necessary after the structural testing of the first tank.

7.5 Leak testing

- 7.5.1 Generally all boundaries for watertight subdivision are to be given a leak test when structural work is complete. The test is to be carried out before the compartment is fitted out and linings or covering applied.
- 7.5.2 Testing is to be carried out by applying an efficient indicating liquid, e.g. soapy water solution, to the weld or outfitting penetration being tested, while the tank or compartment is subject to an air pressure of at least 0,15 bar.
- 7.5.3 It is recommended that the air pressure be raised to 0,2 bar and kept at this level for about one hour to reach a stabilised state, with a minimum number of personnel in the vicinity, and then lowered to the test pressure prior to inspection.
- 7.5.4 A U-tube filled with water to a height corresponding to the test pressure is to be fitted for verification and to avoid overpressure. The U-tube is to have a cross-section larger than that of the air supply pipe. In addition, the test pressure is to be verified by means of a calibrated pressure gauge, or alternative equivalent system.
- 7.5.5 Leak testing is to be carried out, prior to the application of a protective coating, on all fillet welds and erection welds on tank boundaries, except welds made by automatic processes and on all outfitting penetrations.
- 7.5.6 Selected locations of automatic erection welds and pre-erection manual or automatic welds may also be required to be tested before coating, at the discretion of the Surveyor.
- 7.5.7 Where a leak test is specified in *Table 6.7.1 Testing requirements* unless specified otherwise, a tank air test, compressed air fillet weld test or vacuum box test is to be carried out in accordance with the applicable requirements of *Vol 1*, *Pt 6*, *Ch 6*, 7.7 *Definitions and details of tests 7.7.6*. A hydrostatic or hydropneumatic test conducted in accordance with the applicable requirements of *Vol 1*, *Pt 6*, *Ch 6*, 7.7 *Definitions and details of tests 7.7.1* and *Vol 1*, *Pt 6*, *Ch 6*, 7.7 *Definitions and details of tests 7.7.2* will be accepted as a leak test on the condition that safe access to all joints being examined is provided, *see Vol 1*, *Pt 6*, *Ch 6*, 7.8 *Safe access to joints 7.8.1*. Where a hydrostatic or hydropneumatic test is applied as a leak test, the external boundaries are to be free of any liquid residue prior to the commencement of the test.
- 7.5.8 A hose test will be accepted as means of verifying the tightness of joints only in specific locations, identified in *Table 6.7.1 Testing requirements*.

Section 7

- 7.5.9 Air tests of joints can be conducted at any stage during construction provided that all work that might affect the tightness of the joint is completed before the test is carried out.
- 7.5.10 Where acceptable to the attending Surveyor, provided that careful visual inspections show a continuous uniform weld profile shape, free from repairs, and the results of selected NDE testing show no significant defects, the leak testing of automatic butt welds and semi-automatic (flux core arc welding) butt welds may be omitted.

7.6 Gastight testing

- 7.6.1 Where LR has been requested to witness gastight testing in accordance with a specified standard, the boundaries of citadels and zones defined in *Vol 1, Pt 4, Ch 1, 7 Design guidance for nuclear, biological and chemical defence* are to be tested for gas tightness using a pressure drop test. In addition, compartments containing noxious or explosive gases such as Acetone, Dope, Flammable stores, Oxygen, etc. are to be subject to a pressure drop test.
- 7.6.2 The test is to be carried out with compartment as near to completion as possible. Further work on a compartment after the test may result in a retest.
- 7.6.3 In certain compartments that are not able to be made fully gastight due to operational requirements, a greater fall in pressure may be accepted at the discretion of the surveyor. In no case is the pressure to drop more than 0,0075 bar (75 mm of fresh water) in 10 minutes from an initial 0,015 bar (150 mm of fresh water).
- 7.6.4 Consideration will be given to the testing of adjacent boundaries or equivalent in those spaces which are not able to be closed, such as gun rings and main machinery spaces.

7.7 Definitions and details of tests

- 7.7.1 **Hydrostatic test** is a test conducted by filling a space with a liquid to a specified head. Unless another liquid is approved, the hydrostatic test is to consist of filling a space with either fresh or sea water, whichever is appropriate for the space being tested, to the level specified in *Table 6.7.1 Testing requirements* For tanks intended to carry cargoes of a higher density than the test liquid, the head of the liquid is to be specially considered.
- 7.7.2 **Hydropneumatic test** is a combination of a hydrostatic test and a tank air test, consisting of partially filling a tank with water and conducting a tank air test on the unfilled portion of the tank. A hydropneumatic test, where approved, is to be such that the test condition in conjunction with the approved liquid level and air pressure will simulate the actual loading as far as practicable. The requirements for tank air testing shown in *Vol 1*, *Pt 6*, *Ch 6*, *7.7 Definitions and details of tests 7.7.4* and the safety precautions given in *Vol 1*, *Pt 6*, *Ch 6*, *7.5 Leak testing* are to be adhered to.
- 7.7.3 **Hose test** is a test used to verify the tightness of joints with a jet of water. The jet of water is to be directed perpendicular to the joint. It is to be carried out with the pressure in the hose nozzle maintained at not less than 2,0 bar during the test. The hose nozzle is to have a minimum inside diameter of 12 mm and is to be situated no further than 1,5 m from the joint. Where a hose test is not practical because of possible damage to machinery, electrical equipment insulation or outfitting items, it can be replaced by a careful visual examination of welded connections, supported by an ultrasonic or penetration leak test, or an equivalent.
- 7.7.4 **Tank air test** is to be used to verify the tightness of a compartment by means of an air pressure differential and leak indicator solution. An efficient indicating solution (e.g. soapy water) is to be applied to the weld or penetration being tested and is to be examined whilst an air pressure differential of not less than 0,15 bar is applied by pumping air into the compartment. Arrangements are to be made to ensure that any increase in air pressure does not exceed 0,30 bar. A U-tube with a height sufficient to hold a head of water corresponding to the required test pressure is to be used for verification and to avoid overpressure. The cross-sectional area of the U-tube is not to be less than that of the pipe supplying air to the tank. Alternatively, two calibrated pressure gauges can be considered acceptable. All boundary welds, including pipe connections in the compartment are to be examined twice. The first is to be examined immediately upon applying the leak indication solution; the second approximately five minutes afterwards.
- 7.7.5 **Compressed air fillet weld test.** This test consists of compressed air being injected into one end of a fillet welded joint and the pressure verified at the other end of the joint by a pressure gauge. Pressure gauges are to be arranged so that an air pressure of at least 0,15 bar above atmospheric pressure can be verified at each end of all passages within the portion being tested. A leak indicator solution is to be applied and the weld line examined for leaks. A compressed air test can be carried out for partial penetration welds where the root face is greater than 6 mm.
- 7.7.6 **Vacuum box test** is a test used to verify the tightness of joints by means of a localised air pressure differential and leak indicator solution. The test is to be conducted with the use of a box with air connections, gauges and an inspection window that is

Section 7

to be placed over the joint being tested with a leak indicator solution applied. The air within the box is to be removed by an ejector to create a vacuum, i.e. a pressure differential of 0,20 to 0,26 bar inside the box.

- 7.7.7 **Penetration test** can be used where a hose test is not practical to assess butt welds, see *Vol 1, Pt 6, Ch 6, 7.7 Definitions and details of tests 7.7.3*, by applying a low surface tension liquid to one side of a compartment boundary. When no liquid is detected on the opposite side of the boundary after expiration of a defined period of time, the verification of tightness of the compartment's boundary may be assumed. A developer solution can be applied on the other side of the weld to aid leak detection.
- 7.7.8 **Gastight test**. The pressure in the compartment is to be brought to 0,015 bar and the supply isolated. The fall in pressure after 10 minutes is not to be greater than 0,0013 bar. If the specified pressure drop occurs, the compartment is to be inspected for leaks and the test repeated until the specified standard is achieved. A U-tube filled with water to a height corresponding to the test pressure is to be fitted for verification and to avoid overpressure. The U-tube is to have a cross-section larger than that of the air supply pipe.
- 7.7.9 **Protective coating**. Protective coating is the coating system applied to protect the structure from corrosion. This excludes the prefabrication primer.

7.8 Safe access to joints

7.8.1 For leak tests, safe access to all joints under examination is to be provided.

■ Section 1

General

1.1 Application

- 1.1.1 This Part gives the procedures that may be optionally applied for the structural design and assessment of all naval ships. Ships which comply with these requirements will be eligible to be assigned the additional class notations applicable to each procedure. The full list of class notations is given in *Vol 1*, *Pt 1*, *Ch 2 Classification Regulations*.
- 1.1.2 The requirements for the following additional class notations are included within this Part:

TLA Total Load Assessment.

SDA Structural Design Assessment.

■ Section 2

Total Load Assessment, TLA

- 2.1 Total Load Assessment notation TLA
- 2.1.1 The **TLA** procedure is an optional procedure and is applied on a voluntary basis.
- 2.1.2 The ship's structure is examined using a total load approach and stress analysis techniques.
- 2.1.3 The total load approach applies static, hydrodynamic and inertial load components to the structure making due allowance for the local structural configuration. These load components include global and local considerations. The approach includes load combination factors which enable the total design loads to take account of the appropriate phase relationships between the various load parameters, e.g. relative vertical motion and global bending moment.
- 2.1.4 The stress analysis techniques predict the total stresses acting in the structure as a consequence of the total loads. These techniques cover the assessment of stresses in either primary/secondary plating systems or grillage systems.
- 2.1.5 The resulting stresses are then checked against a set of design factors, which include stress, deflection and buckling requirements.
- 2.1.6 Due to the nature of the **TLA** approach it is possible to achieve the following:
- (a) Allow the designer to examine different loading scenarios
- (b) Optimise the structure towards particular design solutions.
- 2.1.7 The **TLA** procedure is in addition to the normal Rule structural design approval requirements specified within *Vol 1, Pt 6, Ch 3 Scantling Determination*
- 2.1.8 The requirements for the **TLA** method are given in *Vol 1, Pt 7, Ch 2 Total Design Loads* and *Vol 1, Pt 7, Ch 3 Total Load Assessment, TLA*. Chapter 2 contains the requirements for the total design loads to be applied to the structure and Chapter 3 contains the requirements for the stress analysis and verification to be performed using these loads.

■ Section 3

Structural Design Assessment, SDA

3.1 Structural Design Assessment notation – SDA

- 3.1.1 The **SDA** procedure is an optional procedure and is applied on a voluntary basis when an Owner or designer seeks to increase confidence levels in the structural integrity of a ship.
- 3.1.2 The ship structure is to be examined using finite plate element methods to assess both the overall and detailed structural capability to withstand static and dynamic loadings.
- 3.1.3 The **SDA** procedure is in addition to the normal Rule structural design approval requirements specified within *Vol 1, Pt 6, Ch 3 Scantling Determination*.
- 3.1.4 The **SDA** procedure may be mandatory for very structurally complex ships. For complex ships, the ship designer is to supply outline details of the ship to LR at an early stage in the design in order that agreement can be reached on the appropriate level of analysis required.
- 3.1.5 Where applicable, the ship structure is to be examined for the structural capability to withstand dynamic loadings from partially filled tanks or the influence of thermal loadings.

■ Section 1

General

1.1 Application

- 1.1.1 This Chapter specifies the method by which the total design loads for the optional Total Load Assessment, **TLA**, approach are derived. The **TLA** approach is given in *Vol 1, Pt 7, Ch 3 Total Load Assessment, TLA*, an overview of the **TLA** approach is given in *Vol 1, Pt 7, Ch 3, 1 Introduction* and illustrated in *Figure 3.1.1 Overview of the Total Load Assessment, TLA Procedure*
- 1.1.2 The total design loads derived in this Chapter are also to be used to form the basic load cases for the optional Structural Design Assessment, **SDA**, procedure, see *Vol 1*, *Pt 7*, *Ch 1*, *3.1 Structural Design Assessment notation SDA*.
- 1.1.3 The total design loads are derived by combining the local and global design loads, defined in *Vol 1, Pt 5, Ch 3 Local Design Loads* and *Vol 1, Pt 5, Ch 4 Global Design Loads* respectively, using load combination factors. These loads represent typical maximum values of combined loads that are simultaneously applied to the structure of a ship.
- 1.1.4 The total design loads given in this Chapter are applicable to all naval ships which are operating in the displacement mode.
- 1.1.5 The total design loads for ships that are operating in the planing or non-displacement modes will need to be specially considered. The loads given here are applicable for these ships whilst they are operating in the displacement mode, i.e. in severe sea states when planing is not possible.

1.2 Overview of total design loads

- 1.2.1 The total design loads to be applied to each structural item are to include the following load and pressure components where applicable:
- global hull girder stress due to vertical bending, σ_{hg} in N/mm², derived in accordance with Vol 1, Pt 6, Ch 4 Hull Girder Strength;
- global hull girder shear stress loads, τ_{hg} in N/mm², derived in accordance with Vol 1, Pt 6, Ch 4 Hull Girder Strength;
- local pressure loads, P in kN/m², where P is the appropriate design pressure value for each component;
- local transverse, LT, or vertical support, LV, loads, in kN;
- mass inertial forces, in kN;
- local shear force loads, in kN.
- 1.2.2 In addition to the above loads, it may be necessary to consider the effects of the following on the structural components:
- bending of primary structure supported by major bulkheads;
- bending of primary structure supported by the side shell or longitudinal bulkheads;
- lateral bending moments and shear forces;
- global and local torsional moments.
- 1.2.3 Most of the above load components include a dynamically fluctuating component due to ship motions, e.g. side shell pressure due to wave and ship motion. These loads will not all be maximum simultaneously, due to their cyclic nature and the

Volume 1, Part 7, Chapter 2

Section 1

phase relationship between load values. Consequently it is not necessary to apply the maximum values of all these load components to the structure at the same time. *Vol 1, Pt 7, Ch 2, 3 Design load combinations* gives a method of combining these loads in order that representative total design loads may be applied to the structure.

- 1.2.4 The method of deriving the Total Design Loads for each structural component is given in Vol 1, Pt 7, Ch 2, 4 Design load systems for longitudinally effective components and Vol 1, Pt 7, Ch 2, 5 Design load systems for structural components or longitudinally ineffective material. However, it remains the responsibility of the designer to ensure that the loads applied are representative.
- 1.2.5 Details of all the loads applied to each structural component are to be supplied to Lloyd's Register (hereinafter referred to as 'LR').
- 1.2.6 The major load components to be applied to, or reacted by, the structure are illustrated in *Figure 2.1.1 Loads and* stresses to be applied to the structure

1.3 Environmental conditions

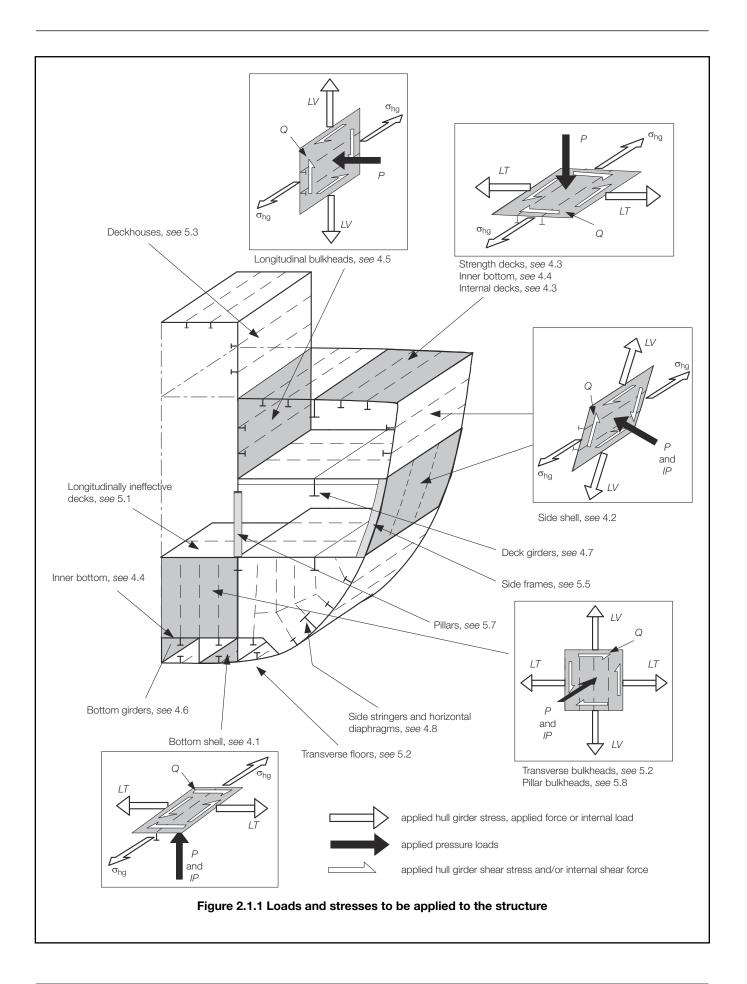

- 1.3.1 The environmental conditions for the determination of the total design loads are to be based on the normal environmental design criteria specified in *Vol 1*, *Pt 5*, *Ch 2*, *2.3 Wave environment* unless otherwise stated.
- 1.3.2 The standard values of wave height factor, f_{Hs} , and service area factor, f_{s} , given in *Vol 1, Pt 5, Ch 3, 1.2 Environmental conditions 1.2.2* and *Vol 1, Pt 5, Ch 2, 2.4 Service area factors* respectively are to be used for the total design loads unless otherwise stated. These factors may be adjusted for damaged loading conditions, residual strength analysis, **RSA**, or for special operating conditions, e.g. a deep draft condition for the recovery of amphibious vehicles in sheltered waters.

1.4 Direct calculations

1.4.1 Alternative methods of establishing the total design loads will be specially considered, provided that they are based on established codes or standards acceptable to LR. In such cases, full details of the methods used are to be provided when plans are submitted for approval.

Volume 1, Part 7, Chapter 2

Section 1

Volume 1, Part 7, Chapter 2

Section 2

1.4.2 Throughout this Chapter, recommended values of effectiveness, ε , are given for each structural component. These effectiveness values specify the proportion of a particular load carried by a structural component as opposed to other supporting structure, see the text for more details. These efficiency values may be derived by direct calculation, similar ship analysis or other suitable techniques. The methods used and values derived are to be agreed with LR.

Section 2

Nomenclature and design factors

2.1 Nomenclature

- 2.1.1 The nomenclature used in this Chapter to describe the loads applied to or reacted by the structure and local dimensional characteristics, e.g. breadths and spans, is based on the following format:
- (a) A _{Suffix}

where

The letter A is the load type or dimension letter and is one of the following:

Load types

- P = denotes an applied normal pressure load, i.e. normal to the plate.
- IP = denotes an applied impulse or impact pressure load.
 - F = denotes an applied point load due to gravity and mass inertial effects.
- LV = denotes an internally generated load acting in the predominantly vertical direction as a consequence of applied forces and pressures, e.g. pillar bulkhead compressive loads.
- LT = denotes an internally generated load acting in the predominantly transverse direction as a consequence of applied forces and pressures, e.g. transverse deck compressive loads.
- QV = denotes a shear force due to local load considerations acting in the predominantly vertical direction.
- QT = denotes a shear force due to local load considerations acting in the predominantly transverse direction.
 - $\sigma = \text{denotes a direct stress to apply as a consequence of hull girder bending.}$
 - $\tau =$ denotes a direct shear stress to apply as a consequence of hull girder shear forces.

Dimensions

- *B* = breadth, in metres, of an area of supported plate or dimension of a structural member. *B* is always measured in the transverse direction.
- S = length of an area of supported plating or dimension of a structural member. S is always measured in the longitudinal direction.
- H = height of an area of supported plating or dimension of a structural member. H is always measured in the vertical direction.

Suffix is either of the following:

- Lower case = to denote a local load value which was derived in accordance with Vol 1, Pt 5, Ch 3 Local Design Loads
- Upper case = to denote a resultant load value that is applied to the structural item under consideration.
- 2.1.2 The symbols used in this Chapter for loads are given below:

Volume 1, Part 7, Chapter 2

Section 2

Local load or pressure components

- P_h = shell envelope hydrostatic pressure, see Vol 1, Pt 5, Ch 3, 3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating, Ps
- P_w = shell envelope hydrodynamic pressure, see Vol 1, Pt 5, Ch 3, 3.3 Hydrostatic pressure on the shell plating, Ph
- P wd = pressure on weather deck, see Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd
- IP bi = bottom impact pressure, see Vol 1, Pt 5, Ch 3, 4.2 Bottom impact pressure, IPbi
- I P _{bf} = Bow flare or above waterline impact pressure, see Vol 1, Pt 5, Ch 3, 4.3 Bow flare and wave impact pressures, IPbf
 - P in = pressure on internal deck, see Vol 1, Pt 5, Ch 3, 5.3 Pressure on internal decks, Pin
- P cd = pressure on cargo deck, see Vol 1, Pt 5, Ch 3, 5.4 Loads for decks designed for cargo or heavy equipment loads, Pcd and Wcd
- P ra = pressure on ramps or lifts, see Vol 1, Pt 5, Ch 3, 6.2 Loads for ramps and lifts, Pra
- H _{tk} = pressure height for tank bulkheads, see Vol 1, Pt 5, Ch 3, 5.6 Pressure height for deep tank bulkheads and boundaries, Htk
- H_{da} = pressure height for watertight bulkheads, see Vol 1, Pt 5, Ch 3, 5.7 Pressure height for watertight bulkheads and boundaries, Hda

Design loads and pressures for structural components

 P_{BS} = design pressure for bottom structure.

 P_{SS} = design pressure for side shell structure.

 P_{DK} = design pressure for deck structure.

 P_{WD} = design pressure for weather deck.

 P_{ID} = design pressure for interior deck.

 P_{IR} = design pressure for inner bottom.

 P_{LB} = design pressure for longitudinal bulkheads.

 $P_{\rm FL} = {\rm design} \ {\rm pressure} \ {\rm for} \ {\rm bottom} \ {\rm floors} \ {\rm and} \ {\rm transverses}.$

 $P_{\rm DH} = {\rm design} \ {\rm pressure} \ {\rm for} \ {\rm deckhouse}, \ {\rm bulwarks} \ {\rm and} \ {\rm superstructures} \ {\rm plating}.$

 P_{DT} = design pressure for deep tank bulkheads.

P_{WT} = design pressure for watertight bulkheads.

 L_{Pl} = design load carried by pillars.

 L_{PB} = design load carried by pillar bulkheads.

 $P_{\rm CD}$ = design pressure to be applied to cargo decks.

 F_{CD} = design load due to discreet mass items to be applied to decks.

Volume 1, Part 7, Chapter 2

Section 3

 $P_{\rm IMP}$ = design pressure for decks subject to impulsive loads.

 P_{WI} = design pressure for deckhouse and superstructure windows.

 QT_{DK} = local shear force for deck plating.

 QT_{FL} = local shear force for floors.

 QV_{BG} = local shear force for bottom girders.

NOTE

- [F] = denotes a force matrix, i.e. a group of forces which are applicable to the structural item under consideration.
- 2.1.3 Other symbols and definitions applicable to this Chapter are defined below or in the appropriate sub-Section:
- (a) T and L_R are defined in Vol 1, Pt 3, Ch 1, 5.2 Principal particulars
- 2.1.4 The units for pressures are in kN/m² and the units for loads and forces are in kN. Stresses are in N/mm². Positive loads and stresses are tensile, negative are compressive.
- 2.1.5 The design pressure, *p*, used in scantling formulae in *Vol 1, Pt 7, Ch 3, 2 Structural resistance* is to be taken as the appropriate pressure value defined in this Chapter.
- 2.1.6 For a direct calculation using finite element (FE) analysis, only loads and pressures with a load type letter of P, IP or F are normally to be applied to the FE structural model. Load type letters σ_{hg} and τ_{hg} may need to be applied as global bending moments and shear forces, i.e. M_D and Q_D , depending on the extent of the FE structural model.

■ Section 3

Design load combinations

3.1 General

- 3.1.1 The local and global loads given in Vol 1, Pt 5, Ch 3 Local Design Loads and Vol 1, Pt 5, Ch 4 Global Design Loads do not include any allowance for phase relationships between the various loadings. These loads are not all maximum at the same time and consequently it is not correct to apply all loads simultaneously to the structure. The purpose of this section is to define the phase relationships and hence allow typical maximum load combinations to be applied to the structure.
- 3.1.2 Special load case combinations may be required to reflect specific operational requirements of the vessel, e.g. sea state 6 operation with the stern well dock flooded for amphibious operations. The details of such operational modes together with any service limitations are to be recorded in the design disclosure document and the Operations Manual, Loading Manual or Stability Information Book.
- 3.1.3 Proposals for deriving the load combinations using direct calculation techniques are to be agreed with LR at the earliest opportunity.

3.2 Design cases for load combinations

- 3.2.1 The load combinations given in *Table 2.3.1 Design load combination factors* are the minimum to be considered for the assessment of the scantlings. Additional load combination cases may be required to demonstrate that the structure is adequate.
- 3.2.2 Each set of load combinations may need to be considered for individual loading conditions to account for differences in local loadings, e.g. different tank fillings, payload or other loadings. This may be performed either using:
- (a) an envelope approach with due consideration of full/empty tanks, etc. or
- (b) as individual load combination sets, in which case the actual still water bending moment and shear force distributions may be used together with the actual draft, trim and deadweight distribution.

Volume 1, Part 7, Chapter 2

Section :

For example, it will be necessary to consider two design cases to review the double bottom tanks, i.e. one with the double bottom tank full and one with the double bottom tank empty.

3.2.3 Load combination cases 1 to 4 are based on the premise that the maximum wave bending moment and shear forces are likely to be generated on a wave that has the same length as the ship.

Table 2.3.1 Design load combination factors

Case No	1	2	3	4	5	6
Design factor	Design Sag case	Max pitch bow up	Design Hog case	Max pitch bow down	Roll case	Design factor affects the following loads
	Crest at FP Trough at 0,5L R	Crest at 0,75L _R Trough at 0,25L _R	Crest at 0,5 <i>L</i> _R Trough at FP	Crest at 0,25L _R Trough at 0,75L _R		
W g (global loads)	-1,0	$\frac{+\sin(\pi x/L_{R})}{2}$	+1,0	$\frac{+\sin(\pi x/L_{R})}{2}$	To be specially considered	M _W , M _{WRS} , Q _W and Q _{WRS} see Vol 1, Pt 7, Ch 2, 3.3 Design global loads – Intact conditions and Vol 1, Pt 7, Ch 2, 3.4 Design global loads – Damaged conditions or Residual Strength Assessment (RSA) conditions
w p (external pressure loads)	+ cos (2πx/L _R)	–sin (2πx/L _R)	+ cos (2πx/L _R)	–sin (2πx/L _R)	To be specially considered	P _{SS} , Vol 1, Pt 7, Ch 2, 3.6 External shell pressures LT QT
w _f (inertial loads)	Combined heave and pitch design factor based on $w_{\rm fheave}$ and $w_{\rm fpitch}$, see Vol 1, Pt 7, Ch 2, 3.5 Inertial force load combination factor, wf					P _{CD} , F _{CD} LV, L _A
w _{fheave} (heave inertial)	+1	0	-1	0	To be specially considered	
W fpitch (pitch inertial)	0	+1	0	-1	To be specially considered	

Note 1. The factor w_g is to be applied to the dynamic portion of the load, see *Vol* 1, *Pt* 7, *Ch* 2, 3.3 Design global loads – *Intact conditions* and *Vol* 1, *Pt* 7, *Ch* 2, 3.4 Design global loads – *Damaged conditions or Residual Strength Assessment (RSA) conditions*.

Note 2. The factor w_p is to be applied to the dynamic portion of the load component, see Vol 1, Pt 7, Ch 2, 3.6 External shell pressures.

Note 3. The factor w_f is to be applied to the dynamic portion of the load component, see Vol 1, Pt 7, Ch 2, 3.5 Inertial force load combination factor, w_f . The w_{fheave} and w_{fpitch} factors are required to consider the phasing between heave and pitch accelerations.

Note 4. x is the longitudinal location under consideration.

Note 5. Sin and cos are the sine and cosine functions with the angle in radians.

3.2.4 Each load case combination consists of a set of w factors, some of these combination factors are longitudinally position dependent factors, e.g. the w_p term will produce maximum pressure amidships and low pressures at the ends for the maximum hogging BM case.

3.3 Design global loads - Intact conditions

3.3.1 The design global hull girder vertical bending moment to be associated with the design load combination cases is as follows:

Volume 1, Part 7, Chapter 2

Section 3

$$M_D = M_S + |w_a| M_W \text{ kNm}$$

where

 $|w_g|$ = absolute value of w_g

 $M_{\rm S}$ and $M_{\rm W}$ are the sagging or hogging values of $M_{\rm S}$ and $M_{\rm W}$ at the longitudinal position under consideration. If $w_{\rm g}$ is positive then the hogging values of $M_{\rm S}$ and $M_{\rm W}$ are to be taken, otherwise $w_{\rm g}$ is negative and the sagging values of $M_{\rm S}$ and $M_{\rm W}$ are to be taken

 $M_{\rm S}$ and $M_{\rm W}$ are given in Vol 1, Pt 5, Ch 4, 2.2 Still water bending moments and Vol 1, Pt 7, Ch 2, 3.3 Design global loads – Intact conditions

 $w_{\rm q}$ is given in Table 2.3.1 Design load combination factors.

3.3.2 The design global hull girder vertical shear force to be associated with the design load combination cases is as follows:

$$Q_D = Q_S + |w_a| Q_W kN$$

where

 $|w_{q}|$ = absolute value of w_{q}

 Q_S and Q_W are the sagging or hogging values of Q_S and Q_W at the longitudinal position under consideration. If w_g is positive then the hogging values of Q_S and Q_{WH} are to be taken, otherwise w_g is negative and the sagging values of Q_S and Q_{WS} are to be taken.

Q_S is given in Vol 1, Pt 5, Ch 4, 2.3 Still water shear forces

Q WS and Q WH are given in Vol 1, Pt 7, Ch 2, 3.7 Vertical wave shear forces

w a is given in Table 2.3.1 Design load combination factors

3.4 Design global loads - Damaged conditions or Residual Strength Assessment (RSA) conditions

3.4.1 The design global hull girder vertical bending moments to be associated with the design load combination cases for residual strength assessment or damaged conditions is to be taken as follows:

$$M_D = M_{SBS} + |w_d| M_{WBS} \text{ kNm}$$

where.

$$|w_{a}|$$
 = absolute value of w_{a}

 $M_{\rm SRS}$ and $M_{\rm WRS}$ are the sagging or hogging values of $M_{\rm SRS}$ and $M_{\rm WRS}$ at the longitudinal position under consideration. If $w_{\rm g}$ is positive then the hogging values of $M_{\rm SRS}$ and $M_{\rm WRS}$ are to be taken, otherwise $w_{\rm g}$ is negative and the sagging values of $M_{\rm SRS}$ and $M_{\rm WRS}$ are to be taken.

M SRS and M WRS are given in Vol 1, Pt 5, Ch 4, 5.6 Damaged still water shear forces and bending moments

 $w_{\rm g}$ is given in Table 2.3.1 Design load combination factors

3.4.2 The design global hull girder vertical shear force to be associated with the design load combination cases for residual strength assessment or damaged conditions is to be taken as follows:

$$Q_D = Q_{SBS} + |w_d| Q_{WBS} kN$$

where

$$|w_{g}|$$
 = absolute value of w_{g}

 $Q_{\rm SRS}$ and $Q_{\rm WRS}$ are the sagging or hogging values of $Q_{\rm SRS}$ and $Q_{\rm WRS}$ at the longitudinal position under consideration. If $w_{\rm g}$ is positive then the hogging values of $Q_{\rm SRS}$ and $Q_{\rm WRS,H}$ are to be taken, otherwise $w_{\rm g}$ is negative and the sagging values of $Q_{\rm SRS}$ and $Q_{\rm WRS,S}$ are to be taken.

Q _{SRS} is given in Vol 1, Pt 5, Ch 4, 5.6 Damaged still water shear forces and bending moments and Vol 1, Pt 5, Ch 4, 5.4 Residual strength vertical wave shear forces

Volume 1, Part 7, Chapter 2

Section 3

w a is given in Table 2.3.1 Design load combination factors

Q WRS.S and Q WRS.H are given in Vol 1, Pt 7, Ch 2, 3.7 Vertical wave shear forces 3.7.2

3.5 Inertial force load combination factor, w_f

3.5.1 The inertial force load combination factor, w_f, to be associated with the design load combination cases is as follows:

$$W_{\rm f} = (1 + a_{\rm 7})$$

where

$$a_z = w_{\text{fheave}} a_{\text{heave}} + w_{\text{fpitch}} a_{\text{pitch}}$$

w fheave and w fpitch are to be taken for the appropriate loading condition, see *Table 2.3.1 Design load combination factors* a heave and a pitch are defined in *Table 3.2.1 Ship motions*

3.6 External shell pressures

3.6.1 The side shell pressure, P SS, to be applied to all external plating is to be derived as follows:

$$P_{SS} = P_h + w_p P_w \text{ kN/m}^2$$

but

$$P_{SS} \ge 0$$

w_p is defined in *Table 2.3.1 Design load combination factors*

 P_h and P_w are defined in Vol 1, Pt 5, Ch 3, 3.2 Combined hydrostatic and hydrodynamic pressure on the shell plating, Ps and Vol 1, Pt 5, Ch 3, 3.3 Hydrostatic pressure on the shell plating, Ph.

3.6.2 The weather deck pressure, P_{WD} , to be applied to all external plating is to be derived as follows:

$$P_{\text{WD}} = P_{\text{h}} + w_{\text{p}} P_{\text{wd}} \text{ kN/m}^2$$

but

 $P_{\text{WD}} \ge 0$

 w_{p} is defined in Table 2.3.1 Design load combination factors

P wd is defined in Vol 1, Pt 5, Ch 3, 3.5 Pressure on exposed and weather decks, Pwd

3.7 Vertical wave shear forces

3.7.1 The wave shear force curves associated with the hogging and sagging bending moments required by the total load approach are to be taken as follows:

 Q_{WH} = shear force distribution to give the hogging bending moment

$$= 3K_b M_o/L_B kN$$

where

 $K_{\rm b}$ is to be taken as follows:

$$K_b = 0$$
 at aft end of L_B

=
$$+0.836F_{fH}$$
 between $0.2L_{B}$ and $0.3L_{B}$

=
$$+0.65F_{fH}$$
 between $0.4L_{R}$ and $0.5L_{R}$

$$=$$
 -0,65 F_{fH} between 0,5 L_{R} and 0,6 L_{R}

=
$$-0.91F_{fH}$$
 between $0.7L_{R}$ and $0.85L_{R}$

= 0 at forward end of $L_{\rm R}$

Volume 1, Part 7, Chapter 2

Section 4

 Q_{WS} = shear force distribution to give the sagging bending moment

 $= 3K_b M_o/L_R kN$

where

 $K_{\rm b}$ is to be taken as follows:

 $K_b = 0$ at aft end of LR

= $+0.836F_{fS}$ between 0,15L _R and 0,3L _R

 $= +0.65F_{fS}$ between 0.4L Rand 0.5L R

= $+0.65F_{fS}$ between $0.5L_{R}$ and 0.6LR

= $-0.91F_{fS}$ between $0.7L_{R}$ and $0.85L_{R}$

= 0 at forward end of $L_{\rm R}$

Intermediate values are to be determined by linear interpolation.

M_o, F_{fH} and F_{fS} are given in Vol 1, Pt 5, Ch 4, 3.3 Vertical wave bending moments

3.7.2 The wave shear force associated with the residual strength assessment load cases or damaged load cases is to be taken as follows:

Q_{WRS},H = shear force distribution to give the hogging bending moment

 $= K_{fRS} Q_{WH}$

where

Q_{WH} = is taken as in Vol 1, Pt 7, Ch 2, 3.7 Vertical wave shear forces 3.7.1

K fRS = is given in Vol 1, Pt 5, Ch 4, 5.2 Environmental conditions

Q WRS.S = shear force distribution to give the sagging bending moment

 $= K_{fBS} Q_{WS}$

where

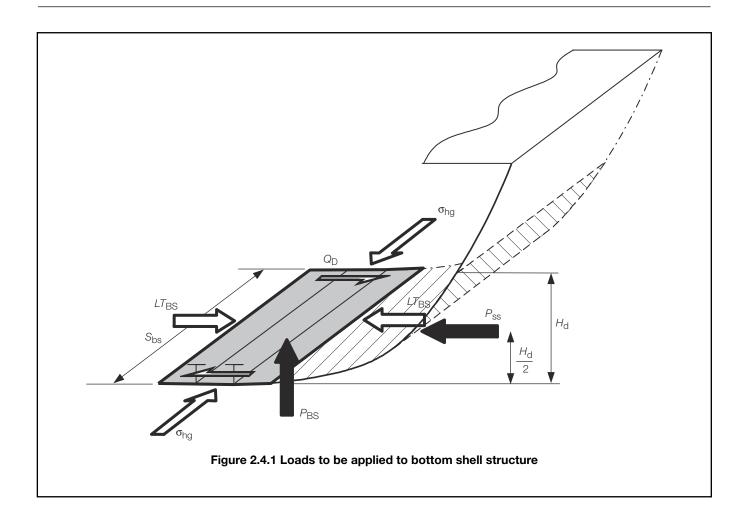

Q WS = is taken as in Vol 1, Pt 7, Ch 2, 3.7 Vertical wave shear forces 3.7.1

■ Section 4

Design load systems for longitudinally effective components

4.1 Bottom shell structures (BS)

4.1.1 The design load values calculated here are to be used to determine the scantlings of bottom shell plating and stiffeners between the keel and the turn of bilge, see Figure 2.4.1 Loads to be applied to bottom shell structure

4.1.2 The design normal pressure, P_{BS} , for the bottom shell plating and stiffeners is to be taken as:

$$P_{BS} = P_{SS} \text{ kN/m}^2$$

where

P SS = is defined in Vol 1, Pt 7, Ch 2, 3.6 External shell pressures 3.6.1

4.1.3 The design impulse pressure, IP_{BS} , for the bottom shell plating and stiffeners is to be taken as

$$IP_{bi} = kN/m^2$$
 (bottom impact)

where

IP bi = is defined in Vol 1, Pt 7, Ch 2, 2.1 Nomenclature 2.1.2

- 4.1.4 The design global vertical bending moment for bottom shell plating and longitudinals is to be taken as M_D , as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions
- 4.1.5 The design transverse load, LT _{BS}, due to hydrostatic and hydrodynamic compressive loading is to be taken as follows:

$$LT_{BS} = -\epsilon_{BS} P_{SS} H_{d} S_{bs} kN$$

where

 H_d = half the vertical distance from the keel to the first effective full breadth deck above the inner bottom, or above the keel, in m. If no effective full breadth decks exist, then H_d is to be taken to the strength deck. H_d is illustrated in Figure 2.4.2 Design parameter Hd for transverse load

Volume 1, Part 7, Chapter 2

Section 4

- S_{bs} = length of the bottom shell plating between major transverse bulkheads, in metres
- ϵ_{BS} = effectiveness of the bottom shell plating, i.e. the relative proportion of the load carried by the bottom shell as opposed to other structure such as the inner bottom, floors and bulkheads
 - = 0,5 for full breadth double bottom structures
 - = 1,0 for single bottom structures or partial breadth double bottom structures

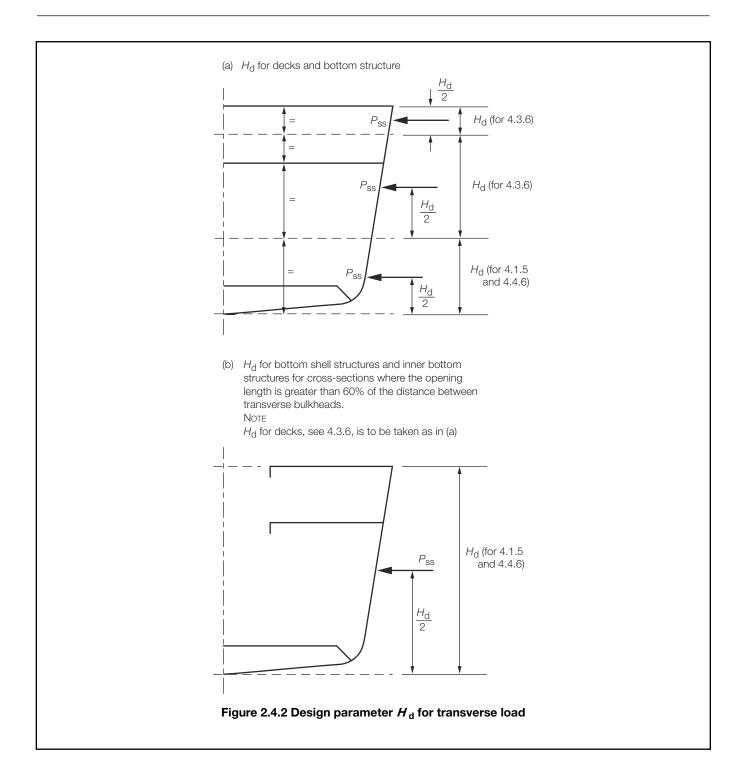

P_{SS} is to be taken at a height H_d/2 above the keel. P_{SS} is defined in Vol 1, Pt 7, Ch 2, 3.6 External shell pressures 3.6.1

- 4.1.6 The design global shear force, Q_D, may be ignored for the bottom plating.
- 4.1.7 The design loads for bottom structure primary members are given in *Vol 1, Pt 7, Ch 2, 4.6 Bottom longitudinal girders* (*BG*), bottom longitudinal girders, and *Vol 1, Pt 7, Ch 2, 5.4 Transverse floors (FL)*, transverse floors.

4.2 Side shell structures (SS)

- 4.2.1 The design pressures calculated here are to be used to determine the scantlings of side shell plating and stiffeners from the turn of bilge up to the weather deck, see *Figure 2.4.3 Loads to be applied to side shell structure*
- 4.2.2 For the side shell structure the design normal pressure, P_{SS} , is to be taken as defined in *Vol 1*, *Pt 7*, *Ch 2*, 3.6 External shell pressures 3.6.1

Section 4

- 4.2.3 The design impulse pressure, IP_{SS} , for the side shell plating and stiffeners is to be taken as follows:
- (a) up to the design waterline

 $IP_{SS} = IP_{bi} \text{ kN/m}^2 \text{ (bottom impact)}$

(b) above the design waterline

 $IP_{SS} = IP_{bf} \text{ kN/m}^2$ (bow flare impact)

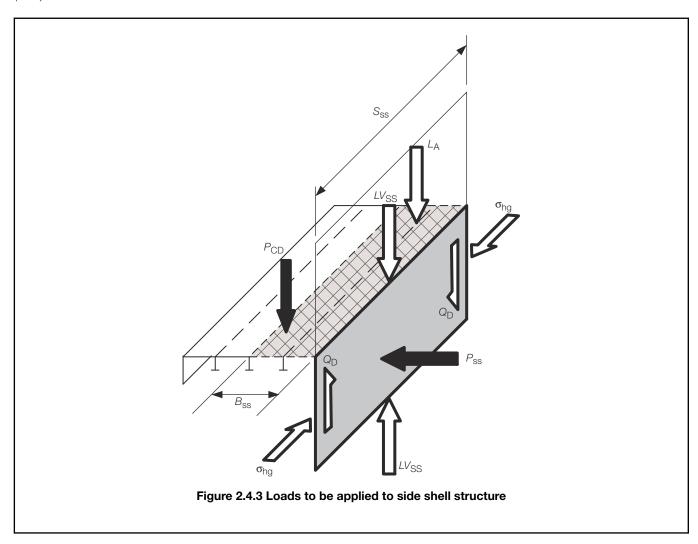

where

 IP_{bi} and IP_{bf} are defined in Vol 1, Pt 7, Ch 2, 2.1 Nomenclature 2.1.2

Volume 1, Part 7, Chapter 2

Section 4

4.2.4 The design global vertical bending moment is to be taken as M_D , as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads – Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads – Damaged conditions or Residual Strength Assessment (RSA) conditions

4.2.5 The design vertical load, LV_{SS} , supported by the side shell plating and stiffeners is to be taken as:

$$LV_{SS} = -\varepsilon_{SS} (S_{SS} B_{SS} P_{CD} + L_A + [F_{CD}]) kN$$

where

 ϵ_{SS} = effectiveness of the side shell plating, i.e. the relative proportion of the load carried by the side shell as opposed to the bounding major transverse bulkheads

= 0,5

 P_{CD} = basic inertial deck design pressure, as appropriate, plus any other local loadings directly above the side shell, in kN/m², see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2

[F_{CD}] = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. F_{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

 L_A = appropriate load, in kN, from pillar(s), bulkheads and side shell structure above the supported deck, assumed zero if there is none over. L_A may be taken as LV_{BP} for the supported bulkhead. LV_{PB} is given in Vol. 1, Pt. 7, Ch. 2, 5.8 Pillar bulkheads (PB)

Volume 1, Part 7, Chapter 2

Section 4

- $S_{ss}B_{ss}$ = are the effective deck area supported by the side shell and are to taken as follows, see Figure 2.4.3 Loads to be applied to side shell structure
 - B_{ss} = mean breadth of the supported deck plating, i.e. half the transverse distance from the side shell to longitudinal bulkheads, or effectively supported longitudinal girders, in metres
 - S_{ss} = length of the side shell between major transverse bulkheads, in metres.
- 4.2.6 The design global shear force is to be taken as Q_D, as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions
- 4.2.7 The design loads for side shell primary members are given in Vol 1, Pt 7, Ch 2, 4.8 Longitudinal stringers (ST) for longitudinal stringers and in Vol 1, Pt 7, Ch 2, 5.5 Side frames and web frames (SF) for side frames and web frames.

4.3 Strength deck and internal deck structures (DK)

- 4.3.1 The design normal pressure, P_{DK} , for the deck plating and stiffeners is to be taken as the greater of the following, provided that the load component is applicable:
- (a) P_{WD} (weather deck pressure), see Vol 1, Pt 7, Ch 2, 3.6 External shell pressures 3.6.2
- (b) P_{ID} (interior deck pressure), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.3
- (c) P CD (cargo deck pressure), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2
- (d) P_{tk} (deep tank boundary, where appropriate).
- 4.3.2 For loading conditions which represent damaged situations and for decks that form part of the watertight subdivision, the design normal pressure, P_{DK} , is to be taken as follows if this is greater than *Vol 1*, *Pt 7*, *Ch 2*, 4.3 Strength deck and internal deck structures (DK) 4.3.1:
- (a) P da (damage head).
- 4.3.3 The design load matrix, $[F_{DK}]$, in kN for the deck plating and stiffeners is to be taken as the combination of the following, as appropriate:
 - [F_{CD}] = see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5 (equipment or other deck loads)
 - L_A = pillar loads from above, if not transferred to pillars below, see Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) 4.2.5

These loads are to be applied in addition to the design pressures above.

- 4.3.4 Normally, the design impulse pressure, IP_{DK} , for the deck plating and stiffeners may be ignored. However, the design impulse pressure will need to be considered for decks designed to withstand helicopter or aircraft landing operations, cargo handling at sea or similar.
- 4.3.5 The design global vertical bending moment is to be taken as M_D , as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions.
- 4.3.6 The design transverse load, LT_{DK} , due to hydrostatic and hydrodynamic compressive loading is to be taken as follows, see also Vol 1, Pt 7, Ch 2, 4.3 Strength deck and internal deck structures (DK) 4.3.8:

$$LT_{DK} = -\varepsilon_{DK} P_{SS} H_d S_{dk} kN$$

where

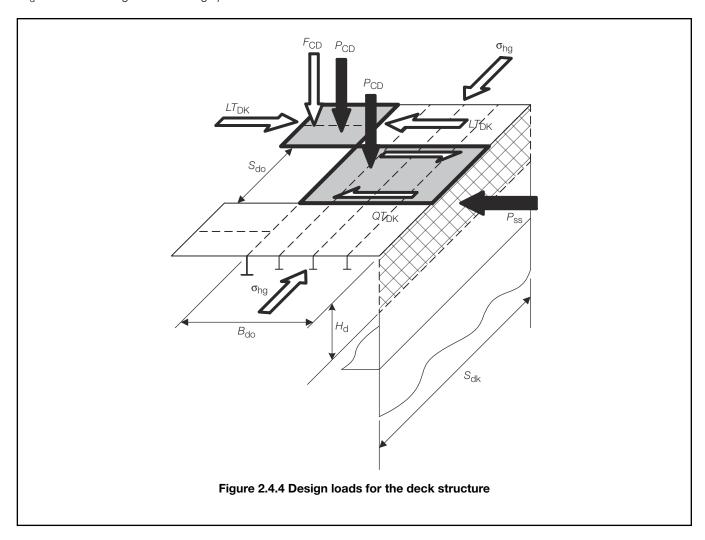

- $H_{\rm d}$ = half the vertical distance from the first full breadth deck below the deck under consideration to the first full breadth deck above this deck, or to the strength deck if there are no decks above, in metres
- S_{dk} = length of the side shell plating between major transverse bulkheads, in m, see Figure 2.4.4 Design loads for the deck structure
- ϵ_{DK} = effectiveness of the deck, i.e. the relative proportion of the load carried by the deck as opposed to other structure such as bulkheads

Volume 1, Part 7, Chapter 2

Section 4

= 0.8

 $P_{\rm SS}$ is to be taken at the mid height of the $H_{\rm d}$ depth, $P_{\rm SS}$ is defined in Vol 1, Pt 7, Ch 2, 3.6 External shell pressures 3.6.1 $H_{\rm d}$ is illustrated in Figure 2.4.2 Design parameter Hd for transverse load

- 4.3.7 Normally, the design global shear force may be ignored for the deck plating. However if the structural arrangement is such that significant shear load is carried by the deck, then it should be considered. In this case the design global shear force is to be taken as Q_D, as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions
- 4.3.8 If the deck is not continuous across the full breadth, due to the presence of large openings, then LT_{DK} may be taken as zero over the opening breadth. In this case it may be necessary to consider the local shear force in the deck plating due to hydrostatic and hydrodynamic loading on the longitudinal span of the deck. This shear force acts in the transverse direction and is to be taken as:

$$QT_{DK} = P_{SS}H_dS_{do}/2 kN$$

where

S do = length of the deck plating between major transverse bulkheads or the length of the deck opening, whichever is lesser, in metres

P SS and H d are defined in Vol 1, Pt 7, Ch 2, 4.3 Strength deck and internal deck structures (DK) 4.3.6

The shear area of the deck plate supporting this shear load is to be based on the breadth of the deck edge strip, B do.

Volume 1, Part 7, Chapter 2

Section 4

4.3.9 The transverse load, LT_{DK} , in way of the full breadth decks at the ends of the deck opening is to be increased by the ratio:

$$S_d/(S_d-S_{do})$$

The efficiency of the deck, ε_{DK} see Vol 1, Pt 7, Ch 2, 4.3 Strength deck and internal deck structures (DK) 4.3.6, may be reduced provided that the transverse bulkheads are capable of carrying more of the transverse loading.

4.3.10 The design loads for deck primary members are given in *Vol 1, Pt 7, Ch 2, 4.7 Deck girders (DG)* for deck girders and in *Vol 1, Pt 7, Ch 2, 5.6 Deck beams (BM)* for deck beams.

4.4 Inner bottom structures (IB)

- 4.4.1 For all loading conditions, the design normal pressure, $P_{\rm IB}$, for the inner bottom plating and stiffeners is to be taken as the greater of:
- (a) P_{ID} (interior deck pressure), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.3
- (b) P CD (cargo deck pressure), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2
- (c) P_{tk} (deep tank pressure, where appropriate).
- 4.4.2 For loading conditions which represent damaged situations, the design normal pressure, $P_{\rm IB}$, for the inner bottom plating and stiffeners is to be taken as the greater of the following. If this is greater than *Vol 1*, *Pt 7*, *Ch 2*, *4.4 Inner bottom structures (IB) 4.4.1*:
- (a) P_{da} (damage head).
- (b) P_{SS} (pressure on shell plating, where appropriate).
- 4.4.3 The design load matrix, [F_{IR}], in kN for the inner bottom plating and stiffeners is to be taken as:

[F CD] (equipment or other deck loads), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

- 4.4.4 The design impulse pressure for the inner bottom plating and stiffeners may be ignored.
- 4.4.5 The design global vertical bending moment for the inner bottom plating and stiffeners is to be taken as M_D , as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions.
- 4.4.6 The design transverse load, LT_{IB} , due to hydrostatic and hydrodynamic compressive loading is to be taken as follows:

$$LT_{IB} = -\epsilon_{IB} P_{SS} H_d S_{ib} kN$$

where

 H_{d} = half the vertical distance from the keel to the first full breadth deck above the inner bottom, in metres

 S_{ib} = span of the bottom shell plating between major transverse bulkheads, in metres, see Figure 2.4.5 Loads to be applied to inner bottom plating

 $\epsilon_{\ IB}$ = effectiveness of the inner bottom, i.e. the relative proportion of the load carried by the inner bottom as opposed to other structure such as the bottom shell, floors and bulkheads

= 0,5 normally

 $P_{\rm SS}$ is to be taken at a height of $H_{\rm d}/2$ above the keel, $P_{\rm SS}$ is defined in *Vol 1*, *Pt 7*, *Ch 2*, *3.6 External shell pressures* $H_{\rm d}$ is illustrated in *Figure 2.4.2 Design parameter Hd for transverse load*

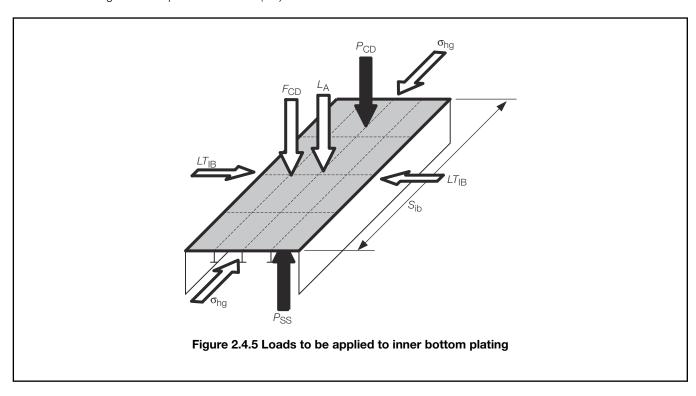

- 4.4.7 The design global shear force, Q_D , may be ignored for the inner bottom plating.
- 4.4.8 The design loads for inner bottom structure primary members are given in *Vol 1, Pt 7, Ch 2, 4.6 Bottom longitudinal girders (BG)* for bottom longitudinal girders and in *Vol 1, Pt 7, Ch 2, 5.4 Transverse floors (FL)* for transverse floors.

Volume 1, Part 7, Chapter 2

Section 4

4.5 Longitudinal bulkhead structures (LB)

4.5.1 The design normal pressure for longitudinal bulkhead plating with longitudinal stiffeners is to be taken as the same for both the plating and stiffeners. The design normal pressure, P_{LB} , is to be taken as $P_{B\ HP}$ as given in Vol 1, Pt 7, Ch 2, 5.2 Transverse watertight and deep tank bulkheads (BH) 5.2.1

- 4.5.2 The design normal pressure for longitudinal bulkhead plating with vertical stiffeners is to be considered separately for the plating and the vertical stiffeners. The design normal pressure for the plating, P_{LB} , is to be taken as P_{BHP} as given in *Vol 1*, *Pt 7*, *Ch 2*, 5.2 *Transverse watertight and deep tank bulkheads (BH) 5.2.1*. The design normal pressure for the stiffener, P_{LBS} , is to be taken as P_{BHS} as given in *Vol 1*, *Pt 7*, *Ch 2*, 5.2 *Transverse watertight and deep tank bulkheads (BH) 5.2.1*
- 4.5.3 The design impulse pressure, IP_{LB} , for the longitudinal bulkhead plating and stiffeners may be ignored, unless these members are likely to be subjected to significant sloshing loads or similar.
- 4.5.4 The design global vertical bending moment for longitudinal bulkhead plating and stiffeners is to be taken as M_D as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions
- 4.5.5 The design vertical load, LV_{LB} , at each intersecting deck level is to derived as follows:

$$LV_{LB} = -(S_{lb} B_{lb} P_{CD} + L_A + [F_{CD}]) kN$$

where

- $P_{\rm CD}$ = inertial deck design pressure, as appropriate, plus any other local loadings directly above the pillar, in kN/m², see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2
- [F_{CD}] = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. F_{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5
 - L_A = appropriate portion of the load or loads, in kN, from pillar(s) or bulkhead(s) above, assumed zero if there is none over, see also Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) 4.2.5

 $S_{
m lb}$ $B_{
m lb}$ is the effective deck area supported by the longitudinal bulkhead and can be taken as follows, see Figure 2.4.6 Loads to be applied to longitudinal bulkhead plating

Volume 1, Part 7, Chapter 2

Section 4

 $B_{
m lb}={
m mean}$ spacing of longitudinal bulkheads, side shell or effectively supported longitudinal girders, in metres.

 S_{lh} = span or length of the longitudinal bulkhead between major transverse bulkheads, in metres.

- 4.5.6 The design global shear force for longitudinal bulkhead plating is to be taken as Q_D , as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions.
- 4.5.7 If the longitudinal bulkhead is not continuous over the full depth of the ship then it will be necessary to consider the local shear force in the longitudinal bulkhead plating as the vertical load must be transferred into the supporting structure, such as transverse bulkheads. This shear force acts in the vertical direction and is to be taken as:

$$QV_{1B} = LV_{1B}/2$$

The shear area of the longitudinal bulkhead plate supporting this shear load is to be based on the depth of the longitudinal bulkhead between decks.

4.5.8 The design loads for longitudinal bulkhead primary members are given in *Vol 1, Pt 7, Ch 2, 4.8 Longitudinal stringers* (ST) for longitudinal stringers and in *Vol 1, Pt 7, Ch 2, 5.5 Side frames and web frames (SF)* for side frames and web frames.

4.6 Bottom longitudinal girders (BG)

- 4.6.1 This sub-Section covers double bottom and single bottom girders. Figure 2.4.7 Loads to be applied to bottom girders illustrates the design loads.
- 4.6.2 The design normal pressure, P _{BG}, for girder web plating is to be taken as the greater of:
- (a) P_{tk} kN/m² (Deep Tank, if applicable), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.4
- (b) P_{da} kN/m² (WT subdivision, only if applicable and for loading conditions which represent damaged situations), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.4
- (c) 5,0 (minimum value for no direct loading).
- 4.6.3 The design impulse pressure, IP_{BG} , for the bottom girder web plating may be ignored, unless these members are subjected to sloshing loads or similar.
- 4.6.4 The design global vertical bending moment for bottom girder plating and stiffeners is to be taken as M_D , as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions
- 4.6.5 The design vertical load, LV _{BG}, acting on the web plating of bottom girders is to be based on the supported loads. Typically these include downwards local inertial pressures, P _{CD}, inertial forces, [F _{CD}], and pillar bulkhead loads above, L _A, all acting on the plating of the inner bottom or the bottom girder flange and the upwards buoyancy loads on the bottom shell plating, P _{BS}. The design vertical load is to be taken as:

$$LV_{BG} = -\varepsilon_{BG} (B_{bg} S_{bg} (P_{CD} - P_{BS}) + [F_{CD}] + L_A) kN$$

where

 ε BG = effectiveness of the bottom girders, i.e. the relative proportion of the load carried by the bottom girders as opposed to other structure such as the transverse floors

= 0,5

 B_{bq} = mean spacing of longitudinal girders or other primary longitudinal structure, in metres, see Note 2

S ba = span or length of the longitudinal girder between transverse bulkheads, in metres

L_A = load, in kN, from pillar(s) above, assumed zero if there is none over, see Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) 4.2.5

F_{CD} = inertial load or loads, in kN, from items of equipment, etc on the supported deck, assumed zero if there is none over. F_{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

Volume 1, Part 7, Chapter 2

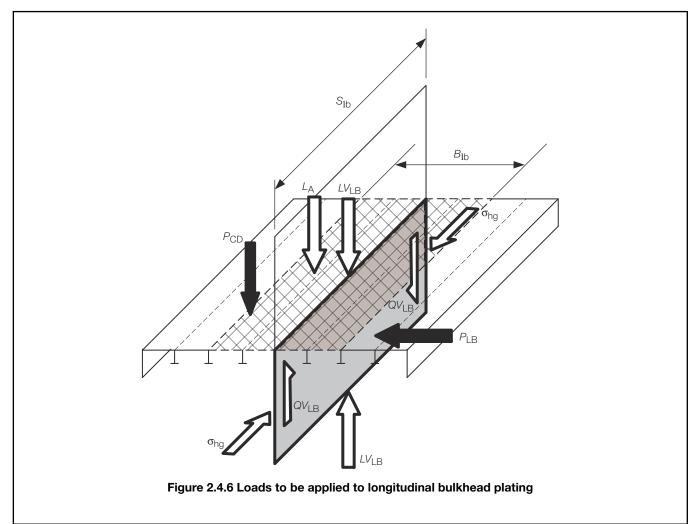

Section 4

P BS is defined in Vol 1, Pt 7, Ch 2, 4.1 Bottom shell structures (BS) 4.1.2

P CD is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2

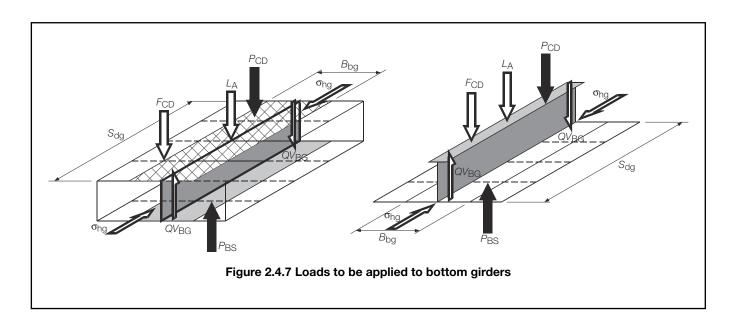

Note 1. For single bottom girders P_{CD} is likely to be zero. In this situation B_{bg} = span or length of the longitudinal girder between transverse bulkheads. P_{CD} should be taken as the distributed machinery load, if it is not included in $[F_{CD}]$.

Note 2. Where the girder is part of a longitudinally stiffened bottom structure with closely spaced floors, the mean spacing B may be taken as the spacing of the longitudinal stiffeners. For grillage or transversely stiffened systems then the spacing is to be taken as stated.

Volume 1, Part 7, Chapter 2

Section 4

- 4.6.6 The design shear force for the bottom girder web plating is to include local and global components.
- (a) The design global shear force is to be taken as Q_D , as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions. If the girder depth is reasonably small then Q_D may be ignored.
- (b) The local shear force component, QV_{BG} , is due to the difference between the buoyancy and the inertial forces. It acts in the vertical direction and is to be taken as:

$$QV_{BG} = \varepsilon_{BG} (B_{bg} S_{bg} (P_{CD} - P_{BS}) + [F_{CD}] + L_A)/2$$

where

 B_{bg} = mean spacing of longitudinal girders or other primary longitudinal structure, in metres, see Note 2.

4.6.7 The design bending load for bottom girder primary member is to be taken as:

$$\epsilon_{\mathrm{BG}}$$
 (B $_{\mathrm{bg}}$ S $_{\mathrm{bg}}$ (P $_{\mathrm{CD}}$ - P $_{\mathrm{BS}}$) + [F $_{\mathrm{CD}}$] + L $_{\mathrm{A}}$) kN

4.6.8 The membrane loads acting on the bottom shell plating are defined in *Vol 1, Pt 7, Ch 2, 4.1 Bottom shell structures (BS)* The membrane loads acting on the inner bottom plating are defined in *Vol 1, Pt 7, Ch 2, 4.4 Inner bottom structures (IB)*. These loads are required to assess the bottom girder beam in addition to the local bending loads.

4.7 Deck girders (DG)

- 4.7.1 The design normal pressure, P_{DG} , for deck girder web plating may be ignored.
- 4.7.2 The design impulse pressure, IP_{DG} , for deck girder web plating may be ignored, unless these members are subjected to sloshing loads or similar.
- 4.7.3 The design global vertical bending moment for deck girders is to be taken as $M_{\rm D}$, as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions.
- 4.7.4 The design vertical load for deck girder webs may be ignored.
- 4.7.5 The design shear force for the deck girder web plating is to include local and global components.
- (a) The design global shear force is to be taken as Q_D, as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions. If the girder depth is reasonably small then Q_D may be ignored.
- (b) The local shear force component, QV_{DG}, is due to the difference between the buoyancy and the inertial forces. It acts in the vertical direction and is to be taken as:

Volume 1, Part 7, Chapter 2

Section 4

$$QV_{DG} = \varepsilon_{BG} (B_{dg} S_{dg} P_{CD} + [F_{CD}] + L_A)/2 \text{ kN}$$

where

 ϵ_{BG} = effectiveness of the deck girders, i.e. the relative proportion of the load carried by the deck girders as opposed to other structure such as the deck beams

= 0.5

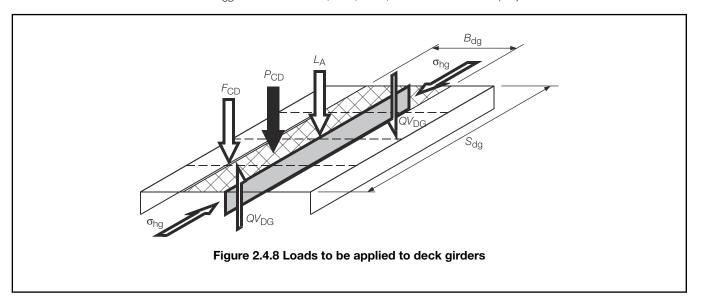

B dg = mean spacing of longitudinal girders or other primary longitudinal structure, in metres, see Figure 2.4.8

Loads to be applied to deck girders

S dq = span or length of the longitudinal girder between transverse bulkheads, in metres

L_A = load, in kN, from pillar(s) above, assumed zero if there is none over

 $F_{\rm CD}$ = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. $F_{\rm CD}$ is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

- 4.7.6 The membrane loads acting on the deck plating are defined in Vol 1, Pt 7, Ch 2, 4.3 Strength deck and internal deck structures (DK)
- 4.7.7 The design bending load for the deck girder primary member is to be taken as:

 ε_{BG} (B _{dq} S _{dq} P _{CD} + [F _{CD}] + L _A) kN.

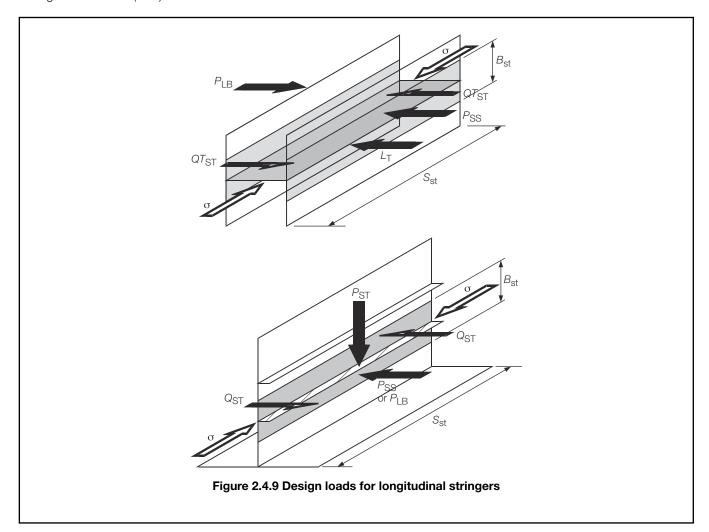

4.8 Longitudinal stringers (ST)

- 4.8.1 This sub-Section covers stringers supporting side shell plating, horizontal girders on longitudinal bulkheads and also covers horizontal diaphragms fitted between a double skin. The design loads are illustrated in *Figure 2.4.9 Design loads for longitudinal stringers*
- 4.8.2 The design normal pressure, P_{ST} , for the web plating of stringer may be ignored unless the stringer forms part of a tank boundary or watertight subdivision, i.e. a watertight horizontal diaphragm. In this case the design pressure is to be taken as the greater of
- (a) P_{tk} kN/m² (Deep Tank, if applicable), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.4
- (b) P_{da} kN/m² (WT subdivision, only if applicable and for loading conditions which represent damaged situations), see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.4.
- (c) 5,0 (minimum value for no direct loading).

Volume 1, Part 7, Chapter 2

Section 4

- 4.8.3 The design impulse pressure, IP_{ST} , for the web plating of stringer may be ignored, unless these members are subjected to sloshing loads or similar.
- 4.8.4 The design global vertical bending moment for longitudinal stringers is to be taken as M_D , as defined in Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions

- 4.8.5 The design transverse load, LT_{ST} , acting on the web plating of horizontal diaphragms is to be based on the pressure loads acting on the plating of the inner skin or longitudinal bulkhead P_{LB} (outwards) and the side shell P_{SS} (inwards). The design transverse load, LT_{ST} , is to be taken as the lesser of:
- (a) $-\varepsilon_{ST} B_{st} S_{st} P_{SS} kN$
- (b) $-\varepsilon_{ST} B_{st} S_{st} P_{LB} kN$

where

- ϵ_{ST} = effectiveness of the horizontal diaphragms, i.e. the relative proportion of the load carried by the horizontal diaphragms as opposed to other structure such as the transverse web or normal frames
 - = 0,5
- H_{st} = mean spacing, in metres, of stringers (or horizontal girders) and other primary horizontal structure, i.e. decks or similar
- S_{st} = length of the stringer (or horizontal girder) between transverse bulkheads, in m, see *Figure 2.4.9 Design* loads for longitudinal stringers

Volume 1, Part 7, Chapter 2

Section 5

 $P_{\rm SS}$ is to be taken as the side shell pressure at the height of the stringer, see Vol 1, Pt 7, Ch 2, 3.6 External shell pressures 3.6.1. $P_{\rm SS}$ is to be ignored for horizontal girders attached to longitudinal bulkheads.

 P_{LB} is to be taken as the longitudinal bulkhead normal pressure at the height of the horizontal girder, see Vol 1, Pt 7, Ch 2, 4.5 Longitudinal bulkhead structures (LB) 4.5.1 This is only required for longitudinal bulkheads that form part of a deep tank or watertight boundary.

Note Where the horizontal diaphragm is part of a longitudinally stiffened structure with regular transverse webs, the mean spacing $H_{\rm st}$ may be based on the longitudinal spacing. For grillage or transversely stiffened systems then the spacing is to be taken as originally stated.

- 4.8.6 The design transverse load, LT ST, for stringers and horizontal girders may be ignored.
- 4.8.7 The design shear force, QT_{ST} , in the stringer web due to hydrostatic, hydrodynamic or tank loading acts in the transverse direction is to be taken as the greater of:
- (a) $\epsilon_{ST} H_{st} S_{st} P_{SS}/2$
- (b) $\epsilon_{ST} H_{st} S_{st} P_{LB}/2$

where

H st = mean spacing, in metres, of stringers (or horizontal girders) and other primary horizontal structure, i.e. decks or similar.

- 4.8.8 The design bending load for the deck girder primary member is to be taken as:
- (a) $\varepsilon_{ST} H_{st} S_{st} (P_{SS} P_{LB})$

where

H_{st} = mean spacing, in metres, of stringers (or horizontal girders) and other primary horizontal structure, i.e. decks or similar.

4.8.9 The membrane loads acting on the side shell and longitudinal bulkhead plating are defined in Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) and Vol 1, Pt 7, Ch 2, 4.5 Longitudinal bulkhead structures (LB), these loads are required to assess the longitudinal stringer beam in addition to the local bending loads.

■ Section 5

Design load systems for structural components or longitudinally ineffective material

5.1 Deck structures (DK)

- 5.1.1 The design pressure, P WD, for weather deck structure is given in Vol 1, Pt 7, Ch 2, 3.6 External shell pressures 3.6.2.
- 5.1.2 For weather decks and interior decks subjected to cargo loads or other pressure loading then the following design pressure is to be used for the plating and stiffeners if it is greater than that given in *Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK)* 5.1.1:

$$P_{\rm CD} = W_{\rm f} W_{\rm cd} \, kN/m^2$$

where

W _{cd} is the static pressure exerted by the cargo, payload, stores or equipment on the deck as specified by the designer in kN/m², see Vol 1, Pt 7, Ch 2, 2.1 Nomenclature 2.1.2 and see also Vol 1, Pt 5, Ch 3, 5.4 Loads for decks designed for cargo or heavy equipment loads, Pcd and Wcd 5.4.1

w f is given in Vol 1, Pt 7, Ch 2, 3.5 Inertial force load combination factor, wf 3.5.1

5.1.3 The design pressure, $P_{\mbox{\scriptsize ID}}$, for interior deck plating and stiffeners is given by:

$$P_{\text{ID}} = w_f W_{\text{in}} \text{ kN/m}^2$$

Volume 1, Part 7, Chapter 2

Section 5

 P_{ID} is not to be taken less than 2,5 kN/m²

W in is defined in Vol 1, Pt 7, Ch 2, 2.1 Nomenclature 2.1.2

5.1.4 For weather or internal decks which form part of a deep tank or watertight boundary then the pressure loading is to be taken as the greater of the following if this is greater than the above:

$$P_{tk} = 9.81 \rho (H_{tk} - z) \text{ kN/m}^2 \text{ (deep tank, if applicable)}$$

 $P_{da} = 10(H_{da} - z) \text{ kN/m}^2$ (WT subdivision, only if applicable and for loading conditions which represent damaged situations)

where

 ρ = specific density of liquid in the tank, to be taken as not less than 1,025

z = distance above the baseline of the mid depth of the deck plating

H_{tk} and H_{da} are defined in Vol 1, Pt 7, Ch 2, 2.1 Nomenclature 2.1.2

5.1.5 The cargo deck design force matrix, [F CD], for plating and stiffeners is to be taken as below for all mass items which act over the deck area considered

(a)
$$[F_{CD}] = W_f [W_{ma}]$$

 $W_{\rm ma}$ is the weight of each item on the deck as specified by the designer in kN. See also Vol 1, Pt 5, Ch 3, 5.4 Loads for decks designed for cargo or heavy equipment loads, Pcd and Wcd 5.4.2

5.1.6 If the deck is required to be immersed during its operation, e.g. an internal dock area, then the deck is to be designed using the side shell pressure loads, P_{SS} , see *Vol 1*, *Pt 7*, *Ch 2*, *3.6 External shell pressures 3.6.1*

5.2 Transverse watertight and deep tank bulkheads (BH)

- 5.2.1 The design normal pressure for bulkhead plating, P_{BHP} , and stiffeners, P_{BHS} , is to be taken as the pressure values P_{bhp} and P_{bhp} respectively given in *Vol 1*, *Pt 5*, *Ch 3*, 5.8 *Design pressures for watertight and deep tank bulkheads and boundaries*
- 5.2.2 The design impulse pressure, IP_{BH} , for the bulkhead plating and stiffeners may be ignored, unless these members are likely to be subjected to significant sloshing loads or similar.
- 5.2.3 The design transverse load, LT_{BH} , due to hydrostatic and hydrodynamic compressive loading is to be taken as follows:

$$LT_{BH} = -\epsilon_{BH} P_{SS} H_{bh} S_{bh} kN$$

where

H_{bh} = half the vertical distance from the deck below the bulkhead under consideration to the deck above, in metres, see Figure 2.5.1 Design parameter H_{bh} for transverse loads and Figure 2.5.2 Design loads for bulkheads

S _{bh} = half the longitudinal distance between adjacent transverse bulkheads, in metres

 ϵ_{BH} = effectiveness of the bulkhead, i.e. the relative proportion of the load carried by the bulkhead as opposed to other structure such as decks

 ϵ_{BH} may be taken as 0,5

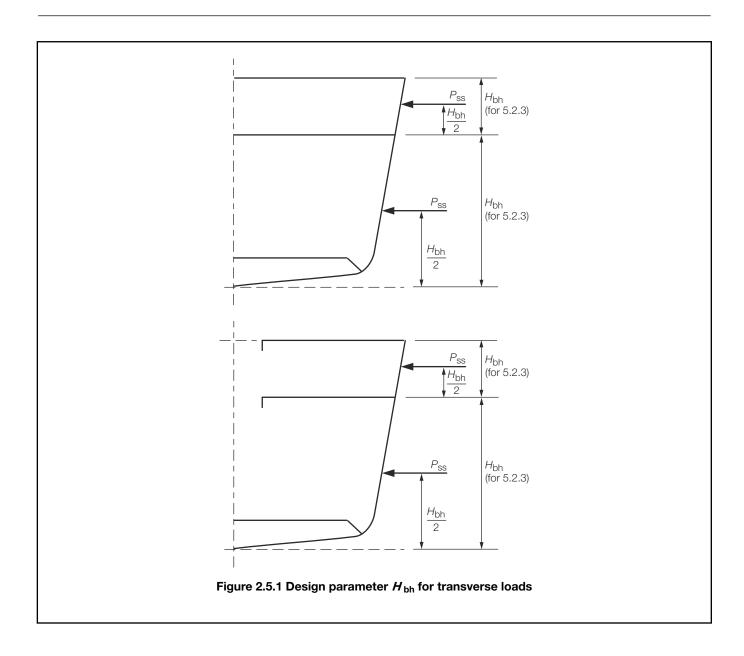

alternatively ϵ_{BH} may be taken as

$$\varepsilon_{BH} = H_{bh}/(2S_{bh})$$
 for $H_{bh} < S_{bh}$

and =
$$1 - S_{bh}/(2H_{bh})$$
 for $H_{bh} > S_{bh}$

P SS is to be taken at the mid height of the H bh depth, P SS is defined in Vol 1, Pt 7, Ch 2, 3.6 External shell pressures 3.6.1

Section 5

5.2.4 The design vertical load, LV _{BH}, supported by the transverse bulkheads is to be based on the pressure loads acting on the plating of the supported deck over, P _{CD}, the local inertial forces, [F _{CD}], and the bulkhead loads above, L _A. The design vertical load is to be taken as

$$LV_{BH} = -(B_{bh}S_{bh}P_{CD} + [F_{CD}] + L_A) kN$$

where

 $B_{\rm bh}$ = breadth of the deck supported by the bulkhead, in metres

L_A = load, in kN, the bulkhead above, assumed zero if there are is over, see Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) 4.2.5

 F_{CD} = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. F_{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

P CD is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2

5.2.5 Normally, the design shear force, QV_{BH} , may be ignored for bulkhead plating. However, if the structural arrangement or load paths are such that significant shear load is carried by the bulkhead, then it should be considered, e.g. when the bulkhead is not continued down to the bottom shell. In this case the design shear force, acting in the vertical direction, is to be taken as

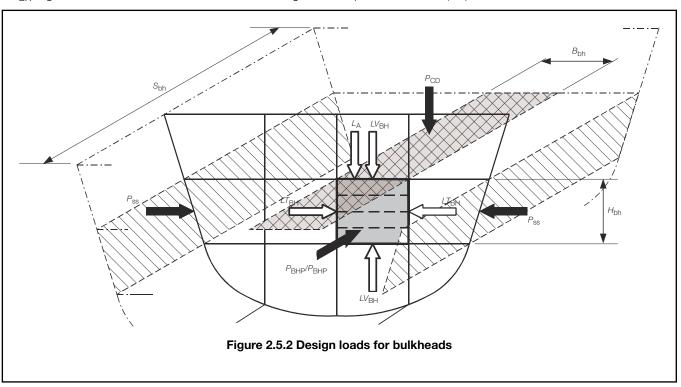

Volume 1, Part 7, Chapter 2

Section 5

 $QV_{BH} = LV_{BH}/2 \text{ kN}$

where

LV BH is given in Vol 1, Pt 7, Ch 2, 5.2 Transverse watertight and deep tank bulkheads (BH) 5.2.4

5.3 Deckhouses, bulwarks and superstructures (DH)

5.3.1 The design normal pressure, P_{DH} , for the plating and stiffeners of deckhouses, bulwarks and the first tier and above of superstructures is given by:

$$P_{DH} = P_{dh} kN/m^2$$

5.3.2 For the side plating and longitudinal bulkheads of deckhouses and superstructures, the design vertical load, LV_{DH} , at each intersecting deck level is to be taken as follows: $LV_{DH} = -\epsilon_{DH} (S_{dh} B_{dh} P_{CD} + L_A + [F_{CD}]) kN$

where

 P_{CD} = basic deck design pressure, as appropriate, plus any other local loadings directly above the pillar, in kN/m^2

 $[F_{CD}]$ = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. F_{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

L_A = appropriate portion of the load or loads, in kN, from pillar(s) or bulkhead(s) above, assumed zero if there is none over, see Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) 4.2.5

 ϵ_{DH} = effectiveness of the side plating or longitudinal bulkhead, i.e. the relative proportion of the load carried by this plating as opposed to other structure such as the transverse bulkheads

= 0,5

 $S_{dh} B_{dh}$ is the effective deck area supported by the deckhouse side plating or longitudinal bulkheads and can be taken as follows:

Volume 1, Part 7, Chapter 2

Section 5

 B_{dh} = mean spacing of longitudinal bulkheads, side shell or effectively supported longitudinal girders, in metres.

S _{dh} = span or length of the side plating or longitudinal bulkhead between major deckhouse transverse bulkheads, in metres.

5.3.3 For transverse bulkheads of deckhouses and superstructures, the design vertical load, *LV* _{DH}, at each intersecting deck level is to be taken as follows:

$$LV_{DH} = -\varepsilon_{DH} (S_{dh} B_{dh} P_{CD} + L_A + [F_{CD}]) kN$$

where

 ϵ_{DH} = efficiency of the transverse bulkheads i.e. the relative proportion of the load carried by the transverse bulkheads as opposed to other structure such as the side plating

= 0.5

 $S_{dh}B_{dh}$ is the effective deck area supported by the transverse bulkhead and can be taken as follows:

S_{dh} = mean spacing of transverse bulkheads, in metres.

 B_{dh} = breadth of the transverse bulkhead, in metres.

- 5.3.4 For decks of deckhouses, the design transverse load, LT DH, at each deck level may normally be ignored.
- 5.3.5 If the superstructure or deckhouse is longitudinally effective then the design global vertical bending moment and shear force are to be taken as M_D and Q_D respectively, see Vol 1, Pt 7, Ch 2, 3.3 Design global loads Intact conditions or Vol 1, Pt 7, Ch 2, 3.4 Design global loads Damaged conditions or Residual Strength Assessment (RSA) conditions for the design of the side plating and longitudinal bulkheads of deckhouse structures.

5.4 Transverse floors (FL)

- 5.4.1 The design normal pressure, P_{FL} , for the web plating of floors of double bottom or single bottom structures is to be taken as the greater of the following:
- (a) P_{tk} kN/m² (Deep tank floor).
- (b) P_{da} kN/m² (WT subdivision, only if applicable and for loading conditions which represent damaged situations).
- (c) 5 kN/m² (minimum value).

where

P da and P tk are defined inVol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.4

- 5.4.2 The design impulse pressure, *I P* _{FL}, for the web plating of floors may be ignored, unless these members are subjected to sloshing loads or similar
- 5.4.3 The design vertical load, LV_{FL} , for the floors is to be based on the pressure loads acting on the plating of the inner bottom P_{CD} (downwards) and the bottom shell P_{BS} (upwards), the local inertial forces $[F_{CD}]$ and pillar bulkhead loads above L_{A} . The design vertical load, LV_{FL} , is to be taken as:

$$LV_{FL} = -\varepsilon_{FLV} (B_{fl} S_{fl} (P_{CD} - P_{BS}) + [F_{CD}] + L_A) kN$$

where

 ϵ_{FLV} = effectiveness of the floors in the vertical direction, i.e. the relative proportion of the load carried by the transverse floors as opposed to bottom girders, etc.

= 1,0 for the floor halfway between transverse bulkheads

 $S_{\rm fl}$ = mean spacing of transverse floors, in metres, see Figure 2.5.3 Loads to be applied to transverse floors

L_A = load, in kN, from pillar(s) or bulkhead(s) above, assumed zero if there is none over, see Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) 4.2.5

Volume 1, Part 7, Chapter 2

Section 5

 F_{CD} = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. F_{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

 $B_{
m fl}={
m breadth}$ of the transverse floor between longitudinal bulkheads or side shell(s), in metres. NOTE $B_{
m fl}$ may be full breadth

P BS is defined in Vol 1, Pt 7, Ch 2, 4.1 Bottom shell structures (BS) 4.1.2

P _{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2

Note

- For single bottom floors P CD is likely to be zero.
- It may be necessary to take account of the impact loading on the bottom plating in the derivation of LV_{FL} and QV_{FL}.
- 5.4.4 The design transverse load, LT_{FL} , for the floor plating due to hydrostatic and hydrodynamic compressive loading is to be taken as follows:

$$LT_{FL} = -\epsilon_{FLT} P_{SS} H_{d} S_{fl} kN$$

where

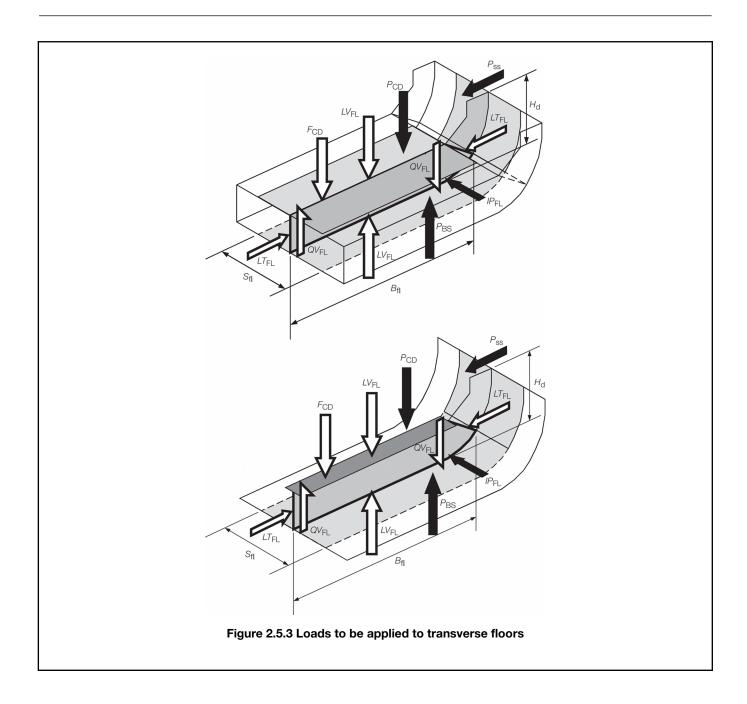

- ϵ_{FLT} = effectiveness of the floors in the transverse direction, i.e. the relative proportion of the load carried by the floor plating as opposed to other bottom structure
 - = $0.3f_{b}$ for double bottom structures
 - = $0.5f_{b}$ for single bottom structures
- $f_{\rm b}$ = 2,0 for bottom structures where transverse elastic buckling of outer bottom plating is likely
 - = 3,0 for bottom structures where transverse elastic buckling of inner and outer bottom plating is likely
 - = 1,0 otherwise

 $P_{\rm SS}$ and $H_{\rm d}$ are to be taken as the values defined for the bottom structure in Vol 1, Pt 7, Ch 2, 4.1 Bottom shell structures (BS) 4.1.5

5.4.5 The design shear force, QV_{FL} , for the floor web plating due to local loading acts in the vertical direction and is to be taken as:

$$\mathrm{QV_{FL}} \ = \ \epsilon_{\mathrm{FLV}} \, (\ B_{\mathrm{fl}} \, S_{\mathrm{fl}} \, (P_{\mathrm{CD}} - P_{\mathrm{BS}}) + [F_{\mathrm{CD}}] + L_{\mathrm{A}}) / ^{2} \, \mathrm{kN}$$

5.4.6 The design bending load for bottom floor primary member is to be taken as LV_{FL} .

5.4.7 The membrane loads acting on the bottom shell plating are defined in Vol 1, Pt 7, Ch 2, 4.1 Bottom shell structures (BS). The membrane loads acting on the inner bottom plating are defined in Vol 1, Pt 7, Ch 2, 4.4 Inner bottom structures (IB) These membrane loads are required to assess the transverse floors in addition to the local bending loads.

5.5 Side frames and web frames (SF)

- 5.5.1 This sub-Section covers side frames, web frames and frames supporting longitudinal bulkheads.
- 5.5.2 The design normal pressure, P_{SF} , for the web plating of side frames may be ignored.
- 5.5.3 The design impulse pressure, IP_{SF} , for the web plating of side frames may be ignored, unless these members are subjected to sloshing loads or similar.
- 5.5.4 The design vertical load, LV _{SF}, for the side frames, including the attached plating, is to be based on the pressure loads acting on the plating of the supported deck over, P _{CD}, the local inertial forces, [F _{CD}], and side frame loads above, L _A. The design vertical load is to be taken as:

$$LV_{SF} = -(B_{fr}S_{fr}P_{CD} + [F_{CD}] + L_A)kN$$

Section 5

where

 S_{fr} = mean spacing of side frames, in metres, see Figure 2.5.4 Loads to be applied to side frames

 $B_{\rm fr}$ = breadth of the deck supported by the side frame, in metres

L_A = load, in kN, the side frame above, assumed zero if there is none over, see Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) 4.2.5

 $F_{\rm CD}$ = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. $F_{\rm CD}$ is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

P CD is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2

- 5.5.5 The design transverse load, LT SF, may be ignored for the side frames.
- 5.5.6 The design shear force, QT _{SF}, for the side frame web plating due to local loading acts in the transverse direction and is to be taken as:

$$QT_{SF} = H_{fr} S_{fr} P_{SS}/2 \text{ kN}$$

where

H_{fr} = length of the side frame between adjacent decks, see Figure 2.5.4 Loads to be applied to side frames

P SS is to be taken at the mid height of the side frame, P SS is defined in Vol 1, Pt 7, Ch 2, 3.6 External shell pressures 3.6.1

NOTE

Volume 1, Part 7, Chapter 2

Section 5

It may be necessary to take account of the impact loading on the side frame plating in the derivation of QT SF.

5.5.7 The design bending load for side frame or web frame primary member is to be taken as:

H fr S fr P SS for frames attached to side shell

H_{fr} S_{fr} P_{IB} for frames attached to longitudinal bulkheads.

5.5.8 The membrane loads acting on the side shell or longitudinal bulkhead plating are defined in Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) or Vol 1, Pt 7, Ch 2, 4.5 Longitudinal bulkhead structures (LB). These membrane loads are required to assess the frames in addition to the local bending loads.

5.6 Deck beams (BM)

- 5.6.1 This sub-Section covers deck beams and deep transverse beams supporting deck structure.
- 5.6.2 The design normal pressure, P BM, for the web plating of deck beams may be ignored.
- 5.6.3 The design impulse pressure, IP_{BM} , for the web plating of deck beams may be ignored, unless these members are subjected to sloshing loads or similar.
- 5.6.4 The design vertical load, LV_{BM} , for the deck beam may be ignored.
- 5.6.5 The design transverse load, LT_{BM} , for the deck beam due to hydrostatic and hydrodynamic compressive loading is to be taken as follows:

$$LT_{BM} = -P_{SS}H_{d}S_{bm}kN$$

where

 $P_{\rm SS}$ and $H_{\rm d}$ are to be taken as the values defined for the deck plating in Vol 1, Pt 7, Ch 2, 4.3 Strength deck and internal deck structures (DK) 4.3.6

5.6.6 The design shear force, QV_{BM} , for the deck beam web plating is to be based on the pressure loads acting on the plating of the deck P_{CD} (downwards), the local inertial forces $[F_{CD}]$ and pillar bulkhead loads above L_{A} . The shear force acts in the vertical direction and is to be taken as:

$$QV_{BM} = (B_{bm} S_{bm} P_{CD} + [F_{CD}] + L_A)/2 kN$$

where

S _{bm} = mean spacing of deck beams, in metres, see Figure 2.5.5 Loads to be applied to deck beams

B bm = span of the deck beams between longitudinal bulkheads, pillars or side shell, in metres

L_A = load, in kN, from pillar(s) or bulkhead(s) above, assumed zero if there is none over, see Vol 1, Pt 7, Ch 2, 4.2 Side shell structures (SS) 4.2.5

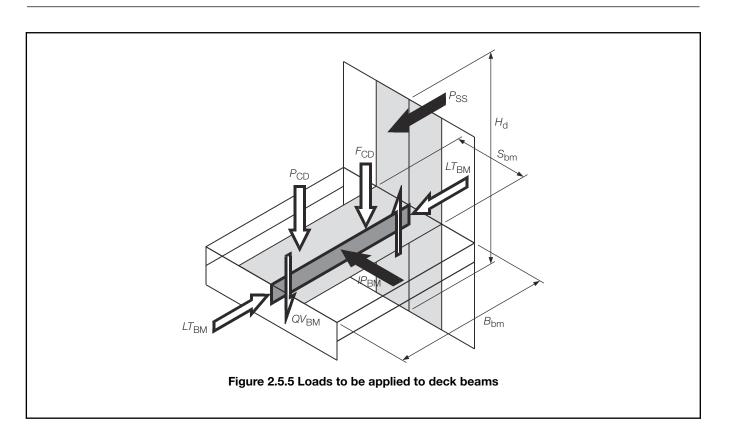

F_{CD} = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. F_{CD} is defined in *Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5*

P CD is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2

5.6.7 The design bending load for deck beam primary member is to be taken as:

(a)
$$(B_{bm} S_{bm} P_{CD} + [F_{CD}] + L_A) kN$$

5.6.8 The membrane loads acting on the deck plating are defined in *Vol 1, Pt 7, Ch 2, 4.3 Strength deck and internal deck structures (DK)* These membrane loads are required to assess the frames in addition to the local bending loads.

5.7 Pillars (PI)

5.7.1 The design load, $LV_{\mathbf{p_I}}$, supported by the pillar is to be taken as:

$$LV_{PI} = -(S_{pi}B_{pi}P_{CD} + L_A + [F_{CD}]) kN$$

where

P_{CD} = inertial deck design pressure, as appropriate, plus any other local loadings directly above the pillar, in kN/m². Where the pillar supports a deck area over which the design pressure varies, then the summation of the these loads is to be used, see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2

[F_{CD}] = appropriate portion of the inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. F_{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

 $B_{\rm pi}\,S_{\rm pi}$ is the effective deck area supported by the pillar bulkhead

B_{pi} = mean spacing of transverses supported by pillars or transverse bulkheads, in metres, see Figure 2.5.6 Loads supported by a pillar

S_{pi} = mean spacing of girders supported by the pillars, longitudinal bulkheads or side shell, in metres

 $L_{\rm A}=$ load, in kN, from pillar(s) or bulkhead(s) above, assumed zero if there is none over may be taken as $LV_{\rm PI}$ for the supported pillar or $LV_{\rm PB}$ for the supported bulkhead, see Vol 1, Pt 7, Ch 2, 5.8 Pillar bulkheads (PB)

 $LV_{\mathbf{p_I}}$ is not to be taken less than 5 kN.

- 5.7.2 When any of the conditions below are satisfied then the pillar load should be derived using direct calculation methods:
- where the structural arrangement is complex;

Volume 1, Part 7, Chapter 2

Section 5

- where it is considered that the load in the pillar will not be accurately represented by the above formulae, e.g. pillars supporting decks in way of the ends of a long superstructure block;
- where the pillar is not supported underneath by the double bottom or substantial structural members.

5.8 Pillar bulkheads (PB)

5.8.1 The vertical in-plane compressive load supported by a pillar bulkhead is to be taken as:

$$LV_{PB} = -(S_{pb}B_{pb}P_{CD} + L_A + [F_{CD}]) kN$$

where

 $P_{\rm CD}$ = inertial deck design pressure, as appropriate, plus any other local loadings directly above the pillar, in kN/m², see Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.2

 $[F_{CD}]$ = inertial load or loads, in kN, from items of equipment, etc. on the supported deck, assumed zero if there is none over. F_{CD} is defined in Vol 1, Pt 7, Ch 2, 5.1 Deck structures (DK) 5.1.5

 $L_{\rm A}=$ appropriate portion of the load or loads, in kN, from pillar(s) or bulkhead(s) above, assumed zero if there is none over, may be taken as $LV_{\rm PI}$ for the supported pillar or $LV_{\rm PB}$ for the supported bulkhead

 $S_{
m pb}$, $B_{
m pb}$ is the effective deck area supported by the pillar bulkhead and can be taken as follows:

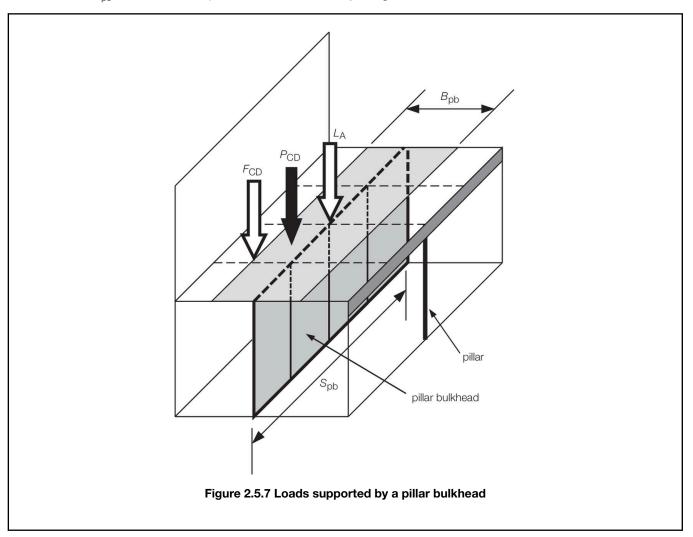

(a) For longitudinal pillar bulkheads, see Figure 2.5.7 Loads supported by a pillar bulkhead:

B_{pb} = mean spacing of longitudinal bulkheads, side shell or effectively supported longitudinal girders, in metres

Volume 1, Part 7, Chapter 2

Section 5

- S _{pb} = length of the pillar bulkhead between major transverse bulkheads or effectively supported transverse web frames or similar, in metres
- (b) For transverse pillar bulkheads:
 - $S_{\rm pb}$ = mean spacing of transverse bulkheads or effectively supported transverse web frames or similar, in metres
 - $B_{\rm pb}$ = breadth of the pillar bulkhead between major longitudinal bulkheads or the side shell, in metres.

- 5.8.2 When any of the conditions below are satisfied then the pillar bulkhead load should be derived using direct calculation methods:
- where the structural arrangement is complex;
- where it is considered that the load in the pillar bulkhead will not be accurately represented by the above formulae, e.g. pillar bulkheads supporting decks in way of the ends of a long superstructure block;
- where the pillar bulkhead is not supported underneath by the double bottom or substantial structural members.

Introduction

1.1 General

1.1.1 The Total Load Assessment, **TLA**, procedure is an optional procedure that is applied on a voluntary basis when an Owner or designer who seeks to increase confidence levels in the structural integrity of a ship. The **TLA** procedure is illustrated in *Figure 3.1.1 Overview of the Total Load Assessment, TLA Procedure*

Volume 1, Part 7, Chapter 3

Section 1

Volume 1, Part 7, Chapter 3

Section 2

- 1.1.2 The **TLA** procedure is based on the following concepts:
- (a) Derive the total design loads acting on each structural member.
- (b) Derive the structural resistance of each structural member.
- (c) Derive the load utilisation factors.
- (d) Ensure the load utilisation factors are less than the required design factors.
- 1.1.3 This Chapter gives the simplified stress analysis methods to be used for the **TLA** procedure. Direct calculations or alternative proven methods of analysis which are more rigorous will be accepted.
- 1.1.4 The design loads for the **TLA** procedure are given in Vol 1, Pt 7, Ch 2 Total Design Loads, Total Design Loads.
- 1.1.5 The structural design factors are given in Vol 1, Pt 7, Ch 3, 4 Structural design factors and utilise the design criteria in Vol 1, Pt 6, Ch 5 Structural Design Factors
- 1.1.6 The simplified stress analysis techniques predict the total stresses acting in the structure as a consequence of the total loads. These techniques cover the assessment of stresses in the following:
- Primary structure.
- Primary/secondary plating systems.
- Grillage plating systems.
- 1.1.7 The resulting stresses are then checked against a set of design factors, which include stress, deflection and buckling requirements.
- 1.1.8 The **TLA** procedure is in addition to the normal Rule structural design approval requirements specified within *Vol 1, Pt 6, Ch 3 Scantling Determination*.

1.2 Structural design

- 1.2.1 The **TLA** procedure only forms part of the structural design process, **TLA** covers the structural design of the ship in the sea environment only. There are many other structural requirements as a consequence of other loads and good structural design practices that need to be incorporated. These include:
- bow flare impact and bottom slamming loads;
- ice requirements;
- design requirements to cover other strength issues, for example helicopter or vehicle decks;
- military requirements such as fragmentation protection;
- local impact loadings due to tugs, docks;
- supporting structure for machinery, cranes and lifting devices; and
- corrosion margins.
- 1.2.2 The structural design should clearly exhibit good structural continuity and smooth transition of scantlings between adjacent plating areas. In general, the **TLA** derived maximum scantlings for each structural member at any section within $0.3L_R$ to $0.7L_B$ are to be maintained over the central region.

■ Section 2

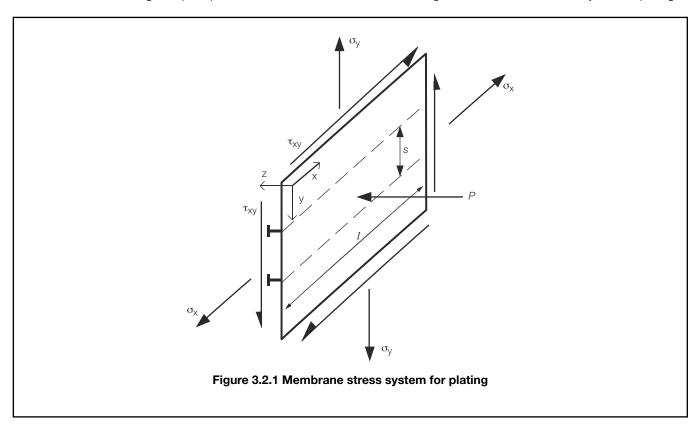

Structural resistance

2.1 Assessment of stresses in structural components

- 2.1.1 The equations and methods given below are to be used to derive the stresses acting within plating and within stiffeners and beams.
- 2.1.2 These equations are valid for plating and beams subjected to lateral, or normal, pressure or point loads, i.e. local design considerations.
- 2.1.3 The stresses in plating and beams subjected to hull girder loads are to be derived in accordance with the methods given in Vol 1, Pt 6, Ch 4 Hull Girder Strength

2.2 Stresses in plating

2.2.1 The loads acting on a plate panel and its dimensions are illustrated in Figure 3.2.1 Membrane stress system for plating

2.2.2 The bending stress in a plate panel between stiffeners due to a uniform lateral pressure is to be calculated as follows:

$$\sigma_{\rm b} = p \left(\frac{22, 4sy\beta}{1000t_{\rm p}} \right) \text{ N/mm}^2$$

where

p = lateral pressure, in kN/m²

 $t_{\rm p}$ = thickness of plating, in mm

s = spacing of secondary stiffeners, in mm

l = length of the plate panel, in metres

γ = convex curvature correction, see Vol 1, Pt 6, Ch 2, 2.4 Convex curvature correction

β = aspect ratio correction, see Vol 1, Pt 6, Ch 2, 2.5 Aspect ratio correction

Note: The plate bending stresses are to be based on the actual stiffener spacing.

2.2.3 The direct stress in a plate panel subjected to membrane or in-plane loading is to be calculated as follows:

$$\sigma_{\rm X} = \frac{10L}{A} \, \text{N/mm}^2$$

where

L = in-plane load on the panel of plating, in kN

A = area normal to the load, L, in cm², ignoring secondary stiffeners which are not continuous but may include deep beams.

2.2.4 The shear stress in a plate panel is to be calculated as follows:

$$\tau_{xy} = \frac{10Q}{A} \text{ N/mm}^2$$

where

Q = shear force acting on the panel of plating

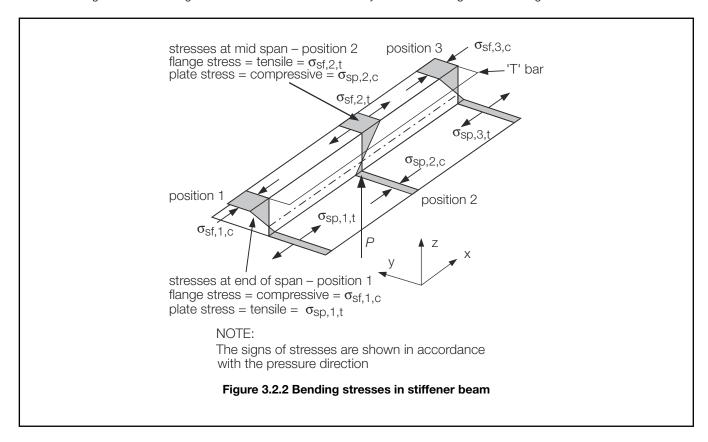

A = cross-sectional area of the panel in the direction of the shear force, in cm²

$$= t_p b_v \text{ or } t_p b_t$$

 $b_{\rm t}$ and $b_{\rm v}$ are the total breadth of the plate panel over which the shear force acts.

2.3 Stresses in secondary and primary member stiffeners

- 2.3.1 The bending stresses, deflection and shear stress in stiffeners or beams due to lateral pressure loading or point loads are to be derived as given below.
- 2.3.2 The stresses in the stiffener flange, σ_{sf} , and the attached plating to the stiffener, σ_{sp} , due to the applied load are illustrated in *Figure 3.2.2 Bending stresses in stiffener beam* and may be derived using the formulae given below.

2.3.3 **Bending stresses**

Bending stress due to a lateral pressure load

$$\sigma_{\rm sf, j} = + \frac{F_{\rm Zj} p \, s_{\rm p} \, l_{\rm e}^2}{Z_{\rm f}} \, \text{N/mm}^2$$

Volume 1, Part 7, Chapter 3

Section 2

$$\sigma_{\mathrm{sp, j}} = -\frac{F_{\mathrm{Zj}} p \, s_{\mathrm{p}} \, l_{\mathrm{e}^2}}{Z_{\mathrm{p}}} \, \mathrm{N/mm}^2$$

Bending stress due to a point load or force

$$\sigma_{\rm sf, j} = + \frac{10^3 F_{\rm Zj} F_{\rm e}}{Z_{\rm f}} \, \text{N/mm}^2$$

$$\sigma_{\rm sp, j} = -\frac{10^3 F_{\rm Zj} F_{\rm le}}{Z_{\rm p}} \text{N/mm}^2$$

Bending stress due to an applied end deflection

$$\sigma_{sf, j} = + \frac{F_{Zj} \delta EI}{10^5 l_{e^2} Z_P} N/mm^2$$

$$\sigma_{\rm sp, j} = -\frac{F_{\rm Zj} \delta E I}{10^5 l_{\rm e}^2 Z_{\rm f}} \text{ N/mm}^2$$

2.3.4 Beam deflection

Deflection in beam due to a lateral pressure load

$$\delta_{s,j} = \frac{10^5 F_{lj} p s_p l_e^4}{EI} mm$$

Deflection in beam due to point load

$$\delta_{s,j} = \frac{10^8 F_{lj} F l_{e^3}}{EI} \text{mm}$$

2.3.5 Shear stresses

Shear stress in beam due to a lateral pressure load

$$\tau_{s, j} = \frac{F_{Aj} p s_p l_e}{100 A_w} \text{ N/mm}^2$$

Shear stress in beam due to a point load

$$\tau_{s,j} = \frac{10 F_{Aj} F}{A_w} \text{ N/mm}^2$$

Shear stress in beam due to an applied end deflection

$$\tau_{s, j} = \frac{F_{Aj}EI \delta}{10l_{a3}A_{w}} \text{ N/mm}^2$$

where

j = position along stiffener beam, where j = 1, 2 or 3, see Table 2.2.1 Section modulus, inertia and web area coefficients for different load models and Figure 3.2.2 Bending stresses in stiffener beam

 Φ_{Z_j} , Φ_{I_j} and = are the section modulus inertia and shear web area coefficients dependent on the loading model assumption, see *Table 2.2.1 Section modulus, inertia and web area coefficients for different load models*, and the position along the stiffener beam

p = lateral pressure, in kN/m²

F = applied force, in kN

 δ = applied deflection, in mm

Volume 1, Part 7, Chapter 3

Section 3

 $l_{\rm e}=$ effective span length of the stiffener or primary member, in metres, see Vol 1, Pt 6, Ch 2, 2.6 Determination of span length

 s_p is the stiffener spacing, in mm

 s_p is to be taken as s for secondary stiffeners and 1000S for primary members, see Vol 1, Pt 6, Ch 2, 1.3 Symbols and definitions 1.3.1

 Z_f and Z_p are the section moduli, in cm³, of the stiffener including attached plating at the flange and attached plating respectively

 $I = \text{section modulus, in cm}^4$

 $A_{\rm w} = {\rm web \ area \ of \ stiffener, \ in \ cm^2}$

 $E = \text{modulus of elasticity, in N/mm}^2$.

2.3.6 The suffixes ',t' and ',c' refer to the tensile or compressive values of bending stress in the stiffener which arise due to the stiffener end condition restraints, see *Figure 3.2.2 Bending stresses in stiffener beam*

■ Section 3

Stress analysis model

3.1 General

- 3.1.1 The stress analysis model given in this Section is to be applied to the total design loads determined in accordance with *Vol 1, Pt 7, Ch 2 Total Design Loads*.
- 3.1.2 The stresses, deflections and other values are to be determined for all load cases and all the design load combinations specified in *Vol 1, Pt 7, Ch 2, 3 Design load combinations*

3.2 Stress determination in primary members

- 3.2.1 Primary members are major structural members and provide support to decks, major equipment, etc. and also control the cross-sectional and longitudinal shape between decks, side shell and bulkheads. The major primary members are listed in the paragraphs below.
- 3.2.2 The following structural items are classed as longitudinal primary members:
- Double bottom girders with attached bottom shell and inner bottom plating.
- Single bottom girders with attached bottom shell plating.
- Deck girders.
- Longitudinal stringers with attached side shell or longitudinal bulkhead plating.
- Horizontal diaphragms with attached side shell and inner skin plating.
- 3.2.3 The following structural items are classed as vertical primary members:
- Deep web frames supporting the side shell or bulkheads including attached plating.
- Double skin web frames including the attached side shell and inner skin plating.
- Deep vertical bulkhead stiffeners.
- 3.2.4 The following structural items are classed as transverse primary members:
- Double bottom floors with bottom shell and inner bottom plating.
- Single bottom floors with bottom shell plating.
- Deep deck or transverse beams with attached deck plating.
- Double skin deck beam with attached upper and lower deck plating.
- Transverse bulkhead stringers with attached bulkhead plating.

Volume 1, Part 7, Chapter 3

Section 3

- 3.2.5 Primary members support the secondary members and can be considered to act independently of the secondary members. They need to be considered as a large beam supporting local loads with the global and local membrane stresses in the attached plating.
- 3.2.6 A typical primary member will consist of:
- Primary attached plating, e.g. bottom shell providing local bending capability.
- Web plate, providing shear capability.
- Upper flange or plating for double skin construction providing local bending capability.

The stresses in the attached plating and flange are to be derived in accordance with the requirements of this Section. The stresses in the web plating are to be determined in accordance with *Vol 1, Pt 7, Ch 3, 3.3 Stress determination in primary/secondary systems*, or *Vol 1, Pt 7, Ch 3, 3.4 Stress determination in grillage systems* if it is of grillage construction.

3.2.7 The stresses in primary members are to be derived using the recommended equations and stiffener end conditions given in *Table 3.3.1 Stress determination in primary members* The stress components used in deriving the primary member stresses are given below.

Table 3.3.1 Stress determination in primary members

Stress direction	Stress equation	Stiffener end condition	Notes			
Longitudinal primary members						
$\sigma_{\!\scriptscriptstyle X}$	$\sigma_{x} = \sigma_{hg} + \sigma_{xb} N/mm^{2}$	Built in	Applicable to the flange and the attached plating			
σ_{y}	$\begin{split} &\sigma_y = \sigma_{yg} \text{ N/mm}^2 \text{ (attached to deck plating)} \\ &\sigma_y = \sigma_{xv} \text{ N/mm}^2 \text{ (attached to side shell or long bhd plating)} \end{split}$	N.A.	Only applicable to the attached plating			
$ au_{Xy}$	$ au_{xy}$ is to be taken as the shear stress for the attached plating, see Vol 1, Pt 7, Ch 3, 3.3 Stress determination in primary/secondary systems or Vol 1, Pt 7, Ch 3, 3.4 Stress determination in grillage systems	_	Only applicable to the attached plating			
Transverse prima	ary members					
$\sigma_{\!\scriptscriptstyle X}$	$\sigma_{\rm x} = \sigma_{\rm yg} + \sigma_{\rm xb} {\rm N/mm^2}$	Built in	Applicable to the flange and the attached plating			
σ_{y}	$\begin{split} &\sigma_y = \sigma_{hg} \text{ N/mm}^2 \text{ (attached to deck plating)} \\ &\sigma_y = \sigma_{xv} \text{ N/mm}^2 \text{ (attached to transverse bulkhead plating} \end{split}$	N.A.	Only applicable to the attached plating			
$ au_{\mathrm{xy}}$	$ au_{xy}$ is to be taken as the shear stress for the attached plating, see Vol 1, Pt 7, Ch 3, 3.3 Stress determination in primary/secondary systems or Vol 1, Pt 7, Ch 3, 3.4 Stress determination in grillage systems	_	Only applicable to the attached plating			
Vertical primary members						
σ_{X}	$\sigma_{x} = \sigma_{xv} + \sigma_{xb} \text{ N/mm}^{2}$	Built in	Applicable to the flange and the attached plating			
$\sigma_{\!\scriptscriptstyle y}$	$\begin{split} &\sigma_y = \sigma_{hg} \text{ N/mm}^2 \text{ (attached to side shell or long bhd plating)} \\ &\sigma_y = \sigma_{yg} \text{ N/mm}^2 \text{ (attached to transverse bulkhead plating)} \end{split}$	N.A.	Only applicable to the attached plating

- 3.2.8 When it is considered that a different combination of stresses is likely to produce higher stresses, then this combination should be considered.
- 3.2.9 In general, a primary member will be subject to the following loads:
- In-plane or axial loading as a consequence hull girder loads, transverse loading due to side shell pressure loads or vertical support loads.
- Bending loads due to the member supporting out of plane external and internal pressures and equipment or cargo loadings.
- 3.2.10 The in-plane or axial loading in the primary member attached plating and flanges is to be taken as the membrane stress derived in accordance with the following:
- (a) For longitudinally effective primary members:

 σ_{hg} is the longitudinal stress due to hull girder bending

$$\sigma_{\rm hg} = \frac{Z_{\rm na} M_{\rm D}}{1000 I_{\rm hg}} \, \text{N/mm}^2$$

(b) For primary members in the transverse direction:

 σ_{yg} is the membrane stress due to a global load of $\ensuremath{\textit{LT}}$

$$\sigma_{\rm yg} = \frac{10 \, LT}{A} \, \rm N/mm^2$$

(c) For primary members in the vertical direction:

 σ_{xy} is the membrane stress due to a vertical load of LV

Volume 1, Part 7, Chapter 3

Section 3

LLOYD'S REGISTER

$$\sigma_{\rm xv} = \frac{10 \, LV}{A} \, \text{N/mm}^2$$

where

M_D = design hull girder bending moment given in Vol 1, Pt 7, Ch 2, 3 Design load combinations

 $z_{\rm na}$ = vertical distance above the neutral axis of the structural member under consideration, in metres

I hg = the section inertia at the longitudinal position under consideration, see Vol 1, Pt 6, Ch 4, 2.3 Shear strength, in m⁴

A =is the total area, in cm², of the primary member including the full breadth of attached plating

LT and LV are defined in Vol 1, Pt 7, Ch 2, 2.1 Nomenclature 2.1.1.

- 3.2.11 The out of plane bending loads to be applied to the primary member are specified in *Vol 1, Pt 7, Ch 2 Total Design Loads*. For example, the out of plane bending load for a double bottom girder is specified in *Vol 1, Pt 7, Ch 2, 4.6 Bottom longitudinal girders (BG) 4.6.7.* In this case the pressure components are to be uniformly distributed over the double bottom girder beam with the point loads applied as individual forces.
- 3.2.12 The stresses in the flange and attached plating due to bending of the primary member are to be derived as follows:
 - σ_{xb} = is the stress in the plating due to bending of the primary member beam/plate combination under lateral pressure loading or lateral inertial loads
 - σ_{xb} = is to be taken as the negative value of σ_{sp} , i.e. $\sigma_{sp,c}$, when the primary member axial stress is negative, similarly the positive value of σ_{sp} , i.e. $\sigma_{sp,t}$, is to be taken when is the axial stress positive
 - When appropriate the σ_{xb} value is to be the summation of stresses as result of inertial pressures and inertial point loads
 - $\sigma_{\text{sp,c}}$ and $\sigma_{\text{sp,t}}$ = are the maximum compressive and tensile stresses in the attached plating of the primary member and are to be derived using the bending stress equations in *Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.3*, see also *Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.6*
- 3.2.13 The section modulus of the primary member with regard to local bending properties is to be derived in accordance with *Vol 1, Pt 6, Ch 2, 2.3 Section properties* with effective breadths of attached plating as given by *Vol 1, Pt 6, Ch 2, 2.2 Effective width of attached plating, be.*
- 3.2.14 The total equivalent stress or von Mises stress, σ_{vm} , is to be derived using the following formula:

$$\sigma_{\text{vm}} = \sqrt{\sigma_{\text{x}}^2 + \sigma_{\text{y}}^2 - \sigma_{\text{y}}\sigma_{\text{x}} + 3\tau_{\text{xy}}^2} \text{ N/mm}^2$$

3.3 Stress determination in primary/secondary systems

- 3.3.1 The primary members support the secondary members. The secondary stiffeners transfer the lateral loads into the primary members.
- 3.3.2 An example of a primary/secondary plating and stiffener system is as follows: a longitudinal spacing of 600 mm and a transverse spacing of 2000 mm with the transverse stiffeners having a section inertia value of five times the secondary longitudinal stiffeners.
- 3.3.3 In a primary/secondary system it is normally sufficient to consider the secondary stiffeners as acting independently of the primary stiffeners. Hence the total stress analysis can ignore the effects of bending of the primary members.
- 3.3.4 The total stress analysis can be based on the plating between the primary transverse members and need only consider plating membrane stresses and bending stresses in secondary members.
- 3.3.5 The stresses in the plating of a primary/secondary plating system are to be derived using the recommended equations and stiffener end conditions given in *Table 3.3.2 Stress determination in longitudinal plating of primary/secondary systems, e.g., decks and longitudinal bulkheads* and *Table 3.3.3 Stress determination in transverse plating of primary/secondary systems, e.g.,*

Section 3

Note The parameters for Equations F to J are given in Vol 1, Pt 7, Ch 3, 3.8 Derivation of the combined transverse stress acting on transversely orientated panels to Vol 1, Pt 7, Ch 3, 3.10 Derivation of the total shear stress on transversely orientated panels.

Volume 1, Part 7, Chapter 3

Section 3

- 3.3.6 When it is considered that a different combination of stresses is likely to produce higher stresses, then this combination should be considered.
- 3.3.7 Buckling of plating is to be assessed using the in-plane membrane stresses only. The membrane stresses are to be derived as follows:

σ_x using Equation B

 σ_{v} using Equation D

τ_{xv} using Equation E

where

Equations B, D and E are defined in *Table 3.3.2 Stress determination in longitudinal plating of primary/secondary systems*, e.g., decks and longitudinal bulkheads.

3.4 Stress determination in grillage systems

- 3.4.1 A grillage system of plating and stiffeners is one where the bending stiffness of the orthogonal stiffeners are similar in magnitude and the orthogonal stiffeners work together to support the applied loads. The grillage system is in turn supported by primary structural items such as deep girders, deep transverse beams or bulkheads.
- 3.4.2 An example of a grillage system is as follows: plating supported by a longitudinal spacing of 600 mm and a transverse spacing of 1500 mm with the transverse stiffeners having an section inertia value of 1,5 times the longitudinal stiffeners.
- 3.4.3 Normally it is necessary to use direct calculations to evaluate the stresses within a grillage plating system. However, it may be sufficient to consider the stiffeners perpendicular to an edge of the grillage panel as acting independently of the grillage system. See Table 3.3.4 Stress determination in longitudinal plating of grillage systems, e.g., decks and longitudinal bulkheads and Methods FF and GG in the attached figure, also Methods II and JJ in Table 3.3.5 Stress determination in transverse plating of grillage systems, e.g., transverse bulkheads..

Volume 1, Part 7, Chapter 3

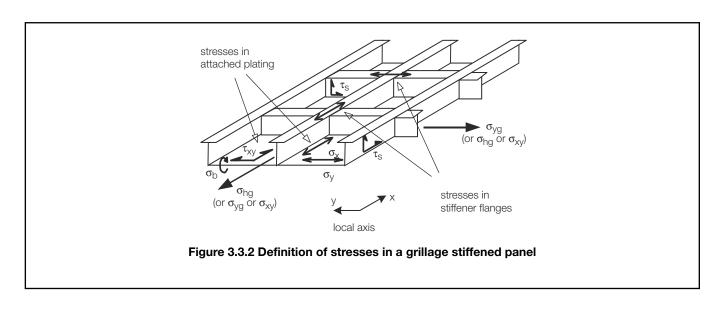

Section 3

- **Note** 1. The parameters for Equations F to J are given in *Vol 1, Pt 7, Ch 3, 3.8 Derivation of the combined transverse stress acting on transversely orientated panels* to *Vol 1, Pt 7, Ch 3, 3.10 Derivation of the total shear stress on transversely orientated panels*.
- **Note** 2. Alternatively the deflection of the vertical member over its full span, excluding the support from horizontal stiffeners, may be applied instead of the free to deflect condition.
- **Note** 3. Alternatively the deflection from the horizontal member over its full span, excluding the support from vertical stiffeners, may be applied instead of the free to deflect condition.

- 3.4.4 The bending stresses in the edge stiffeners may be evaluated on the basis of encastre at the edge of the grillage panel and no rotation and free to deflect at the intersection with the first orthogonal stiffener.
- 3.4.5 In this case, the total stress analysis is to be based on the membrane stress in the plating of the grillage panel and consider the bending stresses in the middle stiffener perpendicular to the edge of the panel.
- 3.4.6 It will be necessary to derive the total stress at the edge of the panel for each stiffener direction.
- 3.4.7 The total stress in the centre of the grillage panel should also be checked. In this case it is necessary to consider the stresses in the plate due to bending of the stiffener in each direction as well as the plating stresses due to membrane loads.
- 3.4.8 The stresses in the plating of a grillage plating system are to be derived using the recommended equations and stiffener end conditions given in *Table 3.3.4 Stress determination in longitudinal plating of grillage systems, e.g., decks and longitudinal bulkheads* and *Vol 1, Pt 7, Ch 3, 3.3 Stress determination in primary/secondary systems 3.3.5* The stresses in the flanges of the panel stiffener are given by *Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.6*, using the conditions given in *Table 3.3.4 Stress determination in longitudinal plating of grillage systems, e.g., decks and longitudinal bulkheads* and *Table 3.3.5 Stress determination in transverse plating of grillage systems, e.g., transverse bulkheads.*. The stresses are illustrated in *Figure 3.3.2 Definition of stresses in a grillage stiffened panel*

Section 3

- 3.4.9 When it is considered that a different combination of stresses is likely to produce higher stresses, then this combination should be considered.
- 3.4.10 Buckling of plating is to be assessed using the in-plane membrane stresses only. The membrane stresses are to be derived as follows:

 σ_x using Equation B

 σ_v using Equation D

 τ_{xy} using Equation E

where

Equations B, D and E are defined in Table 3.3.4 Stress determination in longitudinal plating of grillage systems, e.g., decks and longitudinal bulkheads

3.5 Derivation of the combined longitudinal stress on panels subjected to hull girder bending

- 3.5.1 The longitudinal stresses in the plating and stiffener flanges for structural members subjected to hull girder bending loads as well as lateral loads are to be derived using the equations specified in this Section, see *Table 3.3.2 Stress determination* in longitudinal plating of primary/secondary systems, e.g., decks and longitudinal bulkheads and *Table 3.3.4 Stress determination* in longitudinal plating of grillage systems, e.g., decks and longitudinal bulkheads
- 3.5.2 **Equation A** is used for grillage systems or plating systems with the secondary stiffeners orientated in the longitudinal direction. For these systems, the stress in the plating/stiffener combination due to local bending needs to be considered in addition to the membrane stresses due to hull girder bending. The stress components in Equation A are given below.
- 3.5.3 **Equation B** is used for plating systems with the secondary stiffeners orientated in the transverse (or vertical) direction. For these systems only the longitudinal stress due to hull girder bending needs to be considered.
- 3.5.4 The longitudinal stress components associated with Equations A and B are given below:

 σ_{xq} = is the longitudinal membrane stress due to hull girder bending

$$= \frac{Z_{\text{na}} M_{\text{D}}}{1000 I_{\text{hg}}} \text{ N/mm}^2$$

 σ_{xb} = is the stress in the plating due to bending of the longitudinal stiffener/plate combination under lateral pressure loading or lateral inertial loads

Normally σ_{xb} is to be taken as the negative value of σ_{sp} , i.e. $\sigma_{sp,c}$, when the hull girder bending stress σ_{xg} is negative, similarly the positive value of σ_{sp} , i.e. $\sigma_{sp,t}$, is to be taken when σ_{xg} is positive, see Figure

616

Volume 1, Part 7, Chapter 3

Section 3

3.2.2 Bending stresses in stiffener beam However, there may be cases where it is necessary to consider the opposite situation

When appropriate, the σ_{xb} value is to be the summation of stresses as result of inertial pressures and inertial point loads

 $\sigma_{\text{sp,c}}$ and $\sigma_{\text{sp,t}}$ = are the maximum compressive and tensile stresses in the plating of the stiffener/plate combination and are to be derived using the bending stress equations in Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.3, see also Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.6

M_D = design hull girder bending moment, in kNm given in Vol 1, Pt 7, Ch 2, 3 Design load combinations

 z_{na} = vertical distance above the neutral axis of the structural member under consideration, in metres

 I_{hg} = the section inertia at the longitudinal position under consideration, see Vol 1, Pt 6, Ch 4, 2 Hull girder strength, in m⁴.

3.6 Derivation of the combined transverse stress acting on panels subjected to hull girder bending

- 3.6.1 The transverse stresses in the plating and stiffener flanges for structural members subjected to transverse loads as well as lateral loads are to be derived using the equations specified in this Section, see *Table 3.3.2 Stress determination in longitudinal plating of primary/secondary systems*, e.g., decks and longitudinal bulkheads and *Table 3.3.4 Stress determination in longitudinal plating of grillage systems*, e.g., decks and longitudinal bulkheads
- 3.6.2 **Equation C** is used for grillage systems or plating systems with the secondary stiffeners orientated in the transverse direction. For these systems, the stress in the plating/stiffener combination due to local bending needs to be considered in addition to membrane stresses due to global transverse loading. The stress components in Equation C are given below.
- 3.6.3 **Equation D** is used for plating systems with the secondary stiffeners orientated in the longitudinal direction. For these systems, only membrane stress due to global transverse loading needs to be considered.
- 3.6.4 The transverse stress components associated with equations C and D are given below:

 σ_{VQ} = is the membrane stress due to global transverse loading

$$= \frac{LT}{t_{\rm p}b_{\rm L}} \, \text{N/mm}^2$$

 σ_{yb} = is the stress in the plating due to bending of the longitudinal stiffener/plate combination under lateral pressure loading or lateral inertial loads

Normally, σ_{yb} is to be taken as the negative value of σ_{sp} , i.e. $\sigma_{sp,c}$, when the global transverse stress σ_{yg} is negative, similarly the positive value of σ_{sp} , i.e. $\sigma_{sp,t}$, is to be taken when σ_{yg} is positive, see Figure 3.3.2 Definition of stresses in a grillage stiffened panel. However, there may be cases where it is necessary to consider the opposite situation.

When appropriate, the σ_{yb} value is to be the summation of stresses as result of inertial pressures and inertial point loads

 $\sigma_{\text{sp,c}}$ and $\sigma_{\text{sp,t}}$ = are the maximum compressive and tensile stresses in the plating of the stiffener/plate combination and are to be derived using the bending stress equations in *Vol 1*, *Pt 7*, *Ch 3*, *2.3 Stresses in secondary and primary member stiffeners 2.3.3*, see also *Vol 1*, *Pt 7*, *Ch 3*, *2.3 Stresses in secondary and primary member stiffeners 2.3.6*

LT = is the appropriate transverse design load, in kN, given in Vol 1, Pt 7, Ch 2 Total Design Loads, i.e. LT DK, LT BS, etc.

 t_p = thickness of plating, in mm

Volume 1, Part 7, Chapter 3

Section 3

 b_{\perp} = breadth of plating, in metres, over which the load LT applies. Normally, this is the distance between decks or the height of the plating panel.

3.7 Derivation of the total shear stress

- 3.7.1 **Equation E** is used to derive the total shear stress in the plating for all plating systems.
- 3.7.2 The shear stress components associated with Equation E are given below:

|Q| = denotes the absolute value of parameter Q

$$\tau_{\text{hg}} = \frac{|Q_{\text{D}}|A_{\text{z}}}{I_{hg}\delta_{\text{i}}} \text{N/mm}^2$$

Q_D = is global hull girder shear force, in kN. This will be zero for all transverse plating systems

Q_D = is given in Vol 1, Pt 7, Ch 2 Total Design Loads, Vol 1, Pt 7, Ch 3 Total Load Assessment, TLA

 Q_T = local shear force due to local transverse loads, in kN, given in Vol 1, Pt 7, Ch 2 Total Design Loads, e.g. QT_{DK} , QT_{ST}

QV = local shear force due to local inertial forces, in kN, given in Vol 1, Pt 7, Ch 2 Total Design Loads, e.g. QV DG, QV BG

A z, I $_{\text{hg}}$ and δ_{i} are given in Vol 1, Pt 6, Ch 4, 2.3 Shear strength 2.3.6

b_V, b_T = total breadth over which the shear force acts, typically the height or breadth of the plating panel, in metres, see *Table 3.3.2 Stress determination in longitudinal plating of primary/secondary systems, e.g., decks and longitudinal bulkheads* or *Table 3.3.4 Stress determination in longitudinal plating of grillage systems, e.g., decks and longitudinal bulkheads*

NOTE

All shear force loads are to be assumed positive.

3.8 Derivation of the combined transverse stress acting on transversely orientated panels

- 3.8.1 The transverse stresses in the plating and stiffener flanges for structural members subjected to transverse loads as well as lateral loads are to be derived using the equations specified in this Section, see *Table 3.3.3 Stress determination in transverse plating of primary/secondary systems, e.g., transverse bulkheads* and *Table 3.3.5 Stress determination in transverse plating of grillage systems, e.g., transverse bulkheads*.
- 3.8.2 **Equation F** is used for grillage systems or plating systems with the secondary stiffeners orientated in the transverse direction.
- 3.8.3 **Equation G** is used for plating systems with the secondary stiffeners orientated in the vertical direction.
- 3.8.4 The transverse stress components associated with Equations F and G are given in Vol 1, Pt 7, Ch 3, 3.6 Derivation of the combined transverse stress acting on panels subjected to hull girder bending 3.6.4.

3.9 Derivation of the combined vertical stress acting on transversely orientated panels

- 3.9.1 The vertical stresses in the plating and stiffener flanges for structural members subjected to vertical loads as well as lateral loads are to be derived using the equations specified in this Section, see *Table 3.3.3 Stress determination in transverse plating of primary/secondary systems*, e.g., transverse bulkheads and Vol 1, Pt 7, Ch 3, 3.3 Stress determination in primary/secondary systems 3.3.5
- 3.9.2 **Equation H** is used for grillage systems or plating systems with the transverse secondary stiffeners orientated in the vertical direction.
- 3.9.3 **Equation I** is used for plating systems with the secondary stiffeners orientated in the transverse direction.
- 3.9.4 The vertical stress components associated with Equations H and I are given below:

Volume 1, Part 7, Chapter 3

Section 3

 σ_{xy} = is the membrane stress due to vertical loading

$$= \frac{LV}{t_{\rm p}b_{\rm T}} \, \text{N/mm}^2$$

 σ_{xb} = is the stress in the plating due to bending of the longitudinal stiffener/plate combination under lateral pressure loading or lateral inertial loads

Normally σ_{xb} is to be taken as the negative value of σ_{sp} , i.e. $\sigma_{sp,C}$, when the vertical stress σ_{xv} is negative, similarly the positive value of σ_{sp} , i.e. $\sigma_{sp,t}$, is to be taken when σ_{xv} is positive, see Vol 1, Pt 7, Ch 3, 3.2 Stress determination in primary members 3.2.2. However, there may be cases where it is necessary to consider the opposite situation

When appropriate, the σ_{xb} value is to be the summation of stresses as result of inertial pressures and inertial point loads

 $\sigma_{\text{sp,c}}$ and $\sigma_{\text{sp,t}}$ = are the maximum compressive and tensile stresses in the plating of the stiffener/plate combination and are to be derived using the bending stress equations in Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.3, see also Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.6

where

LV = is the design load, in kN, given in Vol 1, Pt 7, Ch 2 Total Design Loads, e.g. LV SS, LV BH

 t_p = thickness of plating, in mm

 b_{T} = breadth of plating, in metres, over which the load LV applies. Normally, this is the distance between the side shell(s) or longitudinal bulkheads but it is to be reduced for the presence of large openings.

3.10 Derivation of the total shear stress on transversely orientated panels

- 3.10.1 **Equation J** is used to derive the total shear stress in any plating system which is not subjected to global hull girder shear force.
- 3.10.2 The shear stress components associated with Equation J are given below:

 Q_T = local shear force due to local transverse loads, in kN, given in *Vol 1, Pt 7, Ch 2 Total Design Loads*, e.g. QT_{DK} , QT_{SF} , QT_{ST}

QV = local shear force due to local inertial forces, in kN, given in Vol 1, Pt 7, Ch 2 Total Design Loads, e.g. QV_{BM} , QV_{DG} , QV_{BG} , QV_{FL}

B_V, B_T = total breadth, in m, over which the shear force acts, see *Table 3.3.3 Stress determination in transverse* plating of primary/secondary systems, e.g., transverse bulkheads or Vol 1, Pt 7, Ch 3, 3.3 Stress determination in primary/secondary systems 3.3.5.

NOTE

All shear force loads are to be assumed positive.

3.11 Derivation of total stresses in stiffener flanges

3.11.1 The total compressive and tensile stresses in stiffener flanges, σ_{sx} , are given by the following:

$$\sigma_{\text{sx.c}} = \sigma_{\text{ax}} + \sigma_{\text{sf.c}} \text{ N/mm}^2 \text{ (compressive)}$$

$$\sigma_{sx,t} = \sigma_{ax} + \sigma_{sf,t} \text{ N/mm}^2 \text{ (tensile)}$$

where

Volume 1, Part 7, Chapter 3

Section 4

- σ_{ax} = is the axial stress in the stiffener at the combined stiffener plate neutral axis, this is normally to be taken as the membrane stress in the plating, i.e. σ_{xg}, σ_{yg} or σ_{xv} depending on the orientation of the stiffener, see Vol 1, Pt 7, Ch 3, 3.5 Derivation of the combined longitudinal stress on panels subjected to hull girder bending 3.5.4, Vol 1, Pt 7, Ch 3, 3.6 Derivation of the combined transverse stress acting on panels subjected to hull girder bending 3.6.4 or Vol 1, Pt 7, Ch 3, 3.9 Derivation of the combined vertical stress acting on transversely orientated panels 3.9.4
- $\sigma_{\rm sf,t}$, $\sigma_{\rm sf,c}$ = are the tensile and compressive bending stresses the stiffener flange, see Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.3 and Vol 1, Pt 7, Ch 3, 2.3 Stresses in secondary and primary member stiffeners 2.3.6, using the appropriate boundary conditions given in Vol 1, Pt 7, Ch 3, 3 Stress analysis model
- 3.11.2 These formulae may be applied to grillage and primary/secondary stiffened plating systems. The stresses in a stiffener beam subjected to more than one load may be derived by adding the stresses from each load component.

3.12 Derivation of total equivalent stress

3.12.1 The total equivalent stress or von Mises stress, σ_{vm} , is to be derived using the following formula:

$$\sigma_{\text{vm}} = \sqrt{\sigma_{\text{x}}^2 + \sigma_{\text{y}}^2 - \sigma_{\text{y}}\sigma_{\text{x}} + 3\tau_{\text{xy}}^2} \text{ N/mm}^2$$

■ Section 4

Structural design factors

4.1 General

- 4.1.1 This Section gives the allowable design criteria to be used to assess the structure for maximum and minimum stresses and other values derived in accordance with the **TLA** method.
- 4.1.2 The allowable design criteria are also to be used when direct calculation or similar methods are used as an alternative to the **TLA** stress analysis model in *Vol 1, Pt 7, Ch 3, 3 Stress analysis model*.
- 4.1.3 The allowable design criteria are applicable for all ships including NS1 ships.

4.2 Design criteria for the Total Load Assessment (TLA) approach

- 4.2.1 The stresses in the plating and stiffeners that have been derived using the **TLA** method are to be less than the allowable stresses and other design criteria given in this Section. For all areas of the structure, the modes of failures specified in *Table 3.4.1* Design criteria for plating to *Table 3.4.4* Design criteria for primary members are to be satisfied. See also Vol 1, Pt 7, Ch 3, 4.3 Presentation of results for presentation of results.
- 4.2.2 In order to satisfy the requirements, the ratio of the actual stress to the allowable stress or load utilisation factor is to be less than 1,0, similarly for the deflection and buckling utilisation factors. Hence

 σ/σ_a < 1,0

 λ/λ_a < 1,0

 δ/δ_a <1,0

where

 σ = is the actual stress value

 σ_a = is the allowable stress value, see Vol 1, Pt 7, Ch 3, 4.2 Design criteria for the Total Load Assessment (TLA) approach 4.2.3

 λ = is the actual buckling factor of safety achieved

Volume 1, Part 7, Chapter 3

Section 4

 λ_a = is the allowable buckling factor of safety, see Vol 1, Pt 7, Ch 3, 4.2 Design criteria for the Total Load Assessment (TLA) approach 4.2.4

 δ = is the actual deflection

 δ_a = is the allowable deflection value, see Vol 1, Pt 7, Ch 3, 4.2 Design criteria for the Total Load Assessment (TLA) approach 4.2.5

- 4.2.3 The allowable stresses are to be derived using the following formulae:
- Direct or bending allowable stress

$$\sigma_a = f_1 f_{hts} \sigma_o N/mm^2$$

• Shear allowable stress

$$\tau_a = f_1 f_{hts} \tau_o N/mm^2$$

where

f₁ is taken from Table 5.3.2 Allowable stress factors f₁ in Pt₆, Ch₅, as specified below:

- Table 3.4.1 Design criteria for plating for plating.
- Table 3.4.2 Design criteria for stiffeners for stiffeners.
- Table 3.4.3 Design criteria for stiffened panels for plate panels.
- Table 3.4.4 Design criteria for primary members for primary members.

f hts = correction factor for high tensile steel, see Vol 1, Pt 6, Ch 5, 1.3 Higher tensile steel

 σ_{o} = is the minimum yield stress

 $\tau_{\rm O}$ = is the minimum shear yield stress.

4.2.4 The buckling design safety factors are given in *Table 5.3.2 Allowable stress factors f 1* in Pt 6, Ch 5.3 and are to be used in conjunction with the buckling requirements specified in *Vol 1, Pt 6, Ch 2, 3 Buckling*. The required values of safety factors λ_{σ} and λ_{τ} are as specified by f_1 in *Vol 1, Pt 7, Ch 3, 4.2 Design criteria for the Total Load Assessment (TLA) approach 4.2.3*.

(a)
$$\lambda_a = f_1$$

where

f₁ = is taken from Table 5.3.2 Allowable stress factors f₁ in Pt₆, Ch_{5.3} as specified in Vol₁, Pt₇, Ch₃, 4.2 Design criteria for the Total Load Assessment (TLA) approach 4.2.3

4.2.5 The limiting deflection requirements for stiffening members specified in *Table 3.4.1 Design criteria for plating* to *Table 3.4.4 Design criteria for primary members* are to be satisfied. The allowable deflection criteria are expressed as a deflection/span ratio and the actual deflection is to be less than the allowable deflection, δ_a , where δ_a is as follows:

$$\delta_a = f_1 l_e \text{ mm}$$

where

f₁ is taken from *Table 5.3.2 Allowable stress factors f* 1 in Pt 6, Ch 5 as specified in *Vol* 1, Pt 7, Ch 3, 4.2 Design criteria for the *Total Load Assessment (TLA) approach 4.2.3*

 $l_{\rm e}$ = effective span length, in metres.

4.2.6 The assessment of scantling requirements to satisfy the impact or slamming pressure loads for plating and stiffening is given in Vol 1, Pt 6, Ch 3, 14 Strengthening for bottom slamming and Vol 1, Pt 6, Ch 3, 15 Strengthening for wave impact loads above waterline.

4.3 Presentation of results

- 4.3.1 It is recommended that the capability of the structure is represented by one of the following methods:
- (a) Load utilisation factor, LUF, derived as follows:

$$LUF = \frac{actual value}{allowable value}$$

e.g. the stress LUF =
$$\frac{\sigma}{\sigma_a}$$

(b) Adequacy parameter, AP, defined as follows:

$$AP = \frac{1 - LUF}{1 + LUF}$$

where

LUF is given above.

4.3.2 Table 3.4.5 Adequacy parameter (AP) shows a comparison of the adequacy parameter with the load utilisation factor.

Table 3.4.5 Adequacy parameter (AP)

LUF	AP
0,0	1,00
0,5	0,33
0,8	0,111
1,0	0,00
1,2	-0,091
1,5	-0,20
2,0	-0,33

■ Section 1

Scope

1.1 Application

- 1.1.1 This Chapter covers the basis of the requirements for the design, construction, testing, installation, trials and through life changes of engineering systems installed in classed naval ships.
- 1.1.2 For the purposes of these Rules, an engineering system is considered to be a combination of interacting elements (subsystems, equipment, components, hardware, software), organised to achieve one or more of the purposes stated in the Concept of Operations or the System Operational Concept documents.
- 1.1.3 These Rules are to be applied with reference to the operational conditions defined in the Concept of Operations, see *Vol* 1, *Pt* 1, *Ch* 2, 2.2 *Definitions*.

■ Section 2

Engineering system classification provisions

2.1 Provisions

- 2.1.1 The classification provisions for engineering systems installed in naval ships address the following:
- (a) The suitability and functioning of equipment and systems for maintaining the watertight and weathertight integrity of the hull, and spaces within the hull.
- (b) The safety and reliability of engineering systems necessary for propulsion and steering and other engineering systems falling within the Mobility or Ship Type categories.
- (c) The operation and functioning of systems installed for operational requirements relating to the ship type and additional Class notations excluding the operation and functioning of military systems.
- (d) The effectiveness of systems which have been built into the ship in order to maintain basic conditions on board whereby appropriate stores, fuels, equipment and personnel can be safely carried whilst the ship is at sea, at anchor, or moored in harbour.

General Requirements for Classification of Engineering Systems

Volume 2, Part 1, Chapter 1

Section 3

■ Section 3

Engineering system designation

3.1 Categories

- 3.1.1 For the purpose of classification, an Engineering System is defined as any system that may be installed in a ship where such a system comprises one or more sub-systems or components. For the purpose of determining the appropriate assessment process for engineering systems in naval ships, there are three categories:
- (a) Mobility.
- (b) Ship Type.
- (c) Ancillary.
- 3.1.2 Mobility category engineering systems are those systems installed in order for the ship to proceed on operations and are necessary for:
- (a) Maintaining the watertight and weathertight integrity of the hull and spaces within the hull.
- (b) The safety and reliability of propulsion, steering and electrical systems.
- (c) The operation and functioning of emergency machinery and equipment.
- 3.1.3 Ship Type category engineering systems are those systems installed in order for the ship to carry out its in-service purpose and are necessary for:
- (a) The operation and functioning of the systems and equipment installed for purposes relating to the ship's in-service purpose excluding the operation and functioning of military systems.
- (b) The operation and functioning of emergency machinery and equipment.
- 3.1.4 Ancillary category engineering systems are all systems other than Mobility category or Ship Type category, failure of which may compromise the provisions of Classification and are necessary for:
- The provision of basic conditions on board for the carriage of stores, fuels, equipment and personnel when the ship is at sea, at anchor, or moored in harbour.
- 3.1.5 Engineering Systems are to be assigned to the appropriate category taking into consideration the:
- ConOps for the vessel (see Vol 1, Pt 1, Ch 2, 2.2 Definitions 2.2.17);
- criteria in paragraphs *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.1* to *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.4* for Engineering Systems and the Mobility, Ship Type and Ancillary categories;
- dependency of Mobility or Ship Type engineering system upon other systems or services for their correct operation (e.g. if the propulsion plant's electronic control systems is cooled by chilled water, then the chilled water system is to be considered critical to the propulsion plant's function and assigned to the Mobility category);
- military systems and damage control arrangements relating to the Ship Type are to be stated where applicable.
- 3.1.6 Services such as the following are considered necessary for minimum comfortable conditions of habitability:
- cooking;
- heating and cooling;
- domestic refrigeration;
- mechanical ventilation;
- sanitary and fresh water.
- 3.1.7 Services such as the following, which are additional to those in *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.5* and *Vol 2, Pt 1, Ch 1, 3.1 Categories 3.1.6*, are considered necessary to maintain the ship in a normal seagoing operational and habitable condition:
- hotel services, other than those required for habitable conditions;
- thrusters.

General Requirements for Classification of Engineering Systems

Volume 2, Part 1, Chapter 1

Section 4

■ Section 4

Engineering system classification principles

4.1 Classification principles

- 4.1.1 Engineering system classification principles apply to all systems, equipment and components in order to achieve the provisions of classification. There are five groups of principles:
- (a) Design principles.
- (b) Construction principles.
- (c) Installation, integration and test principles.
- (d) Trials principles.
- (e) Through life operation principles.

4.2 Design principles

- 4.2.1 Systems are to be designed, constructed and installed to minimise the risk of:
- (a) harm to personnel
- (b) damage to the platform
- (c) damage to the environment
- 4.2.2 Systems and equipment are to be designed in accordance with the requirements of the relevant parts of the Rules.
- 4.2.3 Systems or components to be integrated into a higher level system are to be designed such that all their interfaces, electrical, mechanical, software or environmental, are clearly defined and compatible.
- 4.2.4 System integration is to be managed by a single designated party, and is to be carried out in accordance with a defined procedure identifying the roles, responsibilities and requirements for all parties involved. This procedure is to identify validation and verification activities to be undertaken and is to be submitted for consideration.
- 4.2.5 Systems are to be designed for the operating conditions defined in the Concept of Operations, see *Vol 1, Pt 1, Ch 2, 2.2 Definitions*, that are to include static and dynamic loads.
- 4.2.6 Mobility category and Ship Type category engineering systems are to be provided with means to monitor and identify potential failures that could lead to catastrophic, hazardous or major consequences and to notify users of degradation in systems performance that could lead to failures.
- 4.2.7 Mobility category and Ship Type category engineering systems are to be provided with means to detect failures that could lead to catastrophic, hazardous or major consequences and to notify users of such failures.
- 4.2.8 Systems are to remain in, or revert to, a safe state when failure occurs.
- 4.2.9 Systems and equipment are to be so designed such that they can be maintained and repaired effectively and safely.
- 4.2.10 Systems are to be so designed that a single failure will not result in the flooding of a watertight compartment from the sea.
- 4.2.11 Systems are to be arranged so that a single failure in equipment or loss of an associated sub-system will not result in failure, contamination or degradation of another system leading to a dangerous situation or loss of a Mobility or Ship Type category system.
- 4.2.12 Mobility and Ship Type category systems are to be such that key functions can be maintained in the event of a single failure in an operational sub-system.
- 4.2.13 Systems are to be provided with effective means of operation and control for all intended functions under all normal and abnormal operational modes.

4.3 Construction principles

4.3.1 The place of construction is to have suitable facilities for the construction, integration and testing of engineering equipment and systems.

General Requirements for Classification of Engineering Systems

Volume 2, Part 1, Chapter 1

Section 4

- 4.3.2 Construction is to be in accordance with plans approved by Lloyd's Register (hereinafter referred to as 'LR') in accordance with the requirements of the relevant parts of the Rules.
- 4.3.3 Where required by the Rules, items are to be constructed under survey.
- 4.3.4 Materials are to be approved, manufactured and tested in accordance with a standard acceptable to LR.
- 4.3.5 Satisfactory operation and load testing is to be witnessed by LR where required by the Rules.

4.4 Installation, integration and test principles

- 4.4.1 Installation and integration are to be carried out in accordance with documentation approved by LR and relevant LR requirements.
- 4.4.2 Installation and integration are to be carried out under LR Survey.
- 4.4.3 Tests are to be conducted in accordance with LR requirements.
- 4.4.4 Integration tests are to verify that the integrated sub-systems and components operate correctly at the higher system level.
- 4.4.5 Any alterations to approved documentation are to be approved by LR.
- 4.4.6 Surveyable items not complying with approved documentation or LR requirements are to be replaced or rectified.

4.5 Trials principles

- 4.5.1 A trials schedule is to be agreed between the Builder, Naval Administration and LR and is to address LR Rule requirements.
- 4.5.2 The trials are to be conducted at agreed operating conditions and are to demonstrate the functional capability of engineering systems.
- 4.5.3 Emergency trips and emergency operating modes are to be demonstrated.
- 4.5.4 Where a Risk Assessment report, (see *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*), has identified the need to prove the conclusions, testing and trials are to be carried out as necessary to investigate the following:
- (a) The effect of a specific component failure.
- (b) The effectiveness of automatic/manual isolation systems.
- (c) The behaviour of any interlocks that may inhibit operation of Mobility or Ship Type systems.
- 4.5.5 The trials records are to be documented with sufficient detail to ascertain that the specified functional requirements of engineering systems have been satisfied. The records are to be available to enable any future trials to verify any significant degradation after in-service operation.

4.6 Through life operation principles

- 4.6.1 Engineering systems and equipment are to be operated and maintained such that the provisions of classification are achieved throughout the life of the vessel.
- 4.6.2 Modifications that may affect the provisions of classification are to be approved by LR.
- 4.6.3 Verification and validation activities are to be employed throughout the life of the ship to ensure compliance with the provisions of classification.
- 4.6.4 Suitable documentation is to be available to ensure that the provisions of classification can be performed effectively.
- 4.6.5 Persons with responsibilities for activities that may affect the provisions of classification are to be competent/ qualified to discharge those responsibilities.
- 4.6.6 The configuration of the vessel shall be identified and controlled throughout its life.
- 4.6.7 Operating and maintenance manuals for all engineering systems are to be provided on board and submitted to LR for information where requested and are to include the following information:
- (a) Particulars of engineering systems.
- (b) Operating instructions for all engineering systems, including recommended continuous operating design limits.
- (c) Maintenance instructions for engineering systems and equipment.

General Requirements for Classification of Engineering Systems

Volume 2, Part 1, Chapter 1

- (d) Instructions for normal and reversionary modes of operation for machinery and equipment in mobility and ship type engineering systems, see Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.18.
- The operating and maintenance manuals required by Vol 2, Pt 1, Ch 1, 4.6 Through life operation principles 4.6.7 are to be presented in a language and format that can be understood by the Operator.

Section 5

Acceptance criteria

5.1 **Acceptance**

- The acceptance process ensures conformity of engineering systems to the provisions of Classification by assessing such systems against LR Rules and Regulations or their equivalent, and specified Standards or Codes.
- The assessment process of engineering systems extends over the full lifecycle of the systems. 5.1.2
- 5.1.3 The assessment requirements applicable to engineering systems are dependent upon the system designation and are detailed in Table 1.5.1 Assessment process for engineering systems

Table 1.5.1 Assessment process for engineering systems

/	SYS TE M	MOBILITY CATEGORY	SHIP TYPE CATEGORY	ANCILLARY
PR OC ESS	/			
DESIG REVII		 Plans of all systems are to be appraised by LR Procedure for component approval is to be agreed between the producer and LR Procedure for component approval is to be agreed 	 Plans to be appraised by LR when required by the Rules and where additional optional Class notation(s) are requested by Owners or Naval Administration 	 Plans of system arrangements are to be reviewed by LR Design review by LR where required by the Rules
CONS	STRU N	All major components and items of equipment are to be constructed under survey in accordance with plans approved by LR and Rule requirements	To be constructed under survey when required by the Rules or Regulations	No requirements unless required by the Rules
TION	ALLA	To be installed under survey in accordance with plans approved by LR and Rule requirements	To be installed under survey in accordance with plans approved by LR and Rule requirements	No requirements unless required by the Rules
TRIAI	LS	To be tested under specified load conditions	To be tested under normal working conditions	Running test of systems under working conditions
IN SERV	ICE	Subject to survey by the Rules or Regulations	Subject to survey where required by the Rules or Regulations or requested by Owners or Naval Administration	General examination

General Requirements for Classification of Engineering Systems

Section 6

MODIFICA TIONS	 Details of modifications are to be approved by LR Construction, installation and trials are to be carried out under survey 	Details of any modifications are to be approved and construction, installation and trials are to be carried out under survey when not required by the Rules or Class notation	 Details of any modifications are to be recorded to enable review by LR Surveyors Modifications are to be reviewed to ensure they do not change the category of the system
DE- COMMISS IONING	Details are to be submitted for consideration	Details are to be submitted for information	Details are to be recorded

5.2 Military systems guidance

- 5.2.1 Where military systems are to be installed in accordance with a specified standard and the guidance within these Rules, the assessment process will be in accordance with the requirements for systems within the Ancillary category in *Table 1.5.1* Assessment process for engineering systems and as detailed in *Vol 2*, *Pt 1*, *Ch 1*, *5.2 Military systems guidance 5.2.2* to *Vol 2*, *Pt 1*, *Ch 1*, *5.2 Military systems guidance 5.2.4*.
- 5.2.2 The proposed arrangements for compliance with Naval Administration requirements, the System Design Description, Rule guidance and any applicable Rule requirement where the system interfaces with the provisions of classification are to be assessed at a design review. This may be an LR specific design review or LR attendance at a design review organised by the Owner or Naval Administration.
- 5.2.3 Survey during installation will validate that the system has been installed with the particulars submitted.
- 5.2.4 Survey during service will be subject to agreement between LR and the Owner for individual installations.

Section 6

Routes to conformance

6.1 Design and construction

- 6.1.1 Plans/procedures as required by the Rules are to be approved by LR.
- 6.1.2 In general, LR acceptance of engineering systems or equipment is by the producer demonstrating compliance with the LR Type Approval system (see Vol 2, Pt 1, Ch 1, 9 Type approval system (for information)). Alternatively, approval of individual systems or equipment may be carried out on the basis of Design Appraisal combined with testing or acceptable service experience.
- 6.1.3 Conformance with the Construction Requirements of systems or equipment is to be demonstrated through compliance with Quality Assurance Scheme for Machinery or survey of individual items at the manufacturer's works.
- 6.1.4 Materials are to have certificates acceptable to LR, see Vol 2, Pt 1, Ch 1, 7 Certification of materials.
- 6.1.5 Testing of components, equipment and systems after manufacture is to comply with the Rules and any applicable standards and codes.

6.2 Machinery to be constructed under survey

6.2.1 All major units of equipment within the Mobility category, and where specifically required within the Ship Type category and Ancillary category, are to be individually surveyed at the manufacturer's works or meet the requirements of the Quality Assurance Scheme for Machinery. The workmanship is to be to the Surveyor's satisfaction and the Surveyor is to be satisfied that the components are suitable for the intended purpose and duty. Examples of such units are:

General Requirements for Classification of Engineering Systems

Volume 2, Part 1, Chapter 1

Section 6

- Main propulsion prime movers (engines, gas turbines and steam turbines) including their associated gearing, flexible couplings and turbochargers as applicable.
- Boilers supplying steam for propulsion or for services essential for the safety or the operation of the ship at sea, including superheaters, economisers, desuperheaters, steam heated steam generators and steam receivers. All other boilers having working pressures exceeding 3,4 bar and having heating surfaces greater than 4,65 m².
- Auxiliary engines which are the source of power for services essential for safety or for the operation of the ship at sea.
- Steering machinery.
- Athwartship thrust units, their prime movers and control mechanisms.
- All pumps necessary for the operation of main propulsion and essential machinery, e.g. boiler feed, cooling water circulating, condensate extraction, fuel oil and lubricating oil pumps.
- All heat exchangers necessary for the operation of main propulsion and essential machinery, e.g. air, water and lubricating oil coolers, fuel oil and feed water heaters, de-aerators and condensers, evaporators and distiller units.
- Air compressors, air receivers and other pressure vessels necessary for the operation of main propulsion and essential
 machinery. Any other unfired pressure vessels for which plans are required to be submitted as detailed in Vol 2, Pt 8, Ch 2
 Other Pressure Vessels
- All pumps essential for safety of the ship, e.g. fire, bilge and ballast pumps.
- Valves and other components intended for installation in essential piping systems, see Vol 2, Pt 7, Ch 1, 2.2 Definitions 2.2.1 having working pressures exceeding 7 bar.
- Alarm and control equipment as detailed in Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems
- Electrical equipment and electrical propelling machinery as detailed in Vol 2, Pt 9 Electrotechnical Systems

6.3 Survey for classification

6.3.1 The Surveyors are to examine and test the materials and workmanship from the commencement of work until the final test of the machinery under full power and any other specified working conditions. Any defects, etc. are to be indicated as early as possible. On completion, a certificate will be issued and an appropriate notation will be assigned in accordance with the Regulations.

6.4 Alternative system of inspection

- 6.4.1 Where items of machinery are manufactured as individual or series produced units, consideration will be given to the adoption of a survey procedure based on quality assurance concepts utilising regular and systematic audits of the approved manufacturing and quality control processes and procedures as an alternative to the direct survey of individual items.
- 6.4.2 In order to obtain approval, the requirements of *Vol 2, Pt 1, Ch 1, 8 Quality assurance scheme for machinery* are to be complied with.

6.5 Installation

- 6.5.1 Where required by the assessment process in *Table 1.5.1 Assessment process for engineering systems*, engineering systems are to be installed under survey in accordance with approved plans and relevant LR Design Appraisal documentation and LR Rules.
- 6.5.2 Documentation required during installation is to be available for inspection by the Owners and LR Surveyors. Such documentation may include:
- Design Appraisal Documents.
- Type Test Certificates.
- Materials Certificates.
- Type Approval Certificates.
- Quality Assurance Certificates.
- Certificates of Construction.

6.6 Trials

6.6.1 Engineering systems are to be tested on completion of installation to demonstrate functionality and suitability for purpose in accordance with LR Rules.

General Requirements for Classification of Engineering Systems

Volume 2, Part 1, Chapter 1

Section 7

6.6.2 Records of trials and testing required by the assessment process in *Table 1.5.1 Assessment process for engineering* systems are to be maintained on board the ship.

6.7 In-service survey

- 6.7.1 Where required by the assessment process in *Table 1.5.1 Assessment process for engineering systems* and in the Regulations, engineering systems are to be surveyed at intervals defined in the Regulations.
- 6.7.2 Records of in-service survey where carried out by the Marine Engineering Officer are to be maintained on board the ship, as defined in the Regulations.

6.8 Modifications

- 6.8.1 Details of modifications to engineering systems or equipment are, as required by *Table 1.5.1 Assessment process for engineering systems* to be submitted to LR for consideration.
- 6.8.2 Records of all modifications to in-service engineering systems that may alter the provisions of classification, are to be maintained on board the ship.

6.9 De-commissioning

- 6.9.1 Details of de-commissioning of engineering systems, as required by *Table 1.5.1 Assessment process for engineering systems*, are to be submitted to LR for consideration.
- 6.9.2 Records of de-commissioning of all equipment and systems that may alter the provisions of classification are to be maintained on board the ship.

6.10 Upkeep by exchange

- 6.10.1 Where propulsion and auxiliary machinery is maintained using an 'upkeep by exchange' policy, details of the system are to be submitted to LR for approval.
- 6.10.2 Where an 'upkeep by exchange' system has been approved, plans of individual replacement units are not required to be submitted provided there have been no changes since the original approval. The manufacture and testing of the replacement units is to be in accordance with the relevant Rule requirements.
- 6.10.3 Records of each 'upkeep by exchange' are to be maintained on board the ship and LR is to witness running tests on load after each exchange. A record history is to be maintained for each exchange unit in the form of a log book.

6.11 Alternative arrangements and calculation methods

- 6.11.1 In addition to cases where direct calculations are specifically required by the Rules, LR will consider alternative arrangements that have been derived by direct calculations in lieu of specific Rule requirements. All direct calculations are to be submitted for examination.
- 6.11.2 Where items are of a novel or unconventional design or manufacture, it is the responsibility of the designer to demonstrate their suitability and equivalence to the Rule requirements. See Requirements for Machinery and Engineering Systems of Unconventional Design, Vol 2, Pt 1, Ch 2 Requirements for Machinery and Engineering Systems of Unconventional Design.
- 6.11.3 Alternative arrangements or fittings that are considered to be equivalent to the Rule requirements will be accepted in accordance with Vol 1, Pt 1, Ch 3, 3.2 Hull.

■ Section 7

Certification of materials

7.1 Materials of construction

7.1.1 Materials used in the construction are to be in accordance with, or shown to be equivalent to *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2* (hereinafter referred to as the Rules for Materials). Details of all materials included and not included in are to be forwarded as soon as possible (preferably at the design concept stage) and before commencement of manufacture.

Section 8

7.2 Welding

- 7.2.1 Welding consumables, plant and equipment are to be in accordance with the requirements specified in *Ch 13, 1.8 Welding equipment and welding consumables* of the Rules for Materials.
- 7.2.2 Welding procedures and welder qualifications are to be tested and qualified in accordance with the requirements specified in *Ch 12 Welding Qualifications* of the Rules for Materials.
- 7.2.3 Production weld tests are to be carried out where specified in the subsequent Chapters of these Rules.
- 7.2.4 All finished welds are to be subjected to non-destructive examination in accordance with the requirements specified in *Ch 13, 2.12 Non-destructive examination of steel welds* of the Rules for Materials and or the requirements specified in the subsequent chapters of these Rules.

Section 8

Quality assurance scheme for machinery

8.1 General

- 8.1.1 The Quality Assurance Scheme for Machinery (QAM Scheme) is an alternative to direct survey and certification of machinery components and equipment required by the Rules. Under the QAM Scheme LR will consider the extent to which manufacturing processes and control procedures ensure conformity of that machinery to Rules, technical specifications and any other applicable standards or codes.
- 8.1.2 This QAM Scheme is applicable to items manufactured under closely controlled conditions. A list of products for which the QAM Scheme is applicable is provided in LR's *ShipRight Procedure Approval of a Manufacturer according to the Quality Assurance Scheme for Machinery*.
- 8.1.3 The QAM Scheme does not reduce the test requirements to be carried out in accordance with LR's Rules.

8.2 Definitions

- 8.2.1 The following definitions apply in the context of this Section:
- 8.2.2 QAM Scheme audit

An audit, conducted by LR at the manufacturer's, or their supplier's or sub-contractor's works, of their products and/or processes, which may include direct survey, in order to provide confidence that products are manufactured, tested and inspected in accordance with LR's Rules. Periodicity of surveillance audits is as agreed in the QAM Scheme Certification Schedule, see LR's ShipRight Procedure Approval of a Manufacturer according to the Quality Assurance Scheme for Machinery.

8.2.3 Assessment

A review, conducted by LR, of evidence gained through a number of sources, such as documentation, submitted by the manufacturer or supplier or sub-contractor, and regular QAM Scheme audit reports, in order to verify that products are manufactured, tested and inspected in accordance with the Rules.

8.2.4 Manufacturer

A company that contracts to supply components or equipment products to a customer or user and applies for approval under the QAM Scheme.

8.2.5 Supplier

A company that contracts to supply materials, components or equipment products to the Manufacturer applying for approval under the QAM Scheme.

8.2.6 Sub-contractor

A company who contracts to deliver a service to a supplier or manufacturer under the agreed QAM Scheme arrangements.

General Requirements for Classification of Engineering Systems

Volume 2, Part 1, Chapter 1

Section 8

8.3 QAM Scheme Arrangements

- 8.3.1 A manufacturer may apply to be approved under the QAM Scheme where the following requirements are met:
- (a) The manufacturer has a quality management system which has been certified as meeting the requirements of ISO 9001, or industry-specific equivalent standard, by a certification body accredited by a member of the International Accreditation Forum and recognised by LR.
- (b) The manufacturer has processes in place suitable for the products to be certified under the QAM Scheme.
- (c) The manufacturer has a satisfactory and documented history of quality performance in the supply of products for which certification under the QAM Scheme is requested.
- 8.3.2 The scope and arrangements for survey, identification and certification of products covered by the QAM Scheme are to be agreed with LR and will be detailed in a Scheme Certification Schedule. The Survey will be based on a technical audit approach, focusing on product realisation. Direct survey may also be used where it is considered appropriate to do so.
- 8.3.3 The QAM Scheme procedures given in LR's *ShipRight Procedure Approval of a Manufacturer according to the Quality Assurance Scheme for Machinery* are to be complied with.
- 8.3.4 Where LR is satisfied that the manufacturer meets all of the requirements of the QAM Scheme, and that it is appropriate for the products being manufactured, LR will issue the manufacturer with a QAM Scheme Certificate which will list products covered.
- 8.3.5 LR reserves the right to carry out unscheduled audits, with appropriate notice, at the manufacturer's works or their suppliers' and sub-contractors' works.
- 8.3.6 Once every three years, a full re-certification assessment of QAM Scheme compliance, including an audit of the manufacturer's works, will be conducted by LR.
- 8.3.7 The manufacturer is to advise LR of changes to the product, processes or suppliers or sub-contractors which would affect compliance with the QAM Scheme or LR's Rules. Any deviations from the approved plans or specifications are to be reported to LR and written approval obtained prior to dispatch of the items.
- 8.3.8 Where it is considered that the manufacturer no longer meets the approval requirements for the QAM Scheme, the QAM Scheme Certificate will be suspended. In these circumstances, the manufacturer will be notified in writing of LR's reasons for suspension of the scheme and the manufacturer will revert to direct survey and issue of LR certificates.
- 8.3.9 **QAM Scheme product certificates.** Where the manufacturer is approved according to the QAM Scheme, they will be entitled to issue 'QAM Scheme product certificates'. These certificates are to clearly detail the product being certified and are to be validated by an authorised representative of the manufacturer. The certificates are to be countersigned by LR to certify that the Rule requirements for that product are being met.

8.4 Acceptance of purchased materials, components and equipment

- 8.4.1 The manufacturer is to establish and maintain procedures and controls to ensure compliance with LR's requirements for certification of products from its suppliers. The manufacturer is to ensure that purchased products that are required to be certified in accordance with Ch 3 Rolled Steel Plates, Strip, Sections and Bars to Ch 10 Equipment for Mooring and Anchoring of the Rules for Materials are made at works which have been approved by LR for the type and grade of product being supplied. The manufacturer's system for control of purchased products is to be based on one or a combination of the following alternatives:
- (a) Product certification by LR at the supplier's works in accordance with the requirements of the Rules.
- (b) Product certification by a supplier separately approved by LR under the QAM Scheme or other LR Quality Scheme covering those products.
- (c) Product certification by the manufacturer in accordance with quality processes for control of suppliers of purchased products included within the scope of the manufacturer's QAM Scheme approval. These quality schemes are to ensure compliance with Rule requirements for the purchased products.

8.4.2 Manufacturers' certificates issued under the QAM Scheme.

Where the manufacturer's system for control of purchased products from suppliers is based on *Vol 2, Pt 1, Ch 1, 8.4 Acceptance* of purchased materials, components and equipment 8.4.1 and Surveyors have confirmed that LR Rules are being satisfied, the manufacturer will be permitted to accept 'Manufacturers' certificates issued under the QAM Scheme', in lieu of LR Certificates for purchased products. The certificates must bear the QAM Scheme mark and the following statement:

General Requirements for Classification of Engineering Systems

Volume 2, Part 1, Chapter 1

Section 9

'This certificate is issued under the arrangements authorised by Lloyd's Register (operating entity, e.g. EMEA) in accordance with the requirements of the Quality Assurance Scheme for Machinery and Scheme number, QAM.......'

Section 9

Type approval system (for information)

9.1 General

- 9.1.1 LR Type Approval is an impartial certification system that provides independent third-party Type Approval Certificates attesting to a product's conformity with specific standards or specifications. It is based on design review and type testing or where testing is not appropriate, a design analysis.
- 9.1.2 The LR Type Approval System is a process whereby a product is assessed in accordance with a specification, standard or code to check that it meets the stated requirements and through selective testing prove its suitability for its intended operation. The testing is carried out on a prototype or randomly selected product(s) which are representative of the manufactured product under approval. Thereafter, the manufacturer testifies that each item delivered is in conformity with that which has been type tested.
- 9.1.3 Details of LR's Type Approval System are contained in the following LR publications:
- (a) Procedure TA02.
- (b) Test Specification 1: Electrical and Control Engineering Products which are Environmentally Tested.
- (c) Test Specification 2: Piping System Components.
- (d) Test Specification 3: Electrical products that do not require Environmental Testing.
- (e) Test Specification 4: Type Testing of Reciprocating Internal Combustion Engines and Associated Ancillary Equipment.
- (f) Test Specification GT04: Gas Turbines.

9.2 Approval criteria

- 9.2.1 LR Type Approval does not preclude inspection and survey procedures required by these Rules for equipment to be installed in naval ships classed or intended to be classed with LR.
- 9.2.2 LR Type Approval is subject to the understanding that the producer's recommendations and instructions for the product and any relevant requirements of these Rules are fulfilled.
- 9.2.3 Where equipment or components have been type approved in accordance with procedures other than LR's, details of the product, certification and testing are to be submitted for consideration.

Requirements for Machinery and Engineering Systems of Unconventional Design

Volume 2, Part 1, Chapter 2

Section

Section

7 Requirements for machinery and engineering systems of unconventional design

Section 1

Requirements for machinery and engineering systems of unconventional design

1.1 General – Scope and objectives

- 1.1.1 The requirements of this Section aim to ensure that risks to maritime safety and the environment, stemming from the introduction of machinery or engineering systems of unconventional design, are addressed insofar as they affect the objectives of naval classification.
- 1.1.2 The requirements of this Section are to be satisfied where machinery is required to be constructed, installed and tested in accordance with Lloyd's Register's (LR's) Rules and Regulations and for which the corresponding machinery class notation is to be assigned, see *Vol 1*, *Pt 1*, *Ch 2*, 3.9 *Machinery and Engineering Systems notations*.
- 1.1.3 The requirements apply to machinery and engineering systems considered by LR to be of unconventional design and which, as a result, are not directly addressed by LR's extant Rules and Regulations. It should be noted however, that the general requirements of LR's Rules and Regulations are to be satisfied as applicable.
- 1.1.4 Compliance with ISO/IEC15288 Systems Engineering System Life Cycle Processes or an acceptable equivalent National Standard may be accepted as meeting the requirements of Vol 2, Pt 1, Ch 2, 1.3 Project management.

1.2 Documents required for design review

- 1.2.1 Information is to be submitted for assessment of compliance with the general requirements of LR's Rules and Regulations, including the general requirements for:
- (a) Machinery, see Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems;
- (b) Steam raising plant and pressure vessels see Vol 2, Pt 8, Ch 1 Steam Raising Plant and Associated Pressure Vessels and Vol 2, Pt 8, Ch 2 Other Pressure Vessels;
- (c) Machinery and ship piping systems, see Vol 2, Pt 7, Ch 2 Ship Piping Systems, Vol 2, Pt 7, Ch 3 Machinery Piping Systems and Vol 2, Pt 7, Ch 5 Ship Type Piping Systems;
- (d) Control, Alerts and Safety Systems, see Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems;
- (e) Electrotechnical Systems, see Vol 2, Pt 9 Electrotechnical Systems;
- (f) Materials, see the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.
- 1.2.2 In addition to the information identified in Vol 2, Pt 1, Ch 2, 1.2 Documents required for design review 1.2.1, the information described in Vol 2, Pt 1, Ch 2, 1.2 Documents required for design review 1.2.3 and Vol 2, Pt 1, Ch 2, 1.2 Documents required for design review 1.2.4 is also to be submitted for consideration.
- 1.2.3 A System Design Description detailing the extent of the machinery or engineering system is to be provided. This is to describe the shipboard services the system is to provide, its operating principles, and its functionality and capability when operating in the environment to which it is likely to be exposed under both normal and foreseeable abnormal conditions. See Vol 2, Pt 1, Ch 3, 3.5 System design description The System Design Description is to be supported by the following information as applicable:
- (a) System block diagram.
- (b) Piping and instrumentation diagrams.
- (c) Description of operating modes, including: Start-up, shutdown, automatic, reversionary, manual and emergency.
- (d) Description of safety related arrangements, including: Safeguards, automatic safety systems and interfaces with ships' safety systems.

Requirements for Machinery and Engineering Systems of Unconventional Design

Volume 2, Part 1, Chapter 2

Section 1

(e) Description of connections to other shipboard machinery, equipment and systems, including:

Electrical, mechanical, fluids and automation.

- (f) Plans of physical arrangements, including: Location, operational access and maintenance access.
- (g) System Operational Concept document, where appropriate, see Vol 2, Pt 1, Ch 3, 3.4 System operational concept.
- (h) Operating manuals, including:

Instructions for start-up, operation, shutdown, instructions for maintenance, instructions for adjustments to the performance and functionality and details of risk mitigation arrangements.

(i) Maintenance manuals, including:

Instructions for routine maintenance, repair following failure, disposal of components and recommended spares inventory.

- 1.2.4 Project process documentation including:
- (a) Project Management Plan, see Vol 2, Pt 1, Ch 2, 1.3 Project management;
- (b) Requirements Definition Document, see Vol 2, Pt 1, Ch 2, 1.4 Requirements definition;
- (c) Quality Assurance Plan, see Vol 2, Pt 1, Ch 2, 1.5 Quality assurance;
- (d) Design Definition Document, see Vol 2, Pt 1, Ch 2, 1.6 Design definition;
- (e) Risk Management Plan, see Vol 2, Pt 1, Ch 2, 1.7 Risk management;
- (f) Configuration Management Plan, see Vol 2, Pt 1, Ch 2, 1.8 Configuration management;
- (g) Verification Plan, see Vol 2, Pt 1, Ch 2, 1.9 Verification;
- (h) Integration Plan, see Vol 2, Pt 1, Ch 2, 1.10 Integration;
- (i) Validation Plan (certification and survey), see Vol 2, Pt 1, Ch 2, 1.11 Validation (certification and survey).

1.3 Project management

- 1.3.1 A project management procedure is to be established in order to define and manage the key project processes. The project processes are to include the processes described in *Vol 2, Pt 1, Ch 2, 1.4 Requirements definition* to *Vol 2, Pt 1, Ch 2, 1.11 Validation (certification and survey).*
- 1.3.2 For the entire project, and each of the processes within the project, the project management procedure is to define the following:
- (a) Activities to be carried out.
- (b) Required inputs and outputs.
- (c) Roles of key personnel.
- (d) Responsibilities of key personnel.
- (e) Competence of key personnel.
- (f) Schedules for the activities.

1.4 Requirements definition

- 1.4.1 A requirements definition procedure is to be established in order to define the functional behaviour and performance of the machinery or engineering system required by individual stakeholders, in the environments to which the machinery or engineering system is likely to be exposed under both normal and foreseeable emergency conditions.
- 1.4.2 The procedure is to take account of requirements resulting from key stakeholders, including:
- (a) Ship's owner.
- (b) Ship's operator.
- (c) Ship's crew.
- (d) Shipyard.
- (e) Systems integrator.
- (f) Designers.
- (g) Maintenance personnel.
- (h) Surveyors.
- (i) Manufacturers and suppliers.

Requirements for Machinery and Engineering Systems of Unconventional Design

Volume 2, Part 1, Chapter 2

Section 1

- (j) Naval Administration.
- (k) LR.
- 1.4.3 The procedure is to take account of requirements resulting from the following influences:
- (a) Operations that the ship is intended to perform during trials, at sea, while docking and training exercises, including those related to mission specific activities and degraded and reversionary modes of operation.
- (b) Ship conditions during normal operations and conditions arising from accidents or reasonable foreseeable failures or misuse of ship equipment or systems.
- (c) The environmental conditions that the equipment or systems will experience due to their location within the ship and due to the geographical location of the ship.
- (d) The requirements of applicable legislation, naval, National and International Standards and classification rules, codes of practice and other instruments agreed by the key stakeholders.
- (e) The number, availability, competence and overall capability of personnel involved with the use, maintenance, assessment and supervision of the system during ship operations.
- (f) Design constraints identified through consideration of the lifecycle of the ship.
- 1.4.4 The procedure is to specify the functional behaviour and performance requirements and is to identify the source of the requirements.

1.5 Quality assurance

- 1.5.1 A quality assurance procedure is to be established in order to ensure that the quality of the machinery or engineering system is in accordance with a defined quality management system.
- 1.5.2 The procedure is to define the specific quality controls to be applied during the project in order to satisfy the requirements of the quality management system.
- 1.5.3 The quality management system is to satisfy the requirements of ISO9001:2000 *Quality management systems Requirements*, or an equivalent acceptable National Standard.

1.6 Design definition

- 1.6.1 A design definition procedure is to be established in order to define the requirements for the design of machinery or an engineering system which satisfies stakeholder requirements, quality assurance requirements and complies with basic internationally recognised design requirements for safety and functionality.
- 1.6.2 The procedure is to ensure that the design of the machinery or engineering system satisfies:
- (a) Statutory legislation.
- (b) LR's requirements.
- (c) International Standards and codes of practice where relevant.
- 1.6.3 The procedure is to take account of stakeholder requirements, see Vol 2, Pt 1, Ch 2, 1.4 Requirements definition.
- 1.6.4 The procedure is to take account of quality assurance requirements, see Vol 2, Pt 1, Ch 2, 1.7 Risk management.
- 1.6.5 The procedure is to ensure that the requirements for the design of major components and subsystems of the machinery or engineering system can be verified before and after integration.
- 1.6.6 The procedure is to specify the design requirements and is to identify the source of the requirements.
- 1.6.7 Any deviations from stakeholder requirements are to be identified, justified and accepted by the originating stakeholder.

1.7 Risk management

- 1.7.1 A risk management procedure is to be established in order to ensure that any risks stemming from the introduction of the machinery or engineering system are addressed, in particular risks affecting:
- (a) The structural strength and integrity of the ship's hull.
- (b) The safety of shipboard machinery and engineering systems.
- (c) The safety of shipboard personnel.
- (d) The reliability of Mobility systems, Ship Type systems, emergency machinery and engineering systems.
- (e) The environment.

Requirements for Machinery and Engineering Systems of Unconventional Design

Volume 2, Part 1, Chapter 2

Section

- 1.7.2 The procedure is to consider the hazards associated with installation, operation, maintenance and disposal both with the machinery or engineering system functioning correctly and following any reasonably foreseeable failure.
- 1.7.3 The procedure is to take account of stakeholder requirements, see Vol 2, Pt 1, Ch 2, 1.4 Requirements definition.
- 1.7.4 The procedure is to take account of design requirements, see Vol 2, Pt 1, Ch 2, 1.6 Design definition.
- 1.7.5 The procedure is to ensure that hazards are identified using acceptable and recognised hazard identification techniques, (see Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)), and that the effects of the following influences are considered:
- (a) Operations that the ship is intended to perform during trials, in service, while docking and in harbour, including those related to mission specific activities and degraded and reversionary modes of operation.
- (b) Ship conditions under normal and reasonably foreseeable abnormal operating conditions arising from failures or misuse of ship equipment or systems.
- (c) Configurations and modes of operation provided for the intended control of machinery and engineering systems.
- (d) The environmental conditions that the equipment or systems will experience due to their location within the ship and due to the geographical location in which the ship operates.
- (e) The reliance and effects on the operation of engineering systems and machinery of the provision and availability of supplies and services and user interaction, including assessment of interdependencies.
- (f) The environmental impact of the ship throughout its lifecycle.
- 1.7.6 The procedure is to ensure that risks are analysed using acceptable and recognised Risk Assessment techniques, (see *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*), and that the following consequences are considered:
- (a) Loss of function.
- (b) Loss of services essential to the safety of the ship, services essential to the safety of shipboard personnel and services essential to the protection of the environment.
- (c) Damage to components.
- (d) Damage caused by fire, explosion, electric shock, harmful releases and hazardous releases.
- 1.7.7 The procedure is to ensure that risks are eliminated wherever possible. Risks which cannot be eliminated are to be mitigated as necessary.
- 1.7.8 Details of risks, and the means by which they are mitigated, are to be included in the operating manual, see *Vol 2, Pt 1, Ch 2, 1.2 Documents required for design review 1.2.3.*

1.8 Configuration management

- 1.8.1 A configuration management procedure is to be established in order to ensure traceability of the configuration of the machinery or engineering system, its subsystems and its components.
- 1.8.2 The procedure is to identify items essential for the safety or operation of the machinery or engineering system, and which could foreseeably be changed during the life time of the machinery or engineering system, including:
- (a) Documentation.
- (b) Software.
- (c) Sensors.
- (d) Actuators.
- (e) Instrumentation modules, boards and cards.
- (f) Valves.
- (g) Pumps.
- 1.8.3 The procedure is to take account of the design requirements, see Vol 2, Pt 1, Ch 2, 1.6 Design definition.
- 1.8.4 The procedure is to include items used to mitigate risks, see Vol 2, Pt 1, Ch 2, 1.7 Risk management.
- 1.8.5 The procedure is to ensure that any changes to configuration control items are:
- (a) Identified.
- (b) Recorded.
- (c) Evaluated.
- (d) Approved.
- (e) Incorporated.

Requirements for Machinery and Engineering Systems of Unconventional Design

Volume 2, Part 1, Chapter 2

Section 1

(f) Verified.

1.9 Verification

- 1.9.1 A verification procedure is to be established in order to ensure that subsystems and major components of the machinery or engineering system satisfy their design requirements.
- 1.9.2 The procedure is to verify design requirements, see Vol 2, Pt 1, Ch 2, 1.6 Design definition.
- 1.9.3 The procedure is to identify the requirements to be verified, the means by which they are to be verified, and the points in the project at which verification is to be carried out.
- 1.9.4 The procedure is to be based on one or a combination of the following activities as appropriate:
- (a) Design review.
- (b) Product inspection.
- (c) Process audit.
- (d) Product testing.

1.10 Integration

- 1.10.1 An integration procedure is to be established in order to ensure that the machinery or engineering system is assembled in a sequence which allows verification of individual subsystems and major components following integration in advance of validating the entire machinery or engineering system.
- 1.10.2 The procedure is to take account of the verification requirements, see Vol 2, Pt 1, Ch 2, 1.9 Verification.
- 1.10.3 The procedure is to identify the subsystems and major components, the sequence in which they are to be integrated, the points in the project at which integration is to be carried out, and the points in the project at which verification is to be carried out.

1.11 Validation (certification and survey)

- 1.11.1 A validation procedure is to be established in order to ensure the functional behaviour and performance of the machinery or engineering system meets with its functional and performance requirements.
- 1.11.2 The procedure is to validate stakeholder requirements, see Vol 2, Pt 1, Ch 2, 1.4 Requirements definition.
- 1.11.3 The procedure is to validate arrangements required to mitigate risks, see Vol 2, Pt 1, Ch 2, 1.7 Risk management.
- 1.11.4 The procedure is to validate the traceability of the configuration control items, see Vol 2, Pt 1, Ch 2, 1.8 Configuration management.
- 1.11.5 The procedure is to identify the requirements to be validated, the means by which they are be validated and the points in the project at which validation is to be carried out, including:
- (a) Factory acceptance testing.
- (b) Integration testing.
- (c) Commissioning.
- (d) Sea trials.
- (e) Survey.

■ Section 1

Scope

1.1 Application

- 1.1.1 This Chapter applies to the design, construction, installation and testing of Mobility, Ship Type, and Ancillary category engineering systems for classed naval ships and covers:
- Main propulsion systems.
- Steering and manoeuvring systems.
- Electrical power systems.
- Auxiliary machinery systems.
- Other engineering systems necessary for the watertight and weathertight integrity and functioning of ship type features.
- Together with their equipment, pressure plant, piping systems, control engineering and electrical engineering systems.
- 1.1.2 Additional requirements for individual systems and components are detailed in the following Parts.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 2

■ Section 2

General provisions

2.1 Provisions

- 2.1.1 The units and formulae used in the Rules are in SI Units.
- 2.1.2 It is the responsibility of the Shipbuilder as main contractor to ensure that the documentation required is prepared and submitted in accordance with a project schedule which has been agreed by LR.
- 2.1.3 The main propulsion machinery will be approved for the maximum continuous power, and associated shaft speed or equivalent design and performance criteria.
- 2.1.4 Main propulsion machinery will be considered for operation at a higher power rating than the classification rating for short time intervals (referred to as short-term high power operation) in conjunction with the intended operation service profile.
- 2.1.5 Facilities are to be provided for cleaning, inspection and maintenance of main propulsion and auxiliary machinery including boilers and pressure vessels.
- 2.1.6 Where it is proposed to depart from the requirements of the Rules, an Engineering and Safety Justification, see *Vol 1, Pt 1, Ch 2, 2.2 Definitions* is to be submitted to Lloyd's Register ('LR') for consideration.
- 2.1.7 Any novelty in the design and/or construction of machinery, boilers, pressure vessels or engineering equipment is to be advised to LR (see also Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems).

■ Section 3

Documentation required for design review

3.1 Submission of information

3.1.1 The documentation described in *Vol 2, Pt 1, Ch 3, 3.2 Documentation* is to be submitted for design review before manufacturing has started.

3.2 Documentation

- 3.2.1 Plans are to indicate clearly the scantlings and materials of construction. Any design alteration to the plan is to be resubmitted for approval, indicating clearly the alteration.
- 3.2.2 The following arrangement plans and documentation are required,
- (a) Plans showing the arrangement of machinery spaces indicating the location of machinery and equipment together with means of access and ventilation;
- (b) Plans showing the maintenance envelope and removal routes of machinery and equipment where routine removal for maintenance is proposed;
- (c) System Operational Concept documents, where required by Vol 2, Pt 1, Ch 3, 3.4 System operational concept;
- (d) System Design Descriptions, see Vol 2, Pt 1, Ch 3, 3.5 System design description; and
- (e) Documentation as required by the individual Chapters for specific machinery and electrotechnical systems or components. This is to include their System Design Descriptions, see Vol 2, Pt 1, Ch 3, 3.5 System design description.

Where elements or sub-systems are to be integrated into a higher level system, an interface definition document shall be submitted detailing all the interfaces between them, electrical, mechanical, software or environmental. The level of detail provided shall enable the system integrator to assess their compatibility for correct operation as part of the higher level system.

3.2.3 Where machinery system components have been approved under LR's Type Approval System or Quality Assurance Scheme for Machinery for the proposed design conditions or service, plans of the component are not required to be submitted. Full details of the components and the existing LR approval are to be submitted.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 3

- 3.2.4 Where operating requirements relating to the design, construction, testing, installation, and integration of machinery and engineering systems have been defined within the scope of *Vol 2, Pt 1, Ch 3, 4 Operating conditions*, evidence of capability and details of previous or proposed testing to demonstrate capability are to be submitted.
- 3.2.5 Where an oil or liquefied petroleum gas fired galley is proposed, details of the oil and gas storage and distribution arrangements together with ventilation arrangements and safety shutdown and alarms are to be submitted.

3.3 Calculations and specifications

- 3.3.1 **Service Profile.** The machinery power/speed operational envelope, grade(s) of fuel and any short-term high power operation.
- 3.3.2 **Classification rating.** The following operational parameters, using the design conditions for the intended Class Notation(s):

Total barometric pressure, bar.

Temperature of engine room, or suction air, °C.

Relative humidity, per cent.

Maximum/minimum temperatures of sea water, or charge air coolant inlet, °C.

See Vol 2, Pt 1, Ch 3, 4.4 Ambient reference conditions 4.4.1 for ambient reference conditions.

- 3.3.3 **Short-term high power operation.** Where the propulsion machinery is being considered for short-term high power operation, full details of the power, speed and time intervals together with fatigue endurance calculations, and documentary evidence indicating the suitability of the component design under these conditions and for the intended class notation are required. The following are to be considered; prime mover, gearbox, flexible coupling, vibration dampers, shafting and propeller:
- (a) The accrued number of load cycles and the percentage component overload are to be those recommended by the designers.
- (b) Excessive overload may require the interval between surveys to be reduced.
- (c) Plans showing the arrangement of resiliently mounted machinery which are to indicate the number, position, type and design of the mounts.
- (d) Machinery is to be maintained in accordance with manufacturer's requirements.
- (e) For electric propulsion:
 - (i) The prime mover rated power in conjunction with its overloading and load build-up capabilities shall be adequate to supply the power needed during transitional changes in operating conditions of the electrical equipment due to manoeuvring and sea and weather conditions.
 - (ii) Reverse power:

When manoeuvring, for example from full propeller speed ahead to maximum design propeller speed astern with the ship making full way ahead, the prime-mover shall be capable of absorbing a proportion of the regenerated power without tripping due to overspeed or reverse power.

Means external to the mechanical and electrical rotating machinery may be provided in the form of, for example, braking resistors to absorb excess amounts of regenerated energy and to reduce the speed of the propulsion motor. The amount of regenerated power shall be limited by the control system. Generators operating with semiconductor converters shall be designed for the expected harmonics of the system. A sufficient reserve shall be considered for the temperature rise, compared with sinusoidal load.

3.3.4 **Damper and Flexible Coupling characteristics.** Documentary evidence that the characteristics have been verified.

3.3.5 **Machinery Fastening.**

- (a) For NS3 type ships or where specified for other ship types, documentary evidence and calculations indicating that machinery is securely mounted for the ship motions and accelerations to be expected during service.
- (b) For NS3 type ships or where specified for other ship types, calculations to demonstrate that mountings of large masses such as main engines, auxiliary engines and electrical equipment can withstand the design collision acceleration according to *Vol* 2, *Pt* 1, *Ch* 3, 5.4 Collision load 5.4.1 without fracturing.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 3

- (c) Plans showing the arrangement of resiliently mounted machinery which are to indicate the number, position, type and design of mounts.
- (d) Natural frequency calculation of resilient mounted machinery.
- (e) Plans showing the arrangement of resin chocks for machinery requiring accurate alignment with the following information:
 - (i) Resin type.
 - (ii) The effective area and minimum thickness of the chocks.
 - (iii) The total deadweight loading of machinery.
 - (iv) The thrust load, where applicable, that will be applied to the chocked item.
 - (v) The loading to be applied to the holding-down bolts.
 - (vi) The material of the holding-down bolts.
 - (vii) The number, thread size, and waisted shank diameter (where applicable) of the holding-down bolts.

See Vol 2, Pt 1, Ch 3, 5.3 Machinery fastenings for requirements.

- 3.3.6 **Manuals.** The operation and maintenance manuals. For class notations covering propulsion and steering machinery redundancy, see *Vol 3 Additional Class Notations*
- 3.3.7 A Risk Assessment (RA), in accordance with the guidance in *Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA)*, is to be carried out, covering the following systems:
- (a) Main and auxiliary machinery systems supporting propulsion, steering, Mobility systems or Ship Type systems.
- (b) Steering systems.
- (c) Electrical generation and distribution systems supporting "Main and auxiliary machinery systems supporting propulsion, steering, Mobility systems or Ship Type systems" and "Steering systems", see Vol 2, Pt 10, Ch 1, 6.2 Physical environment 6.2.4

This requirement is in addition to the requirements for class notations covering propulsion and steering machinery redundancy, and Ship Type piping systems (see Vol 2, Pt 7, Ch 5 Ship Type Piping Systems).

- 3.3.8 **Fatigue Strength Analysis.** Where undertaken as an alternative to the requirements of the individual Chapters, fatigue strength analysis of components indicating a factor of safety of 1,5 at the design loads based on a suitable fatigue failure criteria. The effects of stress concentrations, material properties and operating environment are to be taken into account.
- 3.3.9 **CBRN Protection arrangements**. Where the CBRN Protection requirements are specified, a design statement together with plans and particulars are to be submitted for information. See Vol 2, Pt 1, Ch 3, 4.12 Guidance for CBRN protection, detection and monitoring for CBRN Protection guidance.
- 3.3.10 **Machinery shock resistance arrangements**. Where shock capability requirements for machinery, engineering systems and equipment have been specified, the requirements of *Vol 2, Pt 1, Ch 3, 4.11 Machinery shock arrangements* apply and the following details are to be submitted:
- (a) The shock policy for the ship. This shall include the shock environment to be used for shock calculations; this will remain confidential to LR.
- (b) A design statement that details the shock capability levels for installed machinery, engineering systems and equipment. This statement is to detail how the shock policy has been applied and is to include how the specified shock levels have been accommodated within the design.
- (c) List of shock captive equipment identifying name, system/function, location, intended shock qualification and mounting arrangements.
- (d) List of shock capable equipment identifying name, system/function, location, intended shock qualification and mounting arrangements.
- (e) System plans required by other Sections of the Rules are to identify the location of equipment.
- (f) Evidence of shock testing.
- (g) Shock mount approval documentation.
- (h) In cases where numerical modelling and analysis have been carried out, the following supporting information should be submitted as applicable:
 - (i) Reference to a recognised and validated calculation procedure and software used.
 - (ii) Evidence of software verification and validation.
 - (iii) A description of the modelling.
 - (iv) A summary of analysis parameters including properties and boundary conditions.

Volume 2, Part 1, Chapter 3

Section 3

- (v) Details of the loading conditions and the means of applying loads.
- (vi) Details of acceptance criteria and their derivation.
- (vii) A comprehensive summary of calculation results. Sample calculations should be submitted where appropriate.

In general, submission of large volumes of input and output data associated with such programs as finite element analysis will not be necessary unless requested by LR. The responsibility for error-free specification and input of program data and the subsequent correct transposition of output rests with the designer.

- 3.3.11 **Underwater signature arrangements.** Where the underwater signature requirements for the ship and propulsion system have been specified, a design statement together with plans and particulars are to be submitted for information. See Vol 2, Pt 1, Ch 3, 4.10 Guidance for underwater signature for underwater signature guidance.
- 3.3.12 Electromagnetic compatibility (EMC) See Vol 2, Pt 1, Ch 3, 4.13 Electromagnetic compatibility (EMC).
- (a) The following set of EMC documents is to be submitted and is to include, but not be limited to:
 - (i) an EMC Management Plan which details the ships operational role and defines the EM (Electromagnetic) environment, requirements and responsibilities;
 - (ii) an EMC Control Plan, which defines the design and mitigation measures to be taken to achieve EMC in the agreed EM threat environment. These are to include, but are not limited to the following:
- the EM threats, see Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.12(b) below;
- the zoning concept used;
- a declaration of the emission levels;
- a declaration the minimum immunity levels;
- shielding techniques and requirements;
- cabling requirements; and
- filtering requirements.
 - (iii) an EMC Implementation Plan, which defines the techniques to be used to mitigate the Electromagnetic (EM) threats and the requirements of the EMC Control Plan, including the installation techniques to be applied, see *Vol 2*, *Pt 1*, *Ch 3*, *4.13 Electromagnetic compatibility (EMC) 4.13.4*; and
 - (iv) an EMC Test Plan, which defines the verification and validation requirements, which are to include the analysis, inspection, demonstration and testing requirements, see Vol 2, Pt 1, Ch 3, 4.13 Electromagnetic compatibility (EMC) 4.13.3.

Note Based on the submissions required above, LR will conduct appropriate inspections to verify the processes and techniques defined have been applied correctly.

- (b) the EM Threats are to be defined using the most appropriate method for the assigned ship type and vessel ConOps, See Vol 1, Pt 1, Ch 2 Classification Regulations, and one of the following methods:
- applying the requirements and guidelines of IEC 60533, Electrical Installations in Ships, Electromagnetic Compatibility; or
- applying Naval Authority requirements, as defined in an appropriate naval standard acceptable to LR; or
- conducting an EM threat assessment which, so far as is reasonably practicable:
 - identifies all the EM threats and associated hazards;
 - identifies all the process, procedures and mitigation requirements which are to be applied to achieve the required EMC in the EM threat environment; and
 - has been agreed between shipbuilder and Naval Authority, and is acceptable to LR.
- (c) The ship design must be demonstrated to have taken adequate measures to ensure the required performance of Ship Type and Mobility systems are maintained under all normal and reasonably foreseeable abnormal conditions, see *Vol 2*, *Pt 1*, *Ch 3*, 4.13 Electromagnetic compatibility (EMC).
- 3.3.13 **Fin stabilisers.** Where fin stabiliser systems are fitted, the following details are to be submitted:
- (a) A System Design Description that details the stabiliser performance in terms of a specified roll angle that is not to be exceeded by more than a stated percentage of rolls in a specified wave environment (see Vol 1, Pt 5, Ch 2, 2.3 Wave environment) at a specified ship speed and heading. The performance is to be specified and is to recognise the requirements for ship-based operations, such as flight operations and replenishment at sea (RAS) systems, in terms of sea-keeping and platform heel/trim conditions, and the requirements of Vol 2, Pt 1, Ch 3, 4 Operating conditions regarding operating conditions as applicable. Details of any secondary function of the fin stabiliser to induce ship roll, for example routinely to test

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 5

the fin stabiliser system (against its own induced roll), to facilitate weapon systems testing and to support CBRN Protection pre-wetting systems, are also to be included in the System Design Description.

- (b) Plans of all load bearing, torque transmitting components and hydraulic pressure retaining parts of the fin stabiliser system together with proposed rated torque, all relief valve settings and scantlings.
- (c) Schematic plans of the hydraulic system(s), together with pipe material, relief valves and working pressures.
- (d) Details of safety and control and electrical engineering arrangements.
- (e) Material specifications for components identified in (b).
- (f) Details of proposed testing and sea trials.
- (g) Details of any limits of operation for stabilisation and induced forced roll, e.g. sea states, ship speed, roll amplitude and periodicity limitations.
- 3.3.14 **Machinery spaces and enclosures.** Evidence is to be submitted demonstrating the suitability of the fire-extinguishing arrangements for a machinery space or enclosure as required by *Vol 2, Pt 1, Ch 3, 5.15 Fire detection, alarm and extinguishing arrangements 5.15.2*. The submission is to identify all standards applied in support of the proposed arrangements. The location of equipment, the degree of protection provided by the equipment itself, and the damage control and fire-fighting requirements in the specified fire safety standard are to be taken into account in determination of the suitability of the fire extinguishing arrangements.
- 3.3.15 **Schedule of testing and trials.** Schedules of testing machinery at the manufacturers, pre-sea trial commissioning and sea trials are to be submitted to LR and agreed before commencement of testing and trials. The testing and trials schedules are to identify all modes of ship and machinery operation and the sea trials are to include typical port manoeuvres under all intended operating modes. Reference is also made to the following Rules:
- Vol 1, Pt 3, Ch 5, 8 Anchor windlass design and testing Windlass & capstan trials
- Vol 2, Pt 1, Ch 3, 16 Steering systems Steering systems
- Vol 2, Pt 1, Ch 3, 17 Sea trials Sea trials
- Vol 2, Pt 9, Ch 12, 1 Testing and trials Testing and trials
- Vol 2, Pt 9, Ch 1, 6 Integrated computer control ICC notation Control engineering trials

Testing and trials are to be witnessed by an LR Surveyor unless an alternative arrangement is agreed in writing prior to the trials by the Surveyor. Reports of testing and trials are to be submitted to an LR Surveyor after completion.

- 3.3.16 **Machinery operation.** For mobility and ship type category engineering systems, the equipment/machinery manufacturer's instructions for installation and operation of lubricating and hydraulic oil systems are to be made available to the LR surveyors attending trials/testing/commissioning. The instructions should include information that may affect the safety and reliability of the equipment covering requirements for operating environment, monitoring arrangements, cleanliness, filter arrangements, oil change intervals and precautions to be taken at start-up, in operation and during prolonged periods of shutdown.
- 3.3.17 **Operation of machinery outside its recommended continuous operating design envelope**. Where equipment and machinery installed in mobility and ship type engineering systems may be required to operate for continuous periods outside its recommended continuous operating design envelope, details of the intended operating conditions, time intervals and frequency of use together with documentary evidence indicating the suitability of the design and any limitations under these conditions are required to be submitted. Arrangements may include time alongside manoeuvring, close-down and other military operations or trials. The following items of machinery and equipment are to be considered:
- (a) Prime mover(s);
- (b) Gearbox(s);
- (c) Steering systems;
- (d) Bearings;
- (e) Couplings;
- (f) Vibration dampers;
- (g) Shafting and related power and propulsion transmission items;
- (h) Other items of machinery and equipment in mobility and ship type engineering systems as identified in the specified standards and agreed by the Owner. The manufacturer's requirements and recommendations for operation and maintenance are to be addressed with provision as necessary of documentation such as manuals and warnings with particular reference to lubrication and cooling systems and any predicted adverse effects e.g. fouling. As far as practicable, the specification, selection and arrangements of machinery and equipment are to be agreed between the Shipbuilder and the Owner for foreseeable operating conditions.

Volume 2, Part 1, Chapter 3

Section 3

- 3.3.18 **Training and drill regimes**. Where training and testing regimes for machinery capability and availability, reversionary modes of operation and breakdown drills have been identified by the Owner, full details of the intended regimes are required to be submitted in order to ascertain that the reliability of the machinery and associated systems is not significantly affected. The following are to be considered as applicable and included in the operating and maintenance manuals:
- (a) Machinery repair breakdown drills;
- (b) Post up-keep trials/Routine assessment trials;
- (c) Simulating fault conditions;
- (d) Rapid ship manoeuvres;
- (e) Electrical equipment and system configuration drills;
- (f) Damage control and work-up exercises. As far as practicable, the specification, selection and arrangements of machinery and equipment are to be agreed between the Shipbuilder and Owner for foreseeable training and drill regimes.

3.4 System operational concept

- 3.4.1 The purpose of this sub-Section is to ensure that LR is provided with all the necessary information at the whole ship system-level to perform design appraisal activities at sub-system and equipment level required by these Rules.
- 3.4.2 A System Operational Concept document is to be submitted, detailing the design intent and operational modes for complex systems which contain multiple sub-systems and significant items of equipment (e.g. Prime movers, propulsion devices, etc.). Examples of systems requiring the submission of a System Operational Concept include, but are not limited to:
- Propulsion (or Power and Propulsion for integrated systems).
- Electrical Power Generation and Distribution.
- Platform Management System.
- Replenishment at Sea (RAS) notation.
- Fire Protection (FIRE) notation.
- 3.4.3 The System Operational Concept is to include the following information, as appropriate to the system:
- Reference to the relevant requirements derived from the Concept of Operations;
- Operating modes and philosophy, including reversionary and emergency modes recognising the operational and manning philosophy for the vessel;
- Describe the designer's intent and the criticality of particular system features or equipment (with particular reference to those elements required to maintain Mobility and/or Ship Type systems and those installed for capability only);
- Justify non-compliances with the Rules due to the system design and functionality (e.g. black start requirements applied to designated engines only);
- Information required to be included by the individual Chapters.
- 3.4.4 For ships without complex systems (e.g. single or dual engine installation), the System Operational Concept can be combined with the appropriate System Design Description, see *Vol 2, Pt 1, Ch 3, 3.5 System design description*.
- 3.4.5 The System Operational Concept documents are to be agreed between the designer and Owner. LR may accept alternative documents where these provide the information which would be included within the System Operational Concept. In such cases the relevant sections providing the information required to provide equivalence with the System Operational Concept are to be identified.

3.5 System design description

- 3.5.1 The requirements of this sub-Section aim to ensure that LR is provided with sufficient information at the sub-system and equipment level in order to undertake the design appraisal activities required by these Rules.
- 3.5.2 A System Design Description document is to be submitted to detail the system's sub-system or equipment capability and functionality under all normal and reasonably foreseeable abnormal operating and fault conditions. Examples of systems/ equipment requiring the submission of a System Design Description include but are not limited to:
- Engines.
- Water jet systems.
- Piping systems.
- HVAC systems.
- Refrigeration Machinery (**PRM**) notation.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 4

- 3.5.3 The System Design Description is to include the following information, as appropriate to the system:
- Where appropriate, reference to the related Concept of Operations and/or System Operational Concept document;
- Operating modes and philosophy including reversionary and emergency modes recognising the operational and manning philosophy for the vessel;
- System parameters (capacity, power, discharge rate, etc.);
- System redundancy;
- Degraded performance under extreme operating conditions;
- Information required for inclusion in the System Design Description by individual Chapters.
- 3.5.4 The System Operational Concept documents are to be agreed between the designer and Owner. LR may accept alternative documents where these provide the information which would be included within the System Operational Concept. In such cases the relevant sections providing the information required to provide equivalence with the System Operational Concept are to be identified.

Section 4

Operating conditions

4.1 Availability for operation

- 4.1.1 The design and arrangement is to be such that the machinery can be started and controlled on board ship, without external aid, so that operating conditions can be maintained.
- 4.1.2 Installed machinery is to be capable of operating at defined power ratings with a range of fuels specified by the manufacturer and agreed by the Owner.
- 4.1.3 Smoke and emission levels from machinery exhaust systems are to be in accordance with those specified by the manufacturer and agreed by the Owner over the full operating range.
- 4.1.4 Installed machinery is to be capable of operating and being maintained in accordance with the manufacturer's instructions as required by Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.6 and Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.16.
- 4.1.5 Installed machinery is to be capable of operating satisfactorily in accordance with the manufacturer's stated operating conditions within an operational envelope specified for the ship by the Owner and agreed by the manufacturer/system designer, see Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.17. The optimum operational envelope is where machinery and equipment is operated to provide its best performance without causing undue wear or deterioration that could affect its operational reliability.
- 4.1.6 Installed machinery is to be capable of operating satisfactorily in accordance with the manufacturer's stated operating conditions within defined training and drill regimes specified by the Owner and agreed by the shipyard and machinery/equipment manufacturer, see *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.18*.

4.2 Fuel oil

- 4.2.1 The flash point (closed-cup test) of fuel oil for use in naval ships classed for unrestricted service is, in general, to be not less than 60°C.
- 4.2.2 The use of fuel having a lower flash point than specified in *Vol 2, Pt 1, Ch 3, 4.2 Fuel oil 4.2.1*, as applicable, may be permitted provided that such fuel is not stored in any machinery space and the arrangements for the complete installation are specially approved See *Vol 2, Pt 7, Ch 4 Aircraft/Helicopter/Vehicle Fuel Piping and Arrangements*

4.3 Power ratings

- 4.3.1 In the Chapters where the dimensions of any particular component are determined from shaft power, *P*, in kW, and revolutions per minute, *R*, the values to be used are to be derived from the following:
- For main propelling machinery, the maximum shaft power and corresponding revolutions per minute giving the maximum torque for which the machinery is to be classed.

Volume 2, Part 1, Chapter 3

Section 4

 For auxiliary machinery, the maximum continuous shaft power and corresponding revolutions per minute which will be used in service.

4.4 Ambient reference conditions

- 4.4.1 The rating for classification purposes of main and auxiliary machinery intended for installation in Mobility or Ship Type systems in naval sea-going ships to be classed for unrestricted (geographical) service is to be based on:
- A total barometric pressure of 1000 mb
- An engine room ambient temperature or suction air temperature of 45°C.
- A relative humidity of 60 per cent.
- Sea-water temperature or, where applicable, the temperature of the charge air coolant at the inlet of 32°C.

Note The manufacturer is not expected to provide simulated ambient reference conditions at a test bed.

4.4.2 In the case of a naval ship to be classed for restricted service, the rating is to be suitable for the temperature conditions associated with the geographical limits of the restricted service.

4.5 Ambient operating conditions

4.5.1 Main and auxiliary machinery and equipment in Mobility or Ship Type systems are to be capable of operating satisfactorily under the conditions shown in *Table 3.4.1 Ambient operating conditions*.

Table 3.4.1 Ambient operating conditions

Air				
Installations, components	Location, arrangement	Temperature range (°C)		
Machinery and electrical installations In enclosed spaces		0 to +45, see Note 1		
	On machinery components, boilers, In spaces subject to higher and lower temperatures	According to specific local conditions, see Note 2		
	On the open deck	-25 to +45, see Note 1		
Water				
Coolant		Temperature (°C)		
Sea-water or charge air coolant inlet to charge air cooler		−2 to +32, see Note 1		

Note 1. For ships intended to be classed for restricted service, a deviation from the temperatures stated may be considered.

Note 2. Details of local environmental conditions are stated in Annex B of IEC 60092: *Electrical installations in ships – Part 101: Definitions and general requirements*.

4.5.2 Where it is intended to allow for operation in ambient temperatures outside those shown in *Table 3.4.1 Ambient operating conditions*, the permissible temperatures and associated periods of time are to be specified by the manufacturer and agreed by the Owner. Engineering systems should retain a continuous level of functional capability under these conditions and any level of degraded performance should be defined. Operation under these circumstances should not be the cause of damage to equipment in the system.

4.6 Inclination of ship

4.6.1 Main and auxiliary machinery in Mobility, Ship Type systems, electrical and emergency equipment are to operate satisfactorily under the conditions as shown in *Table 3.4.2 Inclinations*.

Volume 2, Part 1, Chapter 3

Section 4

Table 3.4.2 Inclinations

Engineering installations and equipment	Angle of inclination, degrees (see Note 1)			
	Athwartship		Fore-and-aft	
	Static(Heel)	Dynamic(Roll)	Static(Trim)	Dynamic(Pitch)
Main and auxiliary machinery in Mobility and Ship Type Systems including electrical equipment	15	±22,5	5 (see Note 2)	±7,5
Emergency machinery and equipment including electrical equipment. Switchgear, electrical and electronic appliances (see Note 3) and remote control systems	22,5 (see Note 4)	±22,5	10	±10

- Note 1. Athwartships and fore-and-aft inclination may occur simultaneously.
- Note 2. Where the length of the ship exceeds 100 m, the fore-and-aft static angle of inclination may be taken as 500/L degrees where L = length of ship, in metres.
- Note 3. Up to an angle of inclination of 45 degrees no undesired switching operations or operational changes may occur.
- Note 4. A static damaged condition up to a maximum of 30 degrees may be required by the specified standards.
- 4.6.2 The arrangements for lubricating bearings and for draining crankcase and oil sumps of main and auxiliary engines, gearcases, electric generators, motors and other running machinery are to be designed so that they will remain efficient with the ship inclined under the conditions shown in *Table 3.4.2 Inclinations*
- 4.6.3 Any proposal to deviate from the angles given in *Table 3.4.2 Inclinations* will be specially considered taking into account the type, size and service conditions of the ship.
- 4.6.4 The dynamic angles of inclination in *Table 3.4.2 Inclinations* may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the machinery is capable of operating under these angles of inclination.

4.7 Power conditions for generator sets

- 4.7.1 Auxiliary engines coupled to electrical generators are to be capable under service conditions of developing continuously the power to drive the generators at full rated output (kW) and in the case of engines and gas turbines, of developing for a short period (15 minutes) an overload power of not less than 10 per cent.
- 4.7.2 Engine builders are to satisfy the Surveyors by tests on individual engines that the requirements in *Vol 2, Pt 1, Ch 3, 4.7 Power conditions for generator sets 4.7.1*, as applicable, can be complied with, due account being taken of the difference between the temperatures under test conditions and those referred to in *Vol 2, Pt 1, Ch 3, 4.4 Ambient reference conditions 4.4.1*. Alternatively, where it is not practicable to test the engine/generator set as a unit, type tests (e.g. against a brake) representing a particular size and range of engines may be accepted. With engines and gas turbines any fuel stop fitted is to be set to permit the short period overload power of not less than 10 per cent above full rated output (kW) to be developed.

4.8 Astern power

- 4.8.1 In order to maintain sufficient manoeuvrability and secure control of the ship in all normal circumstances, the propulsion machinery is to be capable of reversing the direction of thrust so as to bring the ship to rest.
- 4.8.2 The propulsion machinery is to be capable of maintaining continuous astern power for the maximum astern speed and time specified by the Owner.
- 4.8.3 Where appropriate the propulsion machinery is to be capable of achieving the astern power necessary to meet the requirements of the **LMA** or **LMNA** notation as applicable (see *Vol 3*, *Pt 1*, *Ch 4 Manoeuvring Assessment*).

4.9 Military requirements

4.9.1 The Owner is responsible for defining the military requirements relating to the design, construction, testing and installation of machinery and engineering systems.

Volume 2, Part 1, Chapter 3

Section 4

- 4.9.2 The following aspects are to be considered for machinery and engineering systems where military requirements are defined:
- Acoustic tiling and other noise reduction techniques.
- Action damage repairs.
- Alternative/back-up supplies.
- · Chocking and securing of machinery.
- Design and installation of machinery to withstand shock.
- Electromagnetic compatibility.
- Electromagnetic hazards to personnel.
- Electromagnetic hazards to fuel storage.
- Electromagnetic hazards to ammunition storage.
- Equipment in magazine spaces.
- IR emission.
- Laser hazards.
- Magnetic restrictions.
- Manoeuvring capabilities.
- CBRN capability.
- Noise and vibration for machinery derived noise and vibration signatures.
- Operation of equipment at high ambient temperatures associated with closedown situations.
- Operation of machinery under excessive list and trim conditions.
- Operation of machinery under partial flooding or damage conditions.
- Radar cross-section.
- Reversionary modes of operation.
- Ruggedness of installation and equipment.
- Shutdown and isolation of HVAC systems.
- Smoke clearance requirements.

The foregoing list is not exhaustive and additional aspects may be specified and included by the Owner.

- 4.9.3 Guidance on design and installation of machinery and engineering systems covering military requirements where they interface with the provisions of classification may be sought from LR for particular installations.
- 4.9.4 Where a military requirement for disabling automatic control, protection or safety functions for machinery and engineering systems has been defined, the consequences of using the disabling arrangements are to be established and included in the operations procedures and orders provided on board the ship. Details of any disabling arrangements are to be recorded and submitted to LR for consideration in each instance.
- 4.9.5 Where military mission requirements specify immediate availability of mobility and ship type category engineering systems from cold start conditions, the equipment and arrangements of sub-systems such as lubrication and cooling are to be suitable for operation at a defined level of capability and functionality at stated temperatures.
- 4.9.6 Systems provided to fulfil military requirements, e.g. weapons or combat systems, are to be arranged such that their operation or failure will not adversely affect the operation of Mobility, Ship Type or Ancillary category systems covered by these Rules.

4.10 Guidance for underwater signature

- 4.10.1 Where military requirements for underwater signature have been specified, the guidance in *Vol 2, Pt 1, Ch 3, 4.10 Guidance for underwater signature 4.10.2* may be used to assist in achieving the requirements. The Owner is responsible for defining the underwater signature and any requirements in addition to the guidance in this Section. The System Design Description is to include underwater signature levels for the ship and propulsion system, which should be agreed between the designer and Owner, see *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.11*
- 4.10.2 Acceptance levels for propulsion and underwater signature are normally specified by the Owner such that propulsive performance and the underwater signature may be determined.
- 4.10.3 The techniques that may be employed for control of underwater signature are outlined in *Table 3.4.3 Control of underwater signature* for guidance purposes.

Volume 2, Part 1, Chapter 3

Section 4

Table 3.4.3 Control of underwater signature

Propeller noise	Low resistance hull at required quiet speed. Attention to good inflow into propeller by integrated propeller/hull design. Noise reduced low rpm propeller design
Propeller cavitation	Low resistance hull at required quiet speed. Attention to good inflow into propeller by integrated propeller/hull design. Attention to propeller design and detail Use of high tolerances in manufacture
Propeller induced vibration	Attention to propeller position relative to hull and the interaction between the hull and propeller. Low resistance hull at required quiet speed. Attention to good inflow into propeller by integrated hull/propeller design
Cavitation noise	Attention to good flow to appendages and appendage siting and alignment. Good appendage shapes

- 4.10.4 The techniques that may be employed for control of underwater signature are:
- (a) All machinery should be assessed for its vibration characteristics.
- (b) All constructional details connecting machinery to the hull should be assessed for their ability to transmit vibration into the water. If required, suitable vibration isolating machinery, pipe and cable mountings are to be used.
- (c) The hull form should be optimised to give efficient performance at the noise quiet speed required in order to obtain the minimum propeller noise signature.
- (d) The hull form should be fair and smooth to minimise resistance and flow noise.
- (e) Underwater openings should be minimised and attention should be given to the noise characteristics of grilles and shutters.
- (f) Attention should be given to the shape, position and alignment of underwater appendages in order to minimise local turbulence, but especially in the flow into the propellers.
- (g) Propeller design should be carried out using appropriate noise reduction features.

4.11 Machinery shock arrangements

- 4.11.1 Where shock requirements for machinery, engineering systems and equipment have been specified, the requirements of this Section are to be met. The Naval Administration is responsible for determining and specifying if these Rules are adequate to meet their requirements and defining any alternative or additional requirements. These Rules may be applied in isolation from or in addition to the requirements of the Shock Enhancement notation, **SH**, see *Vol 1*, *Pt 4*, *Ch 2*, *5 Underwater explosion (shock)*.
- 4.11.2 A shock System Design Description, may be specified by the Owner. The System Design Description is to identify the level of shock resistance for installed machinery, engineering systems and equipment and is to address:
- (a) Protection of the crew and embarked personnel.
- (b) The capability of machinery, equipment and systems to operate after shock loading.
- (c) The capability of securing arrangements to retain machinery and equipment captive after shock loading.
- (d) The location of machinery/equipment and routing of Mobility and/or Ship Type electrical and piping systems to maintain services in the event of damage due to shock loading.

The application of design and installation of machinery systems for shock resistance is dependent on the Owner requirements detailed in the shock policy. Shock capability may range from full operational capability after repeated shock to that for retaining items captive to avoid injury to personnel.

- 4.11.3 The actual threat level used in the calculation of performance of the equipment is to be specified by the Owner and will remain confidential to LR.
- 4.11.4 Where the shock policy requires that shock capability be achieved by separating duplicated items of equipment within a system, with the aim of ensuring that the system remains operational after a shock event, the equipment is to be rugged, and designed to operate in a marine environment. The minimum distance between duplicated items of equipment is to be in accordance with the policy.
- 4.11.5 The shock performance of individual items of ship's equipment required to operate after shock loading is to be assessed by conducting representative shock tests. For larger items of equipment, a combination of shock tests and numerical modelling may be used, as defined in the System Design Description.

Volume 2, Part 1, Chapter 3

Section 4

- 4.11.6 Where equipment shock testing is required, it is to be carried out at a recognised facility in accordance with an acceptable procedure. It is to be ensured that the test arrangements represent the magnitude and direction of loads, and that the loading is applied to the equipment in the configuration in which it will be fitted on board, including shock mounts if applicable.
- 4.11.7 Equipment previously tested to a particular shock acceleration for another application may be fitted on a vessel with a different shock requirement on condition that the environment in which it is fitted is no more severe than that for which it was tested. In this instance, past test results complemented by a mounting calculation for the proposed arrangements are required.
- 4.11.8 Where equipment containing electronic components is required to be shock capable, the electronic components are to be tested in accordance with the requirements of *Vol 2, Pt 1, Ch 3, 4.11 Machinery shock arrangements 4.11.6*.
- 4.11.9 Where equipment is to be installed on shock mounts, the mounts are to be of an approved type and are to meet the requirements of *Vol 1, Pt 4, Ch 2, 5.7 Shock mounts*.
- 4.11.10 For systems, machinery and equipment which are required to be shock captive or shock capable, non-ductile, brittle, low impact resistance, or high notch sensitivity materials, particularly grey cast iron and cast aluminium are not to be used unless their use can be justified and agreed with the Naval Administration. Materials used, where possible, are to be capable of yielding by approximately 10 per cent before fracture. Whenever possible, the use of glass is to be avoided in machinery, engineering systems and equipment. Where this is not possible, toughened glass is to be used. Where glass is used in tank level gauges, for tanks containing flammable fluids, automatic self-closing valves are to be fitted at the top and bottom of the gauge to prevent the loss of fluid.
- 4.11.11 For systems, machinery and equipment which are required to be shock captive or shock capable, the use of materials that will be exposed to temperatures below their ductile to brittle transition temperature is to be avoided.
- 4.11.12 For systems, machinery and equipment which are required to be shock captive or shock capable, stress concentrations in structural arrangements for machinery and equipment are to be avoided and, where possible, welds are to be located away from high stress areas.
- 4.11.13 For systems, machinery and equipment which are required to be shock capable, overhung and cantilevered components on machinery and equipment are to be avoided where possible.
- 4.11.14 For systems, machinery and equipment which are required to be shock capable, direct support of connected items of equipment from two or more separate parts of the ship's structure, such as decks and bulkheads, is to be avoided, since differences in response motions at these positions may cause damage.
- 4.11.15 To minimise relative movement between items of machinery and equipment that require a fixed relationship to each other, wherever possible, they are to be co-located on a common base or frame.
- 4.11.16 For systems, machinery and equipment which are required to be shock capable, where pipework passes through bulkheads, penetrations of an approved type which have been shock tested are to be used to avoid point loading of the pipes during a shock event. Alternatively, flanged penetrations which are permanently attached to the bulkhead are to be used.
- 4.11.17 For systems, machinery and equipment which are required to be shock capable, flexible pipework couplings are to be of an approved type which have been shock tested.
- 4.11.18 Piping runs are to be supported in the region of valves and fittings and supports are to be arranged as close to the elastic centre of the mounting system as possible.
- 4.11.19 Where required by the shock System Design Description, piping containing flammable fluids passing through compartments of high fire risk are to meet the requirements of Vol 2, Pt 1, Ch 3, 4.11 Machinery shock arrangements 4.11.16.
- 4.11.20 Where equipment is required to remain captive, securing arrangements are to be designed to resist the acceleration/ deceleration levels which are associated with the location of the equipment within the ship. The shock captivity levels are to be identified in the System Design Description.
- 4.11.21 The arrangement of equipment attachment locations is to be such that the height of the centre of gravity above the securing plane is small relative to the span of securing bolts; typically the height of the equipment centre of gravity should be less than one half of the distance between the outermost securing bolts.
- 4.11.22 For systems, machinery and equipment which are required to be shock captive or shock capable, equipment housing is to be designed to ensure that it is sufficiently strong to withstand the bolt loadings and not allow them to pull through.
- 4.11.23 For systems, machinery and equipment which are required to be shock capable, the design of machinery trips and breakers is to be such that shock movement cannot trigger them. Also, pivoted parts and link mechanisms, etc. are to be balanced if possible.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 4

- 4.11.24 For systems, machinery and equipment which are required to be shock capable, adequate clearances are to be allowed between fixed and moving items, equipment and structure and pipes and structure. General clearances are to be approximately 100 mm all round.
- 4.11.25 For systems, machinery and equipment which are required to be shock captive or shock capable, all fixing lugs are to be closed eyes and not slots. Minimum clearance holes are to be provided for bolts. In general, bolts up to 20 mm diameter are to have a clearance of 1 mm on diameter and for bolts larger than 20 mm, a clearance of 2 mm on diameter.
- 4.11.26 For systems, machinery and equipment which are required to be shock captive or shock capable, bolted connections are to be tightened to their specified torque limits consistent with the allowable stress in the bolt, typically 2/3 of the yield strength. Lock nuts that lock along the thread length are to be used in preference to lock or star washers.
- 4.11.27 All connections to equipment that is resiliently mounted are to be capable of accommodating the maximum displacements induced by shock. Resilient mounting of equipment onto equipment that is already resiliently mounted is to be avoided.
- 4.11.28 For systems, machinery and equipment which are required to be shock capable, flexible hoses and bellows are to have adequate deflection capability in all directions to accommodate relative displacements induced as a result of shock.
- 4.11.29 Removable items and racks, etc. are to be positively secured when *in situ* with no reliance being made on friction grip or push fits.
- 4.11.30 Safety equipment (removable escape ladders, fire extinguishers, etc.) is to be secured with quick release arrangements.
- 4.11.31 Portable items are to have secure stowage or attachments such that they do not become free following shock.
- 4.11.32 Electrical cables are to be installed to accommodate relative movement under shock.
- 4.11.33 Where electrical system circuit breakers and fuses are rigidly fastened to the structure, they are to be of an approved shockproof design.
- 4.11.34 Electrical plug-in components such as printed circuits or relays are to be positively secured in position. Retention by friction is not permitted.
- 4.11.35 Flexible mounts are not to be degraded by the use of other rigid connections to equipment such as pipework.

4.12 Guidance for CBRN protection, detection and monitoring

- 4.12.1 Where military requirements to operate under the threat of chemical, biological, radiological and nuclear defence (CBRN) warfare have been specified, the guidance in *Vol 2, Pt 1, Ch 3, 4.12 Guidance for CBRN protection, detection and monitoring 4.12.14* may be used to assist in achieving the requirements. The Owner is responsible for defining the levels of threat, operating periods and for specifying any CBRN Protection requirements in addition to the guidance in this Section. The System Design Description for CBRN Protection of the ship should be agreed between the designer and Owner, see *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.9*. For hull structure guidance, see *Vol 1, Pt 4, Ch 1, 7 Design guidance for nuclear, biological and chemical defence*.
- 4.12.2 The prime objectives in the design of CBRN Protection arrangements should address:
- (a) Protection of the crew and embarked personnel.
- (b) Capability of the ship to operate in close-down conditions when engaged in military missions.
- 4.12.3 The ship will have a citadel in which the crew can shelter and in particular, ship operations can be managed for long-term close-down conditions. This citadel may be part or all of the ship. Larger citadels may be sub-divided into a number of smaller sub-citadels. The duration of operation with a citadel in use is to be defined in the System Design Description.
- 4.12.4 The citadel should be designed to provide an over-pressure relative to external ambient conditions such that any leakage of air flows outward from spaces inside the ship. The system design for maintaining over-pressure should recognise degradation of gas-tightness in the ship's structures during operational service and take into account known leakages for the purposes of establishing the required number of air filtration units.
- 4.12.5 Fresh air required for ventilation purposes should pass through an appropriate level of filtration before entering the citadel. Jalousies fitted at the intakes should be capable of controlling the ingestion of water, particulate and corrosive marine salts to limit degradation of filter units due to moisture carry over. The air filtration units should be capable of providing protection against nuclear, biological and chemical threats defined in the specified standards and should be capable of being cleaned and maintained in accordance with the manufacturer's recommendations. The air filtration systems should be capable of being

Volume 2, Part 1, Chapter 3

Section 4

operated from within the citadel. The maintenance arrangements for air filtration systems should ensure that there is minimum risk of introduction of contaminants into the citadel.

- 4.12.6 The number, capacity and arrangements of air filtration units should recognise the requirements for operational capability within the ship's zoning policy and air supply requirements to any sub-citadels.
- 4.12.7 Access to and from the citadel should be via air locks and cleansing stations to decontaminate personnel entering the citadel.
- 4.12.8 A means of monitoring the level of over-pressure within a citadel should be provided.
- 4.12.9 Doors, hatches and other closures that are part of the citadel boundary should be clearly marked as such.
- 4.12.10 All openings into the citadel should be capable of being closed to form a gastight seal. In the case of fluid systems with overboard discharges that are required to be open for operational reasons, these should be fitted with water seals to prevent the ingress of external air. Arrangements should be made to re-circulate air for ventilation/ air conditioning purposes, such as galley air, and where necessary, provide bleed valves such that air may be purged via the air locks/cleansing stations without allowing external air to re-enter the citadel. The arrangements for re-circulation and fresh air intakes should take into account the maximum permitted levels of CO₂ and any other gases/ odours that may prejudice the safety of crew and embarked personnel.
- 4.12.11 In the case of machinery spaces that are to be kept 'clean' during CBRN states by closures, combustion air should be trunked directly to the prime movers and adequate cooling is to be provided within these spaces to maintain safe equipment operation. Arrangements should be provided to permit engines to breathe as required for full power operational requirements. See Vol 2, Pt 1, Ch 3, 5.14 Machinery enclosures for requirements for machinery enclosures.
- 4.12.12 A means of preventing adherence of contamination and for decontamination of the outside of the ship should be provided by pre-wetting/wetting systems. Adequate means of drainage should be provided for pre-wetting/wetting water. The siting of nozzles and drainage arrangements should be arranged to avoid build-up of water and potential ingress of water into air intakes for ventilation and machinery air intakes.
- 4.12.13 A means of monitoring, indicating and warning of CBRN contamination should be provided.
- 4.12.14 Nuclear shelter positions for ship's crew and embarked personnel should be identified. These positions should be provided with adequate means of ventilation capable of maintaining the atmosphere with a maximum CO² level of 1,5% for a defined period of time.

4.13 Electromagnetic compatibility (EMC)

- 4.13.1 For documentation required for design review See also Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.12.
- 4.13.2 Mobility and/or Ship Type systems, including weapons systems, are to be designed and installed such that their performance does not degrade from the manufacturer's specifications as a result of susceptibility to electromagnetic interference (EMI). This is to apply to EMI generated during both normal ship operations and during military activities.
- 4.13.3 An EMC Test Plan is to be established, an EMC analysis carried out and a test report produced, which are to be submitted for review. These are to be in accordance with one of the following:
- (a) the requirements and guidelines of IEC 60533, Electrical Installations in Ships, Electromagnetic Compatibility; or
- (b) the requirements of the Naval Authority, equivalent to (a), as defined in an appropriate naval standard; or
- (c) the requirements of the EMC Management Plan for the ship application, according to its defined EM environment.
- 4.13.4 The EMC Test Plan is to demonstrate that an assessment of the verification and validation requirements has been made, which demonstrates that the appropriate EMC requirements have been specified.
- 4.13.5 The assessment required by paragraph Vol 2, Pt 1, Ch 3, 4.13 Electromagnetic compatibility (EMC) 4.13.4 is to consider:
- (a) the relative proximity and quantity of electrical and electronic equipment to each other, such as transmitters and receivers; and
- (b) whether the EMC requirements proposed are adequate, or whether more onerous requirements are needed.
- 4.13.6 Mobility, Ship Type and Ancillary systems are to comply with the appropriate emission and minimum immunity levels defined in one of the following, and as appropriate to the assigned ship and vessel ConOps, see *Vol 2*, *Pt 1*, *Ch 2 Requirements for Machinery and Engineering Systems of Unconventional Design*;
- (a) IEC 60533, Electrical Installations in Ships, Electromagnetic Compatibility. Additional testing is to be conducted when the EMC analysis does not clearly identify that the requirements of the Naval Authority are satisfied; or

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 4

- (b) an appropriate naval standard, acceptable to the Naval Authority; or
- (c) an EMC Control Plan (see Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.12).

4.14 Machinery interlocks

- 4.14.1 Interlocks are to be provided to prevent any operation of engines, turbines or applicable auxiliary machinery under conditions that could hazard the machinery or personnel. These are to include 'turning gear engaged', 'low lubricating oil pressure', where oil pressure is essential for the prevention of damage during start up, 'shaft brake engaged' and where machinery is not available due to maintenance or repairs. The interlock system is to be arranged to 'fail safe'.
- 4.14.2 In the case of machinery with manual turning gear which is not permanently attached, warning devices or notices may be provided as an alternative to interlocks as required by *Vol 2, Pt 1, Ch 3, 4.14 Machinery interlocks 4.14.1*.

4.15 Stopping of machinery

- 4.15.1 Diesel engines, gas and steam turbines, other prime movers, Mobility systems and Ship Type systems are to be provided with a means of emergency stop, capable of being activated at a position outside the compartment in which the machinery is located. The arrangements are to be fully independent of control and alarm systems, and are to ensure a safe and controlled shutdown of machinery. Where such arrangements depend upon programmable electronic equipment, they are to comply with the relevant requirements in Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems
- 4.15.2 Emergency stops are to be designed to minimise the risk of accidental or unauthorised operation.

4.16 Control of rotating systems

- 4.16.1 An effective means of setting and adjusting the rotation speed of each complete rotating system (e.g. prime mover, gearing, shafting, alternator and propeller) to defined operating performance requirements is to be provided. The means and arrangements for adjusting the speed of rotation are to recognise any requirements for the avoidance of running in barred speed range(s).
- 4.16.2 All prime movers are to be provided with an efficient governor arrangement that is capable of controlling the prime mover's set speed within defined limits when subject to load changes. The performance of governors is to recognise the rotating system's specification of capability during normal, emergency and reversionary modes of operation. For power train systems, the inertia of components and associated requirements for speed control of the prime mover are to be addressed. See Vol 2, Pt 2, Ch 1 Reciprocating Internal Combustion Engines, Vol 2, Pt 2, Ch 2 Gas Turbines and Vol 2, Pt 2, Ch 3 Steam Turbines for the respective performance requirements of governors fitted to diesel engines, gas turbines and steam turbines.
- 4.16.3 The arrangements for control of rotating systems are to comply with Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems as applicable and are to be such that failure in any item of equipment in the control system does not cause a hazard to the operation of the prime mover. The arrangements are to comply with the requirements of Vol 2, Pt 1, Ch 3, 4.16 Control of rotating systems as applicable.

4.17 Survey and refit

4.17.1 Arrangements are to be provided for the discharge of fuels and lubricating oils from the ship to a safe off ship facility where operational requirements necessitate system cleaning and refit.

4.18 Electromagnetic hazards

- 4.18.1 All equipment, operating and observation positions are, as far as is practicable, to be sited clear of sources of electromagnetic energy such as radars, communication transmitters or lightning conductors.
- 4.18.2 Where sources of electromagnetic energy or the swept beam of radar aerials are in close proximity to equipment operating and observation positions, suitable warning notices and markings are to be provided to draw attention to the potential hazards.

4.19 Flexible hose and bellows expansion piece registers

- 4.19.1 Flexible hoses and bellows expansion piece units are life limited and a Register of such units is to be established and maintained for all units installed on board where failure may result in any of the following:
- (a) Fire spread.

Volume 2, Part 1, Chapter 3

Section 5

- (b) Flooding that could lead to the loss of any compartment.
- (c) Loss of availability of a mobility or ship type system.
- (d) Danger to personnel from release of stored energy.
- 4.19.2 The following information is to be included in the Register:
- (a) Equipment designation and location on ship.
- (b) Purpose.
- (c) Hose specification including end fittings.
- (d) Date of manufacture and cure date in the case of rubber units.
- (e) Date of installation.
- (f) Date of pressure/installation testing.
- (g) Routine inspection interval.
- (h) Pressure testing.
- (i) Due for renewal.

A typical Flexible Hose Register format is shown in Table 3.4.4 Typical Flexible Hose Register.

Table 3.4.4 Typical Flexible Hose Register

Flexible hose register				
System		Length		
Equipment			Nominal bore	
Position			Offset angle between elbow and fittings	
End fitting 1	End fitting 1		End fitting 2	
Purpose		Max working pressure		
Specification	Specification		Hose test pressure	
Manufacturer's part No.	Cure date	Date fitted	Date for renewal	Inspection, test, change date and remarks

- 4.19.3 Flexible hoses and bellows expansion pieces are to comply with the requirements of *Vol 2, Pt 7, Ch 1, 13 Flexible hoses* and *Vol 2, Pt 7, Ch 1, 14 Expansion pieces* as applicable and should be labelled in order to provide a clear trace between the Register and equipment.
- 4.19.4 A Naval Authority may require the scope of a flexible hose or expansion bellows piece Register for purposes other than those detailed in *Vol 2, Pt 1, Ch 3, 4.19 Flexible hose and bellows expansion piece registers 4.19.1*.

■ Section 5

Machinery space arrangements

5.1 Machinery spaces

- 5.1.1 Machinery spaces of category A are those spaces and trunks to such spaces which contain:
- (a) internal combustion machinery used for main propulsion; or

Volume 2, Part 1, Chapter 3

Section :

- (b) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power of not less than 375 kW; or
- (c) any oil-fired boiler or fuel oil unit.
- 5.1.2 Machinery spaces are all machinery spaces of Category A and all other spaces containing propulsion machinery, boilers, fuel oil units (defined in *Vol 2, Pt 1, Ch 3, 5.1 Machinery spaces 5.1.3*), steam and internal combustion engines, generators and major electrical machinery, oil filling stations, refrigerating, stabilising, ventilation and air-conditioning machinery, and similar spaces and trunks to such spaces.
- 5.1.3 A fuel oil unit is the equipment used for the preparation of fuel oil for delivery to an oil-fired boiler, or equipment used for the preparation for delivery of heated oil to an internal combustion engine, and includes oil pressure pumps, filters and heaters dealing with oil at a pressure of more than 0,18 N/mm².
- 5.1.4 Aluminium is not to be used for the crowns or casings of Category A machinery spaces. Where the hull is constructed of aluminium or composite material, consideration will be given to the use of aluminium for the crown or casings for such spaces where the fire safety issues relating to the use of aluminium have been addressed to the satisfaction of LR.
- 5.1.5 Windows are not to be fitted in machinery space boundaries. However, this does not preclude the use of glass in control rooms within the machinery space.
- 5.1.6 Machinery space skylights, where fitted, are not to contain glass.
- 5.1.7 In addition, the requirements of Vol 1, Pt 3, Ch 2, 6 Machinery space arrangements are to be complied with.

5.2 Accessibility

- 5.2.1 Accessibility, for attendance and maintenance purposes, is to be provided in all spaces for machinery and engineering systems and equipment.
- 5.2.2 Removal routes for items of machinery and equipment are to be established where routine removal of major items of equipment is envisaged.

5.3 Machinery fastenings

- 5.3.1 Bedplates, thrust seatings and other fastenings are to be of robust construction, and the machinery is to be securely fixed to the ship's structure to the satisfaction of the Surveyor. For NS3 type ships or where specified, the arrangement is to be such that it is sufficient to restrain the dynamic forces arising from vertical and horizontal acceleration appropriate to the intended service, see *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.5* and *Vol 2, Pt 1, Ch 3, 5.4 Collision load*.
- 5.3.2 Machinery may be installed on rafts of rigid construction and these are to be of robust construction to ensure that alignment is maintained under all conditions of ship motion. The rafts are to be securely fixed to the ship's structure.

5.4 Collision load

5.4.1 Unless an accurate analysis of the collision load is submitted and found acceptable by LR, the collision load is to be determined from:

$$g(\text{collision}) = 1, 2 \frac{P_{\text{coll}}}{\Delta g}$$

where the load P_{coll} is taken as the lesser of:

$$P_{\text{coll}} = 460 (M C_{\perp})^{2/3} (E C_{H})^{1/3} \text{ kN}$$

$$P_{\text{coll}} = 9000 \, M \, C_{\text{L}} \, [C_{\text{H}} \, (T+2)]^{1/2} \, \text{kN}$$

where

 C_{H} = a factor given in *Table 3.5.1 Factor C*_H

$$C_{\perp} = \frac{\left(165 + L_{\text{WL}}\right)}{245} \left(\frac{L_{\text{WL}}}{80}\right)_{0,4}$$

D = ship depth, in metres, from the underside of keel amidships to the top of effective hull girder

660

Volume 2, Part 1, Chapter 3

Section 5

 $E = 0.5\Delta V^2 \text{ kNm}$

 H_T = minimum height, in metres, from tunnel or wet-deck bottom to the top of effective hull girder for catamarans and surface effect ships

= D for air cushion vehicles

 L_{WL} = ship waterline length, in metres

M = 1.3 for high tensile steel

= 1,0 for aluminium alloy

= 0.95 for mild steel

= 0,8 for fibre reinforced plastics

T =buoyancy tank clearance to skirt tip, in metres, (negative) for ACVs

= lifted clearance from keel to water surface, in metres, (negative) for hydrofoils

= ship draught to the underside of keel amidships, in metres, for all other ships

V = operational speed of ship, in m/s

 $g = \text{gravitational acceleration} = 9,806 \text{ m/s}^2$

 $\Delta = ext{ship displacement}$, to be taken as the mean of the lightweight and maximum operational weight, in tonnes

Table 3.5.1 Factor C_H

Factor C _H	Catamarans, SES	Mono-hulls, H'Foils	ACVs
Сн	$\frac{T+2+f(D/2)}{2D}$	$\frac{T+2+f(D/2)}{2D}$	$\frac{f}{4}$
where			
f = 0 for	T + 2 < D - H _T	T + 2 < D	_
f = 1 for	$D > T + 2 \ge D - H_{T}$	T + 2 ≥ D	H _T > 2
f = 2 for	T + 2 ≥ D M	_	H _T ≤2

5.5 Resilient mount

- 5.5.1 The dynamic angles of inclination in *Table 3.4.2 Inclinations* may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the vibration levels of flexible pipe connections, shaft couplings and mounts remain within the limits specified by the component manufacturer for the following conditions:
- (a) Maximum dynamic inclinations to be expected during service;
- (b) Start-stop operation; and
- (c) The natural frequencies of the system.

Due account is to be taken of any creep that may be inherent in the mount.

- 5.5.2 For equipment of installed power greater than 375 kW, see *Vol 2, Pt 1, Ch 3, 5.1 Machinery spaces 5.1.1*, a calculation report is to be submitted to demonstrate that the requirements of *Vol 2, Pt 1, Ch 3, 5.5 Resilient mount 5.5.1* are met. The calculation report is to include as a minimum:
- (a) A plan showing the arrangement of the machinery including mounts, exhaust bellows, and flexible couplings and pipe connections, as applicable; and

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 5

- (b) Maximum allowable loads and deflections and any appropriate type approval documentation for each flexible element (resilient mounts, exhaust gas bellows, flexible couplings and any other applicable flexible pipe connections) for the conditions identified in *Vol 2, Pt 1, Ch 3, 5.5 Resilient mount 5.5.1*; and
- (c) Calculations including natural frequencies and maximum expected loads and deflections of each flexible element (resilient mounts, exhaust gas bellows, flexible couplings and any other applicable flexible pipe connections) for the conditions identified in Vol 2, Pt 1, Ch 3, 5.5 Resilient mount 5.5.1.
- 5.5.3 Positive means are to be fitted to ensure that manufacturers' limits for lateral or vertical motion are not exceeded. Where resilient mounts are approved for collision loading, then the extent of any additional anti-collision chocking that may be required will be specially considered. Suitable means are to be provided to accommodate the propeller thrust.
- 5.5.4 Mounts are to be shielded from the possible detrimental effects of oil and, where appropriate, paint and other contaminants.
- 5.5.5 Shafting, piping connections and electrical cable connections are to be provided with sufficient flexibility to accommodate expected movements. Particular attention should be paid to exhaust bellows and the effectiveness of flexible couplings.

5.6 Additional requirements for resilient mounts

- 5.6.1 Where the ship has specified military requirements that include the ability of machinery to withstand shock, the flexible element(s) (resilient mounts, exhaust gas bellows, flexible couplings and any other applicable flexible pipe connections) are to be approved in accordance with such requirements. See also Vol 1, Pt 1, Ch 2, 3.8 Military Distinction notations, Vol 1, Pt 4, Ch 2, 5.7 Shock mounts and Vol 2, Pt 1, Ch 3, 4.11 Machinery shock arrangements.
- 5.6.2 Where the ship has specified military requirements for underwater signature, the flexible element(s) (resilient mounts, exhaust gas bellows, flexible couplings and any other applicable flexible pipe connections) are to be approved in accordance with such requirements. See also Vol 2, Pt 1, Ch 3, 4.10 Guidance for underwater signature.

5.7 Resin chocks

- 5.7.1 Synthetic resin compounds used as materials for chocks under machinery components for which alignment is critical, e.g. main engine, gearbox and auxiliary installations where the engine and generator do not share a common baseplate, are to be of a type accepted by LR.
- 5.7.2 The resin chock materials referred to in Vol 2, Pt 1, Ch 3, 5.4 Collision load 5.4.1 are to be tested in accordance with Ch 14, 2.11 Machinery chocking compounds (resin chocks), Ch 14, 3.9 Machinery chocking compounds and Ch 14, 5.14 Synthetic chocking compounds of the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.
- 5.7.3 Materials for chockings are to be approved for the maximum service temperature that the chock will experience.
- 5.7.4 The use of resin for chocking gas turbine casings or similar high temperature applications will be specifically considered.
- 5.7.5 Where the ship has specified military requirements that include design and installation of machinery to withstand shock, the resin is to be approved for this application.

5.8 Additional requirements resin chocks

5.8.1 Where the ship has specified military requirements that include design and installation of machinery to withstand shock, the resin is to be approved for this application. See also Vol 1, Pt 1, Ch 2, 3.8 Military Distinction notations, Vol 1, Pt 4, Ch 2, 5.6 Seat design and Vol 2, Pt 1, Ch 3, 4.11 Machinery shock arrangements.

5.9 Ventilation

- 5.9.1 All spaces including engine and pump spaces, where flammable or toxic gases or vapours may accumulate, are to be provided with adequate ventilation under all conditions.
- 5.9.2 Machinery spaces are to be ventilated so as to ensure that when machinery or boilers therein are operating at full power in all weather conditions, including heavy weather, a sufficient supply of air is maintained to the spaces for the safety of personnel and the operation of machinery.
- 5.9.3 The selection and arrangements of machinery and associated equipment are to minimise the emission of noxious substances into machinery spaces.

Volume 2, Part 1, Chapter 3

Section !

5.10 Fire protection

5.10.1 All surfaces of machinery where the surface temperature may exceed 220°C and where impingement of flammable liquids may occur are to be effectively shielded to prevent ignition. Where insulation covering these surfaces is oil-absorbing or may permit penetration of oil, the insulation is to be encased in steel or equivalent.

5.11 Means of escape

- 5.11.1 Except as permitted in *Vol 2, Pt 1, Ch 3, 5.11 Means of escape 5.11.2*, two means of escape are to be provided from each machinery space of Category A. In particular, one of the following provisions are to be complied with:
- (a) Two sets of steel ladders as widely separated as possible leading to doors in the upper part of the space similarly separated and from which access is provided to the open deck. In general, one of these ladders shall provide continuous fire shelter from the lower part of the space to a safe position outside the space. The shelter is to be of steel, insulated, where necessary and provided with a self-closing steel door. The shelter will not be required if, due to the special arrangement or dimensions of the machinery space, a safe escape route from the lower part of the space is provided.
- (b) One steel ladder leading to a door in the upper part of the space from which access is provided to the open deck and additionally, to the lower part of the space and in a position well separated from the ladder referred to, a steel door capable of being operated from each side and which provides access to a safe escape route from the lower part of the space to the open deck.

Alternative arrangements in accordance with the requirements as specified by the Naval Administration may also be acceptable.

- 5.11.2 Where specified and agreed by the Naval Administration, in a NS3 category ship, one of the means of escape required in *Vol 2, Pt 1, Ch 3, 5.11 Means of escape 5.11.1* may not be required with due regard being paid to the dimension and disposition of the upper part of the space.
- 5.11.3 When access to any machinery space of Category A is provided at a low level from an adjacent shaft tunnel, there is to be provided in the shaft tunnel, near the watertight door, a light steel fire-screen operable from each side.
- 5.11.4 From machinery spaces other than those of Category A, escape routes are to be provided having regard to the nature and location of the space and whether persons are normally employed in the space.
- 5.11.5 Lifts are not to be considered as forming one of the required means of escape.

5.12 Communications

- 5.12.1 At least two independent means of communication are to be provided between the bridge and engine room control station from which the engines are normally controlled.
- 5.12.2 One of the two means required by *Vol 2, Pt 1, Ch 3, 5.12 Communications 5.12.1* shall visually indicate the order and response, both at the engine room control station and on the bridge.
- 5.12.3 At least one means of communication is to be provided between the bridge and any other control position(s) from which the propulsion machinery may be controlled.
- 5.12.4 At least two independent means of communication are to be provided between the main and emergency switchboards.

5.13 Personnel safety

- 5.13.1 All moving parts of machinery are to be provided with suitable railings and/or guards to prevent injury to personnel.
- 5.13.2 Protection is to be provided to prevent injury from hot surfaces, i.e. by suitable lagging or guards.
- 5.13.3 Assemblies incorporating pre-loaded springs are to be engineered such that spring forces can be released in a controlled and safe manner during the removal and/or disassembly process.
- 5.13.4 Open ends from relief valve pressure release pipes are to be arranged so that any discharge is directed away from positions where personnel might reasonably be expected to be. If relief pipes cross citadel boundaries, the relief valves are to relieve through sealed tundishes able to withstand the citadel over-pressure.
- 5.13.5 Sufficient deck plates, platforms and handholds are to be fitted to provide safe access to all parts of the machinery and ensure safe passageway between machinery and adjacent equipment.
- 5.13.6 Materials used in the construction of machinery and installation of engineering systems are not to be a recognised hazard to personnel. This includes the prohibition of asbestos.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 5

5.13.7 Means are to be provided for automatically giving audible warning of the release of fire-extinguisihing medium into any space in which personnel normally work or to which they have access, see also Vol 2, Pt 9, Ch 9, 5.8 Fire extinguishing media release 5.8.1

5.14 Machinery enclosures

- 5.14.1 Where machinery is installed within enclosures, the requirements of Vol 2, Pt 1, Ch 3, 5.14 Machinery enclosures 5.14.2 and Vol 2, Pt 1, Ch 3, 5.15 Fire detection, alarm and extinguishing arrangements are to be complied with.
- 5.14.2 Enclosures are to be treated as unattended machinery spaces and comply with the relevant Rules for such spaces and installed equipment.
- 5.14.3 Enclosures are, as far as reasonably practicable, to be gastight with flexible sealing arrangements between air induction, exhaust and ventilation systems.
- 5.14.4 The arrangements are to prevent contamination of the machinery space in an CBRN environment.
- 5.14.5 Enclosures are to be constructed to form a suitable fire boundary.
- 5.14.6 An access door, adequate internal lighting and observation windows, with suitable fire rating, are to be located to afford a clear view of both sides of the equipment within the enclosure.
- 5.14.7 Suitable means of drainage of any liquids which may accumulate are to be provided without compromising the citadel.
- 5.14.8 Enclosures are to be suitably ventilated and designed to maintain all components within their safe working temperature under all operating conditions. The ventilation system is to be independent from the machinery space ventilation arrangements and provided with suitable closing devices for fire control purposes.
- 5.14.9 Enclosures are to be provided with a means to enable gas purging with a portable fan in addition to the fixed ventilation system.
- 5.14.10 Means are to be provided to monitor the enclosure air temperature and differential pressure.

5.15 Fire detection, alarm and extinguishing arrangements

- 5.15.1 Machinery spaces and enclosures are to be provided with fire detection, alarm and extinguishing systems in accordance with the fire safety arrangements required by the Regulations in *Vol 1, Pt 1, Ch 2, 1.1 Framework of Classification 1.1.9* For unattended machinery spaces a fire detection system in accordance with *Vol 2, Pt 9, Ch 1, 4.5 Fire detection alarm system* is to be fitted.
- 5.15.2 The design of fire extinguishing arrangements in any machinery space or enclosure are to take the following into consideration:
- (a) The flammable materials and potential sources of ignition within the space or enclosure;
- (b) any need for machinery and equipment to remain operational during operation of the fire extinguishing arrangements;
- (c) the need for machinery and equipment to continue to function normally following operation of the fire extinguishing arrangements; and
- (d) any need for personnel to enter or remain within the space or enclosure during operation of the fire extinguishing arrangements.

In spaces where electrical equipment is located, consideration is to be given to providing separate enclosures where appropriate. See also Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.14.

5.16 Location of emergency installations

5.16.1 Emergency sources of electrical power, fire pumps, bilge pumps except those specifically serving the spaces forward of the collision bulkhead, any fixed fire-extinguishing system and other emergency installations which are essential for the safety of the ship, except anchor windlasses, shall not be installed forward of the collision bulkhead.

Volume 2, Part 1, Chapter 3

Section 6

■ Section 6

Reciprocating internal combustion engines

6.1 Design and testing

- 6.1.1 For details of design requirements, see Vol 2, Pt 2, Ch 1 Reciprocating Internal Combustion Engines.
- 6.1.2 For details of materials and component testing requirements, see Vol 2, Pt 2, Ch 1, 2 Materials and components.
- 6.1.3 For details of engine type testing requirements, see Vol 2, Pt 2, Ch 1, 13 Type Testing General and LR's Type Approval Test Specification No. 4 Type Testing of Reciprocating Internal Combustion Engines and Associated Ancillary Equipment.

6.2 Construction and welding

- 6.2.1 Welding of engine structures is to be in accordance with the requirements specified in *Ch 13 Requirements for Welded Construction* of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).
- 6.2.2 On completion of welding and stress relief heat treatment, welds are to be examined. Welds in transverse girder assemblies are to be crack detected by an approved method. Other joints are to be similarly tested if required by the Surveyors.
- 6.2.3 Forgings and castings are to be examined at the manufacturer's works.

■ Section 7

Turbochargers

7.1 Design and testing

- 7.1.1 For details of design requirements, see Vol 2, Pt 2, Ch 1 Reciprocating Internal Combustion Engines.
- 7.1.2 For details of testing requirements, see Vol 2, Pt 2, Ch 1, 12 Turbochargers.

■ Section 8

Gas turbines

8.1 Design

8.1.1 For details of design requirements, see Vol 2, Pt 2, Ch 2 Gas Turbines.

8.2 Construction under survey

8.2.1 All gas turbine units intended for installation in a ship classed or intended to be classed with LR are to to be constructed in accordance with LR's Quality Assurance Scheme for Machinery, see Vol 2, Pt 1, Ch 1, 8 Quality assurance scheme for machinery.

8.3 Dynamic balancing

8.3.1 All compressor and turbine rotors as finishedbladed and complete with all relevant parts such as halfcouplings, are to be dynamically balanced in accordance with the manufacturer's specification in a machine of sensitivity appropriate to the size of rotor.

8.4 Hydraulic testing

8.4.1 Where design permits, casings are to be tested to a hydraulic pressure equal to 1,5 times the highest pressure in the casing during normal operation, or 1,5 times the pressure during starting, whichever is the higher. For test purposes, if necessary,

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 9

the casings may be subdivided with temporary diaphragms for distribution of test pressure. Where the operating temperature exceeds 300°C, the test pressure is to be suitably corrected.

- 8.4.2 Where hydraulic testing is impracticable, nondestructive tests by ultrasonic or radiographic methods are to be carried out on the entire circumference of all casing parts with satisfactory results. Where ultrasonic tests have been carried out, the manufacturer is to provide documentary evidence that ultrasonic examination has been carried out by an approved operator and that there were no indications of defects which could be expected to have a prejudicial effect on the operational performance of the gas turbine.
- 8.4.3 The shell and tube arrangement of intercoolers and heat exchangers are to be tested to 1,5 times their maximum working pressure.

8.5 Overspeed tests

- 8.5.1 Before installation, it is to be satisfactorily demonstrated that the gas turbine is capable of safe operation for five minutes at 5 per cent above the nominal setting of the overspeed protective device, or 15 per cent above the maximum design speed, whichever is the higher.
- 8.5.2 Where it is impracticable to overspeed the complete installation, each compressor and turbine rotor completely bladed and with all relevant parts such as halfcouplings, are to be overspeed-tested individually at the appropriate speed.

■ Section 9

Steam turbines

9.1 Design

9.1.1 For details of design requirements, see Vol 2, Pt 2, Ch 3 Steam Turbines

9.2 Stability testing of turbine rotors

- 9.2.1 All solid forged H.P. turbine rotors intended for main propulsion service where the inlet steam temperature exceeds 400°C are to be subjected to at least one thermal stability test. This requirement is also applicable to rotors constructed from two or more forged components joined by welding. The test may be carried out at the forge or turbine builders' works:
- (a) after heat treatment and rough machining of the forging, or
- (b) after final machining, or
- (c) after final machining and blading of the rotor.

The stabilising test temperature is to be not less than 28°C above the maximum steam temperature to which the rotor will be exposed, and not more than the tempering temperature of the rotor material. For details of a recommended test procedure and limits of acceptance, see *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1* & 2. Other test procedures may be adopted if approved.

9.2.2 Where main turbine rotors are subjected to thermal stability tests at both forge and turbine builders' works, the foregoing requirements are applicable to both tests. It is not required that auxiliary turbine rotors be tested for thermal stability, but if such tests are carried out, the requirement for main turbine rotors will be generally applicable.

9.3 Balancing

9.3.1 All rotors as finished-bladed and complete with half-coupling are to be dynamically balanced to the Surveyor's satisfaction, in a machine of sensitivity appropriate to the size of rotor.

9.4 Hydraulic tests

- 9.4.1 Manoeuvring valves are to be tested to twice the working pressure. The nozzle boxes of impulse turbines are to be tested to 1,5 times the working pressure.
- 9.4.2 The cylinders of all turbines are to be tested to 1,5 times the working pressure in the casing, or to 2,0 bar, whichever is the greater.
- 9.4.3 For test purposes, the cylinders may be subdivided with temporary diaphragms for distribution of test pressures.

Volume 2, Part 1, Chapter 3

Section 10

9.4.4 Condensers are to be tested in the steam space to 1,0 bar. The water space is to be tested to the maximum pressure which the pump can develop at ship's full draught with the discharge valve closed plus 0,7 bar, with a minimum test pressure of 2,0 bar. Where the operating conditions are not known, the test pressure is to be not less than 3,4 bar, see Vol 2, Pt 7, Ch 1 Piping Design Requirements

9.5 Indicators for movement

9.5.1 Indicators for determining the axial position of rotors relative to their casings, and for showing the longitudinal expansion of casings at the sliding feet, if fitted, are to be provided for main turbines. The latter indicators should be fitted at both sides and be readily visible.

9.6 Weardown gauges

9.6.1 Main and auxiliary turbines are to be provided with bridge weardown gauges for testing the alignment of the rotors.

■ Section 10

Gearing

10.1 Design

10.1.1 For details of design requirements, see Vol 2, Pt 3, Ch 1 Gearing

10.2 Construction and welding

- 10.2.1 Where castings are used for wheel centres, any radial slots in the periphery are to be fitted with permanent chocks before shrinking-on the rim.
- 10.2.2 Where welded construction is used for the manufacture of wheels and gearcases, welding is to be in accordance with the requirements specified in *Ch 13 Requirements for Welded Construction* of the Rules for Materials.
- 10.2.3 Welded constructions are to be stress relief heat treated on completion of welding.
- 10.2.4 Bolted attachments within the gear case are to be secured by locking wire or equivalent means.

10.3 Accuracy of gear cutting

10.3.1 The machining accuracy (Q grade) of pinions and wheels is to be demonstrated. For this purpose, records of measurements are to be available for review.

10.4 Non-destructive testing

- 10.4.1 Magnetic particle or liquid penetrant testing is to be carried out on the teeth of all surface hardened forgings. This examination may also be requested on the finished machined teeth of through hardened gear forgings.
- 10.4.2 The manufacturer is to carry out an ultrasonic examination of all forgings where the finished diameter of the surfaces, where teeth will be cut, is in excess of 200 mm, and is to provide LR with a signed statement that such inspection has not revealed any significant internal defects.
- 10.4.3 On gear forgings where the teeth have been surface hardened, additional test pieces may be required to be processed with the forgings and subsequently sectioned to determine the depth of the hardened zone. These tests are to be carried out at the discretion of the Surveyor, and for induction or carburised gearing, the depth of the hardened zone is to be in accordance with the approved specification. For nitrided gearing, the full depth of the hardened zone, i.e. depth core hardness, is to be not less than 0,5 mm and the hardness at a depth of 0,25 mm is to be not less than 500 Hv.

10.5 Dynamic balancing

- 10.5.1 All rotating elements such as pinion and wheel shaft assemblies and coupling parts, are to be appropriately balanced.
- 10.5.2 The permissible residual unbalance, *U*, is defined as follows:

Volume 2, Part 1, Chapter 3

Section 10

$$U = \frac{60 \text{m}}{R} \times 10^3 \text{ g mm for } R < 3000$$

$$U = \frac{24\text{m}}{R} \times 10^3 \text{ g mm for } R > 3000$$

where

m = mass of rotating element, in kg

R = maximum service rev/min of the rotating element.

10.5.3 Where the size or geometry of a rotating element precludes measurement of the residual unbalance, a full speed running test of the assembled gear unit at the manufacturer's works will normally be required to demonstrate satisfactory operation.

10.6 Meshing tests

- 10.6.1 Initially, meshing gears are to be carefully matched on the basis of the accuracy measurements taken. The alignment is to be demonstrated in the workshop by meshing in the gearbox without oil clearance in the bearings. Meshing is to be carried out with the gears locating in their light load positions and a load sufficient to overcome pinion weight and axial movement is to be imposed.
- 10.6.2 The gears are to be suitably coated to demonstrate the contact marking. The thickness of the coating to determine the contact marking is not to exceed 0,005 mm. The marking is to reflect the accuracy grade specified and end relief, crowning or helix correction, where these have been applied.
- 10.6.3 For gears without crowning or helix correction the marking is to be not less than shown in *Table 3.10.1 No load tooth contact marking*.

Table 3.10.1 No load tooth contact marking

ISO accuracy grade	Contact marking area		
Q ≤ 5	50% b x 40% h _w + 40% b x 20% h _w		
Q≥6	35% b x 40% h _w + 35% b x 20% h _w		
Note 1. Where b is the face width and h $_{\rm w}$ is the working tooth depth.			
Note 2. For spur gears, the values of $h_{\rm w}$ should be increased by a further 10%			

- 10.6.4 Where allowance has been given for end relief, crowning or helix correction, the normal shop meshing tests are to be supplemented by tooth alignment traces or other approved means to demonstrate the effectiveness of such modifications.
- 10.6.5 For gears with crowning or helix correction the marking is to correspond, to the designed no load contact pattern.
- 10.6.6 A permanent record is to be made of the meshing contact for purpose of checking the alignment when installed on board the craft.
- 10.6.7 The full load tooth contact marking is to be not less than shown in *Table 3.10.2 Full load tooth contact marking*

Table 3.10.2 Full load tooth contact marking

ISO accuracy grade	Contact marking area		
Q ≤ 5	60% b x 70% h _w + 30% b x 50% h _w		
Q ≥ 6	45% b x 60% h _w + 35% b x 40% h _w		
Note 1. Where b is the face width and h w is the working tooth depth.			
Note 2. For spur gears, the values of $h_{\rm w}$ should be increased by a further 10%			

Volume 2, Part 1, Chapter 3

Section 1:

10.6.8 Where, due to the compactness of the gear unit, meshing tests of individual units cannot be verified visually, consideration may be given to the gear manufacturer providing suitable evidence that the design meshing condition has been attained on units of the same design.

10.6.9 The normal backlash between any pair of gears should not be less than: + 0,1 mm

$$\frac{a. \alpha_n}{9000} + 0, 1 \text{ mm}$$

where

 α_n = normal pressure angle, in degrees

a =centre distance, in mm.

■ Section 11

Shafting systems

11.1 Design

11.1.1 For details of design requirements, see Vol 2, Pt 3, Ch 2 Shafting Systems

11.2 Construction

- 11.2.1 Boring of the sternframe, fitting of the sterntube and bearings and aligning the shafting are to be carried out to a formal traceable procedure.
- 11.2.2 Before boring the sternframe, the ship's structure should be generally complete to the upper deck and to the engineroom forward bulkhead.

11.3 Shaft bearing clearances

11.3.1 After installation of the screwshaft and any shafting installed in bearings fitted in stern bushes or shaft bearings in 'A' and 'P' brackets, the bearing clearances are to be measured and recorded. The records are to be placed on board.

■ Section 12

Propellers

12.1 Design

12.1.1 For details of design requirements, see Vol 2, Pt 4, Ch 1 Propellers

12.2 Construction and welding

- 12.2.1 Castings are to be examined at the manufacturer's works.
- 12.2.2 All finished propellers are to be examined for material defects, and finish, and measured for dimensional accuracy of diameter and pitch. Propeller repairs by welding, where proposed, are to be in accordance with the requirements of *Ch 9, 1 Castings for propellers* of the Rules for Materials.

12.3 Shop tests of keyless propellers

- 12.3.1 The bedding of the propeller with the shaft is to be demonstrated. Sufficient time is to be allowed for the temperature of the components to equalise before bedding. Alternative means for demonstrating the bedding of the propeller will be considered.
- 12.3.2 Means are to be provided to indicate the relative axial position of the propeller boss on the shaft taper.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 13

12.4 Shop tests of controllable pitch propellers

- 12.4.1 The components of controllable pitch propellers are also subject to material tests, as in the case of solid propellers.
- 12.4.2 Examination of all the major components including dimensional checks, hydraulic pressure testing of the hub and cone assembly and the oil distribution box, where fitted, together with a full shop trial of the completed controllable pitch propeller assembly, is to be carried out.

12.5 Final fitting of keyless propellers

- 12.5.1 After verifying that the propeller and shaft are at the same temperature and that the mating surfaces are clean and free from oil or grease, the propeller is to be fitted on the shaft under survey. The propeller nut is to be securely locked to the shaft.
- Permanent reference marks are to be made on the propeller boss nut and shaft to indicate angular and axial positioning of the propeller. Care is to be taken in marking the inboard end of the shaft taper to minimise stress raising effects.
- 12.5.3 The outside of the propeller boss is to be hard stamped with the following details:

For oil injection method of fitting, the start point load, in Newtons, and the axial pull-up at 0°C and 35°C, in mm. For the dry fitting method, the push-up load at 0°C and 35°C, in Newtons.

12.5.4 A copy of the fitting curve relative to temperature and means for determining any subsequent movement of the propeller are to be placed on board.

12.6 Final fitting of keyed propellers

12.6.1 The fit of the screwshaft cone to both the working and any spare propeller is to be carried out under survey. Generally, a satisfactory fit for keyed type propellers should show a light, overall marking of the cone surface with a tendency towards heavier marking in way of the larger diameter of the cone face. The final fit to cone should be made with the key in place.

■ Section 13

Water jet units

13.1 Design

13.1.1 For details of design requirements, see Vol 2, Pt 4, Ch 2 Water Jet Systems.

13.2 Construction and welding

- 13.2.1 The following components are to be inspected at the manufacturer's works:
- Steering nozzle.
- Reverse bucket.
- Stator impeller.
- Integral bearing.
- 13.2.2 Welded construction is to be in accordance with the requirements specified in *Ch 13 Requirements for Welded Construction* of the Rules for Materials.
- 13.2.3 Welded components are to comply with the requirements of *Vol 1, Pt 3, Ch 3 Ship Control Systems*, and be subject to stress relief heat treatment upon completion. Where an impeller has welded blades, non-destructive testing is to be carried out to an approved procedure.

13.3 Testing

13.3.1 Testing of the first installation of a new type of water jet unit is required and is to demonstrate the adequacy of the steering and reversing mechanisms during the most arduous manoeuvres.

Volume 2, Part 1, Chapter 3

Section 14

■ Section 14

Thrusters

14.1 Design and construction

14.1.1 For details of design and construction requirements, see Vol 2, Pt 4, Ch 3 Thrusters.

14.2 Azimuth thrusters

- 14.2.1 The performance specified for the craft is to be demonstrated.
- 14.2.2 The actual values of steering torque are to be verified during sea trials to confirm that the design maximum dynamic duty torque has not been exceeded.

14.3 Tunnel thrusters

14.3.1 It is to be demonstrated that the thruster unit meets the specified performance.

Section 15

Podded propulsion units

15.1 Design

15.1.1 For details of design requirements, see Vol 2, Pt 4, Ch 4 Podded Propulsion Units.

15.2 Testing and trials

- 15.2.1 The following requirements are to be complied with:
- Vol 2, Pt 1, Ch 3, 17 Sea trials for sea trials.
- Vol 2, Pt 1, Ch 3, 16 Steering systems for steering trials.

In addition, the functional capability specified in Vol 2, Pt 1, Ch 3, 3.1 Submission of information is to be demonstrated to the Surveyor's satisfaction.

- 15.2.2 The actual values of steering torque are to be verified during sea trials to confirm that the design maximum dynamic duty torque has not been exceeded.
- 15.2.3 Electric motor cooling systems are to be verified, as far as possible, to ensure that they are capable of limiting the extremes of ambient temperature to those specified in *Vol 2, Pt 4, Ch 4, 2.3 Pod internal atmospheric conditions 2.3.1*.
- 15.2.4 Any trials and testing identified from the Risk Assessment report, see Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA), are also to be carried out.

■ Section 16

Steering systems

16.1 Design

16.1.1 For details of design requirements, see Vol 2, Pt 6, Ch 1 Steering Gear

16.2 Construction

16.2.1 The requirements of the Rules relating to the testing of Class I pressure vessels, piping and related fittings including hydraulic testing apply.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 17

16.3 Type testing

16.3.1 Each type of power unit pump is to be subjected to a type test. The type test is to be for a duration of not less than 100 hours, the test arrangements are to be such that the pump may run in idling conditions, and at maximum delivery capacity at maximum working pressure. During the test, idling periods are to be alternated with periods at maximum delivery capacity at maximum working pressure. The passage from one condition to another should occur at least as quickly as on board. During the whole test no abnormal heating, excessive vibration or other irregularities are permitted. After the test, the pump is to be opened out and inspected. Type tests may be waived for a power unit which has been proven to be reliable in marine service.

16.4 Testing

- 16.4.1 After installation on board, the steering unit is to be subjected to the applicable hydrostatic and running tests.
- 16.4.2 The steering system is to be demonstrated to show that the requirements of the Rules have been met. The trial is to include the operation of the following:
- (a) The steering system, including demonstration of the functional performances.
- (b) The steering power units, including transfer between steering power units.
- (c) The isolation of one power actuating system, checking the time for regaining steering capability.
- (d) The hydraulic fluid recharging system (may be effected at the dockside).
- (e) The alternative power supply and emergency hand pump operation.
- (f) The steering controls, including transfer of control and local control.
- (g) The means of communication between the steering compartment and the wheelhouse; also, the engine room, if applicable (may be effected at the dockside).
- (h) The alarms and indicators (may be effected at the dockside).
- (i) Where the steering system is designed to avoid hydraulic locking, this feature is to be demonstrated (may be effected at the dockside).

■ Section 17

Sea trials

17.1 Sea trials requirements

17.1.1 Sea trials are to be of sufficient duration and carried out under normal operating conditions applicable to the intended class notation. Individual Chapters give specific requirements.

17.2 Programme

- 17.2.1 Sea trials are to include the demonstration of:
- (a) The adequacy of the starting arrangements of the main engines, auxiliary systems and emergency generators.
- (b) The effectiveness of the steering gear control systems, see Vol 2, Pt 1, Ch 3, 16.4 Testing 16.4.2.
- (c) Manoeuvring, to include:
- starting;
- normal and emergency stopping;
- reversing;
- governor testing;
- safety devices and associated indicators; and
- alarms.
- (d) The redundancy arrangements.
- (e) Tooth contact markings in geared installations using a recognised technique. The marking is to be as detailed in *Vol 2, Pt 1, Ch 3, 10.6 Meshing tests*
- (f) For controllable pitch propellers, the pitch setting under failure conditions.
- (g) Operation of sliding watertight doors under working conditions.

Volume 2, Part 1, Chapter 3

Section 18

- (h) Anchoring test to demonstrate that the windlass with brakes, etc. functions satisfactorily, and that the power to raise the anchor can be developed and satisfies the Rule requirements. See Vol 1, Pt 3, Ch 5, 7 Towing arrangements.
- (i) Operation of bilge and dewatering systems to dry compartments.
- 17.2.2 Main propulsion systems are to undergo tests to demonstrate the astern response characteristics. The tests are to be carried out over at least the manoeuvring range of the propulsion system and from all control positions. A test plan is to be provided by the yard and accepted by the Surveyor. If specific operational characteristics have been defined by the manufacturer, then these are to be included in the test plan.

17.3 Performance testing requirements for naval vessels

- 17.3.1 The performance of main propulsion machinery is to be demonstrated at full power in accordance with an agreed trials schedule. Engine changeover arrangements are to be demonstrated where applicable.
- 17.3.2 The reversing characteristics of the propulsion plant, including the blade pitch control system of controllable pitch propellers, are to be demonstrated and recorded during trials.
- 17.3.3 It is to be verified that the propeller performs satisfactorily under ahead and astern conditions. Where controllable pitch propellers are fitted, the free route astern trial is to be carried out with the propeller blades set in the full pitch astern condition.
- 17.3.4 It is to be verified that large movements of resiliently mounted machinery do not occur during start up and stop, or during normal operating conditions.
- 17.3.5 The installation should be tested to ensure that gas turbines cannot be continuously operated within any speed range where excessive vibration, stalling or surging may be encountered.
- 17.3.6 For main propulsion systems with reversing gears, controllable pitch propellers or electric propeller drive, running astern is not to lead to the overload of any systems.
- 17.3.7 Steam turbine test requirements are to be agreed with LR, consideration is to be given to ventilation and intake arrangements in the astern direction. The duration of the astern trial is to be limited in accordance with manufacturer's recommendations to avoid overheating of the turbine due to the effects of 'windage' and friction.
- 17.3.8 The following information is to be available on board for the use of designated personnel:
- The results of trials to determine stopping times, ship headings and distance;
- For ships having multiple propellers or multiple steering-propulsion arrangements, the results of trials to determine the ability to navigate and manoeuvre with one or more propellers or steering-propulsion units inoperative;
- For ships having a single propulsor driven by multiple engines or electric motors, the results of trials to determine the ability to navigate and manoeuvre with the largest engine or electric motor inoperative.
- 17.3.9 It is to be demonstrated at the sea trial that the stopping distance achieved when the ship is initially proceeding ahead with a speed of at least 90 per cent of the ship's speed corresponding to 85 per cent of the maximum rated propulsion power should not exceed 15 ship lengths after the astern order has been given. However, if the displacement of the ship makes this criterion impracticable then in no case should the stopping distance exceed 20 ship lengths.

■ Section 18

Risk Assessment (RA)

18.1 General

- 18.1.1 A Risk Assessment (RA) supported using a technique selected from IEC/ ISO 31010 *Risk Management Risk Assessment techniques* is to be performed. The technique selected is to be carried out in accordance with the relevant International Standard or applicable National Standard and with *Vol 2, Pt 1, Ch 3, 18.1 General 18.1.2* for systems (a), (b) and (c) as specified in *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.7*. A justification is to be provided which demonstrates the suitability of the Standard and analysis technique chosen.
- 18.1.2 The RA is to demonstrate that suitable risk mitigation has been achieved for all normal and reasonably foreseeable abnormal conditions. The scope of analysis required for each system is defined in *Vol 2, Pt 1, Ch 3, 18.1 General 18.1.3* and in the respective parts of the Rules.

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 19

Note A reasonably foreseeable abnormal condition is an event, incident or failure that:

- has happened and could happen again;
- has not happened but is considered possible. Where the likelihood is considered extremely unlikely or the consequences are trivial, and no further prevention or mitigation action is to be taken, then this is to be justified;
- is planned for (e.g. emergency actions cover such a situation, maintenance is undertaken to prevent it, etc.).

Note These conditions should be identified by:

- using analysis processes that are capable of revealing abnormal conditions;
- employing a mix of personnel including: designers, operators, persons who carry out maintenance, those with relevant domain knowledge and understanding, and competent safety/risk professionals to apply the processes;
- referencing relevant events and historic data; and
- documenting the results of the analysis.
- 18.1.3 The RA is to be organised in terms of items of equipment and function. The effects of item failures or damage at stated level and at higher levels are to be analysed to determine the effects on the system as a whole. Actions for mitigation are to be determined.
- 18.1.4 The RA is to:
- (a) Identify the equipment or sub-system and their modes of operation and the equipment;
- (b) Identify potential failure modes and damage situations and their causes;
- (c) Evaluate the effects on the system of each failure mode and damage situation;
- (d) Identify measures for reducing the risks associated with each failure mode;
- (e) Identify measures for failure mitigation; and
- (f) Identify trials and testing necessary to prove conclusions.
- 18.1.5 At sub-system level it is acceptable, for the purpose of these Rules, to consider failure of equipment items and their functions, e.g. failure of a pump to produce flow or pressure head. It is not required that the failure of components within that pump be analysed. In addition, failure need only be dealt with as a cause of failure of the pump.
- 18.1.6 Where RA is used for consideration of systems that depend on software based functions for control or co-ordination, the analysis is to investigate failure of the function rather than a specific analysis of the software code.

Section 19

Fin stabilisers

19.1 Design and construction

- 19.1.1 For requirements relating to fin stabiliser scantlings, arrangements, foundations, supporting structure and watertight integrity, see *Vol 1, Pt 3, Ch 3, 1 General*.
- 19.1.2 Fin stabiliser actuating systems are to be consistent with the requirements of Vol 2, Pt 6, Ch 1, 5 Design and construction as applicable.
- 19.1.3 Materials for components of fin stabilisers are to be consistent with the requirements of *Vol 2, Pt 6, Ch 1, 3 Materials* as applicable.
- 19.1.4 Control and electrical engineering systems are to comply with the requirements of Vol 2, Pt 9 Electrotechnical Systems and Vol 2, Pt 10 Human Factors respectively as applicable.

19.2 Performance and control

- 19.2.1 Fin stabilisers are to be capable of satisfying the specified functional performance requirements as detailed in the System Design Description, see Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.13.
- 19.2.2 For retractable type fin stabilisers, the servo system arrangements are to be capable of extending the fins fully at the ship's maximum service speed and in the most onerous environmental conditions, for which the ship is designed, see *Vol 1*, *Pt 5*, *Ch 2*, *2.3 Wave environment*.

Volume 2, Part 1, Chapter 3

Section 19

- 19.2.3 After setting to work, the fin stabiliser system is to be entirely automatic irrespective of ship speed or sea state.
- 19.2.4 Where provision is made for an automatic forced roll facility, the roll amplitude and period are to be manually adjustable. Forced induction of rolling motion is not to result in an unsafe condition for the ship, equipment or the crew. The arrangements are also to satisfy the following:
- (a) An automatic forced roll facility is to be selectable by a switch located on the navigating bridge which is located or protected so as to prevent inadvertent operation of this function.
- (b) Controls are to be provided on the navigating bridge to manually adjust the amplitude and periodicity of the induced rolling.
- 19.2.5 Failure of any part of the fin stabiliser unit or its control system is not to result in an unsafe condition which will have detrimental effect on the ship's operating or sea-keeping capability.
- 19.2.6 In the event of failure of the fin actuating system, a hand pump is to be provided, mounted in a readily accessible position, which is capable of moving the fin to a known position and securing it in that position in the absence of electrical power, and being operated by no more than two men when the ship is stopped.
- 19.2.7 Consideration is to be given to hydraulic locking or any other condition where the equipment becomes mechanically locked and cannot be operated. Where the possibility of hydraulic locking cannot be avoided, a clear indication of hydraulic lock is to be provided at the stabiliser control position.

19.3 Control, monitoring and alarms

- 19.3.1 Fin stabiliser actuating control arrangements are to be located in readily accessible positions that have means of communication provided to the machinery control station and the navigating bridge.
- 19.3.2 Fin stabiliser function indicators are to be provided on the navigating bridge and at the main machinery control station.
- 19.3.3 The fin position feedback signals are to be independent of the actuating systems.
- 19.3.4 Alarms and monitoring requirements are indicated in *Table 3.19.1 Alarms and monitoring*.
- 19.3.5 All alarms associated with fin stabiliser faults are to be indicated on the navigating bridge and in accordance with the requirements of Vol 2, Pt 9, Ch 7 Control, Alerts and Safety Systems.

Table 3.19.1 Alarms and monitoring

Item	Alarm	Note
Stabiliser system active	_	Indication, see Vol 2, Pt 1, Ch 3, 19.3 Control, monitoring and alarms
Deviation of actual fin angle position from that demanded	Fault	See Vol 2, Pt 1, Ch 3, 19.3 Control, monitoring and alarms 19.3.3
Fin angle limit exceeded	Fault	
Roll angle	High	
Position indicator of fin	_	Indication, see Vol 1, Pt 3, Ch 3, 3.1 General 3.1.16
Fin stabiliser power units, power	Failure	
Control system power	Failure	
Fin stabiliser hydraulic oil tank level	Low	Each tank to be monitored
Hydraulic oil temperature	High	Where oil cooler is fitted
Hydraulic lock	Fault	Where more than one system (either power or control) can be operated simultaneously each system is to be monitored (see Note)

Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems

Volume 2, Part 1, Chapter 3

Section 20

Hydraulic oil filter differential pressure	High	When oil filters are fitted			
Note This alarm is to identify the system at fault and to be activated when (for example): Position of the variable displacement pump					
control system does not correspond with given order; or incorrect position of 3-way full flow valve or similar in constant delivery pump					

19.4 Trials and testing

system is detected.

- 19.4.1 After installation on board the fin stabiliser unit is to be subject to hydrostatic and running tests.
- 19.4.2 Testing and trials are to be carried out in accordance with procedures that have been agreed between the Shipyard, Owner/Operator and LR. The testing is to demonstrate:
- (a) The stabiliser system including the functional performances specified in the System Design Description required by *Vol 2, Pt 1, Ch 3, 3.3 Calculations and specifications 3.3.13*.
- (b) Extending and retracting the fins.
- (c) Alternative electrical power supply arrangements where provided and functional capability of the emergency hand pump arrangements.
- (d) Stabiliser controls.
- (e) The alarms and indicators.
- (f) Where the stabiliser system is designed to avoid hydraulic locking, this feature is to be demonstrated.

■ Section 20

Fired galley arrangements

20.1 Oil and liquefied petroleum gas fired galleys

- 20.1.1 The use of oil or liquefied petroleum gas fired galleys is acceptable provided arrangements are also acceptable to the Naval Administration and the requirements of *Vol 2, Pt 1, Ch 3, 20.1 Oil and liquefied petroleum gas fired galleys 20.1.2* are complied with.
- 20.1.2 The fuel oil tank is to be located outside the galley and is to be fitted with approved means of filling and venting.
- 20.1.3 The fuel supply to the burners is to be controlled from a position which will always be accessible in the event of a fire occurring in the galley.
- 20.1.4 The galley is to be well ventilated.
- 20.1.5 When liquefied petroleum gas is used, bottles are to be stored on the open deck or in a well ventilated space which only opens to the open deck. Protection against military action is to be provided.
- 20.1.6 The piping design is to be in accordance with the requirements of Vol 2, Pt 7, Ch 1 Piping Design Requirements as applicable.

■ Section 21

Software in systems, machinery and equipment

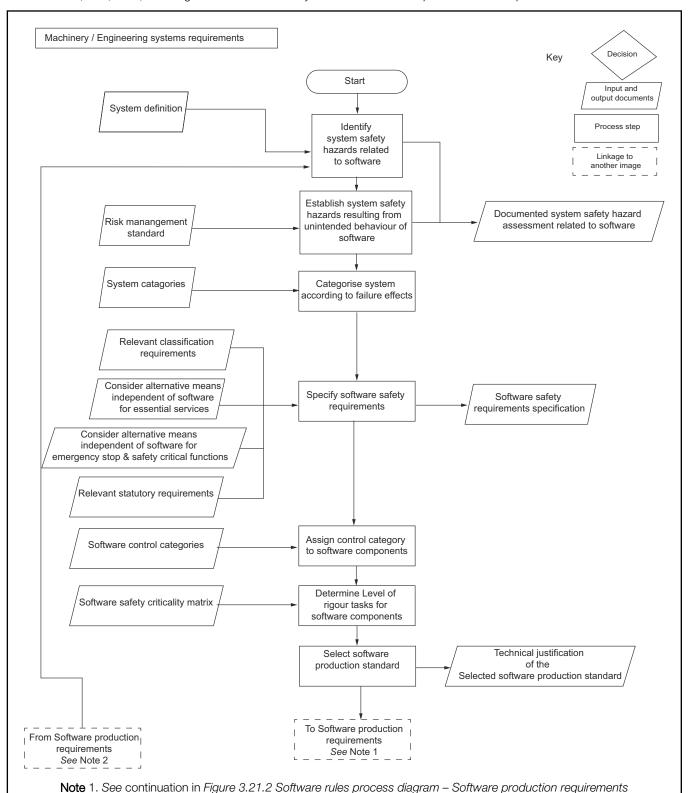

21.1 Goal, functional requirements and applicability

- 21.1.1 Goal: The use of software in systems, machinery and equipment is not to compromise the functionality or safety of those systems, machinery and equipment.
- 21.1.2 Functional requirements: The safety risk arising from the use of software in systems, machinery and equipment is to be appropriately managed by ensuring that software safety requirements are identified and satisfied. A diagrammatic view of the software rules process is shown in *Figure 3.21.1 Software rules process diagram Machinery/Engineering system requirements* and *Figure 3.21.2 Software rules process diagram Software production requirements*.

Volume 2, Part 1, Chapter 3

Section 21

21.1.3 Applicability: These rules apply to all systems, machinery and equipment mentioned in the remaining Parts of Vol 2 Machinery and Engineering Systems of these Rules where software is used as an implementation technology. They also apply to software where the software is used in a role that has an identified impact upon the safety of the ship. Instances where the operational performance of the software can only be characterised accurately in probabilistic terms, e.g. Machine Learning or Artificial Intelligence based systems, will require further and more extensive consideration beyond the scope of this set of Rules. See also Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems – Additional requirements for the production of software.

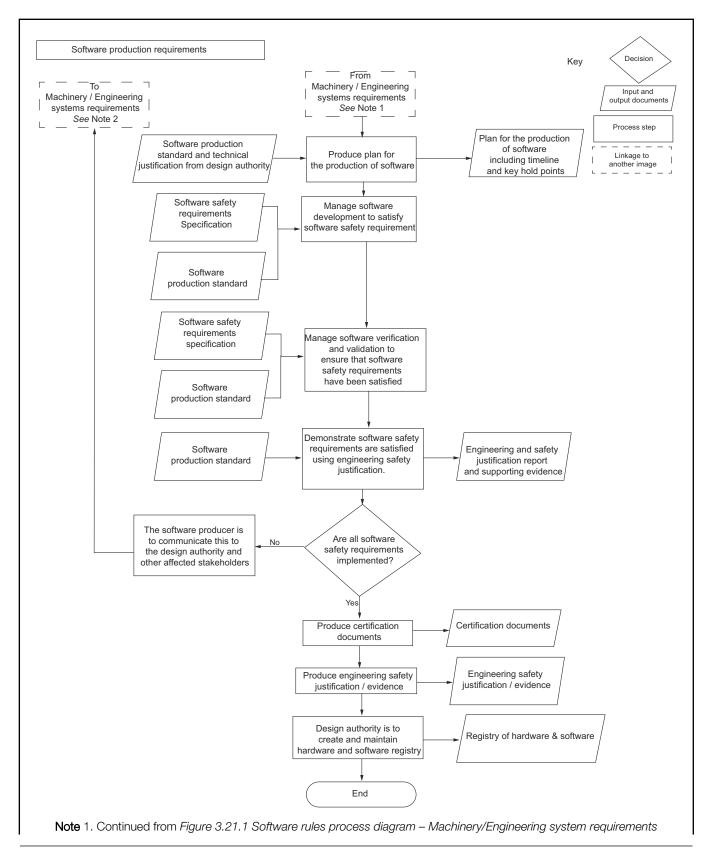

Volume 2, Part 1, Chapter 3

Section 21

Note 2. Continued from Figure 3.21.2 Software rules process diagram – Software production requirements

Figure 3.21.1 Software rules process diagram - Machinery/Engineering system requirements

Volume 2, Part 1, Chapter 3

Section 2:

Note 2. See continuation in Figure 3.21.1 Software rules process diagram – Machinery/Engineering system requirements

Figure 3.21.2 Software rules process diagram - Software production requirements

21.2 Definitions

- 21.2.1 Software: Intellectual creation comprising the programs, procedures, data, rules and any associated documentation relating to the operation of a data processing system or complex hardware, where complex hardware includes but is not limited to custom micro-coded components including application specific integrated circuits (ASIC), programmable logic devices (PLD), field programmable gate arrays (FPGA) or similar electronic technologies.
- 21.2.2 Software module: A standalone executable element of code that provides specific and closely coupled functionality.
- 21.2.3 System Design Authority: Person or organisation that is responsible for the design of the system. In this context, the single designated party responsible for system functionality in its entirety at each lifecycle stage, from concept to disposal.
- 21.2.4 Software producer: The organisation responsible for producing and/or maintaining the software module.
- 21.2.5 System safety hazards: The hazards to the safe operation of the ship resulting from failure or unintended behaviour of a system, item of machinery or equipment which incorporates software.
- 21.2.6 Software safety requirements: Requirements placed on the software which define what the software must do and what the software must not do to address system safety hazards including the degree of reliance placed upon the software.
- 21.2.7 Level of rigour task: A specification of the depth and breadth of software analysis and verification activities necessary to provide a sufficient level of confidence that a software module will function as required.
- 21.2.8 Software Production Standard: An International or National Standard to be applied to the production of software

21.3 Performance requirements

- 21.3.1 The System Design Authority is to identify and document the system safety hazards related to software, categorise the system, and assign the software control categories to each software module. It is then to identify the resulting level of rigour tasks to be applied to each software module utilising processes identified in this Section of these Rules, or an equivalent process acceptable to LR. The resulting software safety requirements and any safety-related statutory and classification software requirements are to be documented and provided to the software producer.
- 21.3.2 Software safety requirements are to be derived from the identified system safety hazards and their categorisations. Consideration is to be given to the effects of failure of a software module or unintended behaviour of a software module which could credibly
- (a) result in a system safety hazard;
- (b) impair the mitigation of a system safety hazard; or
- (c) impair recovery after a system safety hazard has occurred.

The traceability between software safety requirements and system safety hazards is to be documented as part of this process. The establishment of a Systems Risk Register is to be considered to assist the identification of system safety hazards and tracing the resulting software safety requirements. Where the risk assessment technique required by *Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.3* requires the creation of a Systems Risk Register, this is to be submitted for information.

- 21.3.3 System safety hazards resulting from failure or unintended behaviour of software in systems, machinery or equipment incorporating software modules are to be established in accordance with IEC/ISO 31010 Risk Management Risk Assessment techniques and/or an appropriate standard acceptable to LR.
- 21.3.4 Where two systems or items of machinery are intended to function as redundant components, the risk of the software introducing common mode failures that result in the loss or unintended behaviour of both components is to be considered as part of the hazard assessment.
- 21.3.5 System safety hazards are to be identified and the system categorised in accordance with the failure effects in *Table* 3.21.1 System categories or an equivalent categorisation acceptable to LR.

Volume 2, Part 1, Chapter 3

Section 21

Table 3.21.1 System categories

Category	Effects	Typical System Functionality
I	Those systems, failure of which will not lead to unsafe conditions for human safety, safety of the ship and/or threat to the environment.	Monitoring function for informational or administrative tasks
II	Those systems, failure of which could eventually lead to unsafe conditions for human safety, safety of the ship and/or threat to the environment.	Alert and monitoring functions Control functions which are necessary to maintain the ship in its normal operational and habitable conditions
III	Those systems, failure of which could immediately lead to unsafe conditions for human safety, safety of the ship and/or threat to the environment.	Control functions for maintaining the vessel's propulsion and steering Protection and safety functions
IV	Those systems, failure of which would usually result in loss of the ship, death, and/or irreversible significant environmental impact.	Control systems for which manual intervention to avert danger in the event of failure or malfunction is not possible

21.3.6 Software modules are to be assigned a software control category in accordance with the module's degree of control over the system hardware, sub-systems or components as given in *Table 3.21.2 Software control categories* or an equivalent categorisation acceptable to LR.

Table 3.21.2 Software control categories

Software Control Category	Name	Description
1	Full Control Authority	Software module that exercises autonomous control authority over potentially safety-significant hardware systems, sub-systems or components without the possibility of predetermined safe detection and intervention by a control entity to preclude the occurrence of a hazard.
2	Supported Control Authority	Software module that exercises control authority over potentially safety-significant hardware systems, sub-systems or components, allowing time for predetermined safe detection and intervention by independent safety mechanisms to mitigate or control the hazard.
		Software module that displays information requiring immediate Operator intervention to execute a predetermined action for mitigation of or control over a hazard. Software exception, failure, fault or delay will allow, or fail to prevent, hazard occurrence.

Volume 2, Part 1, Chapter 3

Section 21

3	Shared Control Authority	Software module that issues commands over safety-significant hardware systems, subsystems or components requiring a control entity to complete the command function. The system detection and functional reaction includes redundant, independent fault tolerant mechanisms for each defined hazardous condition.
		Software module that generates information used to make critical decisions. The system includes several redundant, independent fault tolerant mechanisms for each hazardous condition, detection and display.
4	Influential	Software module that generates information used to make decisions by the Operator but does not require Operator action to avoid a hazard.

21.3.7 The Level of rigour tasks to be applied to each software module during production are to be determined in accordance with the Software safety criticality Matrix in *Table 3.21.3 Software safety criticality matrix* or an equivalent categorisation acceptable to LR.

Table 3.21.3 Software safety criticality matrix

	System Category			
Software Control Category	I	II	III	IV
4	SwCl 1	SwCl 1	SwCl 1	SwCl 3
3	SwCl 1	SwCl 1	SwCl 2	SwCl 3
2	SwCl 1	SwCl 2	SwCl 3	SwCl 4
1	SwCl 1	SwCl 2	SwCl 4	SwCl 4
	Level of rigour tasks			
SwCl 1	Safety-specific testing.			
SwCl 2	Analysis of requirements and architecture; and conduct in-depth safety-specific testing.			
SwCl 3	Analysis of requirements, architecture and design; and conduct in-depth safety-specific testing.			
SwCl 4	Analysis of requirements, architecture, design and code; and conduct in-depth safety-specific testing.			

- 21.3.8 The Software Production Standard selected by the System Design Authority to develop the software must be able to evidence the Levels of rigour tasks as equivalent to those determined by Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.7. The justification leading to the selection of the Software Production Standard is to be documented and is to include the tasks described in Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.1 to Vol 2, Pt 1, Ch 3, 21.3 Performance requirements 21.3.7. The evidence supporting the case that the required Level of rigour tasks have been undertaken is to be collated by the software producer and included within the engineering and safety justification required by Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software 5.6.1. Software Conformity Assessment (SCA) may be used for this purpose.
- 21.3.9 Where a system or item of machinery or equipment includes more than one software module, the software safety requirements for each software module are to be specified separately.
- 21.3.10 Where a system or item of machinery or equipment includes more than one software module, the System Design Authority is responsible for the successful integration and performance of the software modules. In such cases, the System Design Authority is to assume those responsibilities of the software producer that relate to software integration.

Requirements for Fusion Welding of Volume 2, Part 1, Chapter 4 Pressure Vessels and Piping Section 1

Section

- 1 General
- 2 Manufacture and workmanship of fusion welded pressure vessels
- 3 Repairs to welds on fusion welded pressure vessels
- 4 Post-weld heat treatment of pressure vessels
- 5 Welded pressure pipes
- 6 Non-Destructive Examination

■ Section 1

General

1.1 Scope

- 1.1.1 The requirements of this Chapter apply to the welding of pressure vessels and process equipment, heating and steam raising boilers and pressure pipes. The allocation of Class is determined from the design criteria referenced in *Vol 2, Pt 7, Ch 1 Piping Design Requirements* and *Vol 2, Pt 8 Pressure Plant*.
- 1.1.2 Fusion welded pressure vessels will be accepted only if manufactured by firms equipped and competent to undertake the quality of welding required for the Class of vessel proposed. For Class 1, 2/1 and 2/2 pressure vessels, the manufacturer's works are to be approved in accordance with the requirements specified in *Materials and Qualification Procedures for Ships*, Book A Procedure MQPS 0-4.
- 1.1.3 For pressure vessels which only have circumferential seams, see Vol 2, Pt 8, Ch 1, 1.5 Classification of fusion welded pressure vessels 1.5.4 and Vol 2, Pt 8, Ch 2, 1.5 Classification of fusion welded pressure vessels 1.5.5.

1.2 General requirements for welding plant and welding quality

- 1.2.1 In the first instance, and before work is commenced, the Surveyors are to be satisfied that the required quality of welding is attainable with the proposed welding plant, equipment and procedures in accordance with the guidelines specified in *Materials and Qualification Procedures for Ships Book A, Procedure 0-4*.
- 1.2.2 All welding is to be in accordance with the requirements specified in *Ch 13 Requirements for Welded Construction* of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

■ Section 2

Manufacture and workmanship of fusion welded pressure vessels

2.1 General requirements

- 2.1.1 Prior to commencing construction, the design of the vessel is to be approved where required by Vol 2, Pt 8, Ch 1, 1.6 Plans and Vol 2, Pt 8, Ch 2, 1.6 Plans.
- 2.1.2 Pressure vessels will be accepted only if manufactured by firms that have been assessed and approved in accordance with MQPS 0-4.

2.2 Materials of construction

2.2.1 Where the construction requires post-weld heat treatment, consideration should be given to certifying the material after subjecting the test pieces to a simulated heat treatment.

Requirements for Fusion Welding of Volume 2, Part 1, Chapter 4 Pressure Vessels and Piping

2.2.2 Pressure vessels are to be constructed and examined in accordance with the requirements specified in *Ch 13 Requirements for Welded Construction* of the Rules for Materials, unless more stringent requirements are specified.

2.3 Tolerances for cylindrical shells

- 2.3.1 Measurements are to be made to the surface of the parent plate and not to a weld, fitting or other raised part.
- 2.3.2 In assessing the out-of-roundness of pressure vessels, the difference between the maximum and minimum internal diameters measured at one cross-section is not to exceed the amount given in *Table 4.2.1 Tolerances for cylindrical shells*.

Table 4.2.1 Tolerances for cylindrical shells

Nominal internal diameter of vessel, in mm	Difference between maximum and minimum diameters	Maximum departure from designed form
≤ 300 > 300 ≤ 460 > 460 ≤ 600 > 600 ≤ 900 > 900 ≤ 1220 > 1220 ≤ 1520 > 1520 ≤ 1900	1,0 per cent of internal diameter	1,2 mm 1,6 mm 2,4 mm 3,2 mm 4,0 mm 4,8 mm 5,6 mm
> 1900 ≤ 2300 > 2300 ≤ 2670 > 2670 ≤ 3950	19 mm	6,4 mm 7,2 mm 8,0 mm
> 3950 ≤ 4650 > 4650	19 mm 0,4 per cent of internal diameter	0,2 per cent of internal diameter

- 2.3.3 The profile measured on the inside or outside of the shell, by means of a gauge of the designed form of the shell, and having a chord length equal to one-quarter of the internal diameter of the vessel, is not to depart from the designed form by more than the amount given in *Table 4.2.1 Tolerances for cylindrical shells*. This amount corresponds to x in *Figure 4.2.1 Tolerances for cylindrical shells*.
- 2.3.4 Shell sections are to be measured for out-of-roundness, either when laid flat on their sides or when set up on end. When the shell sections are checked while lying on their sides, each measurement for diameter is to be repeated after turning the shell through 90° about its longitudinal axis. The two measurements for each diameter are to be averaged, and the amount of out-of-roundness calculated from the average values so determined.
- 2.3.5 Where there is any local departure from circularity due to the presence of flats or peaks at welded seams, the departure from designed form shall not exceed that of *Table 4.2.1 Tolerances for cylindrical shells*.
- 2.3.6 The external circumference of the completed shell is not to depart from the calculated circumference (based upon nominal inside diameter and the actual plate thickness) by more than the amounts given in *Table 4.2.2 Circumferential tolerances*.

Requirements for Fusion Welding of Volume 2, Part 1, Chapter 4 Pressure Vessels and Piping

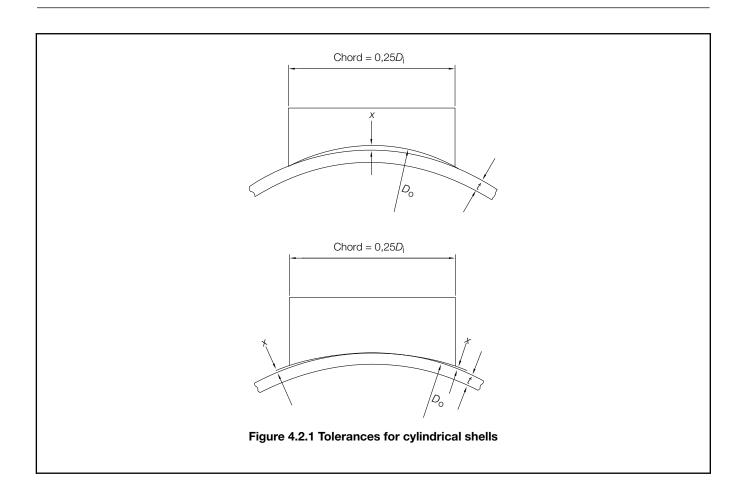

Table 4.2.2 Circumferential tolerances

Outside diameter (nominal inside diameter plus twice actual plate thickness), in mm	Circumferential tolerance
300 to 600 inclusive	±5 mm
Greater than 600	±0,25 per cent

■ Section 3

Repairs to welds on fusion welded pressure vessels

3.1 General

3.1.1 Repairs to welds on fusion welded pressure vessels are to be in accordance with the requirements of, *Ch 13 Requirements for Welded Construction* of the Rules for Materials.

Requirements for Fusion Welding of Volume 2, Part 1, Chapter 4 Pressure Vessels and Piping

■ Section 4

Post-weld heat treatment of pressure vessels

4.1 General

4.1.1 Post-weld heat treatment of fusion welded pressure vessels is to be in accordance with the requirements of, *Ch 13 Requirements for Welded Construction* of the Rules for Materials.

■ Section 5

Welded pressure pipes

5.1 General

5.1.1 Fabrication of pipework is to be carried out in accordance with the requirements of *Ch 13*, 5 *Specific requirements for pressure piping* of the Rules for Materials.

5.2 Welding workmanship

- 5.2.1 Preheating is to be effected by a method which ensures uniformity of temperature at the joint. The method of heating and the means adopted for temperature control are to be to the satisfaction of the Surveyors.
- 5.2.2 All welding is to be performed in accordance with the approved welding procedures by welders who are qualified for the materials, joint types and welding processes employed.
- 5.2.3 Welding without filler metal is generally not permitted for welding of duplex stainless steel materials.
- 5.2.4 All welds in high pressure and high temperature pipelines are to have a smooth surface finish and even contour; if necessary, they are to be made smooth by grinding.
- 5.2.5 Check tests of the quality of the welding are to be carried out periodically at the discretion of the Surveyors.

■ Section 6

Non-Destructive Examination

6.1 General

6.1.1 Non-Destructive Examination (NDE) of pressure vessels is to be performed in accordance with the requirements of *Ch* 13, 5 Specific requirements for pressure piping of the Rules for Materials.

Rules and Regulations for the Classification of Naval Ships, January $_{2022}$

Spare Gear for Machinery Installations

Volume 2, Part 1, Chapter 5

Section 1

Section

1 General

■ Section 1

General

1.1 Application

- 1.1.1 Adequate spare parts for the propelling and auxiliary machinery for Mobility systems and Ship Type systems, together with the necessary tools for maintenance and repair shall be readily available for use.
- 1.1.2 The spare parts to be supplied and their location is to be the responsibility of the Owner but must take into account the design and arrangements of the machinery and the intended service and operation of the ship. Account should also be taken of the recommendations of the manufacturers.

1.2 Guidance for spare parts

1.2.1 For general guidance purposes, spare parts for main and auxiliary machinery installations are shown in LR's *Spare Gear Guidance*.

686

Section

- 1 General requirements
- 2 Materials and components

- 12 Turbochargers
- 13 Type Testing General

■ Section 1

General requirements

1.1 Application

- 1.1.1 Engines providing power for Mobility or Ship Type systems are to be constructed under survey and in accordance with the requirements of this Chapter (see also Vol 1, Pt 1, Ch 2, 3.9 Machinery and Engineering Systems notations).
- 1.1.2 This Chapter is to be read in conjunction with the requirements for Machinery and Engineering Systems in Vol 2, Pt 1, Ch 1 General Requirements for Classification of Engineering Systems and Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems. Specific attention is drawn to the transverse requirements in Vol 2, Pt 1, Ch 3, 4 Operating conditions.
- 1.1.3 The requirements of this Chapter are applicable to reciprocating internal combustion engines operating on liquid, gas or dual fuel for use in Mobility or Ship Type systems (hereinafter referred to as engines). The requirements of *Vol 2, Pt 2, Ch 1, 3 Crankshaft design* do not apply to engines intended for Mobility or Ship Type systems where power does not exceed 110 kW.

1.2 Scope

- 1.2.1 For the purposes of this Chapter engine type, expressed by the manufacturer/licensor's designation, is defined by:
- (a) the bore and stroke;
- (b) the method of injection (i.e. direct injection, indirect injection, pilot injection);
- (c) the fuel pump and injection system (independent line to fuel oil valve, common rail);
- (d) the valve and injection operation (by cams or electronically controlled);
- (e) the fuel(s) used (liquid, dual-fuel, gaseous, etc.);
- (f) the working cycle (4-stroke, 2-stroke);
- (g) the gas exchange (naturally aspirated, turbocharged, etc.);
- (h) the method of turbocharging (pulsating system, constant pressure system);
- (i) the charging air cooling system (with or without intercooler, number of stages);

LLOYD'S REGISTER 687

- (j) cylinder arrangement (in-line, vee, etc.);
- (k) the maximum continuous power per cylinder (or maximum continuous brake mean effective pressure) at maximum continuous speed;
- (l) the manufacturer and type of governor (and control system if applicable) fitted.
- 1.2.2 A complete engine includes the control system, turbocharger(s) and all ancillary systems and equipment referred to in this Chapter that are used for operation of the engine for which there are rule requirements; this includes systems allowing the use of different fuel types.
- 1.2.3 Arrangements for gas only or dual fuel engines will be specially considered. For the requirements for trunk piston internal combustion engines supplied with low pressure (less than 1 MPa) natural gas (methane) as fuel, see *Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5 Pt 5, Ch 2, 15 Engines supplied with low pressure gas.*
- 1.2.4 Primary exhaust gas emissions abatement plant (where fitted) is to meet the requirements of this Chapter; additionally, it is to meet the requirements of *Vol 2*, *Pt 12 Emissions Abatement Plant*. Where secondary exhaust gas emissions abatement systems are fitted to engines, they are to meet the requirements of *Vol 2*, *Pt 12 Emissions Abatement Plant*.

1.3 Approval process

- 1.3.1 All engines intended for installation on an LR Class ship are to be type approved by LR (see LR Type Approval System Procedure TA14 for details of the LR Type Approval process).
- 1.3.2 Each complete engine, as defined in *Vol 2, Pt 2, Ch 1, 1.2 Scope*, intended for installation on an LR Classed vessel, is to have an LR Engine Certificate.
- 1.3.3 For the first engine of a type the approval process and the engine certification process may be performed simultaneously.
- 1.3.4 To apply for an LR Engine Certificate, the following are to be submitted:
- (a) a list of all documents identified in the 'for information' and 'for appraisal' columns of *Table 1.1.1 Plans and particulars to be* submitted with the relevant drawing numbers and revision status. This list is to cross-reference the approved plans previously submitted as part of the engine Type Approval and identify any plans that have been modified.
- (b) where there is a licensor/licensee arrangement the list required by Vol 2, Pt 2, Ch 1, 1.3 Approval process 1.3.4.(a) is to cross-reference the drawings submitted by the designer as part of the engine Type Approval. This list is to identify all changes where the approved design has been modified by the licensee. Where the licensee proposes design modifications to components, a statement is to be made confirming the licensor's acceptance of the proposed changes. If designer/licensor's acceptance is not confirmed, the engine is to be regarded as a different type and is subject to the complete appraisal and type testing process.
- (c) all documents with changes from the approved design are to be submitted for review/appraisal.
- (d) In all cases the complete set of endorsed documents and the list referenced in Vol 2, Pt 2, Ch 1, 1.3 Approval process 1.3.4. (a), which are to be provided by the manufacturer, will be required by the Surveyor(s) attending the manufacturer's works. Where a licensee/licensor arrangement is in place, this set of documents may be a combination of licensor and licensee documents.
- 1.3.5 An LR Engine Certificate is issued upon satisfactory completion of engine assembly, with associated component testing (see Vol 2, Pt 2, Ch 1, 2 Materials and components) and factory acceptance testing (see Vol 2, Pt 2, Ch 1, 11 Factory Acceptance Test and Shipboard Trials of Internal Combustion Engines) or issued in accordance with the alternative approach for product assurance approved by LR, see Vol 2, Pt 1, Ch 1, 6.4 Alternative system of inspection.
- 1.3.6 For appraisal of emergency generator engines and turbochargers additional submissions are required. See Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.5, as applicable.

1.4 Submission requirements

1.4.1 The plans and information are to be submitted as required in *Table 1.1.1 Plans and particulars to be submitted* and *Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.2* to *Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.8* as applicable

Engine particulars (LR Form 2073 with general engine and ancillaries information, Project	X	
Guide, Marine Installation Manual), see Note 1	^	
Material specifications of principal components with information on non-destructive material tests and pressure tests		X
Engine cross-section	Х	
Engine longitudinal section	Х	
Engine frames, welding drawings, see Notes 2 and 3		X
Main engine foundation and holding down and securing arrangements	X (metal chocks)	X (non-metallic chocks)
Bedplate and crankcase of cast design	Х	
Bedplate and crankcase of welded design, with welding details and welding instructions, see Notes 2 and 3		X
Bedplate/oil sump welding drawings, see Note 2		X
Thrust bearing assembly, see Note 4	X	
Thrust shaft or intermediate shaft (if integral with engine)		X
Thrust bearing bedplate of welded design, with welding details and welding instructions, see Note 2		×
Frame, see Note 3, framebox, see Note 3, and gearcase of cast construction	X	
Tie rod	Х	
Connecting rod, assembly, see Note 5	Х	
Crosshead, assembly, see Note 5	Х	
Piston rod, assembly, see Note 5	Х	
Piston, assembly, see Note 5	X	
Piston head	X	
Cylinder jacket/ block of cast construction, see Note 3	Х	
Cylinder cover, assembly, see Note 5	Х	
Cylinder liner	Х	
Counterweights (if not integral with crankshaft), including fastening	Х	
Crankshaft, details (for each crankthrow)		X
Crankshaft, assembly (for each crankthrow)		×
Crankshaft calculations, (see Vol 2, Pt 2, Ch 1, 3 Crankshaft design)	X	
Camshaft drive, assembly, see Note 5	Х	
Flywheel or turning-wheel	Х	
Shaft coupling interface arrangement including dimensions and material details		X
Details of shielding and insulation of exhaust pipes and other parts operating at an elevated temperature, which might be impinged by flammable fluid(s) as a result of a system failure	X	
Schematic layout or other equivalent documents for the engine, see Note 6		
Starting and control air systems		×
• Fuel system		X

Lubricating oil system		×
Cooling water system		×
Hydraulic systems		×
Engine control and safety system		×
High pressure fuel injection pump assembly	X	
High pressure parts for fuel oil injection system, see Note 7		×
Shielding arrangements for high pressure piping - fuel, hydraulic and flammable oils, (see Vol 2, Pt 2, Ch 1, 8.1 Fuel oil, hydraulic and high-pressure oil systems 8.1.1)		X
Fastening arrangements for main bearings	X	
Fastening arrangements for cylinder heads and exhaust valve (two stroke design)	X	
Fastening arrangements for connecting rods	X	
Vibration dampers/detuners and moment compensators	X	
Construction and arrangement of vibration dampers	X	
Details of mechanical joints of piping systems		X
Oil mist detection and/or alternative arrangements		X
Construction of accumulators for electronically controlled engine		X
Construction of common accumulators for electronically controlled engine		X
Construction of accumulators for hydraulic oil and fuel oil		X
Arrangement and details of the crankcase explosion relief valve where applicable (see Vol 2, Pt 2, Ch 1, 10 Safety arrangements)		X
Calculation results for crankcase explosion relief valves (see Vol 2, Pt 2, Ch 1, 10 Safety arrangements)		×
Construction and arrangements of hydraulic systems for actuation of sub-systems:		
Control valves, high-pressure pumps, pipes and accumulators	×	
Drive for high pressure pumps	×	
Valve bodies, if applicable	X	
For engine control, alarm monitoring and safety systems, the plans and information <i>Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.3</i> , see Note 8		X
Generator set test results that state the engine maximum load steps which satisfy the quality of power supply requirements specified in Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS))		Х
Planned operating profiles for the vessel at sea and during manoeuvring as agreed with the Operators		Х
List of sub-contractors for main parts	X	
Operation and service manuals, see Note 9	X

Type approval certification for environmental tests of control components, see Note 12	X	
Details of the engine type test program and the type test report, see Note 13		X
Engine test schedule (FAT and shipboard trials, see Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.2)		X
Documentation verifying compliance with inclination limits (see Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship)		Х
Combustion pressure—displacement relationship		X
Plans and details for dead ship condition starting arrangements, see Vol 2, Pt 7, Ch 3, 12.11 Dead ship condition starting arrangements.		Х

- **Note** 1. LR Form 2073 will be supplied on application. Note that the turbochargers, if required to be Type Approved, are to have plans and particulars submitted as detailed in *Vol 2*, *Pt 2*, *Ch 1*, *1.4 Submission requirements 1.4.5*.
- **Note** 2. For approval of materials and weld procedure specifications. The weld procedure specification is to include details of pre- and postweld heat treatment, weld consumables and fit-up conditions.
- Note 3. For each cylinder for which dimensions and details differ.
- Note 4. If integral with engine and not integrated in the bedplate.
- **Note** 5. Including identification of components to ensure traceability in accordance with the *Rules for the Manufacture, Testing and Certification* of *Materials, July 2021, incorporating Notice No. 1 & 2.*
- Note 6. Details of the system so far as supplied by the engine manufacturer such as: main dimensions, operating media and maximum working pressures
- Note 7. The documentation to contain specifications for pressures, pipe dimensions and materials.
- **Note** 8. The submission is to include a general overview of the operating principles, supported by schematics explaining the functionality of individual systems and sub-systems. The information is to relate to the engine capability and functionality under defined operating and emergency conditions such as recovery from a failure or malfunction, with particular reference to the functioning of programmable electronic systems and any sub-systems. The information is also to indicate if the engine has different modes of operation, such as to limit exhaust gas emissions and/or to run under an economic fuel consumption mode or any other mode that is electronically controlled.
- **Note** 9. Operational manuals are to contain maintenance requirements (servicing and repair) including details of any special tools and gauges that are to be used with their fitting/settings together with any test requirements on completion of maintenance. They are to include a description of each system's particulars and include reference to the functioning of sub-systems.
- **Note** 10. Where engines rely on hydraulic, pneumatic or electronic control of fuel injection and/or valves, the risk-based analysis is to address the mechanical, pressure containing, electrical, electronic and programmable electronic systems and arrangements that support the operation of the engine. It is to demonstrate that failure of the control system will not result in the operation of the engine being degraded beyond acceptable performance criteria for the engine and that suitable risk mitigation has been achieved in accordance with *Vol 2, Pt 2, Ch 1, 3.3 Information to be submitted*. The risk-based analysis will not be explicitly approved by LR.
- **Note** 11. Including quality plan for sourcing, traceability, design, installation and testing of all components used in the fuel and hydraulic oil systems installed with the engine. See Vol 2, Pt 2, Ch 1, 8.1 Fuel oil, hydraulic and high-pressure oil systems 8.1.10.
- **Note** 12. Tests are to demonstrate the ability of the control, protection and safety equipment to function as intended under the specified testing conditions as per Lloyd's Register Type Approval Test Specification Number 1.
- **Note** 13. The type test report may be submitted shortly after the conclusion of the type test. For electronically controlled engines evidence of type testing of the engine with the programmable electronic system, or a proposed factory acceptance test plan at the engine builders with the programmable electronic system functioning, is to be submitted to verify the functionality and behaviour under normal operating and fault conditions of the programmable electronic control system. Where required this is to include proposals for short-term, high power operation.

Rules and Regulations for the Classification of Naval Ships, January $_{2022}$

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 1

- 1.4.2 A schedule of testing at the engine packager's or system integrator's facility, pre-sea trial commissioning and sea trials is to be submitted. The test schedules are to identify all modes of engine operation and the sea trials are to include typical port manoeuvres under all intended engine operating modes. The schedule is to include:
- (a) testing and trials to demonstrate that the engine is capable of operating as described in *Table 1.1.1 Plans and particulars to be submitted*, Note 10;
- (b) tests to verify that the response of the complete mechanical, hydraulic, electrical and electronic system is as predicted for the intended operational modes; and
- (c) testing required to verify the conclusions of the risk-based analysis.

The scope of these tests is to be agreed with LR based on the risk-based analysis.

- 1.4.3 In addition to the applicable plans and particulars required by Vol 2, Pt 9, Ch 1, 1.4 Documentation required for design review the following information for control, alarm, monitoring and safety systems relating to the operation of an electronically controlled engine is to be submitted:
- (a) Engine configuration details, see Vol 2, Pt 2, Ch 1, 4.3 Control engineering systems 4.3.2.
 - (i) Local and remote means to carry out system configuration.
 - (ii) Engine builder procedures for undertaking configuring.
 - (iii) Roles and responsibilities for configuration (e.g. Engine builder, engine packager, system integrator or other nominated party) with accompanying schedule.
 - (iv) Configurable settings and parameters (including those not to be modified from a default value).
 - (v) Configuration for propulsion, auxiliary or emergency engine application.
- (b) Software quality plans, including configuration management documents.
- (c) Software safety evidence.
- (d) Software assessment inspection report such as SCA or IEC 61508, as applicable.

Configuration records are to be maintained and are to be made available to the Surveyor at testing and trials and on request in accordance with Vol 2, Pt 9, Ch 1, 1.7 Alterations and additions and Vol 2, Pt 9, Ch 12, 1.2 Trials 1.2.3.

- 1.4.4 Emergency generator engine plans, information and test schedules, required for design appraisal, are to be in accordance with Vol 2, Pt 9, Ch 2 Electrical Power Generator and Energy Storage.
- 1.4.5 For turbochargers, the following plans and particulars are to be submitted. The submission requirements vary depending on the category of the turbocharger; category A, B and C turbochargers are defined in *Vol 2, Pt 2, Ch 1, 12.1 General 12.1.2*:
- (a) Category A (on request):
 - (i) Turbocharger specification including type, compression ratio and operating condition.
 - (ii) Cross-sectional drawing with principal dimensions and names of components.
 - (iii) Containment test report.
 - (iv) Test program.
- (b) Category B:
 - (i) Turbocharger specification including type of turbine and compressor, compression ratio, bearing and cooling method.
 - (ii) Cross-sectional drawing with principal dimensions and materials of housing components for containment evaluation.
 - (iii) Documentation of containment in the event of disc fracture.
 - (iv) Operational data and limitations, i.e.:
- Maximum permissible operating speed (rpm);
- Alarm level for overspeed;
- Maximum permissible exhaust gas temperature before turbine;
- Alarm level for exhaust gas temperature before turbine;
- Minimum lubrication oil inlet pressure;
- Lubrication oil inlet pressure low alarm set point;
- Maximum lubrication oil outlet temperature;
- Lubrication oil outlet temperature high alarm set point;
- Maximum permissible vibration levels, i.e. self- and externally generated vibration;

(Alarm levels may be equal to permissible limits but are not to be reached when operating the engine at 110 per cent power or at any approved intermittent overload beyond 110 per cent.).

- (v) Arrangement of lubrication system, all variants within a range.
- (vi) A list of main current suppliers and subcontractors for rotating parts and an operation and maintenance manual.
- (vii) Type test reports.
- (c) Category C:
 - (i) Plans and particulars as for Category B.
 - (ii) Drawings of the housing and rotating parts (shaft, wheels, blades and nozzle) including details of blade fixing for turbine and compressor.
 - (iii) Material specifications (including density, Poisson's ratio, range of chemical composition and mechanical properties (at room temperature), and high-temperature strength characteristics as well as creep rate and rupture strength for the design service life (parts subject to 450 degrees Celsius or more)) of all parts mentioned above including details of the material and quality control system to be used for these parts.
 - (iv) Welding details and welding procedure of above-mentioned parts, if applicable.
 - (v) Documentation* of safe torque transmission when the disc is connected to the shaft by an interference fit.
 - (vi) Information on expected lifespan, considering creep, low cycle fatigue and high cycle fatigue.
 - (vii) Operation and maintenance manuals*.
 - (viii) Arrangements of cooling system.

Note * Documentation is to be provided applicable to two representative sizes in a generic range of turbochargers.

- 1.4.6 Where considered necessary LR may require additional documentation to be submitted.
- 1.4.7 The following information is to be submitted to LR for acceptance of oil mist detection equipment and alarm arrangements:
- (a) Description of oil mist detection equipment and system including alarms.
- (b) Copy of the test house report in accordance with the requirements of Test Specification No. 4. See also Vol 2, Pt 2, Ch 1, 13.4 Crankcase oil mist detection system.
- (c) Schematic layout of engine oil mist detection arrangements showing location of detectors/sensors and piping arrangements and dimensions.
- (d) Maintenance and test manual which is to include the following information:
 - (i) Intended use of equipment and its operation;
 - (ii) Functionality tests to demonstrate that the equipment is operational and that any faults can be identified and corrective actions notified;
 - (iii) Maintenance routines and spare parts recommendations;
 - (iv) Limit setting and instructions for safe limit levels; and
 - (v) Where necessary, details of configurations in which the equipment is and is not to be used.
- 1.4.8 Where engine components are subject to autofrettage, the following information is to be submitted (see also Vol 2, Pt 2, Ch 1, 2.4 Autofrettage):
- (a) Drawings and other related documents/information for products to be subjected to autofrettage, including material grade and dimensions.
- (b) Details of product quality assurance processes.
- (c) Place of manufacture and details of external providers of products subjected to autofrettage.
- (d) A report detailing how repeatability and reliability of the autofrettage process is achieved. This is to include the following:
 - (i) method of autofrettage;
 - (ii) method to control extent of autofrettage;
 - (iii) calibration of the autofrettage system; and
 - (iv) details of how the critical parameters affecting product characteristics are controlled.
- (e) Method for recording results and list of data that is recorded.
- (f) Finished component and/or system testing.

Rules and Regulations for the Classification of Naval Ships, January 2022

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 2

1.5 Additional submission requirements for naval vessels

- 1.5.1 In addition to the requirements of Vol 2, Pt 2, Ch 1, 1.4 Submission requirements and Table 1.1.1 Plans and particulars to be submitted, the plans and information in Vol 2, Pt 2, Ch 1, 1.5 Additional submission requirements for naval vessels 1.5.2 and Table 1.1.2 Plans and particulars to be submitted for naval vessels are to be submitted.
- 1.5.2 Risk Assessment (RA) as required by Vol 2, Pt 1, Ch 3 Requirements for Design, Construction, Installation and Sea Trials of Engineering Systems is to be submitted. The RA is to be carried out in accordance with the requirements of Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA) and is to include the following associated sub-systems:
- Starting and stopping.
- Fuel oil.
- Lubricating oil.
- Cooling water (fresh and sea).
- Air induction.
- Exhaust.
- Engine mounting.
- Control and monitoring.
- Electrical power supplies.
- Hydraulic oil (for valve lift).

It is not necessary to consider failure modes relating to the engine components.

■ Section 2

Materials and components

2.1 Crankshaft materials

- 2.1.1 The specified minimum tensile strength of castings and forgings for crankshafts is to be selected within the following general limits:
- (a) Carbon-manganese steel castings -

Rules and Regulations for the Classification of Naval Ships, January 2022

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 2

- 400 to 550 N/mm².
- (b) Carbon-manganese steel forgings (normalised and tempered) -
 - 400 to 600 N/mm².
- (c) Carbon-manganese steel forgings (quenched and tempered)
 - not exceeding 700 N/mm².
- (d) Alloy steel castings
 - not exceeding 700 N/mm².
- (e) Alloy steel forgings
 - not exceeding 1000 N/mm².
- (f) Spheroidal or nodular graphite iron castings -
 - 370 to 800 N/mm².
- 2.1.2 Where it is proposed to use alloy castings, micro alloyed or alloy steel forgings or iron castings, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

2.2 Testing and inspection

- 2.2.1 Materials and components for engines are to be manufactured, tested and documented in accordance with *Table 1.2.1 Summary of testing and associated documentation for engine components* under a quality control system that is suitable for the actual engine types to be certified by LR. See also Vol 2, Pt 2, Ch 1, 2.2 Testing and inspection 2.2.4 and the applicable requirements specified in the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2.*
- 2.2.2 Where an LR quality scheme is in place (see Pt 5, Ch 1, 1.3 Alternative approach for product assurance of the Rules and Regulations for the Classification of Ships, July 2021, incorporating Notice No. 1, 2, 3, 4 & 5, the testing and documentation requirements in Table 1.2.1 Summary of testing and associated documentation for engine components will be in accordance with a specific LR quality scheme certification schedule identifying the tests, intervention requirements and associated documentation including types of certificates that are to be issued.
- 2.2.3 The testing and inspection in *Table 1.2.1 Summary of testing and associated documentation for engine components* is to be documented by the manufacturer (e.g. manufacturer certified materials testing or manufacturer issued NDT report as applicable), except where LR intervention is explicitly required, in which case an LR Component Certificate is to be issued which confirms conformity with the Rule requirements, with tests carried out on either the finished component itself or on samples taken from earlier stages in the production of the component, as applicable.
- 2.2.4 Where an LR material certificate is specified for components listed in *Table 1.2.1 Summary of testing and associated documentation for engine components*, the material is to be from an LR approved manufacturer, and manufactured within the scope of approval of that manufacturer, except where explicitly stated otherwise in other Parts and Chapters of the Rules.
- 2.2.5 The manufacturer is not exempted from responsibility for any relevant tests and inspections of those parts for which documentation is not explicitly requested by LR. Manufacturers are to be equipped in such a way that all materials and components can be consistently produced to the required standard. This includes production and assembly lines, machining units, special tools and devices, assembly and testing rigs as well as all lifting and transportation devices.
- 2.2.6 Where Table 1.2.1 Summary of testing and associated documentation for engine components states that a test report is required, this is to be issued by the manufacturer and provided for review by the Surveyor. The report is to identify the samples from the current production batch that have been tested and inspected to confirm that the component complies with all applicable requirements.
- 2.2.7 Where a manufacturer's document (test certificate or NDT report) is required in *Table 1.2.1 Summary of testing and associated documentation for engine components*, this is to be issued by the manufacturer and provided for review by the Surveyor. The document is to comply with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2, Ch 1, 3.1 General 3.1.3 or Ch 1, 5.6 Non-destructive examination reports 5.6.1 as applicable and is to identify the tests and inspections that have been carried out on the finished component itself or, where applicable, on samples taken from earlier stages in the production of the component.*
- 2.2.8 Components and materials not specified in *Table 1.2.1 Summary of testing and associated documentation for engine components* or of novel design will be specially considered upon submission of their details.

Reciprocating Internal Combustion Engines

Volume 2, Part 2, Chapter 1

M = Mechanical property analysis	V = Visual examination of accessible surfaces	
UT = Ultrasonic testing (see Note 1)	LR () = Test/inspection to be certified by LR	
CD = Crack detection by MPI or DPT (see Note 7)	TR[] = Test report required for process in brackets (see	
W () = Test/inspection to be certified by manufacturer	Vol 2, Pt 2, Ch 1, 2.2 Testing and inspection 2.2.6)	

Note 1. Ultrasonic testing is not required for components manufactured from cast iron.

Note 2. Material properties include chemical composition and mechanical properties, as identified in the table above. Where mechanical testing is required this is to include testing of surface treatment, such as surface hardening (hardness, depth and extent), peening and rolling (extent and applied force) as applicable. Mechanical tests are to be conducted after the final heat treatment has been applied.

Note 3. Dimensional inspection, including assessment of surface condition.

Note 4. Hydraulic testing is applied on the water/oil side of the component. The full lengths of cooling spaces are to be tested, where applicable. Where design or testing features may require modification of these test requirements, special consideration may be given.

Note 5. Where welding is carried out, welding and welder qualifications are to be carried out in accordance with the Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2, Ch 12 Welding Qualifications.

Note 6. Hydraulic testing is also required for those parts filled with cooling water and having the function of containing the water which is in contact with the cylinder or cylinder liner.

Note 7. Magnetic particle testing is to be carried out on ferro-magnetic materials, penetrant testing is only to be carried out on non-ferritic materials. Visual examination alone is considered insufficient. Magnetic particle and dye penetrant testing are to be carried out when the forgings are in the finished machined condition.

Note 8.See also Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2, Ch 5, 3.5 Nondestructive examination 3.5.1 for detailed non-destructive examination requirements for other bolts and studs.

Note 9. Magnetic particle testing of tie rods may be confined to the threaded portions and the adjacent material over a length equal to that of the thread.

Note 10. Where components are subjected to an autofrettage process accepted by LR (see Pt 5, Ch 2, 2.4 Autofrettage), the component pressure test may be omitted. The assembled system containing such components is to be shown, where practicable, to be pressure-tight as required for hydraulic systems.

Note 11. Pumps used in jerk or timed pump systems only need to have the assembled high pressure containing components hydraulically tested.

Note 12. Material and component certification for accumulators or coolers which are classed as pressure vessels are dependent on the operating pressure and temperature, see Vol 2, Pt 8, Ch 2, 1.5 Classification of fusion welded pressure vessels and Vol 2, Pt 8, Ch 2, 1.7 Materials. Charge air coolers are only to be tested on the water side.

Note 13. Ultrasonic testing is required to prove full adhesion between base material and bearing metal.

Note 14. Material certification requirements for pumps and piping components are dependent on the operating pressure and temperature. Requirements given in this table apply except where alternative requirements are explicitly given elsewhere in the Rules. See Vol 2, Pt 7, Ch 1, 4.1 Metallic materials.

2.3 **Alignment gauges**

All main and auxiliary oil engines exceeding 220 kW are to be provided with an alignment gauge which may be either a bridge weardown gauge, or a micro-meter clock gauge for use between the crankwebs. Only one micrometer clock gauge need be supplied for each ship provided the gauge is suitable for use on all engines.

699 LLOYD'S REGISTER

Rules and Regulations for the Classification of Naval Ships, January 2022

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 3

2.4 Autofrettage

- 2.4.1 Manufacturers, and external providers of products or services, who carry out autofrettage of engine components, are to apply an approach for product assurance that is accepted by LR.
- 2.4.2 Documentation for the autofrettage process and the associated approach for product assurance is to be submitted in accordance with *Vol 2*, *Pt 2*, *Ch 1*, *1.4 Submission requirements 1.4.8*.
- 2.4.3 Testing carried out as part of the approach for product assurance is to confirm that the autofrettage process has not detrimentally affected the components and demonstrate that the prescriptive Rule requirements for pressure containment have been met, see *Table 1.2.1 Summary of testing and associated documentation for engine components*.

Section 3

Crankshaft design

3.1 Application

3.1.1 The requirements of *Vol 2, Pt 2, Ch 1, 3 Crankshaft design* apply to engines of powers greater that 110 kW intended for mobility or ship type systems.

3.2 Scope

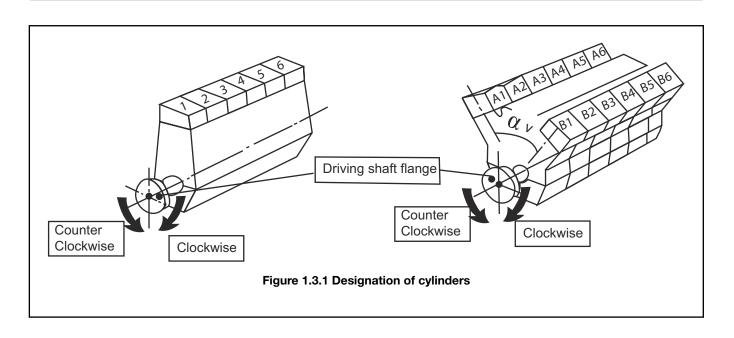

- 3.2.1 The formulae given in this Section are applicable to solid or semi-built crankshafts of forged or cast steel, having a main support bearing adjacent to each crankpin.
- 3.2.2 This section uses the static determinate method; alternative methods, including a fully documented stress analysis, will be considered.
- 3.2.3 Calculations are to be carried out for the maximum continuous power rating for all designed operating conditions. Calculations are to include short-term high power operation where applicable.
- 3.2.4 Designs of crankshafts not included in this scope will be subject to special consideration.
- 3.2.5 Where a crankshaft design involves the use of surface treated fillets, or when fatigue parameter influences are tested, or when working stresses are measured, the relevant documents with calculations/analysis are to be submitted to LR.
- 3.2.6 The design of crankshafts is based on an evaluation of safety against fatigue in the highly stressed areas. The calculation is also based on the assumption that the areas exposed to highest stresses are :
- (a) fillet transitions between the crankpin and web as well as between the journal and web,
- (b) outlets of crankpin oil bores.
- 3.2.7 When the journal diameter is equal to or larger than the crankpin one, the outlets of main journal oil bores are to be formed in a similar way to the crankpin oil bores, otherwise separate documentation of fatigue safety will be specially considered.
- 3.2.8 Calculation of crankshaft strength consists initially in determining the nominal alternating bending (see Vol 2, Pt 2, Ch 1, 3.6 Calculation of bending stresses) and nominal alternating torsional stresses (see Vol 2, Pt 2, Ch 1, 3.7 Calculation of torsional stresses) which, multiplied by the appropriate stress concentration factors (SCF) (see Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors), result in an equivalent alternating stress (uniaxial stress) (see Vol 2, Pt 2, Ch 1, 3.10 Equivalent alternating stress). This equivalent alternating stress is then compared with the fatigue strength of the selected crankshaft material (see Vol 2, Pt 2, Ch 1, 3.11 Fatigue strength). This comparison will show whether or not the crankshaft concerned is dimensioned adequately (see Vol 2, Pt 2, Ch 1, 3.12 Acceptability criteria).
- 3.2.9 Further information and guidance on crankshaft design is provided in LR's *Guidance Notes for the Calculation of Stress Concentration Factors*, *Fatigue Enhancement Methods and Evaluation of Fatigue Tests for Crankshafts*.

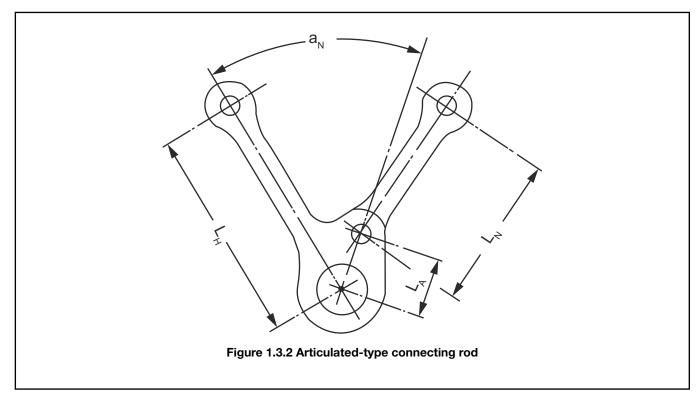

3.3 Information to be submitted

- 3.3.1 For the calculation of crankshafts, the documents and particulars listed below are required, this information is provided by completing LR Form 2073 and submitting the applicable plans required in *Table 1.1.1 Plans and particulars to be submitted*:
- Crankshaft drawing (which must contain all data in respect of the geometrical configurations of the crankshaft);

- Type designation and kind of engine (in-line engine or V-type engine with adjacent connecting rods, forked connecting rod or articulated-type connecting rod);
- Operating and combustion method (2-stroke or 4-stroke cycle/direct injection, precombustion chamber, etc.);
- Number of cylinders;
- Output power at maximum continuous rating (MCR), in kW;
- Output speed at maximum continuous power, in rpm;
- Maximum firing pressure, P_{max} , in MPa;
- Mean indicated pressure, in MPa;
- Charge air pressure (before inlet valves or scavenge ports, whichever applies), in MPa;
- Digitised gas pressure/crank angle cycle for MCR (presented at equidistant intervals at least every 5° CA);
- Mean piston speed;
- Compression ratio;
- Vee angle α_v , in degrees;
- Firing order numbered from driving end, see Figure 1.3.1 Designation of cylinders;
- Direction of rotation;
- Cylinder diameter, in mm;
- Piston stroke, in mm;
- Centre of gravity of connecting rod from large end centre, in mm;
- Radius of gyration of connecting rod, in mm;
- Length of connecting rod between bearing centres, L_H, in mm;
- Mass of single crankweb (indicate if webs either side of pin are of different mass values), in kg;
- Centre of gravity of crankweb mass from shaft axis, in mm;
- Mass of counterweights fitted (for complete crankshaft) indicate positions fitted, in kg;
- Centre of gravity of counterweights (for complete crankshaft) measured from shaft axis, in mm;
- All individual reciprocating masses acting on one crank, in kg;
- Crankshaft material specification(s) (according to ISO, EN, DIN, AISI, etc.);
- Mechanical properties of material (minimum values obtained from longitudinal test specimens):
 - tensile strength, in N/mm²
 - yield strength, in N/mm²
 - reduction in area at break, percentage
 - elongation, percentage
- Method of manufacture (free form forged, continuous grain flow forged, drop-forged, etc.; with description of the forging process);
- For semi-built crankshafts minimum and maximum diametral interference, in mm;

Particulars of alternating torsional stress calculations, see Vol 2, Pt 2, Ch 1, 3.7 Calculation of torsional stresses.

- 3.3.2 The following information is also required for appraisal of the crankshaft (not contained in Form 2073):
- For engines with articulated-type connecting rod (see Figure 1.3.2 Articulated-type connecting rod):
 - Distance to link point L_A , in mm
 - Link angle α_N , in degrees
 - Connecting rod length L_N , in mm
- firing interval (if applicable) i.e. if not evenly distributed
- Mass of connecting rod (including bearings), in kg;
- Mass of piston (including piston rod and crosshead where applicable), in kg;

- Every surface treatment affecting fillets or oil holes shall be specified so as to enable calculation according to Chapter 3 of the LR Guidance Notes for the Calculation of Stress Concentration Facrors, Fatigue Enhancement Methods and Evaluation of Fatigue Tests for Crankshafts;
 - This is to include crankshaft fatigue enhancement factors K_1 and K_2 where applicable.
- Maximum alternating torsional stress τ_a (N/mm²)
- Mechanical properties of material (minimum values obtained from longitudinal test specimens), in addition to the information listed above:

Impact energy K_V , in Joules

3.4 Symbols

- 3.4.1 For the purposes of this Chapter the following symbols apply, see also;
- Figure 1.3.3 Crank dimensions for overlapped crankshaft
- Figure 1.3.4 Crank dimensions for crankshaft without overlap
- Figure 1.3.5 Crankpin section through the oil bore
- Figure 1.3.6 Crankthrow of semi-built crankshaft

B = transverse breadth of web, in mm

D = crankpin diameter, in mm

 D_{A} = the outside diameter of web or twice the minimum distance between centreline of journals and outer contour of web, whichever is less, in mm

 D_{BH} = diameter of axial bore in crankpin

 D_{BG} = diameter of axial bore in journal

 $D_{\rm G}$ = journal diameter

 D_0 = diameter of radial oil bore in crankpin, in mm

 D_s = shrink diameter of main journal in web, in mm

E = pin eccentricity

 $E_{\rm m}$ = Young's modulus of crankshaft material, in N/mm²

F = area related to cross-section of web, in mm²

 K_{e} = bending stress factor (considers the influence of adjacent crank and bearing restraint)

 $K = \text{fatigue enhancement factor } (K = K_1.K_2)$

 K_1 = fatigue enhancement factor due to manufacturing process

 K_2 = fatigue enhancement factor due to surface treatment

 L_s = length of shrink fit, in mm

 $M_{\rm BON}$ = alternating bending moment calculated at the outlet of crankpin oil bore

 $M_{\rm BRFN}$ = alternating bending moment related to the centre of the web, in Nm

 M_{TN} = maximum alternating torque, in Nm

 M_{Tmax} = maximum value of the torque, in Nm

 M_{Tmin} = minimum value of the torque, in Nm

 Q_{REN} = alternating radial force related to the web, in N

 $R_{\rm H}$, $R_{\rm G}$ = fillet radius at junction of web and pin or journal, in mm

 $S = \text{pin overlap, in mm } S = \frac{D + D_G}{2} - E$

 $T_{\rm H}$, $T_{\rm G}$ = recess of pin or journal fillet radius into web measured from web face, in mm

W =axial thickness of web, in mm

 W_{eqw} = section modulus related to cross-section of web, in mm³

 $W_{\rm e} = {\rm section \ modulus \ related \ to \ cross-section \ of \ axially \ bored \ crankpin, \ in \ mm^3}$

 $W_{\rm p}$ = polar section modulus related to cross-section of axially bored crankpin or bored journal, in mm³

y = distance between the adjacent generating lines of journal and pin, in mm

Note $y \ge 0.05D_S$. Where y is less than $0.1D_S$ special consideration is to be given to the effect of the stress due to the shrink fit on the fatigue strength at the crankpin fillet.

 α_B = bending stress concentration factor for crankpin fillet

 α_T = torsional stress concentration factor for crankpin fillet

 β_B = bending stress concentration factor for main journal fillet

Note α_B and β_B are defined as the ratio of the maximum equivalent stress (von Mises) occurring in the fillets under bending load, to the nominal bending stress related to the web cross-section. See Figure 1.3.7 Stress concentration factors in crankshaft fillets.

 β_{O} = compression stress concentration factor for main journal fillet

Note β_Q is defined as the ratio of the maximum equivalent stress (von Mises) occurring in the fillet due to the radial force, to the nominal compressive stress related to the web cross-section.

 β_T = torsional stress concentration factor for main journal fillet

Note Note. α_T and β_T are defined as the ratio of the maximum equivalent shear stress occurring in the fillets under torsional load, to the nominal torsional stress related to the axially bored crankpin or journal cross-section. See Figure 1.3.7 Stress concentration factors in crankshaft fillets.

 γ_B = bending stress concentration factor for outlet of crankpin oil bore

 γ_T = torsional stress concentration factor for outlet of crankpin oil bore

Note γ_B and γ_T are defined as the ratio of the maximum principal stress occurring at the outlet of the crankpin oil-hole under bending and torsional loads respectively, to the corresponding nominal stress related to the axially bored crankpin cross section. See Figure 1.3.8 Stress concentration factors and stress distribution at the edges of oil drillings.

 σ_{add} = additional bending stress due to misalignment and bedplate deformation as well as due to axial and bending vibrations

 σ_B = specified minimum UTS of crankshaft material, in N/mm²

 σ_{BFN} = nominal alternating bending stress related to the web, in N/mm²

 σ_{BG} = alternating bending stress in journal fillet, in N/mm²

 σ_{BH} = alternating bending stress in crankpin fillet, in N/mm²

 σ_{BO} = alternating bending stress in the outlet of the oil bore, in N/mm²

 $\sigma_{BON} = \text{nominal alternating bending stress in the outlet of the oil bore related to the crankpin diameter, in N/mm²$

 σ_{QFN} = nominal alternating compressive stress due to radial force related to the web, in N/mm²

 σ_{DW} = allowable fatigue strength of crankshaft, in N/mm²

 σ_{SP} = minimum yield strength of material for journal pin, in N/mm²

 σ_{SW} = minimum yield strength of material for crankweb, in N/mm²

 σ_{TO} = alternating torsional stress in the outlet of the crankpin oil bore, in N/mm²

 σ_y = equivalent alternating stress for crankpin fillet, journal fillet or outlet of crankpin oil bore as applicable, in N/mm²

 τ_{H} = alternating torsional stress in crankpin fillet, in N/mm²

 τ_G = alternating torsional stress in journal fillet, in N/mm²

 $\tau_{N} = \text{ calculated nominal alternating torsional stress referred to crankpin or journal (as applicable), in N/mm²$

 τ_a = manufacturer stated crankshaft half range torsional stress limit, in N/mm²

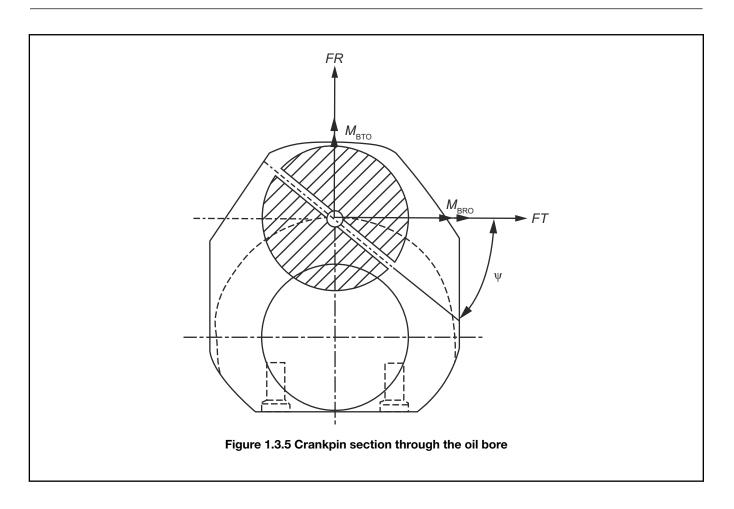

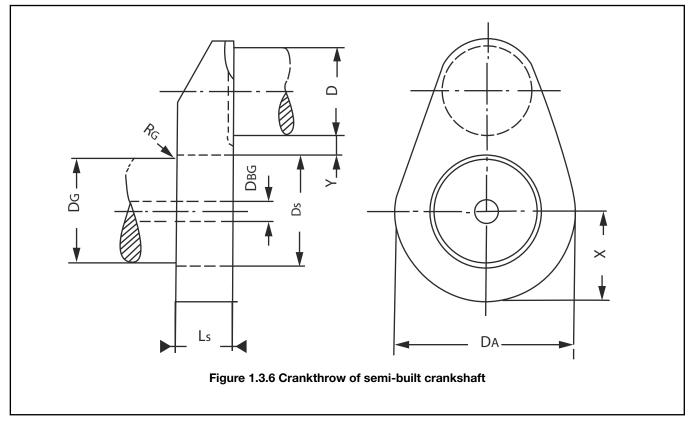

Reciprocating Internal Combustion Engines

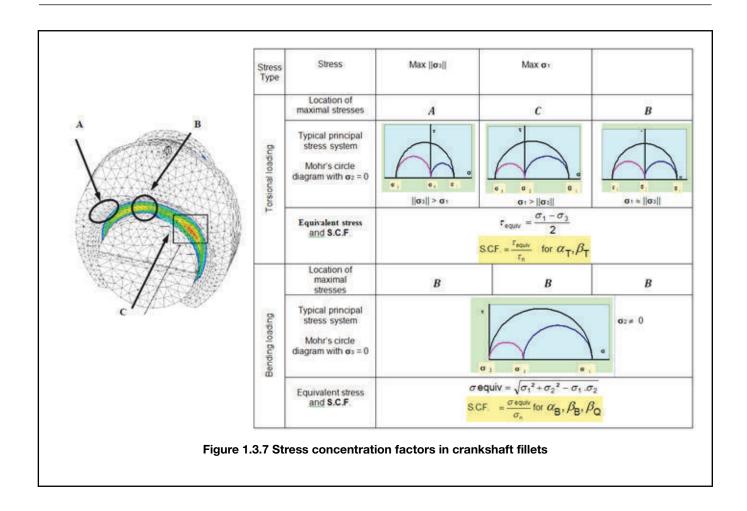

Volume 2, Part 2, Chapter 1 Section 3

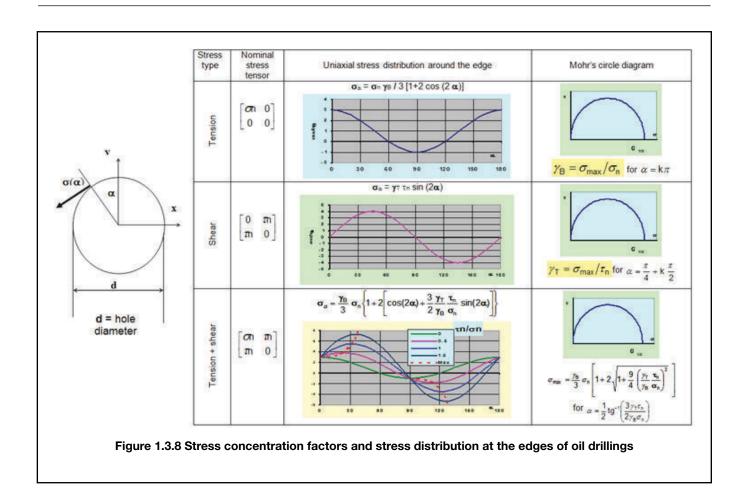

706

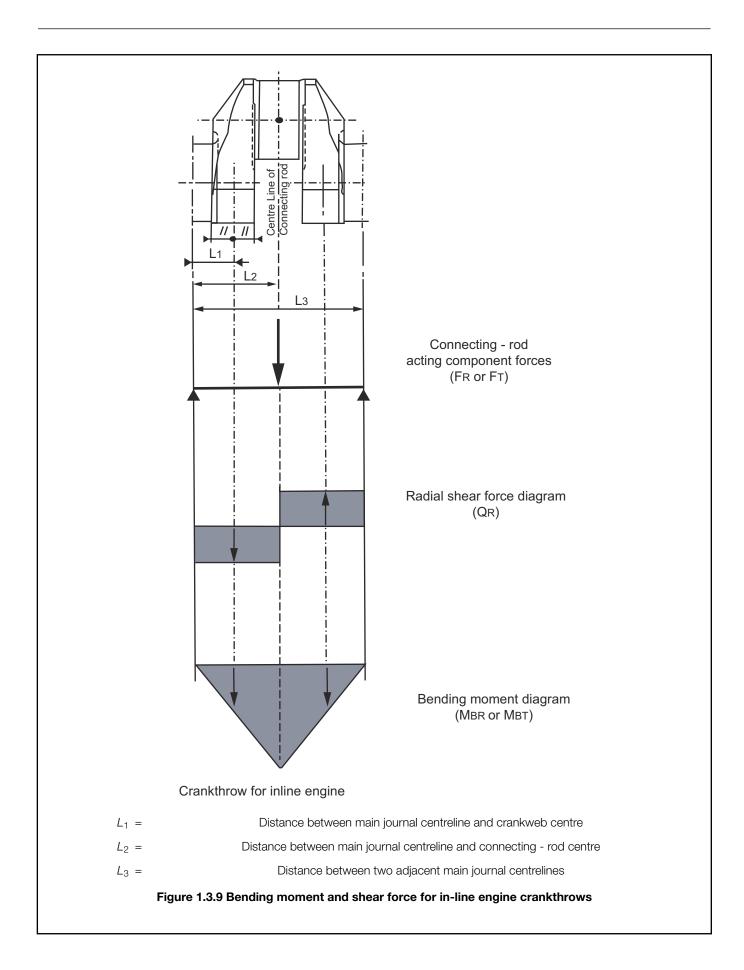

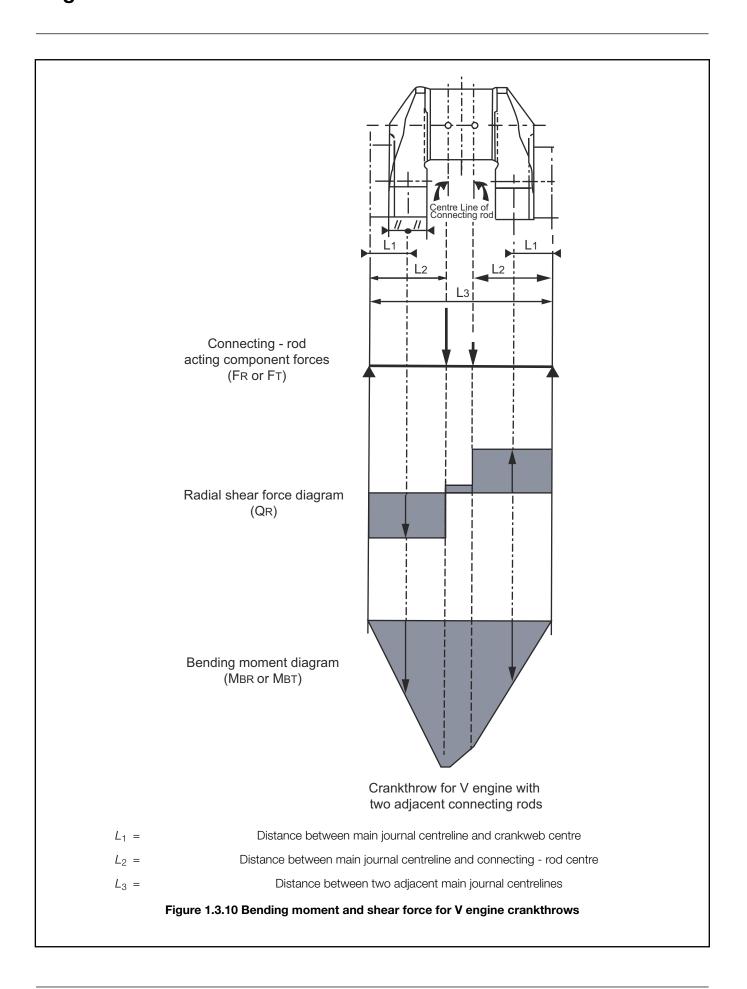

3.5 Calculation of alternating stresses due to bending moments and radial forces – assumptions

- 3.5.1 The calculation is based on a statically determined system, composed of a single crankthrow supported in the centre of adjacent main journals and subject to gas and inertia forces. The bending length is taken as the length between the two main bearing midpoints (distance L_3 , see Figure 1.3.9 Bending moment and shear force for in-line engine crankthrows and Figure 1.3.10 Bending moment and shear force for V engine crankthrows).
- 3.5.2 The bending moments, $M_{\rm BR}$ and $M_{\rm BT}$, are calculated in the relevant section based on triangular bending moment diagrams due to the radial component $F_{\rm R}$ and tangential component $F_{\rm T}$ of the connecting-rod force, respectively (see Figure 1.3.9 Bending moment and shear force for in-line engine crankthrows). For crankthrows with two connecting-rods acting upon one crankpin the relevant bending moments are obtained by superposition of the two triangular bending moment diagrams according to phase (see Figure 1.3.10 Bending moment and shear force for V engine crankthrows).

Reciprocating Internal Combustion Engines

Volume 2, Part 2, Chapter 1

- 3.5.3 The bending moment $M_{\rm BRF}$ and the radial force $Q_{\rm RF}$ are taken as acting in the centre of the solid web (distance L_1) and are derived from the radial component of the connecting-rod force. The alternating bending and compressive stresses due to bending moments and radial forces are to be related to the cross-section of the crankweb. This reference section results from the web thickness W and the web width B (see Figure 1.3.3 Crank dimensions for overlapped crankshaft and Figure 1.3.4 Crank dimensions for crankshaft without overlap). Mean stresses are neglected.
- 3.5.4 The two relevant bending moments for bending acting on the outlet of crankpin oil bores are taken in the crankpin cross-section through the oil bore. See;
- Figure 1.3.5 Crankpin section through the oil bore,
- Figure 1.3.9 Bending moment and shear force for in-line engine crankthrows, and
- Figure 1.3.10 Bending moment and shear force for V engine crankthrows.

 $M_{\rm BRO}$ is the bending moment of the radial component of the connecting-rod force and $M_{\rm BTO}$ is the bending moment of the tangential component of the connecting-rod force. The alternating stresses due to these bending moments are to be related to the cross-sectional area of the axially bored crankpin. Mean bending stresses are neglected.

3.6 Calculation of bending stresses

- 3.6.1 The radial and tangential forces due to gas and inertia loads acting upon the crankpin at each connecting-rod position are to be calculated over one working cycle. Using the forces calculated over one working cycle and taking into account of the distance from the main bearing midpoint, the time curve of the bending moments, $M_{\rm BRF}$, $M_{\rm BRO}$ and $M_{\rm BTO}$, and radial forces, $Q_{\rm RF}$, as defined in Vol 2, Pt 2, Ch 1, 3.5 Calculation of alternating stresses due to bending moments and radial forces assumptions 3.5.3 and Vol 2, Pt 2, Ch 1, 3.5 Calculation of alternating stresses due to bending moments and radial forces assumptions 3.5.4 are then calculated.
- 3.6.2 Nominal bending stresses are referred to the web bending modulus.
- 3.6.3 In case of V-type engines, the bending moments progressively calculated from the gas and inertia forces of the two cylinders acting on one crankthrow are superposed according to phase. Different designs (forked connecting-rod, articulated-type connecting-rod or adjacent connecting-rods) shall be taken into account.
- 3.6.4 Where there are cranks of different geometrical configurations in one crankshaft, the calculation is to cover all crank variants.
- 3.6.5 The decisive alternating values will then be calculated according to:

$$X_{N} = \pm \frac{1}{2} (X_{\text{max}} - X_{\text{min}})$$

where

 $X_{\rm N}$ is considered as alternating force, moment or stress

 X_{max} is maximum value within one working cycle

 X_{\min} is minimum value within one working cycle

3.6.6 Nominal alternating bending and compressive stresses in a web cross-section are calculated as follows:

$$\sigma_{\text{BFN}} = \pm \frac{M_{\text{BRFN}}}{W_{\text{eqw}}} 10^3 K_{\text{e}} \text{ N/mm}^2$$

$$\sigma_{QFN} = \pm \frac{Q_{RFN}}{F} K_e \text{ N/mm}^2$$

where

$$M_{\text{BRFN}} = \pm \frac{1}{2} (M_{\text{BRF max}} - M_{\text{BRF min}}) \text{ Nm}$$

$$W_{\text{eqw}} = \frac{BW^Z}{6} \text{ mm}^3$$

 $K_e = 0.8$ for crosshead engines

= 1,0 for trunk piston engines

Rules and Regulations for the Classification of Naval Ships, January 2022

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 3

where

$$Q_{\text{RFN}} = \pm \frac{1}{2} (Q_{\text{RF max}} - Q_{\text{RF min}}) \text{ N}$$

$$F = \text{BW mm}^2$$

3.6.7 Nominal alternating bending stress in the outlet of the crankpin oil bore is calculated as follows:

$$\sigma_{\text{BON}} = \pm \frac{M_{\text{BON}}}{W_{\text{e}}} 10^3 \,\text{N/mm}^2$$

where

 $M_{\rm BON}$ is taken as the ½ range value $M_{\rm BON}$ = ± ½ ($M_{\rm BOmax}$ – $M_{\rm BOmin}$) Nm

and

 $M_{\text{BO}} = (M_{\text{BTO}} \cos \psi + M_{\text{BRO}} \sin \psi), \ \psi = \text{angular position in degrees}, \ \text{see Figure 1.3.5 Crankpin section through the oil bore}$

 $M_{\rm BRO}$ = bending moment of the radial component of the connecting-rod force

 $M_{\rm BTO}$ = bending moment of the tangential component of the connecting-rod force

$$W_{\rm e} = \frac{\pi}{32} \left(\frac{D^4 - D_{\rm BH}^4}{D} \right) \text{ mm}^3$$

- 3.6.8 Alternating bending stresses for the crankpin fillet and journal fillet are calculated as follows:
- (a) For the crankpin fillet:

$$\sigma_{\rm BH} = \pm (\alpha_{\rm b} \ \sigma_{\rm BFN}) \ \rm N/mm^2$$

where

α_B is calculated according to Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors 3.8.6.(a)

(b) For the journal fillet

$$\sigma_{BG} = \pm \left(\beta_B \, \sigma_{BFN} + \beta_O \, \sigma_{OFN}\right) \, N/mm^2$$

where

β_B is calculated according to Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors 3.8.7.(a)

β_O is calculated according to Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors 3.8.7.(b)

3.6.9 Alternating bending stresses for the outlet of crankpin oil bore are calculated as follows:

$$\sigma_{BO} = \pm (\gamma_B \sigma_{BON}) N/mm^2$$

where

γ_B is calculated according to Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors 3.8.8.(a)

3.7 Calculation of torsional stresses

- 3.7.1 The nominal alternating torsional stress, τ_N , is to be taken into consideration. The value is to be derived from forced-damped vibration calculations of the complete dynamic system. Alternative methods will be given consideration. The engine designer is to advise the maximum level of alternating vibratory stress that is permitted (τ_a).
- 3.7.2 τ_a or τ_N (as applicable) is to be applied as a limiting value for the torsional vibration assessment required by *Vol 2, Pt 5, Ch 1 Torsional Vibration*.
- 3.7.3 Nominal alternating torsional stress is calculated as follows:

$$\tau_{\rm n} = \pm \frac{M_{\rm TN}}{W_{\rm P}} 10^3 \quad \text{N/mm}^2$$

where

$$\begin{split} M_{\rm TN} &= \pm \frac{1}{2} \Big(M_{\rm Tmax} - M_{\rm Tmin} \Big) \, {\rm Nm} \\ W_{\rm p} &= \frac{\pi}{16} \Bigg(\frac{D^4 - D_{\rm BH}^{\quad \ 4}}{D} \Bigg) \, \, {\rm mm}^3 \, {\rm for \, the \, crankpin, \, or \,} \\ W_{\rm p} &= \frac{\pi}{16} \Bigg(\frac{D_{\rm G}^{\quad 4} - D_{\rm BG}^{\quad 4}}{D_{C}} \Bigg) \, \, {\rm mm}^3 \, {\rm for \, the \, journal} \end{split}$$

 τ_N is to be ascertained from assessment of the torsional vibration calculations where the maximum and minimum torques are determined for every mass point of the complete dynamic system and for the entire speed range by means of a harmonic synthesis of the forced vibrations from the first order up to and including the 15th order for 2-stroke cycle engines and from the 0,5th order up to and including the 12th order for 4-stroke cycle engines. Whilst doing so, allowance must be made for the damping that exists in the system and for unfavourable conditions (misfiring in one of the cylinders when no combustion occurs but only compression cycle). The speed step calculation shall be selected in such a way that any resonance found in the operational speed range of the engine shall be detected.

- 3.7.4 For the purpose of the crankshaft assessment, the nominal alternating torsional stress considered in calculations is to be the highest calculated value, according to the method described in *Vol 2, Pt 2, Ch 1, 3.7 Calculation of torsional stresses 3.7.3*, occurring at the most torsionally loaded mass point of the crankshaft system.
- 3.7.5 The approval of the crankshaft will be based on the installation having the largest nominal alternating torsional stress (but not exceeding the maximum figure specified by the engine manufacturer). For each installation it is to be ensured by calculation that the maximum approved nominal alternating torsional stress is not exceeded. See Vol 2, Pt 5, Ch 1 Torsional Vibration.
- 3.7.6 Alternating torsional stresses for the crankpin fillet, the journal fillet and the outlet of the crankpin oil bore are calculated as follows.
- (a) Maximum alternating torsional stress in crankpin fillet:

$$\tau_{\text{H}} \ = \ \pm \left(\alpha_{T} \, \tau_{N}\right) \, N/mm^{2}$$

where

α_T is calculated according to Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors 3.8.6.(b).

(b) Maximum alternating torsional stress in the journal fillet (not applicable to semi-built crankshafts):

$$\tau_{\text{G}} = \pm \left(\beta_{T} \tau_{N}\right) N/\text{mm}^{2}$$

where

β_T is calculated according to Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors 3.8.7.(c).

(c) Maximum alternating torsional stress in the outlet of the crankpin oil bore:

$$\sigma_{\text{TO}} \ = \ \pm \! \left(\gamma_T \, \tau_N \! \right) \, N / mm^2$$

where

γ_T is calculated according to Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors 3.8.8.(b).

3.8 Stress concentration factors

- 3.8.1 Stress concentration factors (SCF) are to be calculated using the analytical formulae outlined in this Section.
- 3.8.2 Crankshaft variables to be used in calculating the geometric stress concentrations factors are shown in *Table 1.3.1* Crankshaft variables for SCF calculation, their limits of applicability are shown in *Table 1.3.2* Crankshaft variable boundaries for analytical SCF calculation.
- 3.8.3 Where the geometry of the crankshaft is outside the boundaries (see *Table 1.3.2 Crankshaft variable boundaries for analytical SCF calculation*) of the analytical SCF the calculation method detailed in Chapter 1 and Chapter 4 of the LR *Guidance*

Notes for Calculation of Stress Concentration Factors, Fatigue Enhancement Methods and Evaluation of Fatigue Tests for Crankshafts may be undertaken.

- 3.8.4 Where reliable experimental measurements and/or calculations are available, which can allow direct assessment of SCF, these can be used. The relevant documents and their analysis are to be submitted for consideration in order to demonstrate their equivalence. This is always to be performed when dimensions are outside the boundaries shown in *Table 1.3.2 Crankshaft variable boundaries for analytical SCF calculation*.
- 3.8.5 Chapters 1 and 4 of the LR *Guidance Notes for Calculation of Stress Concentration Factors, Fatigue Enhancement Methods and Evaluation of Fatigue Tests for Crankshafts* describe how finite element (FE) analyses can be used for the calculation of the SCF. Care needs to be taken to avoid mixing equivalent (von Mises) stresses and principal stresses.

Table 1.3.1 Crankshaft variables for SCF calculation

Variable	Function			
_	$=R_{H}/D$ for crankpin fillet			
r	$=R_{G}/D$ for journal fillet			
s	= S/D			
	= W/D crankshafts with overlap			
W	= W_{red}/D crankshafts without overlap			
b	= B/D			
d _o	$=D_{O}/D$			
d_{G}	$=D_{\mathrm{BG}}/D$			
d _H	$=D_{\text{BH}}/D$			
t _H	= T _H /D			
t_{G}	$=T_{\mathbb{G}}/D$			

Table 1.3.2 Crankshaft variable boundaries for analytical SCF calculation

Variable	Upper bound
S	≤ 0,5
W	≤ 0,8
b	≤ 2,2
r	≤ 0,13
$d_{\mathbb{G}}$	≤ 0,8
d_{H}	≤ 0,8
d _o	≤ 0,2
	s w b r d _G d _H

Notes

Low range of s can be extended down to large negative values provided that:

- If calculated f(recess) < 1 then the factor f(recess) is not to be considered (f(recess) = 1)
- If s < -0.5 then f(s,w) and f(r,s) are to be evaluated replacing actual value of s by -0.5.
- 3.8.6 Crankpin SCF are calculated as follows:
- (a) Bending

 $\alpha_{\text{B}} = 2,6914 \cdot f(s,w) \cdot f(w) \cdot f(b) \cdot f(r) \cdot f(d_{\text{G}}) \cdot f(d_{\text{H}}) \cdot f(\text{recess})$

where

$$f(s,w) = -4,1883 + 29,2004w - 77,5925w^2 + 91,9454w^3 - 40,0416w^4 + (1 - s)(9,5440 - 58,3480w + 159,3415w^2 - 192,5846w^3 + 85,2916w^4) + (1 - s)^2(-3,8399 + 25,0444w - 70,5571w^2 + 87,0328w^3 - 39,1832w^4)$$

$$f(w) = 2,1790w^{0,7171}$$

$$f(b) = 0.684 - 0.0077b + 0.1473b^2$$

$$f(r) = 0,2081 r^{(-0,5231)}$$

$$f(d_{\rm G}) = 0.9993 + 0.27d_{\rm G} - 1.0211d_{\rm G}^2 + 0.5306d_{\rm G}^3$$

$$f(d_{\rm H}) = 0.9978 + 0.3145d_{\rm H} - 1.5241d_{\rm H}^2 + 2.4147d_{\rm H}^3$$

$$f(recess) = 1 + (t_H + t_G)(1.8 + 3.2s)$$

(b) Torsion

$$\alpha_{\rm T} = 0.8 \cdot f \cdot (r,s) \cdot f(b) \cdot f(w)$$

where

$$f(r,s) = r^{(-0,322 + 0,1015 (1-s))}$$

$$f(b) = 7,8955 - 10,654b + 5,3482b^2 - 0,857b^3$$

$$f(w) = w^{(-0,145)}$$

- 3.8.7 Journal fillet SCF are calculated as follows (not applicable to semi-built crankshafts):
- (a) Bending

$$\beta_B = 2.7146 \cdot f_B(s, w) \cdot f_B(w) \cdot f_B(b) \cdot f_B(r) \cdot f_B(d_G) \cdot f_B(d_H) \cdot f(recess)$$

where

$$f_{\rm B}(s,w) = -1,7625 + 2,9821w - 1,5276w^2 + (1-s)(5,1169 - 5,8089w + 3,1391w^2) + (1-s)^2(-2,1567 + 2,3297w - 1,2952w^2)$$

$$f_{\rm B}(w) = 2,2422w^{0,7548}$$

$$f_{\rm B}(b) = 0.5616 + 0.1197b + 0.1176b^2$$

$$f_{\rm B}(r) = 0.1908r^{(-0.5568)}$$

$$f_{\rm B}(d_{\rm G}) = 1,0012 - 0,6441d_{\rm G} + 1,2265d_{\rm G}^2$$

$$f_{\rm B}(d_{\rm H}) = 1,0022 - 0,1903d_{\rm H} + 0,0073d_{\rm H}^2$$

$$f(\text{recess}) = 1 + (t_H + t_G)(1.8 + 3.2s)$$

(b) Compression due to the radial force

$$\beta_Q = 3.0128 \cdot f_Q(s) \cdot f_Q(w) \cdot f_Q(b) \cdot f_Q(r) \cdot f_Q(d_H) \cdot f(recess)$$

where

$$f_{\rm O}(s) = 0.4368 + 2.1630(1 - s) - 1.5212(1 - s)^2$$

$$f_{\rm Q}(w) = \frac{w}{0,0637 + 0,9369w}$$

$$f_{\rm O}(b) = b - 0.5$$

$$f_{\rm Q}(r) = 0.5331 r^{(-0.2038)}$$

$$f_{\rm O}(d_{\rm H}) = 0.9937 - 1.1949d_{\rm H} + 1.7373d_{\rm H}^2$$

where

 $f(recess) = 1 + (t_H + t_G)(1.8 + 3.2s)$

(c) Torsion

 $\beta_T = \alpha_T$ if the diameters and fillet radii of crankpin and journal are the same, or

 $\beta_T = 0.8 f(r,s).f(b).f(w)$ if crankpin and journal diameters and/or radii are of different sizes

where

f(r,s), f(b) and f(w) are to be determined in accordance with Vol 2, Pt 2, Ch 1, 3.8 Stress concentration factors 3.8.6.(b), however,

the radius of the journal fillet is to be related to the journal diameter: $r = \frac{R_{\rm G}}{D_{\rm G}}$

- 3.8.8 Crankpin oil bore SCF for radially drilled oil holes are calculated as follows:
- (a) Bending

$$\gamma_{\rm B} = 3 - 5,88d_{\rm o} + 34,6d_{\rm o}^2$$

(b) Torsion

$$\gamma_{\rm T} = 4 - 6d_0 + 30d_0^2$$

3.9 Additional bending stress

3.9.1 In addition to the alternating bending stresses in fillets (seeVol 2, Pt 2, Ch 1, 3.6 Calculation of bending stresses 3.6.8) further bending stresses due to misalignment and bedplate deformation as well as due to axial and bending vibrations are to be considered by applying σ_{add} as given by Table 1.3.3 Additional bending stresses

Table 1.3.3 Additional bending stresses

Type of engine	σ_{add}
Crosshead engines	± 30 N/mm² (see Note 1)
Trunk piston engines	± 10 N/mm ²
Note 1. The additional stress of ±30 N/mm ² is composed of two components:	
 (a) an additional stress of ±20 N/mm² resulting from axial vibration (b) an additional stress of ±10 N/mm² resulting from misalignment/bedplate deformation 	

3.9.2 It is recommended that a value of ±20 N/mm² be used for the axial vibration component for assessment purposes where axial vibration calculation results of the complete dynamic system (engine/shafting/gearing/propeller) are not available. Where axial vibration calculation results of the complete dynamic system are available, the calculated figures can be used instead.

3.10 Equivalent alternating stress

- 3.10.1 In the fillets, bending and torsion lead to two different biaxial stress fields which can be represented by a von Mises equivalent stress with the additional assumptions that bending and torsion stresses are time phased and the corresponding peak values occur at the same location (see *Figure 1.3.7 Stress concentration factors in crankshaft fillets*). As a result the equivalent alternating stress is to be calculated for the crankpin fillet as well as for the journal fillet by using the von Mises criterion.
- 3.10.2 At the oil hole outlet, bending and torsion lead to two different stress fields which can be represented by an equivalent principal stress equal to the maximum of principal stress resulting from combination of these two stress fields with the assumption that bending and torsion are time phased (see *Figure 1.3.8 Stress concentration factors and stress distribution at the edges of oil drillings*).
- 3.10.3 The above two different ways of equivalent stress evaluation both lead to stresses which can be compared to the same fatigue strength value of crankshaft assessed according to the von Mises criterion.

3.10.4 Equivalent alternating stress, σ_v , is defined as:

(a) For the crankpin fillet:

$$\sigma_{\text{V}} = \pm \sqrt{(\sigma_{BH} + \sigma_{add})^2 + 3\tau_{H}^2} N/\text{mm}^2$$

(b) For the journal fillet:

$$\sigma_{\text{V}} = \pm \sqrt{(\sigma_{BG} + \sigma_{add})^2 + 3\tau_{G}^2} N/\text{mm}^2$$

(c) For the outlet of crankpin oil bore:

$$\sigma_{\text{V}} \; = \; \frac{1}{3}\sigma_{BO} \left[1 + 2\sqrt{1 + \frac{9}{4} \left(\frac{\sigma_{TO}}{\sigma_{BO}}\right)^2} \; \right] \quad \text{N/mm}^2$$

3.11 Fatigue strength

3.11.1 The fatigue strength is to be understood as that value of equivalent alternating stress (von Mises) which a crankshaft can permanently withstand at the most highly stressed points. The fatigue strength can be evaluated by means of the following formulae.

(a) Related to the crankpin diameter:

$$\sigma_{\text{DW}} = \\ \pm K \Big(0.42 \sigma_{\text{B}} + 39.3 \Big) \Bigg[0.264 + 1.073 D^{-0.2} + \frac{785 - \sigma_{\text{B}}}{4900} + \frac{196}{\sigma_{\text{B}}} \sqrt{\frac{1}{R_{\text{X}}}} \Bigg] \text{ N/mm}^2$$

with

 $R_X = R_H$ in the fillet area

 $R_{\rm X} = D_{\rm o}/2$ in the oil bore area

(b) Related to the journal diameter:

$$\sigma_{\text{DW}} = \pm K \left(0.42 \sigma_{\text{B}} + 39.3 \right) \left[0.264 + 1.073 D_{\text{G}}^{-0.2} + \frac{785 - \sigma_{\text{B}}}{4900} + \frac{196}{\sigma_{\text{B}}} \sqrt{\frac{1}{R_{\text{X}}}} \right] \text{N/mm}^2$$

where

 $K = K_1K_2$

 K_1 = fatigue endurance factor appropriate to the manufacturing process

= 1,05 for continuous grain flow forged or drop-forged crankshafts

= 1,0 for free form forged crankshafts (without continuous grain flow)

 = 0,93 for cast steel crankshafts with cold rolling treatment in fillet area manufactured by companies using a LR approved cold rolling process

 K_2 = fatigue enhancement factor for surface treatment. These treatments are to be applied to the fillet radii

A value for K_2 will be assigned upon application by the engine designers. Full details of the process, together with the results of full scale fatigue tests will be required to be submitted for consideration. See Chapter 2 of the LR *Guidance Notes for the Calculation of Stress Concentration Factors, Fatigue Enhancement Methods and Evaluation of Fatigue Tests for Crankshafts*. Alternatively, the following values may be taken (surface hardened zone to include fillet radii):

 $K_2 = 1,15$ for induction hardened

= 1,25 for nitrided

Where a value of K_1 or K_2 greater than unity is to be applied then details of the manufacturing process are to be submitted. An enhanced K_1 factor will be considered, subject to special approval of the manufacturing specification. See *Materials and Qualification Procedures for Ships, Book E, Procedure MQPS 5-2*.

Rules and Regulations for the Classification of Naval Ships, January 2022

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 3

- 3.11.2 The formulae in $Vol\ 2$, $Pt\ 2$, $Ch\ 1$, $3.11\ Fatigue\ strength\ 3.11.1$ are subject to geometry limits. The junction of the oil hole with the crankpin or main journal surface is to be formed with an adequate radius and smooth surface finish down to a minimum depth equal to 1,5 times the oil bore diameter and for calculation purposes R_H , R_G or R_X are to be taken as not less than 2 mm.
- 3.11.3 Fatigue strength calculations or, alternatively, fatigue test results determined by experiment based either on full size crankthrow (or crankshaft) or on specimens taken from a full size crankthrow may be required to demonstrate acceptability. The experimental procedure for fatigue evaluation of specimens and fatigue strength of crankshaft assessment are to be submitted for approval by LR. The procedure is to include as a minimum: method, type of specimens, number of specimens (or crankthrows), number of tests, survival probability, and confidence number. See also Chapter 2 of the LR Guidance Notes for the Calculation of Stress Concentration Factors, Fatigue Enhancement Methods and Evaluation of Fatigue Tests for Crankshafts. Alternatively, the following
- 3.11.4 When journal diameter is equal or larger than the crankpin diameter, the outlets of main journal oil bores are to be formed in a similar way to the crankpin oil bores, otherwise separate fatigue strength calculations or, alternatively, fatigue test results may be required.
- 3.11.5 Only surface treatment processes approved by LR are permitted. Guidance for calculation of surface treated fillets and oil bore outlets is presented in Chapter 3 of the LR Guidance Notes for the Calculation of Stress Concentration Factors, Fatigue Enhancement Methods and Evaluation of Fatigue Tests for Crankshafts.

3.12 Acceptability criteria

3.12.1 The sufficient dimensioning of a crankshaft is confirmed by a comparison of the equivalent alternating stress and the fatigue strength. The acceptability factor, Q, is to be greater than or equal to 1,15 for the crankpin fillet, the journal fillet, the outlet of crankpin oil bore:

$$Q = \frac{\sigma_{DW}}{\sigma_{V}}$$

3.13 Shrink fit of semi-built crankshafts

- 3.13.1 The following formulae are applicable to crankshafts assembled by shrinking main journals into the crankwebs, see also Figure 1.3.6 Crankthrow of semi-built crankshaft.
- 3.13.2 In general, the radius of transition, $R_{\rm G}$, between the main journal diameter, $D_{\rm G}$, and the shrink diameter, $D_{\rm S}$, is to be not less than $0.015D_{\rm G}$ or $0.5(D_{\rm S}-D_{\rm G})$ where the greater value is to be considered.
- 3.13.3 Deviations from these parameters will be specially considered.
- 3.13.4 The maximum permissible internal diameter in the journal pin is to be calculated in accordance with the following formula, this condition serves to avoid plasticity in the hole of the journal pin:

$$D_{\text{BG}} = D_{\text{SV}} \sqrt{1 - \frac{4000 S_{\text{R}} M_{\text{max}}}{\mu \pi D_{\text{S}}^2 L_{\text{S}} \sigma_{\text{SP}}}} \text{ mm}$$

where

- S_R = safety factor against slipping; however, a value not less than 2 is to be taken unless documented by experiments.
- M_{max} = absolute maximum value of the torque M_{Tmax} in accordance with Vol 2, Pt 2, Ch 1, 3.7 Calculation of torsional stresses 3.7.3, in Nm
 - μ = coefficient for static friction; however, a value not greater than 0,2 is to be taken unless documented by experiments
- 3.13.5 The actual oversize Z of the shrink fit must be within the limits Z_{\min} and Z_{\max} calculated in accordance Vol~2, Pt~2, Ch~1, 3.13 Shrink fit of semi-built crankshafts 3.13.6 and Vol~2, Pt~2, Ch~1, 3.13 Shrink fit of semi-built crankshafts 3.13.7. When Vol~2, Pt~2, Ch~1, 3.13 Shrink fit of semi-built crankshafts 3.13.5 cannot be complied with, then the calculated values of Z_{\min} and Z_{\max} are not applicable due to multizone-plasticity problems. In such cases Z_{\min} and Z_{\max} are to be established from FEM calculations.
- 3.13.6 The minimum required diametral interference is to be taken as the greater of:

$$Z_{\min} \geq \frac{\sigma_{\rm SW} D_{\rm S}}{E_{\rm m}} \quad {\rm mm}$$

and

$$Z_{\min} \ge \frac{4000}{\mu \pi} \frac{S_{\rm R} M_{\max}}{E_{\rm m} D_{\rm S} L_{\rm S}} \frac{1 - Q_{\rm A}^2 Q_{\rm S}^2}{(1 - Q_{\rm A}^2)(1 - Q_{\rm S}^2)}$$
mm

where

$$Q_{\rm A} = \frac{D_{\rm S}}{D_{\rm A}}$$
 web ratio, $Q_{\rm A} = \frac{D_{\rm S}}{D_{\rm A}}$

$$Q_{\rm S}$$
 = shaft ratio, $Q_{\rm S} = \frac{D_{\rm BG}}{D_{\rm S}}$

3.13.7 The maximum diametral interference is not to be greater than:

$$Z_{\text{max}} \le D_{\text{S}} \left(\frac{\sigma_{\text{SW}}}{E_{\text{m}}} + \frac{0.8}{1000} \right) \text{mm}$$

This condition serves to restrict the shrinkage induced mean stress in the fillet.

3.13.8 Reference marks are to be provided on the outer junction of the crankwebs with the journals.

■ Section 4

Electronically controlled engines

4.1 General

- 4.1.1 The requirements of this Section are applicable to engines for propulsion, auxiliary or emergency power purposes with programmable electronic systems implemented and used to control fuel injection timing and duration, and which may also control combustion air or exhaust systems. The requirements of this Section also apply to programmable electronic systems used to control other functions (e.g. starting and control air, cylinder lubrication, etc.) where essential for the operation of the engine.
- 4.1.2 These engines may be of the crosshead or trunk-piston type. They generally have no direct camshaft driven fuel systems, but have common rail fuel/hydraulic arrangements and may have hydraulic actuating systems for the functioning of the exhaust systems.
- 4.1.3 The operation of these engines relies on the effective monitoring of a number of parameters such as crank angle, engine speed, temperatures and pressures using programmable electronic systems to provide the services essential for the operation of the engine such as fuel injection, air inlet, exhaust and speed control.
- 4.1.4 Details of proposals to deviate from the requirements of this Section are to be submitted and will be considered on the basis of a technical justification produced by the engine packager or system integrator.
- 4.1.5 Each engine is to be configured for the specified performance and is to satisfy the relevant requirements for propulsion, auxiliary or emergency engines.
- 4.1.6 During the life of the engine details of any proposed changes to control, alarm, monitoring or safety systems which may affect safety and the reliable operation of the engine are to be submitted to LR for approval.

4.2 Risk Assessment (RA)

4.2.1 A Risk Assessment (RA) is to be carried out in accordance with the requirements of Vol 2, Pt 1, Ch 3, 18 Risk Assessment (RA), and to demonstrate compliance with the applicable requirements of this sub-Section appropriate to the engine application. The analysis is to be a risk-based consideration of engine operation and ship and personnel safety, and is to demonstrate adequate risk mitigation through fault tolerance and/or reliability in accordance with the specified criteria in Vol 2, Pt 2, Ch 1, 4.2 Risk Assessment (RA) 4.2.2 to Vol 2, Pt 2, Ch 1, 4.2 Risk Assessment (RA) 4.2.4, relevant to the engine application.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 4

- 4.2.2 For ships with a single main propulsion engine, a RA of system reliability is to be carried out and is to demonstrate that an electronic control system failure:
- (a) will not result in the loss of the ability to provide the services essential for the operation of the engine, see Vol 2, Pt 9, Ch 7, 4.5 Control systems, general requirements 4.5.7 and Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.2;
- (b) will not affect the normal operation of the services essential for the operation of the engine other than those services dependent upon the failed part, see Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems 5.5.4 and Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems 5.5.5; and
- (c) will not leave either the engine, or any equipment or machinery associated with the engine, or the ship in an unsafe condition, see Vol 2, Pt 9, Ch 7, 4.3 Alarm systems, general requirements 4.3.15, Vol 2, Pt 9, Ch 7, 4.4 Safety systems, general requirements 4.4.5, Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.3, Vol 2, Pt 9, Ch 8, 5.1 General requirements 5.1.4 and Vol 2, Pt 9, Ch 8, 5.5 Additional requirements for integrated systems 5.5.5.
- 4.2.3 A RA is to be carried out for:
- (a) main engines on ships with multiple main engines or other means of providing propulsion power; and/or
- (b) auxiliary engines intended to drive electric generators forming the ship's main source of electrical power or otherwise providing power for essential services.

The RA is to demonstrate that adequate hazard mitigation has been incorporated in electronically controlled engine systems or the overall ship installation, with respect to personnel safety and providing propulsion power and/or power for essential services for the safety of the ship. Arrangements satisfying the criteria of Vol 2, Pt 2, Ch 1, 4.2 Risk Assessment (RA) 4.2.2 will also be acceptable.

- 4.2.4 For engines for emergency power purposes, a RA is to be carried out to demonstrate that the design incorporates adequate hazard mitigation, such that the likelihood of an electronic engine system failure resulting in the loss of the ability to provide emergency power when required has been reduced to a level considered acceptable by LR and that means are provided to detect failures and permit personnel to restore engine availability to operate on demand. Failures which would result in engine failure and/or damage or loss of availability are to be identified and the report is to include documentation of:
- (a) component reliability evidence;
- (b) failure detection and alarms; and
- (c) failure response required to restore engine availability and maintain personnel safety.
- 4.2.5 The RA report is to:
- (a) Identify the standards used for analysis and system design.
- (b) Identify the engine, its purpose and the associated objectives of the analysis.
- (c) Identify any assumptions made in the analysis.
- (d) Identify the equipment, system or sub-system and the mode of operation.
- (e) Identify potential failure modes and their causes.
- (f) Evaluate the local effects (e.g. fuel injection failure) and the effects on the system as a whole (e.g. loss of propulsion power) of each failure mode.
- (g) Identify measures for reducing the risks associated with each failure mode (e.g. system design, failure detection and alarms, redundancy, quality control procedures for sourcing, manufacture and testing, etc.).
- (h) Identify trials and testing necessary to prove conclusions.
- 4.2.6 In an electronically controlled engine, it is necessary to define the essential services on which the operation of the engine relies, and the control functions, alarm functions and safety functions for the equipment and machinery providing these services. Examples of essential services are:
- (a) Starting arrangements.
- (b) Fuel supply arrangements.
- (c) Lubricating oil arrangements.
- (d) Hydraulic oil arrangements.
- (e) Cooling arrangements.
- (f) Power supply arrangements.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 4

4.2.7 At sub-system level, it is acceptable to consider failure of equipment items and their functions, e.g. failure of a pump to produce flow or pressure head. It is not required that the failure of components within that pump be analysed, and failure need only be dealt with as a cause of failure of the pump.

4.3 Control engineering systems

- 4.3.1 Control, alarm, monitoring, safety and programmable electronic systems are to comply with *Vol 2, Pt 9 Electrotechnical Systems* and *Vol 2, Pt 10 Human Factors*, as applicable.
- 4.3.2 The engine control, alarm, monitoring and safety systems are to be configured to comply with the relevant requirements (e.g. operating profile, alarms, shutdowns, etc.) of this Chapter and *Vol 2, Pt 9 Electrotechnical Systems* and *Vol 2, Pt 10 Human Factors* for an engine for main, auxiliary or emergency power purposes. Details of the engine configuration are to be submitted for consideration, see *Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.2*.

4.4 Software

- 4.4.1 Software lifecycle activities are to be carried out in accordance with an acceptable quality management system, see Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.2 and Vol 2, Pt 9, Ch 8, 5.4 Additional requirements for Mobility category and safety critical systems 5.4.7.
- 4.4.2 Appropriate safety related processes, methods, techniques and tools are to be applied to software development and maintenance by the engine packager or system integrator. Selection and application of techniques and measures in accordance with Annex A of IEC 61508-3, Functional safety of electrical/electronic/programmable electronic systems: Software requirements, Vol 2, Pt 1, Ch 3, 21 Software in systems, machinery and equipment and Vol 2, Pt 9, Ch 8, 5.6 Programmable electronic systems Additional requirements for the production of software for the production of software or other relevant standards or codes acceptable to LR, will generally be acceptable.
- 4.4.3 To demonstrate compliance with Vol 2, Pt 2, Ch 1, 4.4 Software 4.4.1 and Vol 2, Pt 2, Ch 1, 4.4 Software 4.4.2:
- (a) software quality plans and safety evidence are to be submitted for consideration, see Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.3.(b) and Vol 2, Pt 2, Ch 1, 1.4 Submission requirements 1.4.3.(c); and
- (b) an assessment inspection of the engine packager's or system integrator's completed development is to be carried out by LR. The inspection is to be tailored to verify application of the standards and codes used in software safety assurance accepted by LR.

4.5 Additional requirements for emergency engines for naval vessels

- 4.5.1 Electronically controlled engines will only be accepted for use as emergency engines when the additional requirements of this sub-Section are satisfied.
- 4.5.2 Electrically powered control equipment required for engine starting or operation is to be served by not less than two individual power supplies, one fed from a main switchboard circuit and one from an emergency switchboard circuit provided in accordance with Vol 2, Pt 2, Ch 1, 4.5 Additional requirements for emergency engines for naval vessels 4.5.3 and Vol 2, Pt 2, Ch 1, 4.5 Additional requirements for emergency engines for naval vessels 4.5.4.
- 4.5.3 Each power supply is to be provided with an Uninterruptible Power System (UPS) in accordance with *Vol 2, Pt 9, Ch 3, 7.3 Uninterruptible power systems* capable of supplying the starting arrangements for three successive starts over a period of at least 30 minutes. A manual supply changeover switch is to be provided.
- 4.5.4 The power supplies are not to pass through a common switchboard or section board and are not to use common feeders, protective devices, control circuits, controlgear assemblies or battery chargers, so that any single fault will not cause the loss of both supplies. Where adequate circuit protection and stored battery and charging capacity exists, the engine starting batteries may be used to provide one supply.
- 4.5.5 Where the proposed arrangement of engine electronic control systems do not incorporate redundancy to satisfy the requirements of *Vol 2, Pt 2, Ch 1, 4.2 Risk Assessment (RA) 4.2.1*, evidence is to be submitted that demonstrates the arrangements have been assessed and found to comply with IEC 61508, functional safety of electrical/electronic/programmable electronic systems, or a relevant alternative standard. The submissions are to include proposals for LR to verify compliance (reviews, surveys, trials, etc.) with the applicable standard(s).
- 4.5.6 Where emergency engines are used as harbour sets, the system is to comply with the requirements of *Vol 2, Pt 9, Ch 2, 5.2 Emergency source of electrical power 5.2.6.* This function is to be included in the RA

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 5

4.5.7 Emergency engines are required to be immediately available in an emergency and capable of being controlled remotely or automatically.

Section 5

Construction and welded structures

5.1 Crankcases

5.1.1 Crankcases and their doors are to be of robust construction to withstand anticipated crankcase pressures that may arise during a crankcase explosion taking into account the installation of explosion relief valves required by *Vol 2, Pt 2, Ch 1, 10 Safety arrangements* and the doors are to be securely fastened so that they will not be readily displaced by a crankcase explosion.

5.2 Welded joints

- 5.2.1 Bedplates and major components of engine structures are to be made with a minimum number of welded joints.
- 5.2.2 Double welded butt joints are to be adopted wherever possible in view of their superior fatigue strength.
- 5.2.3 Girder and frame assemblies should, so far as possible, be made from one plate or slab, shaped as necessary, rather than by welding together a number of small pieces.
- 5.2.4 Steel castings are to be used for parts which would otherwise require complicated weldments.
- 5.2.5 Care is to be taken to avoid stress concentrations such as sharp corners and abrupt changes in section.
- 5.2.6 Joints in parts of the engine structure which are stressed by the main gas or inertia loads are to be designed as continuous full strength welds and for complete fusion of the joint. They are to be so arranged that, in general, welds do not intersect, and that welding can be effected without difficulty and adequate inspection can be carried out. Abrupt changes in plate section are to be avoided and where plates of substantially unequal thickness are to be butt welded, the thickness of the heavier plate is to be gradually tapered to that of the thinner plate. Tee joints are to be made with full bevel or equivalent weld preparation to ensure full penetration.
- 5.2.7 In single plate transverse girders the castings for main bearing housings are to be formed with web extensions which can be butt welded to the flange and vertical web plates of the girder. Stiffeners in the transverse girder are to be attached to the flanges by full penetration welds.

5.3 Materials and construction

- 5.3.1 All welded construction is to be in accordance with the requirements specified in *Ch 13 Requirements for Welded Construction* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*, using welding procedures and welders that have been qualified in accordance with *Ch 12 Welding Qualifications* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*.
- 5.3.2 Plates, sections, forgings and castings are to be of welding quality in accordance with the requirements of *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*, and with a carbon content generally not exceeding 0,23 per cent. Steels with higher carbon contents may be approved subject to satisfactory results from welding procedure tests.
- 5.3.3 Before welding is commenced the component parts of bedplates and framework are to be accurately fitted and aligned.
- 5.3.4 The welding is to be carried out in positions free from draughts and is to be downhand (flat) wherever practicable. Welding consumables are to be suitable for the materials being joined. Preheating is to be adopted when heavy plates or sections are welded. The finished welds are to have an even surface and are to be free from undercutting.
- 5.3.5 Welds attaching bearing housings to the transverse girders are to have a smooth contour and, if necessary, are to be made smooth by grinding.

5.4 Post-weld heat treatment

5.4.1 Bedplates are to be given a stress relieving heat treatment except engine types where the bedplate as a whole is not subjected to direct loading from the cylinder pressure. For these types, only the transverse girder assemblies need be stress relieved.

- 5.4.2 Stress relieving is to be carried out by heating the welded structure uniformly and slowly to a temperature between 580°C and 620°C, holding that temperature for not less than one hour per 25 mm of maximum plate thickness and thereafter allowing the structure to cool slowly in the furnace.
- 5.4.3 Omission of post-weld heat treatment of bedplates and their sub-assemblies will be considered on application by the engine builder with supporting evidence in accordance with *Ch 13, 2.10 Post-weld heat treatment 2.10.6* of the Rules for Materials.

5.5 Inspection

- 5.5.1 Welded engine structures are to be examined during fabrication, special attention being given to the fit of component parts of major joints prior to welding.
- 5.5.2 Inspection of welds is to be in accordance with the requirements of *Ch 13, 1.11 Non-destructive examination of welds* of the *Rules for the Manufacture, Testing and Certification of Materials, July 2021, incorporating Notice No. 1 & 2*
- 5.5.3 Welds in transverse girder assemblies are to be crack detected by an approved method to the satisfaction of the Surveyors. Other joints are to be similarly tested if required by the Surveyors.

■ Section 6

Turning gear

6.1 General requirements

- 6.1.1 Turning gear is to be provided for all engines to facilitate operating and maintenance regimes as required by the manufacturer.
- 6.1.2 The turning gear for all propulsion engines is to be power-driven and is to be continuously rated at a value to ensure protection to the weakest part of the machinery. Alternative proposals may be made subject to special consideration.
- 6.1.3 The turning gear for auxiliary engines may be hand operated (manual) except where this is not practicable, in which case the provision of *Vol 2*, *Pt 2*, *Ch 1*, *6.1 General requirements 6.1.2* is to be complied with.
- 6.1.4 The turning gear for all engines is to be fitted with safety Interlocks which prevent engine operation when engaged see *Vol 2, Pt 1, Ch 3, 4.14 Machinery interlocks*. Indication of engaged/disengaged is to be provided at all start positions.
- 6.1.5 The remote control device of power-driven turning gear is to be so designed that power is removed from the turning gear when the operating switch is released.
- 6.1.6 Means are to be provided to secure the turning gear when disengaged.
- 6.1.7 Overload protection arrangements are to be provided to prevent damage to the electric motor and the turning gear train.

■ Section 7

Control and monitoring of main, auxiliary and emergency engines

7.1 General

- 7.1.1 Control engineering systems are to comply with the requirements of Vol 2, Pt 9 Electrotechnical Systems.
- 7.1.2 Oil mist detection or engine bearing temperature monitors (or equivalent device) fitted as required by *Vol 2, Pt 2, Ch 1,* 10.8 Oil mist detection 10.8.1 are to operate as follows:
- (a) For trunk piston engines, automatic shutdown of the engine is to occur when oil mist or high bearing temperature is
- (b) For crosshead engines, automatic slow-down is to occur when oil mist or high bearing temperature is detected.
- (c) Where arrangements are made to override the automatic slow-down or shutdown due to high oil mist or bearing temperature, the override is to be independent of other overrides.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 7

- (d) Where the bearing temperature monitoring method is chosen, all bearings in the crankcase are to be monitored where practicable, e.g. main, crankpin, crosshead.
- (e) Where engine bearing temperature monitors or equivalent devices are provided for the prevention of the build-up of oil mist that may lead to a potentially explosive condition within the crankcase, details are to be submitted for consideration. The submission is to demonstrate that the arrangements are equivalent to those provided by oil mist detection, see Vol 2, Pt 2, Ch 1, 10.8 Oil mist detection 10.8.15.

Where required, for each trunk piston engine, one oil mist detector (or engine bearing temperature monitoring system or equivalent device) having two independent outputs for initiating the alarm and shutdown would satisfy the requirement for independence between alarm and shutdown systems.

7.1.3 All main and auxiliary engines intended for Mobility or Ship Type systems are to be provided with means of indicating the lubricating oil pressure supply to them. Where such engines are of more than 37 kW, audible and visual alarms are to be fitted to give warning of an appreciable reduction in pressure of the lubricating oil supply. Further, these alarms are to be actuated from the outlet side of any restrictions, such as filters, coolers, etc.

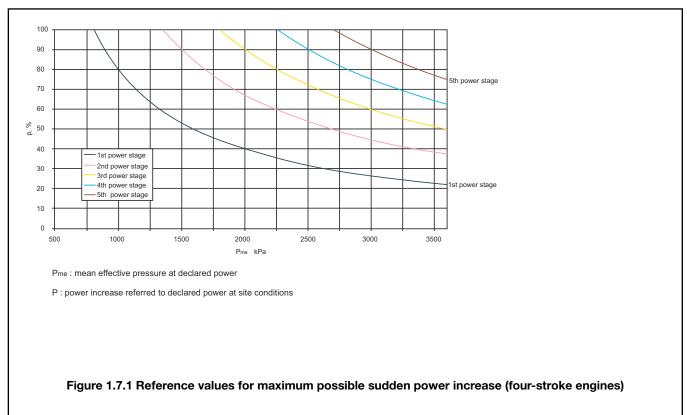

7.2 Main engine governors

- 7.2.1 An efficient speed governor is to be fitted to each main engine so adjusted that the speed does not exceed that for which the engine is to be certified by more than 15 per cent.
- 7.2.2 Engines coupled to electrical generators that are the source of power for main electric propulsion are to comply with the requirements for electrical generator engines in respect of governors and overspeed protection devices.
- 7.2.3 When electronic speed governors of main internal combustion engines form part of a remote control system, they are to comply with the following conditions:
- (a) If lack of power to the governor may cause changes in the present speed and direction of thrust of the propeller, which
 consequently compromise safe operation of the vessel, then a backup power supply is to be provided;
- (b) Local control of the engines is always to be possible. A means to effect safe transfer of control to the local control position and then control the engine is to be available in all normal and reasonably foreseeable abnormal conditions;
- (c) In addition, electronic speed governors and their actuators are to be type approved in accordance with LR's Type Approval System Test Specification Number 1.

7.3 Auxiliary and emergency engine governors

- 7.3.1 Prime movers for driving generators of the main and emergency sources of electrical power are to be fitted with a speed governor which will prevent transient frequency variations in the electrical network in excess of ± 10 per cent of the rated frequency, with a recovery time to steady state conditions not exceeding 5 seconds, when the maximum electrical step load is switched on or off.
- 7.3.2 In the case when a step load equivalent to the rated output of a generator is switched off, a transient speed variation in excess of 10 per cent of the rated speed may be acceptable, provided that this does not cause the intervention of the overspeed device as required by *Vol 2, Pt 2, Ch 1, 7.5 Overspeed protective devices*.
- 7.3.3 At all loads between no load and rated power, the permanent speed variation should not be more than ±5 per cent of the rated speed.
- 7.3.4 Prime movers are to be selected in such a way that they will meet the load demand within the ship's power distribution system. Application of electrical load should be possible with two load steps and must be such that prime movers, running at no load, can suddenly be loaded to 50 per cent of the rated power of the generator followed by the remaining 50 per cent after an interval sufficient to restore the speed to steady state. Steady state conditions should be achieved in not more than 5 seconds. Steady state conditions are those at which the envelope of speed variation does not exceed +1 per cent of the declared speed at the new power.
- 7.3.5 Application of electrical load in more than two load steps can only be permitted if the conditions within the ship's power distribution system permit the use of such prime movers which can only be loaded in more than two load steps (see Figure 1.7.1 Reference values for maximum possible sudden power increase (four-stroke engines)) and provided that this is already allowed for at the design stage. This is to be verified in the form of system specifications to be approved and to be demonstrated at ship's trials. In this case, due consideration is to be given to:
- (a) The power required for the electrical equipment to be automatically switched on after blackout and to the sequence in which it is connected.

(b) Where generators are to be operated in parallel and where the power has to be transferred from one generator to another in the event of any one generator being switched off.

- 7.3.6 Emergency generator sets are to comply with the requirements of Vol 2, Pt 2, Ch 1, 7.3 Auxiliary and emergency engine governors 7.3.1 to Vol 2, Pt 2, Ch 1, 7.3 Auxiliary and emergency engine governors 7.3.3 even when:
- (a) their total consumer load is applied suddenly; or
- (b) their total consumer load is applied in steps, subject to:
- the total load being supplied within 45 seconds of power failure on the main switchboard;
- the maximum step load being declared and demonstrated;
- the power distribution system being designed such that the declared maximum step loading is not exceeded; and
- the compliance of time delays and loading sequence with the above being demonstrated at ship's trials.
- 7.3.7 For a.c. generating sets operating in parallel, the governing characteristics of the prime movers shall be such that within the limits of 20 per cent and 100 per cent total load, the load on any generating set will not normally differ from its proportionate share of the total load by more than 15 per cent of the rated power of the largest machine, or 25 per cent of the rated power of the individual machine in question, whichever is the less. For an a.c. generating set intended to operate in parallel, facilities are to be provided to adjust the governor sufficiently finely to permit an adjustment of load not exceeding 5 per cent of the rated load at normal frequency.
- 7.3.8 For generator set voltage control requirements see Vol 2, Pt 9, Ch 2, 6.4 Generator control.
- 7.3.9 For quality of power supplies (QPS) requirements see Vol 2, Pt 9, Ch 1, 2.1 Quality of power supplies (QPS).

7.4 Additional requirements for auxiliary engine governors for naval vessels

- 7.4.1 The no-load stability of governors on electrical generator engines is to be such as to enable satisfactory paralleling to be achieved.
- 7.4.2 Specific electrical power supply requirements for a particular installation as specified in the System Operational Concept, ELS Notation or by the Naval Administration are to be applied in addition to the requirements of *Vol 2*, *Pt 2*, *Ch 1*, 7.3 Auxiliary and emergency engine governors . See also *Vol 2*, *Pt 9*, *Ch 1*, 3 Quality of power supplies ELS notation.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 7

7.5 Overspeed protective devices

- 7.5.1 Each main engine developing 220 kW or over which can be declutched or which drives a controllable pitch propeller and also each auxiliary engine developing 220 kW and over for driving an electric generator, is to be fitted with an approved overspeed protective device.
- 7.5.2 The overspeed protective device, including its driving mechanism, is to be independent of the governor required by *Vol 2, Pt 2, Ch 1, 7.2 Main engine governors* or *Vol 2, Pt 2, Ch 1, 7.3 Auxiliary and emergency engine governors* and is to be so adjusted that the speed does not exceed that for which the engine and its driven machinery are to be classed by more than 20 per cent for main engines and 15 per cent for auxiliary engines.

7.6 Unattended machinery

- 7.6.1 Where main and auxiliary engines are fitted with automatic or remote controls so that under normal operating conditions they do not require any manual intervention by the operators, they are to be provided with the alarms and safety arrangements required by Vol 2, Pt 2, Ch 1, 7.6 Unattended machinery to Vol 2, Pt 2, Ch 1, 7.8 Auxiliary engines as appropriate. Alternative arrangements which provide equivalent safeguards will be considered.
- 7.6.2 Where machinery is arranged to start automatically or from a remote control station, interlocks are to be provided to prevent start-up under conditions which could present a hazard to the machinery.
- 7.6.3 Where machinery specified in this Section is required to be provided with a standby pump, the standby pump is to start automatically if the discharge pressure from the working pumps falls below a predetermined value.
- 7.6.4 Where a first stage alarm together with a second stage alarm and automatic shutdown of machinery are required in the relevant Tables of this Section, the sensors and circuits utilised for the second stage alarm and automatic shutdown are to be independent of those required for the first stage alarm.
- 7.6.5 Means are to be provided to prevent leaks from high pressure fuel oil injection piping for main and auxiliary engines dripping or spraying onto hot surfaces or into machinery air inlets. Such leakage is to be collected and, where practicable, led to a collector tank(s) fitted in a safe position. An alarm is to be provided to indicate that leakage is taking place. These requirements may also be applicable to high pressure hydraulic oil piping depending upon the location.

7.7 Engines for propulsion purposes

7.7.1 Alarms and safeguards are indicated in Vol 2, Pt 2, Ch 1, 7.7 Engines for propulsion purposes 7.7.2 to Vol 2, Pt 2, Ch 1, 7.7 Engines for propulsion purposes 7.7.8 and Table 1.7.1 Engines for propulsion purposes: Alarms and slow-downs and Table 1.7.2 Engines for propulsion purposes: Automatic shutdowns.

Table 1.7.1 Engines for propulsion purposes: Alarms and slow-downs

Item	Alarm	Note
Lubricating oil sump level	Low	Engines
Lubricating oil inlet pressure*	1st stage	Engines. Slow-down
Lubricating oil inlet temperature*	High	Engines
Lubricating oil filters differential pressure	High	_
Activation of oil mist detection arrangements (or activation of the temperature monitoring systems or equivalent devices of: - the engine main, crank and crosshead bearing oil	I Pala	For crosshead engines, automatic slow-down. For trunk- piston engines, see Table 1.7.2 Engines for propulsion purposes: Automatic shutdowns. See also Vol 2, Pt 2, Ch 1, 7.1 General 7.1.2
outlet; or - the engine main, crank and crosshead bearing)		
Cylinder lubricator flow	Low	One sensor per lubricator unit on crosshead engines. Slow-down
Thrust bearing temperature*	High	Slow-down

Piston coolant inlet pressure	Low	If a separate system. Slow-down
Piston coolant outlet temperature*	High	Per cylinder (if a separate system). Slow-down
Piston coolant outlet flow*	Low	Per cylinder (if a separate system). Slow-down
Cylinder coolant inlet pressure or flow*	Low	Slow-down (automatic on trunk piston engines)
Cylinder coolant outlet temperature*	1st stage high	Per cylinder (if a separate system) Slow-down (automatic on trunk piston)
Engine cooling water system – oil content	High	Required for crosshead engines where engine cooling water used in oil/water heat exchangers
Sea-water cooling pressure	Low	_
Fuel valve coolant pressure	Low	If a separate system
Fuel valve coolant temperature	High	If a separate system
Fuel oil pressure from booster pump	Low	_
Fuel oil temperature or viscosity*	High and Low	Heavy oil only
Common rail fuel oil pressure	Low	_
Fuel oil high pressure piping*	Leakage	See Vol 2, Pt 2, Ch 1, 7.6 Unattended machinery 7.6.5
Common rail servo oil pressure	Low	_
Charge air cooler outlet temperature	High	Trunk piston engines
Scavenge air temperature (fire)	High	Per cylinder, (2 stroke engines). Slow-down
Scavenge air receiver water level	High	_
Exhaust gas temperature*	High	Per cylinder. Slow-down (automatic on trunk piston engines), see Note 5
Exhaust gas temperature deviation from average*	High	Per cylinder, for engine power >500 kW/cylinder, see Note 5
Turbocharger speed	High	Category B and C turbochargers, see Notes 11 and 12
Turbocharger exhaust gas inlet temperature	High	Category B and C turbochargers, see Notes 6 and 12
Turbocharger lubricating oil inlet pressure	Low	Only for forced lubrication systems on category B and C turbochargers, see Notes 7, 10 and 12
Turbocharger lubricating oil outlet temperature	High	Category C turbochargers, if not a forced system, oil temperature near each bearing, see Notes 7 and 12
Starting air pressure*	Low	Before engine manoeuvring valve
Control air pressure	Low	_
Direction of rotation	Wrong way	Reversible engines, see also Vol 2, Pt 2, Ch 1, 7.7 Engines for propulsion purposes 7.7.7
Automatic start of engine	Failure	See Vol 2, Pt 2, Ch 1, 7.7 Engines for propulsion purposes 7.7.7
Electrical starting battery charge level*	Low	_
Feed water or water/thermal fluid forced circulation flow (if fitted)	Low	See Vol 2, Pt 7, Ch 3, 6.2 Feed and circulation pumps 6.2.6 and Note 8
Uptake temperature	High	To monitor for soot fires. See Notes 8 and 9
Note 1. Where 'per cylinder' appears in this Table, suitable	e alarms mav l	oe situated on manifold outlets for trunk piston engines.

- Note 2. For engines and gearing of 1500 kW or less only the items marked * are required.
- Note 3. Common sensors are acceptable for alarms and slow-down functions.
- **Note** 4. Except where stated otherwise in the Table, slow-down may be effected by either manual or automatic means, by reduction of speed or power as appropriate.
- Note 5. For trunk piston engine powers <500 kW/cylinder, a common sensor for exhaust gas manifold temperature may be fitted.
- **Note** 6. Alarm and indication of the exhaust gas temperature at turbocharger inlet may be waived if alarm and indication for individual exhaust gas temperature is provided for each cylinder and the alarm level is set to a value specified by the turbocharger manufacturer. For Category B turbochargers, the exhaust gas temperature may be alternatively monitored at the turbocharger outlet provided that the correlation between inlet and outlet temperatures is established and verified and the alarm level is set to a correspondingly safe level for the turbine.
- **Note** 7. Where the outlet temperature for each bearing cannot be measured due to the design, details of alternative proposals in accordance with the turbocharger manufacturer's instructions may be submitted for consideration.
- Note 8. Alarm only required when an exhaust gas economiser/boiler/thermal oil heater is fitted.
- Note 9. Alternatively, details of an appropriate fire detection system are to be submitted for consideration.
- **Note** 10. Separate sensors are to be provided if the lubrication oil system of the turbocharger is not integrated with the lubrication oil system of the engine or if it is separated by a throttle or pressure reduction valve from the engine lubrication oil system. Where the turbocharger is provided with a self-contained lubricating oil system integrated with the turbocharger, lubricating oil inlet pressure need not be monitored.
- Note 11. Where multiple turbochargers are activated sequentially, speed monitoring is not required for the turbocharger(s) being activated last in the sequence, provided that all turbochargers share the same intake air filter and they are not fitted with waste gates.

Note 12. SeeVol 2, Pt 2, Ch 1, 12.1 General 12.1.2 for details of turbocharger categorisations.

Table 1.7.2 Engines for propulsion purposes: Automatic shutdowns

Item	Alarm	Note
Lubricant oil inlet pressure	2nd stage low	Automatic shutdown of engines, see Vol 2, Pt 2, Ch 1, 7.6 Unattended machinery 7.6.4
Activation of oil mist detection arrangements (or activation of the temperature monitoring systems or equivalent devices of:	High	For trunk piston engines, automatic shutdown. For crosshead engines, see <i>Table 1.7.1 Engines for propulsion purposes: Alarms and slow-downs. See also Vol 2, Pt 2, Ch 1, 7.1 General 7.1.2.</i>
- the engine main and crank bearing oil outlet; or		
- the engine main and crank bearing)		
Cylinder coolant outlet temperature	2nd stage high	Automatic shutdown of trunk piston, see Vol 2, Pt 2, Ch 1, 7.6 Unattended machinery 7.6.4
Overspeed	High	Automatic shutdown of engine, see also Vol 2, Pt 2, Ch 1, 7.5 Overspeed protective devices. Details of alternative proposals in accordance with the manufacturer's instructions may be submitted for consideration

- 7.7.2 Alarms are to operate for the fault conditions shown in *Table 1.7.1 Engines for propulsion purposes: Alarms and slow-downs*. Where applicable, indication is to be given at the relevant control stations that the speed or power of the main propulsion engine(s) is to be manually reduced or has been reduced automatically.
- 7.7.3 Alarms are to operate, and automatic shutdown of machinery is to occur for the fault conditions shown in *Table 1.7.2 Engines for propulsion purposes: Automatic shutdowns*.
- 7.7.4 The following engine services are to be fitted with automatic temperature controls so as to maintain steady state conditions throughout the normal operating range of the propulsion engine(s):
- (a) Lubricating oil supply.
- (b) Piston coolant supply, where applicable.
- (c) Cylinder coolant supply, where applicable.
- (d) Fuel valve coolant supply, where applicable.
- (e) Fuel oil supply, where fuel oil grades require heating or cooling only, see also Vol 2, Pt 2, Ch 1, 7.7 Engines for propulsion purposes 7.7.5.
- 7.7.5 The fuel oil supply may be fitted with an automatic control for viscosity instead of the temperature control required by *Vol* 2, *Pt* 2, *Ch* 1, 7.7 Engines for propulsion purposes 7.7.4.
- 7.7.6 Indication of the starting air pressure is to be provided at each control station from which it is possible to start the main propulsion engine(s).
- 7.7.7 The number of automatic consecutive attempts which fail to produce a start are to be limited to three. For reversible engines which are started and stopped for manoeuvring purposes, means are to be provided to maintain sufficient starting air in the air receivers. For electric starting, see *Vol 2*, *Pt 2*, *Ch 1*, *9.2 Electric starting*.
- 7.7.8 Prolonged running in a restricted speed range is to be prevented automatically or, alternatively, an indication of restricted speed ranges is to be provided at each control station.

7.8 Auxiliary engines

- 7.8.1 Alarms and safeguards are indicated in *Table 1.7.3 Auxiliary engines: Alarms and shutdowns*.
- 7.8.2 For engines operating on heavy fuel oil, automatic temperature or viscosity controls are to be provided.

Table 1.7.3 Auxiliary engines: Alarms and shutdowns

Item	Alarm	Note
Lubricating oil inlet temperature	High	_
Lubricating oil inlet pressure	1st stage low	_
	2nd stage low	Automatic shutdown of engine, see Vol 2, Pt 2, Ch 1, 7.6 Unattended machinery 7.6.4
Activation of oil mist detection arrangements (or activation of the temperature monitoring systems or equivalent devices of:	High	Automatic shutdown of engine, see also Vol 2, Pt 2, Ch 1, 7.1 General 7.1.2
- the engine main and crank bearing oil outlet; or		
- the engine main and crank bearing)		
Fuel oil high pressure piping	Leakage	See Vol 2, Pt 2, Ch 1, 7.6 Unattended machinery 7.6.5
Coolant outlet temperature (for engines >220 kW)	1st stage high	_
	2nd stage high	Automatic shutdown of engine, see Vol 2, Pt 2, Ch 1, 7.6 Unattended machinery 7.6.5
Coolant pressure or flow	Low	_
Fuel oil temperature or viscosity	High and Low	Heavy oil only

Overspeed	High	Automatic shutdown of engine, see also Vol 2, Pt 2, Ch 1, 7.5 Overspeed protective devices. Details of alternative proposals in accordance with the manufacturer's instructions may be submitted for consideration.
Common rail servo oil pressure	Low	_
Common rail fuel oil pressure	Low	_
Starting air pressure	Low	_
Electrical starting battery charge level	Low	_
Exhaust gas temperature (for engines >500 kW/cylinder)	High	Per cylinder.
Feed water or water/thermal fluid forced circulation flow (if fitted)	Low	See Vol 2, Pt 7, Ch 3, 6.2 Feed and circulation pumps 6.2.6 and Note 3
Uptake temperature	High	To monitor for soot fires. See Notes 3 and 4
Turbocharger speed	High	Category B and C turbochargers, see Notes 7 and 9
Turbocharger exhaust gas inlet temperature	High	Category B and C turbochargers, see Notes 8 and 9
Turbocharger lubricating oil outlet temperature	High	Category C turbochargers, if not a forced system, oil temperature near each bearing, see Notes 6 and 9
Turbocharger lubrication oil inlet pressure	Low	Only for forced lubrication systems on category B and C turbochargers, see Notes 5, 6 and 9

Note 1. For emergency engines, including engines used for the emergency source of electrical power required by SOLAS, see *Vol 2, Pt 7, Ch 3, 12.11 Dead ship condition starting arrangements*.

- Note 2. The tailoring document or System Design Description may specify additional requirements of the Naval Administration.
- Note 3. Alarm only required when an exhaust gas economiser/boiler/thermal oil heater is fitted.
- Note 4. Alternatively, details of an appropriate fire detection system are to be submitted for consideration.
- **Note** 5. Separate sensors are to be provided if the lubrication oil system of the turbocharger is not integrated with the lubrication oil system of the engine or if it is separated by a throttle or pressure-reduction valve from the engine lubrication oil system.
- **Note** 6. Where outlet temperature from each bearing cannot be monitored due to the engine/turbocharger design, alternative arrangements may be accepted. Continuous monitoring of inlet pressure and inlet temperature in combination with specific intervals for bearing inspection in accordance with the turbocharger manufacturer's instructions may be accepted as an alternative.
- **Note** 7. Where multiple turbochargers are activated sequentially, speed monitoring is not required for the turbocharger(s) being activated last in the sequence, provided that all turbochargers share the same intake air filter and they are not fitted with waste gates.
- **Note** 8. Alarm and indication of the exhaust gas temperature at the turbocharger inlet is not required if alarm and indication for individual exhaust gas temperature are provided for each cylinder and the alarm level is set to a value specified by the turbocharger manufacturer. For Category B turbochargers, the exhaust gas temperature may be alternatively monitored at the turbocharger outlet provided that correlation between inlet and outlet temperatures is established and verified and the alarm level is set to a correspondingly safe level for the turbine.

Note 9. See Vol 2, Pt 2, Ch 1, 12.1 General 12.1.2 for details of turbocharger categorisations.

7.9 Emergency engines

7.9.1 Alarms and safeguards are indicated in *Table 1.7.4 Alarms and safeguards for emergency engines*.

Reciprocating Internal Combustion Engines

Volume 2, Part 2, Chapter 1

Section 8

Table 1.7.4 Alarms and safeguards for emergency engines

Item	Alarm for engine power <220 kW	Alarm for engine power ≥220 kW	Note
Fuel oil leakage from pressure pipes	Leakage	Leakage	See Vol 2, Pt 2, Ch 1, 7.6 Unattended machinery 7.6.5
Lubricating oil temperature	-	High	-
Lubricating oil pressure	Low	Low	-
Activation of oil mist detection arrangements (or activation of the temperature monitoring systems or equivalent devices of: - the engine main and crank bearing oil outlet; or - the engine main and crank bearing)	-	High	See Note
Coolant pressure or flow	-	Low	-
Coolant Temperature (can be air)	High	High	-
Overspeed	-	High	Automatic shutdown
Note For engines having a power of more than 2250 kW or a cylinder bore of more than 300 mm.			

- 7.9.2 The safety and alarm systems are to be designed to 'fail safe'. The characteristics of the 'fail safe' operation are to be evaluated on the basis not only of the system and its associated machinery, but also the complete installation, as well as the ship.
- 7.9.3 Regardless of the engine output, if shutdowns additional to those specified in *Table 1.7.4 Alarms and safeguards for emergency engines* are provided except for the overspeed shutdown, they are to be automatically overridden when the engine is in automatic or remote control mode during navigation.
- 7.9.4 Grouped alarms of at least those items listed in *Table 1.7.4 Alarms and safeguards for emergency engines* are to be arranged on the bridge.
- 7.9.5 In addition to the fuel oil control from outside the space, a readily accessible local means of engine shutdown is to be provided.
- 7.9.6 Local indications of at least those items listed in *Table 1.7.4 Alarms and safeguards for emergency engines* are to be provided within the same space as the engines and are to remain operational in the event of failure of the alarm and safety systems.

7.10 Additional requirements for engine stopping for naval vessels

7.10.1 At least two independent means of stopping the engines quickly from the control station under any conditions are to be available.

■ Section 8

Piping

8.1 Fuel oil, hydraulic and high-pressure oil systems

8.1.1 Fuel oil and hydraulic oil piping systems are to comply with *Vol 2, Pt 7, Ch 1 Piping Design Requirements* and *Vol 2, Pt 7, Ch 3 Machinery Piping Systems* as applicable.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 8

- 8.1.2 Engine fuel system components are to be designed to accommodate the maximum peak pressures experienced in service. Where fuel injection pumps are fitted, particular attention is to be given to the fuel injection pump supply and spill line piping which may be subject to high-pressure pulses from the pump. Connections on such piping systems should be chosen to minimise the risk of pressurised oil fuel leaks. Fatigue analysis may be considered necessary to establish the suitability of the piping system components for the pressures and fluctuating stresses that the pipe system may be subject to in normal service.
- 8.1.3 On engines used for propulsion, where fuel oil and hydraulic oil pressure pumps are fitted, and these are essential for engine operation, not less than two fuel oil and two hydraulic oil pressure pumps are to be provided and arranged such that failure of one pump does not render the other pump(s) inoperative. Each fuel oil pump and hydraulic oil pump is to be capable of supplying the quantity of oil for engine operation at its maximum continuous rating and arranged ready for immediate use.
- 8.1.4 External high pressure fuel delivery piping between the fuel injection pump or high pressure fuel pumps and the fuel injectors is to be protected with a jacketed piping system capable of containing leakage and/or spray of flammable fluid from a high pressure line failure. The jacketed piping arrangements are to be approved, see *Table 1.1.1 Plans and particulars to be submitted*. The protection of high-pressure fuel pipes on common rail fuel systems will be specially considered.
- 8.1.5 The protection required by Vol 2, Pt 2, Ch 1, 8.1 Fuel oil, hydraulic and high-pressure oil systems 8.1.4 is to prevent fuel oil or fuel oil mist from reaching a source of ignition on the engine or its surroundings. Suitable drainage arrangements are to be made for draining any fuel oil leakage to one or more collector tank(s) fitted in a safe position. These tanks are to be separate from any tank used to collect other oils such as lube oil or hydraulic oil to prevent cross-contamination. An alarm is to be provided to indicate that leakage is taking place. The collector tank arrangement is to be approved.
- 8.1.6 The hydraulic oil pressure piping between the high pressure hydraulic pumps and hydraulic actuators is to be protected with a jacketed piping system or suitable enclosure capable of containing hydraulic oil leakage from a high pressure pipe failure. Where flammable oils are used in high-pressure systems to operate exhaust valves, the oil pipe lines between the high-pressure oil pump and actuating oil pistons are to be protected with a jacketed piping system capable of preventing oil spray from a high-pressure line failure.
- 8.1.7 All lubricating and hydraulic oil pipes and oil fuel pipes that are not jacketed nor suitably enclosed are to be suitably installed and screened to avoid oil spray or leakage onto hot surfaces, see also Vol 2, Pt 7, Ch 3, 2.9 Precautions against fire 2.9.4 and Vol 2, Pt 7, Ch 5, 11.10 Precautions against fire 11.10.2 as applicable.
- 8.1.8 Where flammable oils are used in high-pressure actuating systems, a fatigue analysis is to be carried out in accordance with a suitable standard and all anticipated pressure, pulsation and vibration loads are to be considered. The analysis is to demonstrate that the design and arrangements are such that the likelihood of failure is as low as reasonably practicable. The analysis is to identify all assumptions made and standards to be applied during manufacture and testing. Any potential weak points that may develop due to incorrect construction or assembly are also to be identified.
- 8.1.9 Accumulators and associated high pressure piping are to be designed, manufactured and tested in accordance with a standard applicable to the maximum pressure and temperature rating of the system.
- 8.1.10 For high pressure oil containing and mechanical power transmission systems, the quality plan for sourcing, design, installation and testing of components is to address the following issues (see *Table 1.1.1 Plans and particulars to be submitted*, Note 11):
- (a) Design and manufacturing standard(s) applied.
- (b) Materials used for construction of key components and their sources.
- (c) Details of the quality control system applied during manufacture and testing.
- (d) Details of type approval, type testing or approved type status assigned to the machinery or equipment.
- (e) Details of installation and testing recommendations for the machinery or equipment.

8.2 Additional requirements for fuel oil, hydraulic and high pressure oil systems for naval vessels

- 8.2.1 Where multi-engined installations are supplied from the same fuel source, means of isolating the fuel supply and spill piping to individual engines is to be provided. These means of isolation are not to affect the operation of the other engines and are to be operable from a position not rendered inaccessible by a fire on any of the engines.
- 8.2.2 Means are to be provided safely to purge the fuel oil system of air.
- 8.2.3 Short lengths of synthetic rubber hoses that comply with the requirements of *Vol 2, Pt 7, Ch 1, 13 Flexible hoses* may be used to accommodate relative movement between machinery and fixed piping systems.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 8

8.3 Exhaust systems

- 8.3.1 Where the surface temperature of the exhaust pipes and silencer may exceed 220°C, they are to be water cooled or efficiently lagged to minimise the risk of fire and to prevent damage by heat. Where lagging covering the exhaust piping system including flanges is oil-absorbing or may permit penetration of oil, the lagging is to be encased in sheet metal or equivalent. In locations where the Surveyor is satisfied that oil impingement could not occur, the lagging need not be encased.
- 8.3.2 Where the exhausts of two or more engines are led to a common silencer or exhaust gas-heated boiler or economiser, an isolating device is to be provided in each exhaust pipe.
- 8.3.3 For alternatively fired furnaces of boilers using exhaust gases and oil fuel, the exhaust gas inlet pipe is to be provided with an isolating device and interlocking arrangements whereby oil fuel can only be supplied to the burners when the isolating device is closed to the boiler.
- 8.3.4 In two-stroke main engines fitted with exhaust gas turbochargers which operate on the impulse system, provision is to be made to prevent broken piston rings entering the turbine casing and causing damage to blades and nozzle rings.
- 8.3.5 Where the exhaust is led overboard near the waterline, the exhaust system shall be so designed as to prevent water from entering the engine exhaust manifold through wave or wake action, both when the engine is in operation or shutdown. The system shall also be designed to prevent ingress of water at the angles of inclination as shown in *Vol 2, Pt 1, Ch 3, 4.6 Inclination of ship*.
- 8.3.6 Where the exhaust is cooled by water spray, the exhaust pipes are to be self-draining overboard. Suitable measures shall be taken to prevent inadvertent closure of drain valves where this may lead to sprayed water entering the engine. Means shall be provided to prevent water from flowing back into the engine when the engine is stopped.
- 8.3.7 Exhaust systems having components sensitive to heat shall be fitted with a high temperature alarm after water injection. This alarm shall be integrated into the ship's alarm system.
- 8.3.8 Exhaust pipes penetrating the shell below the bulkhead deck shall be provided with a shipside valve or other approved positive means of closure at the shell to prevent back-flooding into the hull through a damaged exhaust system.
- 8.3.9 The exhaust system shall be designed such that the exhaust back-pressure is within the allowable limits stated by the engine manufacturer under all expected operating conditions.

8.4 Additional requirements for exhaust systems for naval vessels

- 8.4.1 The exhausts are to be in accordance with the engine manufacturer's design and installation requirements. Particular attention is drawn to the requirements on pressure and flow conditions to be achieved throughout the intake exhaust systems.
- 8.4.2 Each engine is to have an independent exhaust system unless arrangements are made to address risks associated with combined exhausts e.g back pressure, trapped combustion products and unburned fuel vapours.
- 8.4.3 The arrangement of the exhaust system is to be such as to prevent exhaust gases being drawn into the manned spaces, air conditioning systems and air intakes. They should not discharge into air cushion intakes.
- 8.4.4 The design of exhaust systems is to prevent deterioration of engine parts resulting from ingress of sea or rain water via the exhaust ducting when the engine is not in use. Drainage arrangements are to be provided and are to be led to a tank suitable for the potentially corrosive nature of any drainage.
- 8.4.5 Exhaust systems are not to pass through accommodation spaces.
- 8.4.6 The exhaust system is to accommodate thermal expansion and movement of the duct due to the combined effects of operating the engines and flexure of the ship's structure.
- 8.4.7 The exhaust ducting and silencers are to be designed and installed to minimise the risk of unburnt fuel collecting inside the duct.
- 8.4.8 The design of the exhaust ducting and associated equipment is to minimise the risk of soot collecting at any point other than those specifically intended for soot removal. Inspection and access openings are to be provided.
- 8.4.9 Plastic pipes intended for exhaust systems are to be in accordance with a recognised Code or Standard suitable for the intended service conditions.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 8

8.5 Starting air pipe systems and safety fittings

- 8.5.1 In designing the compressed air installation, care is to be taken that the compressor air inlets will be located in an atmosphere reasonably free from oil vapour or, alternatively, an air duct from outside the machinery space is to be led to the compressors.
- 8.5.2 The air discharge pipe from the compressors is to be led direct to the starting air receivers. Provision is to be made for intercepting and draining oil and water in the air discharge for which purpose a separator or filter is to be fitted in the discharge pipe between compressors and receivers.
- 8.5.3 The starting air pipe system from receivers to main and auxiliary engines is to be entirely separate from the compressor discharge pipe system. Stop valves on the receivers are to permit slow opening to avoid sudden pressure rises in the piping system. Valve chests and fittings in the piping system are to be of ductile material.
- 8.5.4 Drain valves for removing accumulations of oil and water are to be fitted on compressors, separators, filters and receivers. In the case of any low-level pipelines, drain valves are to be fitted to suitably located drain pots or separators.
- 8.5.5 The starting air piping system is to be protected against the effects of explosions by providing an isolating non-return valve or equivalent at the starting air supply to each engine.
- 8.5.6 In direct reversing engines, bursting discs or flame arresters are to be fitted at the starting valves on each cylinder; in non-reversing and auxiliary engines at least one such device is to be fitted at the supply inlet to the starting air manifold on each engine. The fitting of bursting discs or flame arresters may be waived in engines where the cylinder bore does not exceed 230 mm.
- 8.5.7 Alternative safety arrangements may be submitted for consideration.

8.6 Requirements for lubricating oil systems for naval vessels

- 8.6.1 The lubrication system for each engine is to be independent from any other engine. A common lubricating oil storage tank arrangement may be provided.
- 8.6.2 Each engine is to be provided with a means of checking the running and static level of oil in the system/engine.
- 8.6.3 Means are to be provided to purge safely lubricating oil systems of air.
- 8.6.4 All vent pipes are to be arranged with a continuous upward slope of at least 10° to prevent the collection of oil in pockets and bends.
- 8.6.5 Oil sampling arrangements with the ability to take samples when the engine is running are to be fitted with valves or cocks of the self-closing type and located in positions as far removed as possible from any heated surface or electrical equipment.

8.7 Requirements for air intake systems for naval vessels

- 8.7.1 The air intakes are to be in accordance with the engine manufacturer's design and installation requirements. Particular attention is drawn to the requirements on pressure and flow conditions to be achieved throughout the intake system.
- 8.7.2 Engine intakes are to be arranged to provide sufficient air to the engines whilst minimising the ingestion of harmful particles.
- 8.7.3 An air filter is to be fitted at the inlet to each engine. The air filters are to satisfy the following:
- (a) Be readily removable for cleaning.
- (b) Have an efficiency of not less than 98 per cent at 100 per cent of rated flow capacity when tested to an acceptable standard specified by the manufacturer.
- (c) Be provided with an indicator, such as a pressure drop indicator, to indicate when a filter requires cleaning.
- (d) Be of a design that does not degrade the performance of the engine.
- (e) For engines drawing air from the engine compartment, be as close as possible to the engine air inlet and in such cases, the debris screen required by Vol 2, Pt 2, Ch 1, 8.7 Requirements for air intake systems for naval vessels 8.7.6.(c) may be omitted.
- 8.7.4 Where there is a requirement to provide a ducted air system to convey air from inlets on deck to the engine, the requirements of Vol 2, Pt 2, Ch 1, 8.7 Requirements for air intake systems for naval vessels 8.7.5 to Vol 2, Pt 2, Ch 1, 8.7 Requirements for air intake systems for naval vessels 8.7.8 are to be complied with.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 9

- 8.7.5 The ducting is to be led by the most direct route practicable consistent with the arrangement of adjacent systems and equipment.
- 8.7.6 Each ducted air supply is to have the following:
- (a) Means to prevent sea spray, aerosol salt and sand reaching the engine and means to remove any such substances that enter the intakes or their bypass arrangements. Suitable drainage arrangements to remove any water from intakes and intake bypass arrangements (where fitted) to guard against the risk of icing are also to be provided.
- (b) Means of ensuring that loads are not transmitted from the engine to the ducting, such as a flexible bellows, see Vol 2, Pt 7, Ch 1, 14 Expansion pieces.
- (c) A debris screen that is easily accessible for cleaning located close to the engine.
- 8.7.7 The design of induction air systems is to provide a nominal constant air speed that should be as low as reasonably practicable to minimise pressure losses. The inlet pressure drop across the system, including filters and silencers, etc. is not to exceed the engine manufacturer's recommendations.
- 8.7.8 Air induction system intakes are to be designed and installed such that turbulent flow is not induced therein by ship motions.

■ Section 9

Starting arrangements

9.1 Air starting

9.1.1 Air starting arrangements are to meet the requirements of Vol 2, Pt 7, Ch 3, 12 Air compressors and air starting arrangements.

9.2 Electric starting

- 9.2.1 Where main engines are fitted with electric starters, two batteries are to be fitted. Each battery is to be capable of starting the engines when cold and the combined capacity is to be sufficient without recharging to provide the number of starts of the main engines as required by *Vol 2*, *Pt 7*, *Ch 3*, *12 Air compressors and air starting arrangements*. In other respects batteries are to comply with the requirements of *Vol 2*, *Pt 9*, *Ch 2*, *7 Batteries*.
- 9.2.2 Electric starting arrangements for auxiliary engines are to have two separate batteries or be supplied by separate circuits from the main engine batteries when such are provided. Where one of the auxiliary engines only is fitted with an electric starter one battery will be acceptable.
- 9.2.3 The combined capacity of the batteries for starting the auxiliary engines is to be sufficient for at least three starts for each engine.
- 9.2.4 Engine starting batteries are to be used only for the purposes of starting the engines and for the engines' own control, alarm, monitoring and safety arrangements. Means are to be provided to ensure that the stored energy in the batteries is maintained at a level required to start the engines as defined in *Vol 2, Pt 2, Ch 1, 9.2 Electric starting 9.2.1* and *Vol 2, Pt 2, Ch 1, 9.2 Electric starting 9.2.3*.
- 9.2.5 Where engines are fitted with electric starting batteries, an alarm is to be provided for low battery change level.

9.3 Additional requirements for electric starting for naval ships

9.3.1 Transient electrical loads due to starting of engines are not to interfere with power supplies to control and weapons systems.

9.4 Starting of the emergency source of power

- 9.4.1 Emergency generators are to be capable of being readily started in their cold conditions down to a temperature of 0°C. If this is impracticable, or if lower temperatures are likely to be encountered, consideration is to be given to the provision and maintenance of heating arrangements, so that ready starting will be assured.
- 9.4.2 Each emergency generator that is arranged to be automatically started is to be equipped with an approved starting system having two independent sources of stored energy, each of which is sufficient for at least three consecutive starts. When

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 10

hand (manual) starting is demonstrated to be effective, only one source of stored energy need be provided. However, this source of stored energy is to be protected against depletion below the level required for starting.

- 9.4.3 Provision is to be made to maintain continuously the stored energy at all times, and for this purpose:
- (a) Electrical and hydraulic starting systems are to be maintained from the emergency switchboard.
- (b) Compressed air starting systems may be maintained by the main or auxiliary compressed air receivers, through a suitable non-return valve, or by an emergency air compressor energised by the emergency switchboard.
- (c) All these starting, charging and energy storing devices are to be located in the emergency generator room. These devices are not to be used for any purpose other than the operation of the emergency generator.
- 9.4.4 Electronically controlled emergency engines are to comply with the additional requirements of Vol 2, Pt 2, Ch 1, 4.5 Additional requirements for emergency engines for naval vessels.
- 9.4.5 When automatic starting is not required by the Rules and where it can be demonstrated as being effective, hand (manual) starting is permissible, such as manual cranking, inertial starters, manual hydraulic accumulators, powder charge cartridges.
- 9.4.6 When hand (manual) starting is not practicable, the provisions of Vol 2, Pt 2, Ch 1, 9.4 Starting of the emergency source of power 9.4.2 and Vol 2, Pt 2, Ch 1, 9.4 Starting of the emergency source of power 9.4.3 are to be complied with except that starting may be manually initiated.
- 9.4.7 Electric starting arrangements are to also satisfy Vol 2, Pt 2, Ch 1, 9.2 Electric starting 9.2.2 to Vol 2, Pt 2, Ch 1, 9.2 Electric starting 9.2.5 and Vol 2, Pt 2, Ch 1, 9.3 Additional requirements for electric starting for naval ships 9.3.1.

9.5 Engine control, alarm, monitoring and safety system power supplies

- 9.5.1 Power supplies are to be arranged so that power for electrically powered control, alarm, monitoring and safety systems required for engine starting and operation will remain available in the event of a failure. Power is to remain available to permit starting attempts for the number of starts specified by this Section for each individual source of stored energy.
- 9.5.2 Where adequate battery and charging capacity exists, an engine-starting battery may be used as one source of electrical power required by Vol 2, Pt 2, Ch 1, 9.5 Engine control, alarm, monitoring and safety system power supplies 9.5.1.
- 9.5.3 An alarm is to be activated in the event of failure of a power supply and, where applicable, low battery charge level. Manual power supply changeover facilities are permitted.

■ Section 10

Safety arrangements

10.1 Relief valves

- 10.1.1 Scavenge spaces in open connection with cylinders are to be provided with explosion relief valves.
- 10.1.2 Crankcases are to be provided with lightweight spring-loaded valves or other quick-acting and self-closing devices, to relieve the crankcases of pressure in the event of an internal explosion and to prevent any inrush of air thereafter. The valves are to be designed and constructed to open quickly and be fully open at a pressure not greater than 0,2 bar.
- 10.1.3 The valve lids are to be made of ductile material capable of withstanding the shock of contact with stoppers at the full open position.
- 10.1.4 Each valve is to be fitted with a flame arrester that permits flow for crankcase pressure relief and prevents the passage of flame following a crankcase explosion. The valves are to be type tested in a configuration that represents the installation arrangements that will be used on an engine and in accordance with *Vol 2, Pt 2, Ch 1, 13.3 Crankcase explosion relief valves*. The valves are to be positioned on engines to minimise the possibility of danger and damage arising from emission of the crankcase atmosphere. Where shielding from the emissions is fitted to a valve, the valve is to be tested to demonstrate that the shielding does not adversely affect the operational effectiveness of the valve.
- 10.1.5 The valves are to be provided with a copy of the manufacturer's installation and maintenance manual that is pertinent to the size and type of valve being supplied for installation on a particular engine. The manual is to contain the following information:

• Description of valve with details of function and design limits.

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 10

- Copy of type test certification.
- Installation instructions.
- Maintenance in service instructions to include testing and renewal of any sealing arrangements.
- Actions required after a crankcase explosion.
- 10.1.6 A copy of the installation and maintenance manual required by Vol 2, Pt 2, Ch 1, 10.1 Relief valves 10.1.5 is to be provided on board ship.
- 10.1.7 Plans showing details and arrangements of the relief valves are to be submitted for approval. See Vol 2, Pt 2, Ch 1, 1.4 Submission requirements.
- 10.1.8 The valves are to be provided with suitable markings that include the following information:
- Name and address of manufacturer.
- Designation and size.
- Month/Year of manufacture.
- Approved installation orientation.

10.2 Number of relief valves

- 10.2.1 Internal combustion engines having a cylinder bore of 200 mm and above or a crankcase volume of 0,6 m³ and above shall be provided with crankcase explosion relief valves.
- 10.2.2 In engines having cylinders exceeding 200 mm but not exceeding 250 mm bore, at least two relief valves are to be fitted; each valve is to be located at or near the ends of the crankcase. Where the engine has more than eight crankthrows an additional valve is to be fitted near the centre of the engine.
- 10.2.3 In engines having cylinders exceeding 250 mm but not exceeding 300 mm bore, at least one relief valve is to be fitted in way of each alternate crankthrow with a minimum of two valves. For engines having 3, 5, 7, 9, etc. crankthrows, the number of relief valves is not to be less than 2, 3, 4, 5, etc. respectively.
- 10.2.4 In engines having cylinders exceeding 300 mm bore, at least one valve is to be fitted in way of each main crankthrow.
- 10.2.5 Additional relief valves are to be fitted for separate spaces on the crankcase, such as gear or chaincases for camshaft or similar drives, when the gross volume of such spaces exceeds 0,6 m³.

10.3 Size of relief valves

- 10.3.1 The combined free area of the crankcase relief valves fitted on an engine is to be not less than 115 cm^2/m^3 based on the volume of the crankcase.
- 10.3.2 The free area of each relief valve is to be not less than 45 cm².
- 10.3.3 The free area of the relief valve is the minimum flow area at any section through the valve when the valve is fully open.
- 10.3.4 In determining the volume of the crankcase for the purpose of calculating the combined free area of the crankcase relief valves, the volume of the stationary parts within the crankcase may be deducted from the total internal volume of the crankcase.

10.4 Vent pipes

- 10.4.1 Through ventilation, and any arrangement which could produce a flow of external air within the crankcase, is in principle not permitted except for trunk piston type dual fuel engines where crankcase ventilation is to be provided. Where crankcase vent or breather pipes are fitted, they are to be made as small as practicable and/or as long as possible to minimise the inrush of air after an explosion. Vents from crankcases of main engines are to be led to a safe position on deck or other approved position.
- 10.4.2 If provision is made for the extraction of gases from within the crankcase, e.g. for oil mist detection purposes, the vacuum within the crankcase is not to exceed 25 mm of water.
- 10.4.3 Lubricating oil drain pipes from engine sump to drain tank are to be submerged at their outlet ends. Where two or more engines are installed, vent pipes, if fitted, and lubrication oil drain pipes are to be independent to avoid intercommunication between crankcases.

10.5 Warning notice

10.5.1 A warning notice is to be fitted in a prominent position, preferably on a crankcase door on each side of the engine, or alternatively at the engine room control station. This warning notice is to specify that whenever overheating is suspected in the

Reciprocating Internal Combustion Volume 2, Part 2, Chapter 1 Section 10

crankcase, the crankcase doors or sight holes are not to be opened until a reasonable time has elapsed after stopping the engine, sufficient to permit adequate cooling within the crankcase.

10.6 Crankcase access and lighting

- 10.6.1 Where access to crankcase spaces is necessary for inspection purposes, suitably positioned rungs or equivalent arrangements are to be provided as considered appropriate.
- 10.6.2 When interior lighting is provided it is to be flameproof in relation to the interior and details of which are to be submitted for approval. No wiring is to be fitted inside the crankcase.

10.7 Fire extinguishing system for scavenge manifolds

10.7.1 Crosshead type engine scavenge spaces in open connection with cylinders are to be provided with approved fixed or portable fire extinguishing arrangements which are to be independent of the fire extinguishing system of the engine room.

10.8 Oil mist detection
